Sartre, JEAN-PAUL (b. 1905). French man of letters. He was born in Paris, June 5, 1905, and educated at Paris and La Rochelle. In 1930 he became a teacher of philosophy, and before the Second Great War wrote books on philosophical subjects, developing, under the influence of Kierkegaard and Heidegger, his own variety of what became known as Existentialism (*q.v.*), which was to provide the background of all his later work. Mobilised in 1939, he was taken prisoner in 1940, returning to Paris soon and working for the French underground resistance movement. He turned to the drama and the novel in an attempt to gain wider appreciation for his outlook. *Huis-Clos*, 1943 (performed and published in London and New York under the alternative titles *Vicious Circle*, and *No Exit*), was a striking beginning to his career as a playwright, and was followed by *Les Mouches*, 1943; *Morts Sans*

J. P. Sartre, French
man of letters

Sépulture, 1946; and La Putain Respectueuse, 1946; all seen in London. Sartre's most striking work of fiction, the trilogy, *Les Chemins de la Liberté*, 1944-47, portrays the dilemma of the individual caught up into power politics. All his works were placed on the papal index, 1948.

Sarum. Latin name for Salisbury. Old Sarum is a parish 2 m. N. of Salisbury, Wilts, once a city of importance. Occupied in late-Celtic, perhaps in Neolithic times, it became a Saxon burgh, a Norman stronghold, and a medieval city, and returned two parliamentary members down to 1832. Carved out of a chalk knoll 300 ft. above the Avon, the central mound was encircled by a plain, protected by an oval earthwork enclosing 27½ acres. The Romano-British *Sorbiodunum*, commonly identified with the mound, probably occupied the adjacent Stratford-sub-Castle. The Sherborne see was transferred thither in 1075; the office-books called the *Sarum Use* (v.i.) were compiled there about 1085; and its population migrated to Salisbury in 1227. Vested in the office of works as an ancient monument, it was excavated from 1912 onwards. *See Earthwork; Port Way; Salisbury.*

Sarum Use, THE. Customs or rules followed anciently in the English diocese of Salisbury, especially in connexion with the celebration of the Mass. Drawn up by Bishop Osmund in the 11th century, and adopted by the province of Canterbury in 1542, it forms the chief basis of the English Book of Common Prayer. *See Breviary; Liturgy; Missal; Prayer Book.*

Sarzana. City of Italy, in the prov. of Spezia. It stands near the river Magra, 8 m. by rly. E. of Spezia. Its handsome Gothic cathedral, 1255-1474, is built of white marble, and was founded in memory of Pope Nicholas V, a native. During the Second Great War it was damaged by shellfire. Other striking structures are the castle of Sarzanello and the Palazzo del Capitano. There is trade in wine, oil, and silk, and glass bottles and bricks are manufactured. Sarzana is built on the site of the ancient Luna. In 1814 it was ceded to the kingdom of Sardinia, to which it belonged until it was merged in the kingdom of Italy in 1861. Pop. est. 15,000.

Sasaram. Town of Bihar state, India, in Shahabad dist. Formerly a great junction on the Calcutta road, now a rly. junction, it is situated W. of the Son about

midway between Benares and Gaya, near the Kaimur Hills. It was named Sasaram Nasir-ul-Hukkam, the loyal town, by government edict, after the defeat by the citizens of a rebel band in the Mutiny, 1857. The mausoleum of Sher Shah, usurping Afghan emperor of Delhi, 1540-45, stands on an island in a lake, and is a good specimen of Pathan architecture. Pop. 22,308.

Sasebo or **SASEHO.** Naval port of Japan. It stands on the W. coast of the island of Kyushu, and is connected by rly. with Yatsushiro, Kokura, and Nagasaki. The third Japanese naval station in importance, Sasebo was founded in 1886. U.S. aircraft dropped some 1,000 tons of incendiary bombs on this port, June 28, 1945. Pop. 185,900.

Sash (Arab. *shash*, muslin turban). Broad band of silk or similar material worn round the waist or over the shoulder as a part of the costume of women and children, and as part of the insignia of office or of uniform. In the British infantry, except in rifle regiments, officers and sergeants, when in full dress, wear a crimson sash, originally intended as the means by which a wounded man could be carried off the field by two bearers. In 1743 the officers wore the sash over the right shoulder; later it was worn round the waist in most regiments. In 1855 it was worn over the left shoulder by officers, and the right shoulder by sergeants but in 1902 the officers reverted to wearing it round the waist, sergeants continuing to wear it over the right shoulder. *See Uniform.*

Sash. Separate member of a window, carrying the glass. In the sash-and-frame window a pair of sashes are arranged to slide vertically one over the other in a boxed frame. In other forms of window the sash may be hinged at top or side, or fixed. *See Window.*

Sasine (Fr. *saisir*, to occupy). In Scots law, a word formerly used for the act of taking possession of land. This was done by handing a

symbol, such as a clod of earth, to the new possessor, and the deed was recorded in a document signed by the parties concerned. This method was abolished in 1845. Transfers of land are now registered in the sasine office. In England the feudal equivalent was *seizin*.

Saskatchewan (Cree, rapid river). River of Canada. It is formed by two streams, the N. and the S. Saskatchewan. The former rises in the Rocky Mountains and flows E., receiving the Battle, Clearwater, and other streams. The latter is a union of the Bow and Belly rivers, which unite some miles W. of Medicine Hat in Alberta. This, too, flows E. and receives the Red Deer. The two Saskatchewanes unite near Prince Albert, and the joint stream discharges through Lake Cedar into Lake Winnipeg. It is navigable from Edmonton to its mouth. To the head of Bow the length of the river is 1,205 m., but the united river is only about 300 m.

Saskatchewan. Province of Canada. Its area is 251,700 sq. m. of which 13,725 sq. m. are water.

Its name is taken from its main river system, two branches of which cross it. It became a province in 1905, being formerly part of the N.W. territories. Regina is the capital.

Saskatoon is the seat of the university, and other important cities are Moose Jaw, Prince Albert, Battleford, Swift Current, Weyburn, and Estevan.

Two-thirds of the province is part of the grain-growing central plains and the remainder part of the forested and mineral bearing Pre-Cambrian shield. The plains form the largest wheat and cereal growing part of Canada, and Saskatchewan in 1947 produced 173,000,000 bushels out of a total crop of 340,767,000 bushels—more than 50 p.c. of all Canadian

Saskatchewan arms

Saskatchewan, Canada. The Convocation Hall of the University of Saskatchewan, at Saskatoon

production. Saskatchewan is the largest single supplier of wheat and flour for Great Britain. In addition to cereals, the province produces livestock, hogs, wool, timber, poultry, furs, coal, petroleum, sodium sulphate, potash, and base metals. The largely uninhabited northern shield is rich in water-power and mineral possibilities, as well as in timber and fresh-water fish. The province is traversed by the main lines of the two Canadian rlys., by the Trans-Canada airlines, and by a government-owned bus service. More than two-thirds of the population reside in rural areas, mainly on farms or in small villages. Just under 50 p.c. of the people are of British origin, and there are large groups of Scandinavians, Germans, Ukrainians, and other Slavs.

The government consists of a lieutenant-gov. representing the crown and appointed by the federal government and an elected legislature with a cabinet chosen from the strongest party. Elections are held at not less than five-year intervals. The government has departments under ministers including Provincial Treasury, At-

torney General, Agriculture, Education, Cooperation and Co-operative Development, Public Works, Labour, Natural Resources, Health, Social Welfare, and Municipal affairs. There is also an economic advisory and planning board responsible to the cabinet, which guides the operations of a group of state-owned industries such as the Saskatchewan minerals corporation, telephone company, power commission, clay products, timber board, fish board, insurance company, and other industries or services. The province has an extensive cooperative movement both in marketing and wholesale selling. There is a state-directed health and hospital service to cover all parts of the province and a universal system of free schools. There are 55 members in the legislature. The province elects 16

members of the federal parliament at Ottawa and has six members of the federal senate. Pop. 895,992.

Graham Spry,
Agent-General

Saskatchewan,
UNIVERSITY OF
Canadian university. It was established by the provincial legislature in 1907 to serve as an educational centre for the province. The buildings of the university are at Saskatoon, the site covering 1,640 acres. They include laboratories and library, and there is a large experimental farm. The faculties are arts, science, law, education, music, commerce, agriculture, and engineering. There are hostels for both men and women, and three theological colleges at Saskatoon are affiliated with the univ. See illus. p. 7325.

Saskatoon. Capital and second largest city of Saskatchewan, Canada. It stands on the S. Sas-

Saskatoon, Canada. The main thoroughfare of the city

katchewan river, 470 m. W.N.W. of Winnipeg, on the C.P.R. and the C.N.R., of which it is the mid-western headquarters. Here are the provincial university, agricultural college, experimental farm, and school for training teachers. Cement and chemicals are made; there are machine shops and foundries; trade is done in grain. Only a village in 1900, Saskatoon supported a pop. of 44,829 in 1948.

Sassafras (*Sassafras variifolium*). Tree of the family Lauraceae, native of N.E. America. It

Sassafras. Twig showing fruit and two shapes of leaves; inset, left, single fruit; right, flower spray

has yellow-green twigs and oval leaves, some cut into three lobes, greenish-yellow flowers in short sprays, and blue and plum-like fruit on a red, club-shaped stalk. The twigs and leaves are mucilaginous, and the bark has a spicy aromatic odour. The root and bark have stimulating properties and are used as ingredients in medicine, as well as furnishing a yellow dye. The leaves make Sassafras tea, and are used to thicken soup, while a kind of beer is brewed from young shoots, and the oil extracted from the fruit is used in perfumery.

Sassanids. Name of a Persian dynasty which ruled from A.D. 226 to 651. Within a hundred years of

Saskatchewan. Map of the Canadian province, one of the most fertile grain districts in N. America

the destruction of the great Persian empire by Alexander the Great, a new empire called Parthian, under a dynasty called the Arsacidae, was set up in the regions E. of the Euphrates. This dynasty ruled till 226, when it was overthrown by a Persian chief, Babegan or Ardashir. The dynasty took its name from Sassan, a more or less mythical ancestor of Ardashir. *See Persia.*

Sassari. Northern prov. of Sardinia. It is bounded on three sides by the Mediterranean, and has an area of 4,120 sq. m. The surface is mountainous, but in the fertile portions fish, wine, oil, cereals, and tobacco are produced. and there is some mineral wealth. The capital is Sassari. Pop. est. 350,000. *See Caprera*; *Terranova.*

Sassari. City of Sardinia, capital of the prov. of Sassari. It stands on the river Torres, 12 m. by rly. S.E. of Porto Torres on the Gulf of Asinara. It has a 12th century cathedral, a 13th century church, a 14th century castle, a university founded 1677, and an important museum containing Roman relics. A well-built town, it is surrounded by olive and orange groves. It trades in grain, hides, cheese, and oil. In the vicinity are gold and silver mines. Sassari was ceded by the Pisans to the Genoese in 1288, and was sacked by the French in 1527. Pop. est. 60,000.

Sasseno. Island of the Adriatic Sea off the coast of Albania. It lies at the entrance to the Bay of Avlona.

Sassoon, SIR JACOB ELIAS (1844-1916). British banker and merchant. Grandson of David Sassoon of Bagdad, a merchant who migrated to Bombay in the early part of the 19th century, he was the son of David Sassoon who founded the firm of E. D. Sassoon

Sir Jacob Sassoon.
British banker

and Co. Jacob spent many years in China, and settled in London in 1880. He took a leading part in developing the cotton industry of W. India. A philanthropist, he established the central college of science in Bombay, and was the recognized head of the Jewish community in India. Sir Jacob was made a baronet in 1909, and died Oct. 24, 1916. He was succeeded in the title by his younger brother, Edward Elias (1853-1924), whose son, Ellie Victor (b. Dec. 30,

1881), later became chairman of the family business.

Sassoon, SIR PHILIP ALBERT GUSTAVE DAVID (1888-1939). British politician. He was born

Dec. 4, 1888, and educated at Eton and Christ Church, Oxford, becoming 3rd baronet in 1917 on the death of his father, who was related to the family described in the previous article. The same year Philip became Conservative M.P. for Hythe, and served in the First Great War, acting as secretary to Haig. He then became private secretary to Lloyd George, 1920, and was under-secretary for Air under Baldwin, 1924-29, occupying the same position in the national governments of 1931-37, when he was made first commissioner of Works.

An enthusiastic aeronaut, he toured R.A.F. stations in India, Iraq, Egypt, the Sudan, and Malta by air in 1928, long before such journeys by air were common. It was largely through his influence that the govt. decision, for reasons of economy, not to compete for the Schneider trophy (*q.v.*) in 1931 was reversed. At home he encouraged civil aviation, piloting his own aeroplane. He was from 1932 hon. air commodore in the A.A.F. His private flying field at Lympe became a R.A.F. aerodrome during the Second Great War. A generous patron of art also, he frequently threw open his house in Park Lane for period art exhibitions in aid of the Royal Northern hospital, of which he was chairman. He was a trustee of the National Gallery, Wallace Collection, and Tate Gallery. He died June 3, 1939.

Sassoon, SIEGFRIED LORRAINE (b. 1886). English poet and writer. Related through his

Siegfried Sassoon,
English poet

mother to the Thornycroft engineers and sculptors, he was born Sept. 8, 1886. A youth passed in Kent provided the background for *Memoirs of a Fox-Hunting Man*, which first brought him into public notice in 1928 and gained the Hawthornden prize next year. Infantry service in the First Great War, including a

revulsion which led him to try to throw up his commission, was to be chronicled in *Memoirs of an Infantry Officer*, 1930; it also evoked poems, some of bitter invective, others expressing the strange beauty of quiet moments in the din of conflict. The trilogy of memoirs of "George Sherston" was completed in 1936 with *Sherston's Progress*. Autobiography, *The Weald of Youth*, followed in 1942; *Siegfried's Journey*, 1945. He published a biography of Meredith in 1948. Sassoon's prose has an easy flow, even when he is satirical. His poems were collected in 1947; those previously published as *The Heart's Journey* especially reveal his sensitive nature, and some have been set to music. Everyone Sang is an anthology piece, and All Souls' Day a magnificent affirmation of faith.

Sastri, SRINIVASA (V.S.) (1869-1946). Indian politician. A Brahman, he was born at Valangimann, near Kumbakonam, Madras, Sept. 22, 1869, and was a pupil of the government college there. He became head of the Hindu high school, Triplicane, 1899. A leader of the moderate reformers, he represented Madras on the viceregal legislative council, 1916-20, and on the council of state in the Indian legislature, 1921. A notable orator, he spoke for India at the imperial conference of 1921, and at the L. of N. assembly. In 1927 he became Indian government agent in S. Africa. Sastri received the C.H. in 1930. He was vice-chancellor of Annamalai university, 1935-40. He died April 17, 1946.

Satan. One of the many Hebrew names given to the prince of the powers of darkness. Satan means literally an adversary, a hindering influence, and though most authorities hold that Our Lord is represented as expressing belief in Satan as a personal being, some think that He accommodated His language to the popular Hebraic mode of expressing the power of evil. The idea of a supreme evil spirit, the Devil or Satan, came into prominence among the Jews about the time of the captivity. Milton, in *Paradise Lost* and *Paradise Regained*, did much to establish modern belief in a personal cause of the Fall and of the moral evil of the world. *See Devil.* Consult art. Satan, in *Hastings's Dictionary of the Bible*, 1904.

Satan-Worship. Ritual reverence of the devil as the personalised ruler of the powers of evil. Involving the principle of moral evil, it is distinguishable from the pro-

pitiation of malignant spirits which pervades animistic religions. It differs also from the devil-worship of the Yezidis, who venerate the arch-enemy in the belief that such friendliness, offered to him while a fallen angel, will be rewarded when he regains paradise. The worship of Satan as almighty and supreme finds no place in the history of religion.

Late in the 19th century there were declared to occur in France and elsewhere persons who, unable to perceive beneficent omnipotence in the government of the universe, deliberately defied the Supreme Being by offering allegiance to his adversary. This perverted cult, called Satanism, was short-lived.

From 1885, a voluminous literature, mostly emanating from Paris, alleged the widespread existence of a powerful cult, alternatively called Palladism or Luciferism. Declared to have been founded by Albert Pike at Charleston, U.S.A., whence it spread to Europe, it was described as an integral part of Continental masonic ritual, marked by a revival of the indecencies of the Black Mass. Gabriel Jogand, under the pen-name Leo Taxil, after professing conversion to Rome, and a German confederate, Hacks, under the pen-name Bataille, published elaborate "revelations" which were eagerly accepted by a credulous public. During 1896-97 the confederates confessed the whole thing to be a hoax.

Satara. District and town of India, in the Central division, Bombay state. The district lies to the E. of the W. Ghats. It is crossed by the rly. S. from Poona. Food grains and pulses are the chief crops. The town 2,300 ft. above sea level, is 55 m. S. of Poona on the main road from Poona to Belgaum. It has monuments of the Mahratta age and the famous sword of Sivaji. Brass ware is manufactured. Area of dist. 4,891 sq. m. Pop., dist., 1,327,249; town, 22,454.

Satellite (Lat. *satelles*, attendant). In astronomy, a companion body to a planet or star. According to a theory of their formation, the planets, before being completely cooled, and while still rapidly rotating semi-liquid bodies, threw off their satellites, which, however, had not sufficient speed of direct motion to escape from the attraction of the parent body. The inner planets, Venus and Mercury, have no satellites; the earth one, the moon; Mars two: Jupiter eleven; Saturn, in addition to its rings, nine; Uranus, five; Neptune, one.

Some of the satellites, e.g. that of Neptune, have a retrograde motion. The moon is the largest satellite relative to its planet. Many stars have dark satellites, and others companions only a little less bright than their primaries. See Planet; Star.

Satellite Town. Town the growth and economic life of which depend principally on another town or city, e.g. Leith, the port of Edinburgh. The satellite towns that served London in the 18th and 19th centuries, e.g. Tottenham, Islington, Hammersmith, Clapham, and Camberwell, have all been absorbed into London, as the built-up area has spread from within the 5-m. to

Following the issue of the Barlow and Scott Reports (*qq.v.*), the New Towns Act, 1946, authorised the establishment in the British Isles by development corporations appointed and financed by the govt. of new satellite towns to relieve pressure of pop. on existing towns. See Town Planning; consult Garden Cities of Tomorrow, E. Howard, 1902; A Plan for Town and Country, P. Pool and F. Stephenson, 1944; Report of New Towns Committee (Cmd. 6876), H.M.S.O., 1946.

Sati or Sutttee (Hind., virtuous wife). Hindu widow who immolates herself on her husband's funeral pyre, or is separately immolated when he has died at a

Sati or Sutttee. Scene at the burning of a Hindu whose widow is being immolated on the funeral pyre as an act of virtue

From an old print

beyond the 10-m. radius; and London's present satellites include many of the towns of the home counties, which depend for their prosperity on residence in them of people working in London.

Sir Ebenezer Howard proposed in 1898 that new satellite towns or garden cities should be built as an alternative to the sprawl of the great cities, such as London and Birmingham. Such cities would not be dormitory towns, but would be planned as complete cities with industries of their own, becoming social units large enough to afford all the amenities of city life, yet small enough to be in close relation with the surrounding countryside. The first garden city, Letchworth, was so planned and begun in 1903, the development being in the hands of a corporation, which was the landowner. Letchworth attracted to itself numerous industries, so that the majority of its residents work locally. Welwyn Garden City, established in 1920 as a satellite town 21 m. from London, also has local industries, but a greater proportion of its residents work in London.

The act itself is properly called sahamarana, accompanying-in-death, or anamarana, following-in-death; in ordinary European usage the word sati denotes the act as well as the victim.

Unknown in Vedic times, widow-burning was recorded by ancient historians of Alexander's Indian campaigns. Revived in the 6th century A.D., it was fortified by the alleged example of Siva's consort, hence called Sati. Akbar forbade compulsory sati, and self-immolation was deprecated by Sikh teaching. It continued unabated, especially in N. India; on the death in 1710 of a Marava prince, his 47 widows performed sati, and in 1817 the Bengal presidency recorded 700 cases. After its abolition by law in British India in 1829 it dwindled rapidly, but lingered longer in the native states, being performed by several widows of Sir Jung Bahadur of Nepal in 1877. Since that date it has become virtually extinct.

Widow-burning is related to a primitive custom, still observable in negro Africa, of providing necessary service in the afterworld

by sacrificing women and slaves. Early Aryan practice led to its widespread occurrence in Europe, as with the Greek Evadne and the Norse Brunhild. Julius Caesar mentioned it in connexion with Gaulish chieftains, a Yorkshire barrow apparently confirms it for Bronze Age Britain, and it was practised by the Slavonic Wends. Hindu colonists carried it to Malaysia, and it is traceable in aboriginal N. America.

Satie, ERIC ALFRED LESLIE (1866–1925). French composer. Son of a music publisher and composer, he was born at Honfleur, Calvados, March 17, 1866, and studied at Paris conservatoire. In 1889 he produced *Ogives*, which included *Gymnopédies* and *Gnosiennes*. During this period he wrote waltz songs for the music-hall singer Paulette Goddard, and in 1890 became friendly with Debussy (who orchestrated two of the *Gymnopédies*). Many of his pieces had literary titles, e.g. *Pièces en forme de poire*, *Choses vues à droite et à gauche*, *Véritables préludes flasques* (for a dog). Later works included the ballets *Parade*, 1917 (performed by Diaghilev's company), *Relâche*, 1924, and a symphonic drama in 3 parts, with voice, on Plato's dialogues.

Satie, who became a member of the group Les Six in Paris after the First Great War, was a pioneer in polytonality. Paradoxical, an exhibitionist, he had a sense of the grotesque, and his music enjoyed a certain vogue in the 1920s. He died in Paris, July 2, 1925.

Satin. Silk or rayon stuff with smooth glossy surface. It was apparently first made in China, and the name may come from the city in China known in the Middle Ages as Zaitun, which produced rich silken fabrics. The word is more generally derived from Latin *seta* (silk). Satin was known in England in the 13th century, but was not made there until the 17th cen-

tury, when the manufacture was introduced by French Protestant refugees. Spitalfields became famous for fine satins. The lustre of satin is produced partly by using silk or rayon of fine quality, partly by a special method of weaving. Sateen is a cotton fabric woven by the same method as satin.

In the weaving of satin and sateen the great majority of the warp in the former case and the weft in the latter, is on the face of the fabric; when carefully manufactured satin shows no pattern and appears perfectly smooth, though its construction follows the lines of twill. This absence of pattern is chiefly accounted for by the fine silk or rayon threads used for the warp, the coarser and stronger threads of the weft being fewer in number. In the manufacture of damask a mixture of satin and sateen weaving is carried out, as there are certain preponderances of warp and weft threads, and these provide the characteristic pattern of damask (*q.v.*). Satin-stitch is a form of parallel stitches set closely together and giving the effect of a sheen or lustre.

Satin Bird (*Ptilonorhynchus violaceus*). Species of bower bird. It is related to the birds of paradise.

Satin Bird, the delicately shaded species of Australian bower-bird

The feathers of the forehead have a very silky or satin-like lustre. The birds occur in N. and E. Australia, and construct bowers or playing grounds, which they ornament with twigs, pebbles, land shells, etc.

Satin Spar. Name given to compact fibrous varieties of calcite and gypsum. Both have a satin-like lustre which is well brought out by polishing.

Satinwood (*Chloroxylon swietenia*). Tree of the family Rutaceae. It is a native of India. The leaves are divided into two rows of numerous oval leaflets; and the small, whitish flowers are in large clusters. The wood is close-grained, hard, and of a yellow tint, with a satiny lustre. It is used for veneers, the backs of brushes, turnery, etc.

Satire (Lat. *satura*, medley). In literature, the exposure of vice or folly prompted by indignation. As such it ranges from lofty denunciation of the wickedness of an age to scornful reflection upon the defects of an individual, and equally includes lengthy and elaborated compositions in verse or prose, and the sententious brevity of an epigram. All passions come within its purview, but its concern is with the abuse of these, and its function is destructive criticism. As a picture of living manners satire has enduring interest, but as a substantive form of literary art it is marred by its essential uniformity of censure.

Satire as a literary form has been known since very early times. Archilochus of Paros (*fl.* c. 700 B.C.) and Simonides of Amorgos, at about the same period, were both exponents of the satiric form of poetry. Both adopted the iambic metre for it. In Italy, however, satire found its most congenial soil. Originating in the crude drama of the peasantry, it was given regular poetic form by Ennius, and later was cultivated to a high degree of perfection by Lucilius, Horace, Persius, and Juvenal. Writing in the orthodox hexameter form, these men produced vigorous criticism of contemporary life, each stamping his work with his own character. They set, moreover, what was to remain the standard of classic satiric verse, in conformity with which poets of different blood and later ages were to produce didactic poetry of high dignity and moral usefulness, its splendid scorn of vice and folly emphasised by the pungent brevity of its expression.

Martial, Lucian, and Petronius Arbiter made substantive contributions to the material form of satire, the first by epigrams, the second by dramatic dialogues, the third by licentious fiction describing the corrupt pleasures of an effete society. These had their disciples and imitators in later days, but generally the unworthier qualities of their work were most commonly reproduced.

Nevertheless, satire has had its triumphs in the literature of every country. The 17th and 18th centuries were its flowering time in Europe. Then, as Pope put it, wit grew polite; poets learned to preserve freedom and forbear vice; and satire rose to hit the happy medium and heal with morals what it hurt with wit. In England, Pope himself, with Dryden and Swift, and, before them, Donne; in

Satinwood. Divided leaves and, inset, left, flower-spray; right, flower

France, Boileau, Molière, and Voltaire; in Spain, Cervantes; and in Germany, Richter and, later, Heine; these men are true satirists, truly virtuous in that nothing was so hateful to them as hypocrisy, and true poets in that they ennobled invective into allegory. Consult Rise of Formal Satire in England, R. M. Alden, 1899; English Satires, O. Smeaton, 1899; English Satire, ed. N. Furlong, 1946.

Satire Ménippée. French satire. It was named after the *Saturae Menippeae*, which were written by Varro in imitation of the writings of the Greek cynic Menippus. The *Satire Ménippée* was written in 1593 and published at Tours the next year. The writers were P. Le Roy, J. Paserat, F. Chrestien, N. Rapin, and P. Pithou. In a medley of jests, epigrams, and parodies in prose and verse, they ridiculed the League and its promoters, the Guises, and effectively supported the claims of Henry IV of France.

Satpura. Mountain range of India. It lies E.-W. between the Narbada and Tapi rivers, falling partly within the Madhya union and mainly in the Khandesh div. of Bombay state. The average height is 3,000 ft.

Satrap. Provincial governor under the ancient Persian empire. He was responsible only to the Persian king, and was possessed of absolute power in his own territory. The word in modern usage denotes a petty tyrant.

Satsuma. Small group of islands off the S.W. coast of Kyushu Island, Japan.

Satsuma Ware. Noted Japanese ware. Satsuma faience of soft paste was first made in 1598 by Japanese workers, who had learnt their craft in Korea. This type had green, yellow, black or parti-coloured (flambé) glaze. A second, Satsuma-Tangen, had a vitrifiable glaze. The third type (end of the 18th century) had a hard paste, and was decorated with diaper patterns, flowers, and Japanese mythological creatures. A fourth type, with hard white paste, was decorated in colours and gold, also with yellow, black, olive-green, or mustard-yellow glazes.

Satul Mare (Hung. Szatmar Nemeti). Town of Rumania. It stands on the right bank of the Samos, 63 m. N.E. of Debreczen. The town was founded by Germans in the 11th century. An important rly. junction, it lay in N. Transylvania, given to Hungary by the Vienna award of 1940. The Russians took it by storm from its

German occupiers Oct. 25, 1944. By the peace treaty with Rumania, 1947, it reverted to that country. Pop. 56,006.

Saturation. State when the limit of capacity is reached for one body to be filled with another. This amount depends upon both the solute and the solvent, and generally increases with the temperature, e.g. 100 gm. of water can dissolve 197 gm. of cane sugar at 15° C. and 487 gm. at 100° C., but only 36 gm. and 40 gm., respectively, of common salt at these temperatures. By carefully cooling a hot saturated solution it is possible to prevent the solute from precipitating, and supersaturation results. Ordinary gases such as oxygen, nitrogen, etc., or their mixture, air, are usually unsaturated. A volume of air is said to be saturated with water vapour when, on exposure to a flat surface of water or ice, just as many molecules of water vapour penetrate the surface as pass into the air, i.e. at the particular temperature the vapour is in equilibrium with its liquid. Under normal conditions of saturation air at 100° F. (38° C.) can hold about ten times as much water vapour as a similar mass of air at 32° F. (0° C.). Below freezing point the saturation vapour pressure over a supercooled water surface is greater than that over ice at the same temperature.

Saturday. Seventh day of the week, named from the planet Saturn, to which the day was dedi-

cated by the Romans. Saturday is the Jewish sabbath. Holy Saturday is the day before Easter. The Saturday half-holiday was a very old institution in England, dating back to the reign of Henry III. It fell into abeyance, and was re-introduced about 1854 by Sir Richard Tangye, and became general in 1860. See Early Closing.

Saturday Review. THE. Former British weekly journal. It was founded by A. J. B. Beresford-Hope, Nov. 3, 1855, and its first editor was John Douglas Cook, 1855-66. For many years it maintained a high literary standard, its contributors including E. A. Freeman, Mark Pattison, John Morley, G. Saintsbury, Max Beerbohm, and Frank Harris, who was its proprietor during 1894-98. Its dramatic criticism included contributions by Bernard Shaw, 1895-98. A later editor was Gerald Barry, 1924-30. It was bought by Lady Houston in 1934. Under the editorship of J. Wentworth Day its broad Liberal outlook then disappeared, and it became a paper representing the extreme right wing of Conservatism. Within a year it ceased publication.

Saturn. In classical mythology, Italian god of agriculture. According to a popular legend, Saturn was an ancient king of Latium, whose reign, being a time of great happiness and prosperity, was the so-called Golden Age (q.v.). Saturn was subsequently identified with the Greek Cronos, and the repulsive story relating to that god is associated with him. See Cronos.

Saturn. In astronomy, the next outward planet to Jupiter of the superior planets. Its mean distance from the sun is 887,100,000 m., and its equatorial diameter 74,200 m. The planet is lighter than water and is the least dense of all the planets. The time occupied in its yearly path about the sun is 29.46 years, and the time of rotation at the equator 10 hours 14 mins. 23 secs. The time of revolution depends upon the latitude, observation of two remarkable white spots which appeared in temperate latitudes of the planet in 1903 giving a period of 10 hours 39 mins. 21 secs. The spectrum of Saturn shows that its atmosphere contains large quantities of methane and ammonia.

Saturn's conspicuous feature is the ring, or rings, the inconsistent appearance of which startled Galileo, their discoverer, until improved telescopes explained the appearances and disappearances of this remarkable feature of the planet. Hardly visible edgeways,

Satsuma Ware. Bottle slung on cord, and bowl, of the Japanese faience ware
Victoria and Albert Museum

the ring system was thought, till the middle of the 19th century, to be a solid body or bodies. But in 1857 Clerk Maxwell proved mathematically that the rings must consist of an aggregation of fine particles revolving independently, with periods determined by their distances from the planet. The ring system is situated in the plane of the planet's equator, and consists in chief of two bright outer rings, one within the other, separated by what is called Cassini's division, from its discoverer, and an inner dark ring called the crape ring. There are other gaps and subdivisions less conspicuous. The outside diameter of the outer ring is 171,000 m.; and the breadth of this flat ring is 10,000 m.

Then comes Cassini's gap of 3,000 m. The inner bright ring is broader than the outer one, 16,000 m. The crape ring which melts into it is 11,500 m. broad, and there is a gap of 7,000 m. between the crape ring and the planet. The appearance of the crape ring has been explained as due to its being composed of particles similar to those in the bright outer rings, but less thickly strewn, so that the dusky appearance is due to continuously recurring shadows. Evanescent markings or divisions in the bright rings testify to the unequal rotation, and slight irregularities in the shape of the rings, and of the shadow which the planet casts upon them, show that the orbital planes are not all the same. The inner dusky ring is transparent, *i.e.* sunlight passes through it. Maxwell's theoretical conclusion that all the rings consist of aggregates of tiny moons or particles each moving independently in its own orbit round the planet, was verified observationally in 1895, when Keeler showed spectroscopically that the outer parts of the rings travel more slowly than the inner, and that the innermost portions travel about twice as fast as Saturn rotates.

The thickness of this ring system is probably not more than 50 m., and may be as little as 10. The small particles composing the rings are probably the remnants of a former satellite which approached within Roche's Limit (*q.v.*), and was broken up by tidal forces.

Saturn has nine satellites. Mimas, which revolves at a mean distance of 115,400 m. and was discovered by Herschel in 1789; Enceladus (148,000 m., Herschel, 1789); Tethys (183,200 m., Cassini, 1684); Dione (234,700 m., Cassini, 1684); Rhea (327,800 m., Cassini,

Saturn. Diagram showing (top to bottom) phases in the position of the rings of the planet as they appeared to change over a period of fifteen years

1672); Titan (759,900 m., Huygens, 1655); Hyperion (922,000 m., Bond, 1848); Iapetus (2,213,000 m., Cassini, 1671); and Phoebe (8,044,000 m., Pickering, 1898). The discovery of another (Themis) was announced by Pickering in 1905 but has not been confirmed. Phoebe is remarkable for its retrograde motion: this and its great distance from Saturn make it possible that it is a captured asteroid. In 1944 the largest satellite, Titan, was found to have an atmosphere similar to Saturn's.

Saturnalia. In ancient Rome, the annual festival of Saturn. Originally a rustic merry-making of unknown antiquity, probably celebrating the winter solstice, it was kept under the republic on Dec. 19, extended by Augustus to

three days, Dec. 17-19, and later to a week. Schools and law courts were closed. Slaves enjoyed freedom of speech and temporary liberty, and were waited on by their masters. The term is figuratively applied to any occasion of unbridled riot or crime.

Saturninus, LUCIUS APPULEIUS (d. 100 B.C.). Demagogue of ancient Rome. He allied himself with the great popular leader, Gaius Marius. As tribune in 100 B.C., he was responsible for a measure reducing the price of corn and providing for the distribution of land among the veterans of Marius. Associated with him in these schemes was another demagogue named Glaucia. These measures brought their authors great popularity, but the murder of Mem-

mius, a rival of Glaucia, caused a reaction, and in the disturbances which followed the two demagogues were killed by hot-headed young nobles. Marius had been called upon by the senate to maintain order, and was powerless to save them.

Satyr. In Greek mythology, minor nature deity. They were chiefly found in attendance upon

Satyr. Fabulous nature deity as represented in ancient sculpture
British Museum

the god Bacchus. Of repellent appearance, with pointed goat's ears, horns, and a tail, they were addicted to wine and licentiousness. The Roman poets confused them with the Fauns.

Sauckel, FRITZ (1894-1946). German Nazi leader. A Bavarian, born Oct. 27, 1894, at Hassfurt, he ran away from school to sea, and became a British prisoner of war in 1914. A locksmith, he took up Nazi politics at their beginning, and by 1927 was *Gauleiter* for Thuringia. State premier in 1932, he was confirmed in office by Hitler, who in 1942 chose him dictator of manpower. For the crimes against humanity which he committed in occupied territories, Sauckel was indicted as a principal at the Nuremberg trials, and was hanged on Oct. 16, 1946.

Saud, IBN. The ruler of Saudi Arabia is described in this Encyclopedia as Ibn Saud.

Saudi Arabia. Kingdom which covers the greater part of Arabia and is described in the article on that country.

Sauerkraut (Ger., sour cabbage). Preserved, salted cabbage, a staple article of food in Germany and parts of N. Europe. Both red and white cabbages are used, but

chiefly the latter. The outer leaves are discarded, and the cabbages finely shredded and placed in a barrel in layers, with salt and often condiments between. When the barrel is full, the whole is pressed down with a heavy weight till white globules appear on the surface, showing that fermentation is taking place. When a crust forms the sauerkraut is ready for use. It makes a good garnish, and is usually boiled and may be braised. *Pron.* sour-crowt.

Saugor OR **SAGAR.** District and town of the Madhya union, India, in the Jubbulpore division. The dist. is the most N. in the province, lying N. of the Vindhya ranges on the Malwa plateau at an average alt. of 2,000 ft. There is some black cotton soil and the rainfall is 46 ins.; cotton and wheat are the chief crops. A third of the area is under tillage, and another third could be cultivated. Area 6,761 sq. m. Pop. 939,068.

Saugor town is the largest trading centre in a considerable area, and is served by rly. Its fort, with 20 round towers, was completed by the Mahrattas in 1780. A cavalry school was founded here in 1910. Saugor is nearly 2,000 ft. above sea level on the border of a lake, has wide streets and fine facilities for bathing. Pop. 50,700.

Saul (d. c. 1010 B.C.). First king of Israel. The son of Kish, of the tribe of Benjamin, he delivered Jabesh-Gilead from Nahash, king of Ammon, and was made king at Gilgal. Thenceforward his chief task was the struggle with the Philistines. With his son Jonathan, he inflicted a great defeat on them at Gibeah or Geba, and afterwards crushed the Amalekites, but having disobeyed a command to destroy them utterly, received

from Samuel (*q.v.*) the message that Jehovah had rejected him. His insane jealousy drove David (*q.v.*) into outlawry. Finally, the Philistine hosts gathered in the plain of Megiddo, and Saul, abandoned by his religious guides, sought the witch of Endor, and the next day was overthrown at Mt. Gilboa, where his sons were killed, and he fell upon his sword (1 Sam. 8 to 2 Sam. 1). See also Paul.

Sault Sainte Marie. Town of Ontario, Canada. It stands on St. Mary's river, between Lakes Huron and Superior, just opposite the American city of the same name, with which it is connected by a rly. bridge a mile long. It is on the C.N.R. and Algoma Central and Hudson Bay rly. The town owes its importance to its position on the Sault Sainte Marie Canal, and its industries include the making of steel rly. cars, bricks, and chemicals. The name is due to the falls (O.F. *sautier*, to leap) in St. Mary's river. Adjoining it is the new town of Steelton, named from its leading industry. *Pron.* Soosan-mary. Pop. 25,794.

Sault Sainte Marie. City of Michigan, U.S.A. It stands on St. Mary's river, just opposite its Canadian namesake, and is a station on the C.P.R. and several American rlys. Here are St. Mary's Locks, four reservoirs which raise ships 19 ft. from Lake Huron to Lake Superior. It was originally the site of a Jesuit mission and has existed since 1662. Pop. 15,847.

Sault Sainte Marie Canals OR **SOO CANALS.** Ship canals in N. America. The Canadian one was cut to enable big ships to pass between Lakes Superior and Huron, and was opened in 1895. It takes its name from the rapids in St. Mary's river. Since 1855 there had been a ship canal on the American side of the river, and for

Sault Sainte Marie Canals. The great Canadian lock, 900 ft. in length

forty years this was used by Canadian shipping passing through the Great Lakes. Canada, however, was anxious to have her own canal here, and in 1888 it was put in hand. A little over a mile long, with 20½ feet of navigable water, it has one immense lock, 900 ft. by 60 ft., which is emptied and filled by electrical power. The American waterway has been much improved since 1907, four

looks larger than the Canadian having been constructed. Both canals are closed by ice for 100 to 120 days each winter, from Dec. to mid-April. No recent figures of traffic are available, but, in 1937, 87,633,600 tons went through the canals, the value being nearly \$1,000,000,000. During the same year the combined tonnage of the Panama, Suez, Manchester, and Kiel Canals was only about 83,000,000 tons.

Saumarez, JAMES SAUMAREZ, BARON DE (1757-1836). British sailor. He was born in Guernsey,

Baron de Saumarez,
British sailor
After Jean

March 11, 1757, and commanded the Russell in Rodney's victory off Dominica in 1782, and the Orion in Bridport's somewhat half-hearted fight off Brest in 1795. He

had the same ship in the victory of St. Vincent and at the battle of the Nile. His greatest success as a flag officer was achieved in 1801, when, after making an unsuccessful attack on a French fleet in Algieras, he engaged a greatly superior Franco-Spanish force and, without material loss, drove it into port short of two ships blown up and one captured. Admiral in 1814, he was appointed vice-admiral of Great Britain in 1821 and raised to the peerage in 1831 on the coronation of William IV. He died in Guernsey, Oct. 9, 1836. *Consull* Life, 2 vols., Sir J. Ross, 1838.

Saumur. Town of France. In the dept. of Maine-et-Loire, it stands at the foot of a hill on the left bank of the river Loire, 30 m. S.E. of Angers. On the riverside in the vicinity of the town are prehistoric caves, with Celtic remains, including the dolmen of

Bagneux, the largest and best preserved Druidic chamber in France. The castle, founded in 1040, is now an arsenal and powder magazine. A famous Huguenot stronghold, Saumur was one of the chief schools of Protestant theology until the revocation of the Edict of Nantes, when it lost its prosperity by the expulsion of many of its inhabitants. In 1793 it was captured, after a great battle, by the Vendéans. Its church of Notre Dame de Nantilly is a pilgrim resort and has splendid tapestries. The town manufactures rosaries, enamels, etc., and has tinplate factories. Here is a cavalry school founded in 1768. Pop. 17,635.

Saumur OR SPARKLING SAUMUR. White, effervescent wine. It is grown in the Loire vineyards, and made at, and matured in the limestone caves near Saumur. It is made in the same way as champagne (*q.v.*), which it resembles in general characteristics, and though not so fine or rich, it is delicate, dry, and of moderate strength.

Saunders, SIR CHARLES (c. 1713-75). British sailor. He entered the navy in 1727, sailed in Anson's voyage round the world, 1740-44, was promoted to the Gloucester, and in 1746 captured a Spanish vessel, his share of the prize money being about £30,000. Com-

Sir Charles Saunders,
British sailor

mander-in-chief of the Newfoundland station, 1752, in 1756 he sailed to the Mediterranean, where he took over command the following year. Vice-admiral in 1759, he transported Wolfe and his troops to Quebec. Knighted 1761, he became first lord of the Admiralty 1766, and died Dec. 7, 1775.

Saunders, HILARY AIDAN ST. GEORGE (b. 1898). British writer. He was born Jan. 14, 1898, and educated at Downside, and Balliol College, Oxford. Secretary to Nansen (*q.v.*) during 1921-23, he was on the secretariat of the League of Nations from 1920 to 1937. He then became assistant

librarian to the house of commons, being promoted to librarian in 1946. During the Second Great War he wrote the official booklet, *The Battle of Britain*, which sold in enormous numbers, and accounts of other aspects of the war effort, *e.g.* *Bomber Command*, 1942, *Combined Operations*, 1943. In collaboration with John Palmer, he wrote many novels under the pseudonym of Francis Beeding; also as David Pilgrim.

Saurashtra, UNITED STATE OF. Name (meaning personal kingdom) given to a state of the Union of India, formed from the former Kathiawar states and inaugurated at Jamnagar, Feb. 15, 1948. It comprised what were formerly 860 different administrative units, including 221 states; the chief former states being Nawanagar, Bhavnagar, Gondal, Porbandar, Dhrangadhra, and Rajkot. The jam sahib of Nawanagar became rajpramukh. Junagadh having joined Saurashtra, Jan. 20, 1949, the union includes almost all the Kathiawar peninsula. Area 21,318 sq. m. Pop. (1950 est.) 3,960,000.

Sauria (Gr. *sauros*, lizard). Obsolete term for an order of reptiles including the lizards and the snakes.

Sauropterygia (Gr. *sauros*, lizard; *pteryx*, wing). Extinct fossil amphibious or aquatic reptiles. Found in Triassic, Permian, Carboniferous, Jurassic, and other deposits, they had small heads, long necks, and short tails, and two pairs of paddles for swimming. Some of the reptiles were over 30 ft. in length.

Sausage. Article of food consisting generally of a casing or skin filled with some food mixture. Sausage skins are usually made from the carefully cleaned intestines of sheep, pigs, or cattle, though various synthetic casings are being increasingly used. The internal mixture, or the sausage proper, is made up of meat, bread, or other cereal, seasoned with salt, pepper, spices, and herbs. The meat is usually pork or beef, chopped fine or minced. In the U.S.A. many sausages made from cooked or smoked meat are popular. The Germans invented a great variety of sausages.

In Great Britain sausages are generally made from fresh meat, beef or pork being most usual. Before the Second Great War typical recipes were: (1) Lean pork, 15 lb.; fat, 6 lb.; bread or biscuit powder, 4 lb.; seasoning, 14 oz., and preservative. (2) Lean beef, 12 lb.; beef fat, 8 lb.;

Saumur, France. South front of the 11th century castle, built by the Count of Anjou

bread, 4 lb.; biscuit powder, 4 lb.; with seasoning and colouring matter. During and after the Second Great War, the proportion of meat was decreased, but was

Sausage. A hydraulically operated machine for filling sausages. See text
By courtesy of the Alexander Mfg. Co.

controlled by law. The method of filling is shown in the illustration. The mixture when chopped is placed into a filling machine, and extruded by hydraulic pressure supplied through pipe A to a piston moving vertically in the filling chamber B. The sausage meat is extruded through the nozzle, on to which the casings are fitted, and the meat is forced into the required size of casing.

Saussure, HORACE BÉNÉDICT DE (1740-99). Swiss physicist. Born at Geneva, Feb. 17, 1740, he studied botany, and was professor of philosophy at Geneva, 1762-86. He specialised in the flora and geology of the Alps, was one of the first to reach the summit of Mont

H. B. de Saussure, Swiss physicist
After St. Ours

Blanc, and undertook other climbs for research and scientific observation, the results of which were afterwards published in *Voyages dans les Alpes, 1778-96*. He added greatly to the geological data of the Alps, invented and improved many meteorological instruments, and died Jan. 22, 1799. *Consult* Life, D. W. Freshfield, 1921.

His son, Nicholas Théodore de Saussure, who was born Oct. 14, 1767, and died April 18, 1845, was the first to make a quantitative analysis of plant nutriment.

Sausrurite. In mineralogy, name given to a supposed variety of jade found in the Swiss Alps. It was so named from its discoverer H. B. de Saussure. It is waxy, white to pale green in colour, and is now recognized as resulting from the alteration of such rocks as gabbro. It is a mixture of albite, chlorite, epidote, etc.

Sauterne. French white wine grown in the Sauterne district, S. of Bordeaux. The region, comparatively small, is hilly, and the soil partly cretaceous. Owing to this and to the grapes being well matured and gathered with extreme care, Sauterne is a fuller-bodied, sweeter, stronger wine than Médoc. Of a pale golden tint, it has a clinging taste and distinctive, delicate bouquet. It contains from 9 to 14 p.c. of alcohol, keeps well, and commands high prices. Château Yquem is considered the finest Sauterne.

Savage, MICHAEL JOSEPH (1872-1940). New Zealand statesman, first Labour prime minister of the dominion. This son of a farmer at Benalla, Australia, went to New Zealand in 1907 to work as a miner. He was chosen M.P. for W. Auckland in 1919, and in 1933 succeeded Holland as Labour party chief. Winning the elections two years later, Savage took office as premier and foreign minister, and at once adopted a salary-sharing scheme for his party members. Much attention was given to social services. Savage came to London for the coronation and imperial conference in 1937, and easily won the elections next year. He led the dominion into the Second Great War, but died in office, March 26, 1940, being succeeded by Peter Fraser.

Savage, RICHARD (d. 1743). British poet. He claimed to be the illegitimate son of the countess of Macclesfield, and that his father was the 4th Earl Rivers. This claim was denied, and a poem entitled *The Bastard, 1728*, is an expression of Savage's feelings regarding the repudiation of his parentage. Further similar expressions of feeling were silenced by a pension. Savage was the author of two other poems, *The Wanderer*, which described a journey through Europe, and the *Progress of a Divine*. His poems all

have a gloomy tone, reflecting the wretchedness of his own life. The hardships of his early days were often shared with Johnson, the two sometimes being in such straits that they had not the wherewithal to pay for a night's lodging. Savage died Aug. 1, 1743, in a debtor's prison at Bristol, the gaoler, it is said, paying the expenses of the funeral. Johnson included Savage in his *Lives of the Poets*. *Consult* R. S.: a *Mystery in Biography*, S. V. Makower, new ed. 1935.

Savage Club, THE. London club. Founded in 1857 by a brilliant coterie of London Bohemians,

Savage Club badge

its 500 town and 100 country members are connected professionally with literature, art, science, and the drama, and its weekly house dinners during the winter months, to which guests are invited, have a world-wide reputation. With it are affiliated some of the leading clubs in Toronto, Brisbane, Sydney, Melbourne, and New York. The clubhouse is at 1, Carlton House Terrace, S.W.1.

Savanilla OR SABANILLA. Seaport of Colombia, S. America, in the dept. of Atlantico. It stands near the mouth of the river Magdalena, 18 m. by rly. W.N.W. of Barranquilla, of which it is the port. The harbour, though spacious, is shallow, large vessels being compelled to anchor some miles out. Most of its trade has been taken over by the neighbouring Puerto Colombia. Pop. 2,000.

Savanna. Natural grass land in tropical countries. Savannas are known, also, as llanos in Venezuela, campos in Brazil, downs in Australia, and park lands in Africa. They form one of the natural vegetation regions of the globe and occur in regions of summer rainfall between the hot deserts, which are rainless, and the tropical forests, where rain falls at all seasons. Near the desert the vegetation is patchy, near the forest trees are more numerous, elsewhere trees are usually found along the lines of the water-courses.

The rainfall varies between 10 and 40 ins. annually, and the mean temperature of the coldest

St. Savage

month is rarely below 60° F.; there are usually two seasons, the rainy and the dry, but in parts there may be two rainy and two dry seasons. Vegetation, mainly of a bulbous character, grows with great rapidity at the beginning of the wet weather, and by the end of the rainy season the seeds have ripened and fallen; during the dry season most of the vegetation withers.

Savannah. Auxiliary steamer built at Savannah, Georgia. She was the first vessel fitted with

repairing shops, foundries, machine shops, cotton-seed oil and lumber mills, and fertiliser factories. Pop. 95,996.

Planned in a sketch by a debtor who died in one of those English prisons which Georgia was founded to relieve, Savannah was first settled in 1733. It was taken by the British, Dec. 29, 1778, and made a base against the rebelling Americans. In 1789 it was incorporated. Sherman captured the city, where there has always been a large negro pop., from the Confederates in 1864.

Savery, ANNE JEAN MARIE RENÉ (1774-1833). French soldier. Born at Marcq, Ardennes, April 26, 1774, he entered the army in 1790. Having served on the Rhine, in Egypt, and in Italy, he became a brigadier-general and one of Napoleon's trusted lieutenants. The wars of 1805-07, in the course of which he was also employed as a diplomatist, added to his reputation and

brought him the dukedom of Rovigo. In 1808 he was sent to Spain, where he was largely responsible for placing Joseph Bonaparte on the throne. In 1810 he was made head of the police in France, and he was loyal to Napoleon until the last. Exiled 1815, he returned to France in 1818. In 1831 he was made commander-in-chief of the French army in Algeria and he died in Paris June 2, 1833. Consult his *Mémoires*, 1828.

General Savery,
Duc de Rovigo

Save, OR SAVA. A river of Yugoslavia. It rises in the E. Alps, in the N.W. corner of the country, flows E. across Croatia, and between Bosnia and Slavonia, to join the Danube at Belgrade, after a course of 500 m. The chief tributaries, which all join it from the left, are the Kulpa, Unna, Vrbas, Bosna, and Drina. It is navigable to Sissek (365 m.). The chief town on its banks is Zagreb. The lower course is marshy, and the towns usually lie away from the river. Heavy fighting took place along the banks of the Save during the First Great War.

Savernake. Name of a village and forest in Wiltshire, England, lying S.E. of Marlborough. The forest, 16 m. in circumference, is beautifully wooded; its chief trees are oaks and beeches, and in it is a deer park, said to be the largest in England. In early times a royal forest, it belongs to the marquess of Ailesbury, to whom it came from the Seymours, but is leased to the forestry commissioners. In 1950 the crown commissioners purchased 10,000 acres of the Savernake estate adjacent to the forest. The village (pop. 157) has a rly. station.

Savery, THOMAS (1650-1715). English engineer and inventor. He was born at Shilstone, Devon, and became a military engineer, experimenting in his spare time. In 1696 he patented a capstan-operated paddle for driving ships. Although its practicability was demonstrated, official jealousy prevented its adoption by the Navy. In 1698 he patented an engine on the steam-vacuum principle for water-pumps in coal mines. This was installed in several mines, and provided the basis for Newcomen's steam pump. Among Savery's other inventions was a new type of assay furnace. Appointed surveyor to the waterworks at Hampton Court in 1714, he died in May, 1715.

Savigliano.

Town of Italy, in the prov. of Cuneo. Situated on the river Maira, 32 m. by rly. S. of Turin, and 8 m. E. of Saluzzo, it retains parts of its old walls, and has a fine church, containing paintings by Giovanni Molinari, a native. In the town is a triumphal arch to Victor Amadeus I

Savannah. The first vessel to cross the Atlantic using steam as an auxiliary to her sails

steam to cross the Atlantic. In 1819 she made the passage from Savannah to Liverpool in 25 days. The Savannah was fully rigged, but had an auxiliary engine upon her decks, which worked the paddles while the vessel was not under sail. The greater part of her Atlantic voyage, however, was made under sail power.

Savannah. River of the U.S.A. Rising in the Blue Ridge Mts., it flows S.E., forming the boundary between South Carolina and Georgia, and enters the Atlantic about 10 m. below Savannah city. It is about 450 m. long, and is navigable to Augusta for small steamers.

Savannah. City of Georgia, U.S.A., the co. seat of Chatham co. The second largest city and principal port of the state, it stands on the Savannah river, 18 m. from its mouth, and is served by rlys. and by ocean-going and coasting steamers. The city contains many broad, tree-shaded streets, and from the number and variety of its trees is known as the Forest City. Among the prominent buildings are the city hall, the Telfair academy, and the R.C. cathedral. Savannah is one of the foremost ports for cotton and naval stores, and also ships large quantities of lumber, cotton seed, turpentine, and resin. It has rly. car and

Savannah, Georgia. Christ Church, the old church where John Wesley preached during his residence in the Georgian city

of Savoy. There are locomotive and printing works, foundries, sugar factories, and silk, linen, and hemp manufactures. Here in 1779 the Austrians and Russians defeated the French.

Savigny, FRIEDRICH KARL VON (1779-1861). German jurist. Born at Frankfurt-on-Main, Feb. 21,

F. K. von Savigny,
German jurist
After Kruger

1779, he was educated at Marburg, and became a teacher at Landshut and in 1810 professor of Roman law at Berlin. In 1842 he was appointed to draft the legis-

lative measures of the Prussian government, with the style of high chancellor. Having reformed the divorce and other laws, he retired from public life in 1848, but lived until Oct. 25, 1861. Savigny was one of the greatest jurists of the 19th century. His *Law of Possession*, 1803; *History of Roman Law in the Middle Ages*, 1815-31; and *System of Modern Roman Law*, 1840-49, have become classics, and his principles have permeated all Continental jurisprudence. See *Jurisprudence*.

Savile, BARON. British title borne by the family of the same name since 1888. The Saviles are an old Yorkshire family and have held various titles, one of them, George, being Charles II's marquis of Halifax (*q.v.*). One branch is represented by the earl of Mexborough. In 1888 a barony was conferred on John Savile (1818-96), illegitimate son of the 8th earl of Scarbrough, whose estates he inherited. His nephew John (1854-1931), 2nd baron, assumed the additional surname of Lumley. He was succeeded as 3rd baron by his son George (b. Jan. 24, 1919).

Savile, SIR HENRY (1549-1622). English scholar. Born at Bradley, near Halifax, Nov. 30, 1549, and educated at Brasenose College, Oxford, he became known as a mathematician and a Greek scholar.

After traveling abroad he was made warden of Merton College, Oxford, in 1585, provost of Eton in 1596 by the favour of Queen Elizabeth, whose

Sir Henry Savile,
English scholar

tutor he had been, and was knighted by James I in 1604. His chief contribution to scholarship is his sumptuous edition of S. Chrysostom, 1610-13. This founder of the Savilian professorships of geometry and astronomy at Oxford died at Eton, Feb. 19, 1622.

Savile Club. London club. Founded in 1868, it is of social character, without political attachments. Its first house was in Spring Gardens, whence it soon moved to Savile Row. In 1882 the clubhouse was transferred to 107, Piccadilly. In 1929 it moved to 69, Brook St., Grosvenor Square, W.1, for its future home. Its members have included many of the greatest in the literary world, such as Stevenson, Hardy, Kipling, Bridges, Wells, and Yeats.

Saville Theatre. London playhouse, in Shaftesbury Avenue, W.1. It was opened Oct. 8, 1931, by Jack Waller, the first production being *For the Love of Mike*. One of its most noted productions was Bernard Shaw's *Geneva*, 1938. The theatre became celebrated as a home of revues and comedies in which Leslie Henson was prominent. It seats 1,250.

Savings Bank. Institution for the promotion of thrift. The term is usually applied to an organization which undertakes to receive and invest deposits of a small amount, the idea being that these represent the savings of people with small incomes. Though generally known as banks, such institutions may be so moderate in size and capital as to be in reality thrift or provident clubs. The latter are not registered as banks, and have no legal status.

The larger banks, known as trustee savings banks, can be formed only with the approval of the national debt commissioners, and are under state inspection. Their management is by boards of trustees without remuneration. These, along with penny banks, are governed by Acts of parliament, principally the Trustee Savings Bank Act, 1863, which has been frequently amended. A savings bank may also be conducted on the joint stock system, or by a municipality or by the state, as in the case of the Post Office Savings Bank (*q.v.*).

The savings bank originated at Brunswick in 1765, and others were established in France, Prussia, and Switzerland in the 18th century. The first savings bank in England was organized at Wendover by the Rev. Joseph Smith, in 1799, similar institutions being founded

in Scotland, 1807, and in Ireland, 1815. Trustee savings banks became very popular in the first half of the 19th century, the depositors increasing from 429,400 in 1831, to 1,600,000 in 1861, the year of the founding of the P.O. savings bank, in which were incorporated a large number of the trustee banks. Military and naval savings banks were instituted in 1859 and 1866 respectively. In addition there are school and railway savings banks. In 1950 there were 4½ million active accounts in trustee savings banks, and 21¼ million in the Post Office savings bank.

Savings Certificate. This form of investment for the small saver is described under National Savings.

Savoia. Name of a series of aircraft built by the Savoia-Marchetti co., Italy. Before the Second Great War this co. built a wide range of civil and military aircraft, and devoted much attention to the development of the trimotored low-wing monoplane. During the Second Great War a large part of the machines of the Italian air force were Savoia bombers and fighters. From 1946 the co. concentrated on four-engined monoplanes.

Savoie. Dept. of France. In the S.E. of the country, it is bounded on the E. and S.E. by Italy. Its area is 2,388 sq. m. The chief river is the Isère, others being its tributaries, Arc and Arly. The dept. is mainly mountainous, a number of Alpine peaks being over 12,000 ft. high. Agriculture is carried on, and sheep and cattle are reared. The vine and various fruits are grown in the valleys, and cheese is extensively manufactured. Chambéry is the chief town; other places are Aix-les-Bains, which has famous mineral springs, and Albertville. Savoie was formed into a department in 1860, being part of the territory ceded by Italy to France. It previously formed part of the duchy of Savoy (*q.v.*). Pop. 235,939.

Savona. Seaport of Italy, in the prov. of Savona. Picturesquely situated on the coast of the Riviera di Ponente, 27 m. by rly. S.W. of Genoa, it has a castle built by the Genoese in 1542. Its cathedral, 1589-1604, has a modern dome and interesting paintings. S. Maria di Castello is a 15th century church. Among other notable buildings are the Della Rovere palace, a picture gallery, and a theatre named after the poet Chiabrera, a native of the city. Additions were made to it late in the 19th century, and

Savona became one of the chief seaports of Italy, with shipbuilding yards, ironworks, and engineering workshops, foundries, etc. The manufactures include soap, paper, and silks.

The ancient Savo, the place was a Roman settlement. For some centuries there was a great rivalry between Savona and Genoa. The Genoese, in the 16th century, made its harbour useless, and then took possession of the city, which again became important after the fall of the republic. Its harbour was reconstructed in 1815. Pop. (1936) 64,199.

Savonarola, GIROLAMO (1452–98). Italian monk and reformer. Born at Ferrara, Sept. 21, 1452, he was the third son of Michele Savonarola. His grandfather, a doctor of medicine, encouraged

Girolamo Savonarola, the Italian reformer. From a painting by Fra Bartolommeo
Museum of S. Mark's, Venice

his love of learning, and as a boy he proved himself a diligent and able student. Originally intended for a medical career, he entered the Dominican Order after his hopeless love for a daughter of the noble house of Strozzi had been spurned, joining the convent of San Marco in Florence. After early failures he attracted attention in 1489 by his fervent preaching, and two years later he became prior. His theology appears always to have been orthodox; his denunciations were directed against the intellectual and sensual paganism which permeated the social and ecclesiastical organism of the time.

The enthusiasm he aroused as a moral reformer dragged him into the political vortex; assuming almost the character of an inspired

prophet warning Florence of the wrath to come, he inevitably discovered the means to her regeneration in political programmes. Charles VIII of France was to be the regenerator, and when that king actually came to Florence in 1494, Savonarola's character as a prophet seemed established. The Medici, representatives of the pagan spirit, were driven from Florence; the religious enthusiasm of Savonarola's followers, known as Piagnoni or "weepers," made it seem that he was about to establish a "kingdom of God" in Florence, in which social vices and frivolities would be as rigorously repressed as they were 150 years later by the "godly" in Great Britain.

But Florentine policy concerned other states, to whom Savonarola's political aims were not satisfactory. His claims to prophetic powers and divine authority provided Pope Alexander VI with an excuse, first for ordering him to abstain from preaching, and then, when he disobeyed, for excommunicating him. A challenge to an ordeal by fire, between one of Savonarola's followers and a friar of the antagonistic Franciscan order, ended in a fiasco which ruined Savonarola's prestige. The reaction was fatal. Savonarola was brought to trial as an impostor and a heretic, was condemned, and with two of his followers was put to death by strangling, May 23, 1498. Savonarola figures prominently in George Eliot's novel, *Romola*. *Consult* Lives, P. Villari, Eng. trans. L. Villari, 3rd imp. 1899; E. L. S. Horsburgh, 4th ed., 1911; N. Van Wyck, 1926; P. Misciatelli, Eng. trans. M. Peters-Roberts, 1930.

Savory or **SAVOURY** (*Satureia*). Genus of labiate plants, used as pot herbs. Summer savory (*S. hortensis*) is a downy, aromatic annual, native of S. Europe. It has small, narrow oblong leaves, and small, pale lilac flowers in whorls. Winter savory (*S. montana*)

Savory. Spray of foliage and flowers of *S. montana*. Inset, single flower

is a perennial with a shrubby base, native of the same region. It has slender leaves and pale purple flowers. Both plants are gathered when just coming into flower and dried for use when required.

Savoy. Cultivated variety of cabbage. It is distinguished by its curled and wrinkled leaves. It is

Savoy. Leaves and roots of this hardy variety of cabbage

particularly hardy and will stand frost well, and hence it is of great value during winter. By sowing seeds of early and late varieties in April and May a succession of produce is obtained in late autumn and winter. The seedlings are raised on a spare border from seeds sown in shallow drills, and are planted in their final places in June–July. Good savoys are Dwarf Green Curled, Best of All (early), Late Drumhead, Rear-guard, and New Year. Manured soil gives the best results.

Savoy. Former prov. of the kingdom of Sardinia, ceded to France in 1860. The old prov. comprised the present departments of Savoie and Haute-Savoie (*q.v.*), and was roughly contained between the Alps, the Lake of Geneva, and the river Rhône, with its capital at Chambéry. Part of the Burgundian kingdom of Arles in the 10th century, it was granted to Umberto Biancamano in 1034, and from that date until its cession to France, except during 1792–1816, was ruled by the house of Savoy (*v.i.*) as part of the duchy of Savoy and later of the kingdom of Sardinia. As the highway between France and Italy the country was of great strategical importance, but the ability and traditional valour of its sovereigns kept it intact until the armies of revolutionary France overran it on their way to Italy in 1792. The country was then formally annexed to France, but by the congress of Vienna it was restored to its ancient sovereigns. As the price of his consent to the annexation

of Tuscany to the kingdom of Sardinia, Napoleon III demanded the cession of Savoy and Nice to France. This was unwillingly conceded by Cavour and raised much protest from England and other European powers, but after an almost unanimous plebiscite in favour of annexation the formal treaty was signed March 24, 1860. *See* Cavour; Italy; Napoleon III; Sardinia, Kingdom of.

Savoy, House of. Name of the dynasty which until its expulsion in 1946 was the oldest reigning family of Europe. It was founded by Umberto Biancamano (Humbert of the White Hand) who in 1034 was granted Savoy and the adjacent territories W. of the Alps. The lands on the Italian side, later called Piedmont, were added by marriage, c. 1056.

Savoy, London. River front of the old hospital, as it appeared about 1650. AAA, main building. B, prison. CC, the chapel. D, water stairs. E, German Lutheran church. F, French church. G, German Calvinistic church.

From a print by George Vertue

Peter II (d. 1268) visited England and was made earl of Richmond by Henry III, who also gave him the manor on the Thames thereafter called the Savoy. Amadeus V, nephew of Peter and called the Great, reigned 1285-1323, extended his dominion, and acquired reputation as arbiter in various disputes between France and England. His grandson, Amadeus VI, who reigned 1343-83, took a prominent part in the stormy politics of Italy, and his son, Amadeus VII, count 1383-91, added Nice to his territories.

He was succeeded by his son Amadeus VIII (1391-1440), whom the emperor Sigismund created duke of Savoy in 1416. This wise and liberal prince abdicated in 1440 and retired to a hermitage near Geneva. Although not in orders, he was elected anti-pope as Felix V by the council of Basel (q.v.). The family underwent the varying fortunes of the unsettled times until Emanuel Philibert, who had served in the Spanish

armies under Charles V, reigned 1553-80, and raised his estate from a petty dukedom to a position of European power and importance. Succeeding dukes sided with or against France in the wars of the 16th and 17th centuries, and their territories were the scene of constant conflict until Victor Amadeus II, duke 1675-1730, and his cousin, the great warrior Eugene (q.v.), expelled the French. In 1720 Victor Amadeus became king of Sardinia. *See* Chambéry; Italy; Sardinia.

Savoy, The. District of London. S. from the Strand between Wellington Street and Carting Lane, W.C., it is named after Peter, earl of Savoy, and gives its name to a chapel royal, an hotel, and a theatre. Peter, who was granted the manor in 1236 by Henry III, bequeathed it to the monks of Montjoy, Havering-atte-Bower, Essex. From them it was bought for 300 marks (about £3,000) by Eleanor of Provence wife, of Henry III, it became a residence for many notable personages, including Alexander III of Scotland, during his visit to London, and in 1284 was

given to Eleanor's son, Edmund Crouchback. Edmund, who married Blanche, queen of Navarre, planted in the extensive gardens, famous at that time for their figs, cherries, plums, nuts, etc., the first red rose to be grown in England. He is said to have brought it with his bride from Provence.

The palace was improved and extended by Henry, 4th earl and 1st duke of Lancaster, and it served as the prison of King John of France, 1357, after Poitiers, and in 1360-64. Under John of Gaunt it witnessed many remarkable gatherings. Chaucer is said to have been married in its chapel. It was destroyed by Wat Tyler and his followers. Annexed to the crown by

Henry IV, it was rebuilt, 1512-17, under the will of that king, as a hospital or kind of monastic almshouse, the new structure being magnificent. Probably on the foundations of John of Gaunt's chapel was erected what is now known as the chapel royal. This, in 1564-1717, became the church of the parishioners of the first church of S. Mary-le-Strand, and so was known as S. Mary-le-Savoy.

In 1549 more than 8,000 people were benefited. In 1553 Henry VIII handed over the property to the hospitals of Bridewell and S. Thomas, but Mary refounded the institution in 1556, and it had among its masters George Montaigne or Mountain, who became archbishop of York; Mark Antonio de Dominis, known as archbishop of Spalatro; Sheldon, later archbishop of Canterbury; and Henry Killigrew, during whose term of office part was let out in tenements to distinguished personages, and part served as a military and naval hospital, the precinct also becoming a sanctuary for debtors. While the hospital was suppressed about 1702, the chapel remained, and under the incumbency of the notorious John Wilkinson was the scene of hundreds of clandestine marriages. Later the main building or hall became a barracks. Other parts were put to various uses, including that of a marshalsea or prison. The last of the hospital buildings disappeared when the approach to Waterloo Bridge was made in 1817. The Savoy conference was held here in 1661, and there were French and German chapels in the precinct.

The chapel is Perpendicular in style, built N. and S., and has a picturesque graveyard. It was made a chapel royal by George III, restored by George IV, 1826-30, and by Victoria, 1864. Its modern reputation is due in great measure to Henry White (d. 1900), made

Savoy, London. Interior of the chapel royal as restored by Queen Victoria in 1864

chaplain in 1859. Thomas Fuller and Samuel Pratt preached here, and the Savoy was the burial place of Gawain Douglas, George Wither, and the Anne Killigrew of Dryden's elegiac poem. There is a memorial window to Richard D'Oyly Carte.

The Savoy Theatre receives a separate entry. Adjoining the theatre, partly on the site of the Savoy palace and that of old Worcester House, is the Savoy Hotel, opened 1889, and extended 1903-04, the Strand frontage measuring 250 ft. The ballrooms will accommodate over 1,000 guests. In the courtyard is a bronze statue of Peter of Savoy. *Consult Memorials of the Savoy, W. J. Loftie, 1878.*

Savoy Conference. Meeting of 12 bishops and 12 Puritans held in the Savoy Palace in 1661. It met for the purpose of discussing changes in the Book of Common Prayer and other ecclesiastical matters. After sitting from April 15 to July 24, the conference broke up without effecting anything, and the ultimate result was that a large number of Puritans left the established Church.

Saw. Varieties of saw teeth used for timber. 1. Rip saw teeth. 2. Cross-cut saw teeth. 3. Cross-cut double-hand log saw: A. Cutting teeth. B. Clearing teeth

Savoy Operas. A complete list of these works is given under Gilbert and Sullivan.

Savoy Theatre. London playhouse, in the Strand, W.C.2. Built for Richard D'Oyly Carte from designs by C. J. Phipps, it was opened Oct. 10, 1881, the first production being *Patience*—which had already enjoyed a long run at the Opéra Comique. The original home of the majority of operas by Gilbert and Sullivan (*q.v.*). The Savoy was the first London theatre to be lit by electricity. It was leased by H. B. Irving during 1913-19. After complete internal reconstruction, the theatre was reopened 1929. Successful productions at the Savoy have included *Merrie England*, 1902; *Peter Ibbetson*, 1920; *Young Woodley*, 1928; *Journey's End*, 1929; *The Man Who Came to Dinner*, 1941; *Life with Father*, 1947; and *Gilbert and Sullivan revivals*. The theatre seats 1,138.

Savu. Island group of Indonesia. It lies between the islands of Timor and Sandalwood. Rice, indigo, and tobacco are produced. Area, 231 sq. m.

Saw. Hand or machine tool for cutting wood, metal, stone, etc. Handsaws are the tools of the car-

Saw. Small type sawbench for joinery work

penter, joiner, and cabinet maker, for ripping (sawing lengthwise to the grain) or cross-cutting (across the grain). The blade ranges in length from 22 to 30 ins., being longer for rip saws. The teeth vary in size from about 4 to the inch for rip saws to 8 or more to the inch for cross-cut saws. In rip saws the tooth front is almost or quite vertical, whereas in cross-cut saws the front slopes back slightly from the toe of the blade.

In order to prevent the blade jamming in the saw cut, the teeth are set or bent slightly outwards from the middle line of the blade, so making the latter effectively thicker at the cutting edge than at the back. In some saws further aid to clearance is afforded by thinning the blade towards the back; blades are also tapered slightly in thickness from the heel towards the toe, behind the cutting edge. The tooth of a rip saw acts like a chisel, whereas that of a cross-cut saw slices across the fibres of the wood much as a sharp knife would do.

Other woodworking saws used by hand are the back saws, shorter and with a brass or steel stiffener along the top of the back which allows a thinner blade to be used and preserves the shape of the blade. Examples are tenon saws and dovetail saws, used for cutting joints. For cutting inside curves there are the compass saw

and the keyhole saw, with narrow blades. Exterior curves are shaped with the bow saw and the coping saw, which allow pierced work to be negotiated. The first has a tensioned wood frame in which the thin, narrow blade is stretched; the other has a metal bow. Back saws have small, fine teeth, with little set, enabling close work to be done in jointing.

MACHINE SAWS. Power-operated circular saws and band saws are used for converting logs into baulks and deals, for reducing large forms of timber into others suited for building work, or for cutting up timber in joinery works. The circular saw is mounted on a spindle and driven at a high speed ranging from about 3,000 r.p.m. for a saw of 12-in. diam. to 1,000 r.p.m. for one three times that diam. Rim speed, at which a point on the periphery of the blade will pass a given point, is roughly constant for all sizes, about 10,000 ft. per minute. The teeth may be formed by notching out the blade as in a hand saw, or be inserted into the blade and locked by some suitable device. The band saw consists of a narrow endless strip of steel having teeth cut in one edge. It is supported by pulleys in tension and driven by power applied to one of these pulleys. Band saws are used in sawmills for converting logs, and other types in joinery works for sawing sweeps and curved members, for which the thin, narrow blade is especially adapted. Circular saws are ordinarily built into benches, but there is another type called a pendulum saw. In this the saw itself is

Saw. Cold-metal-saw sharpener
Russell & Sons, Ltd., Leicester

Saw. A stone-cutting circular saw fitted with carbide blade.
Bramley Engineering Co., Ltd., Leeds

mounted at the lower end of a swinging frame hung on an overhead pivot so that it can be made to traverse the work.

SAWS FOR METAL. These range from the piercing saw used by jewellers and silversmiths to the large and powerful circular saw for cutting bars and billets of steel. The first has a thin, highly tempered blade like that of a fretsaw and is mounted under tension in a metal bow. Similar in principle, but employed for severing light bars and tubes, is the hacksaw, with a shallower bow. A heavier type, with deeper frame, cuts thicker bars and steel rails. Small-diameter circular saws are used for light sheet metal by silversmiths and others. Larger circular saws have solid teeth or inserted teeth. Special types for "hot-sawing"—severing bars, billets, rails, etc., as they leave the rolling mills—run at about twice the speed of timber saws. Circular saws for cutting cold steel turn at a much lower speed—about 80 ft. per minute; for cutting aluminium sheet the speed is ten times greater than this. Band saws are largely used for metal, bakelite, hard rubber, etc.

STONE-CUTTING SAWS. The older method is to employ steel blades set in a reciprocating frame, but the actual cutting agent consists of sharp grit and steel shot fed with water against the edge of the blades where they work

against the stone. More recent saws are circular in shape. In one form an outer rim of carborundum or similar abrasive material is attached to a disk of steel; in another type the steel disk is studded with diamonds which do the cutting. Such saws may be 6 ft. in diameter.

J. St. D. Reed

Sawatch, SAGUACHE, OR SIERRA MADRE. Range of mts. in Colorado, U.S.A. It parts the headstreams of the Grand and Gunnison rivers from that of the Arkansas river, and contains some of

the loftiest peaks in the country, among them being Harvard, 14,375 ft.

Sawbridgeworth. Urban dist. of Herts, England. It stands on the Stort, on the Essex border, 12 m. E. of Hertford, and has a station on the rly. from London to Cambridge. There are old established maltings and nurseries and a flour mill. Pop. 3,646. Pron. locally Sapsworth.

Sawdust. Fine particles produced in sawing wood or stone. Timber sawdust has many uses: it is a filling between partitions for insulating against heat or cold, and has acoustic insulating properties also. Wood sawdust can be burned in suitably designed heating or cooking stoves, and is fuel for steam boilers. Mahogany sawdust is used for fish curing; and furriers use sawdust of mahogany and rosewood in dressing furs. Mixed with cement or other binding agent, sawdust can be laid to produce a jointless flooring. It was an ancient practice to strew sawdust on floors as an absorbent. Another use is in the production of tar and alcohol by distillation. Some plastics are derived from sawdust, and methods of recombining the dust into building blocks have been used. Sawdust from the mill finds a market as a packing or stuffing material.

Saw Fish (*Pristis*). Group of large fishes. They are related to the sharks, but the upper jaw is

produced to form a long, flattened beak, having a row of sharp teeth set in sockets at either edge. They are found mainly in the tropics, but one species occurs in the Mediterranean and Atlantic. They often exceed 20 ft. in length, with a saw 6 ft. long. See Shark.

Saw-Fly. Large group of hymenopterous insects forming the greater part of the sub-order Symphyta. The name alludes to the finely toothed ovipositor with which the female saws slits in plant tissues to contain her eggs. The larvae are caterpillars closely resembling those

Saw-Fly. *Trichosoma tibialis*, a species which attacks hawthorn bushes

of moths in general appearance and many are destructive, especially the Pine saw-fly (*Diprion pini*) and the Gooseberry saw-fly (*Pteronix ribesii*), all being plant feeders. Over 400 species are British. See Forestry; Insect.

Sawtrej OR SAUTRE, WILLIAM (ex. 1401). English Lollard. While a priest at Lynn, in 1399, he was summoned before the bishop of Norwich on a charge of heresy, which he was afterwards declared to have abjured. In 1401 Sawtrej was again examined before convocation at St. Paul's by Archbishop Arundel and condemned as a relapsed heretic. He was burnt at Smithfield—the first Lollard to suffer by fire—by an order of Henry IV. See Lollards.

Saw-wort. Leaves and thistle-like flower-heads of the herb

Saw-wort (*Serratula tinctoria*). Perennial herb of the family Compositae. A native of Europe, it has

Saw Fish. Shark-like tropical fish, showing, on the left, the long saw

long leaves cut into lobes with toothed edges. The flowers form a head like that of a small thistle, of long, oval shape surmounted by a crown of red-purple rays. It yields a yellow dye.

Sawyer, ROBERT. Character in Dickens's *The Pickwick Papers*. He is one of two rowdy medical students encountered by Mr. Pickwick at Dingley Dell at Christmas, the other being Benjamin Allen. Pickwick attends an uproarious dinner party at Sawyer's lodgings in Lant Street, Borough, and hears some extravagant stories of medical experiences. Sawyer later starts in practice as "Sawyer, late Nockemorf."

Sawyer, Tom. See Tom Sawyer, Adventures of.

Saxe, MAURICE, MARSHAL (1696-1750). French soldier. Born at Goslar, Oct. 28, 1696, he was a

Marshal Saxe,
French soldier
After I. Jones

natural son of Augustus the Strong, elector of Saxony, his mother being Aurora, countess of Königs-
mark. He took the name of Saxe, and his military career began at 12, when

he joined the army of Prince Eugene in the Low Countries; he served with the Russo-Polish army against the Swedes and against the Turks in Hungary.

He added to his reputation while serving under the duke of Berwick in the French army, notably at the siege of Philippsburg in 1734. In the War of the Austrian Succession he commanded in Bohemia, taking Prague and Eger (Cheb). In 1744, now a marshal, Saxe received the command of the French army in Flanders, and on May 11 (N.S.), 1745, inflicted a signal defeat on the allies at Fontenoy. His last success was capturing Maastricht, 1747. He died at Chambord, Nov. 30, 1750. Marshal Saxe was the author of the posthumous *My Reveries*, 1757, in which he embodied his ideas on the art of war; and *Letters and Memoirs*, 1794. Notorious for amours, he is the subject of *The Prodigious Marshal*, E. B. d'Autvergne, 1930.

Saxe, DUCHIES OF. A number of former federal states of Germany, most of them in Thuringia, ruled by branches of the electoral dynasty of Saxe, which became a royal dynasty in 1866. The largest of the duchies was the grand duchy of Saxe-Weimar-Eisenach which,

at the time of its merger with the other Thuringian states after the 1918 revolution, had an area of 1,393 sq. m. and a pop. of 400,000. Next in size and pop. were the duchy of Saxe-Meiningen (953 sq. m. and 285,000) and that of Saxe-Coburg-Gotha (763 sq. m. and 270,000). The smallest was that of Saxe-Altenburg (511 sq. m. and 220,000). Apart from these four Saxon duchies, which were federal states of the pre-1918 German empire, there were a number of minor ones, e.g. the duchies of Saxe-Coburg-Saalfeld, Saxe-Gotha-Altenburg, Saxe-Hildburghausen, Saxe-Merseburg, Saxe-Naumburg-Weitz, Saxe-Weissenfels, which existed at various periods from the 12th century to 1826, but were eventually merged with the Saxon states, all being ruled by branches of the Wettin dynasty from the time when the Emperor Sigismund, in 1423, invested Margrave Frederick of Meissen of that house with the lands and the electorate.

Internationally, the Coburg branch played the most important part; it produced Portugal's king Ferdinand II, Belgium's royal dynasty founded by Leopold I, Bulgaria's prince, later King Ferdinand, and Queen Victoria's prince consort Albert. Coburg itself was ruled, during 1893-1900, by Victoria and Albert's second son Alfred, duke of Edinburgh, and from 1900 to 1918 by Leopold Charles, duke of Albany, son of their fourth son. Queen Victoria's mother was also a princess of Saxe-Coburg.

Both the Weimar and the Meiningen rulers won a reputation as patrons of arts and letters. Under Charles Augustus (1758-1828) Weimar, and Jena university, became an intellectual centre of Europe, where Goethe, Schiller, Herder, Wieland, and others of European eminence lived and wrote. Meiningen, under duke George II, who acted as stage-manager of his own theatre from 1874, gained international fame as a school of acting; this tradition was kept up by duke Bernhard who, after his abdication, took up the theatre as a profession.

Together, the four duchies represent 80 p.c. of the total area, 77 p.c. of the pop., of the free state of Thuringia, formed in 1919. The town and former district of Coburg then, however, voted for inclusion in Bavaria. Situated between the rivers Elster and Werra, and crossed by the Saale and Unstrut, some 50 p.c. of the mostly hilly

country is developed agriculturally; about one-third is forest. Its economic basis, however, is small scale industry: tools, toys, china, glass and stoneware, leather, food (especially sausages and chocolate), weaving, and specialised branches of engineering. Market gardening and seed production also flourish. There are many spas and health resorts in the Thüringer Wald, a range of hills and mts. up to 3,000 ft. which covers the S. half of the duchies; until, after the Second Great War, it was handed over, by the British and U.S. forces who had conquered it, to Russian occupation, the international tourist industry played an important part in the economic balance of the country.

There are only three towns with a population exceeding 50,000: Gera, Jena, and Weimar. The smaller towns, with palaces, theatres, orchestras, museums, schools, and other attractions provided at an early date by ambitious rulers rivalling one another had a fascination for visitors from abroad. Owing to their close family relations with the rulers of the great powers, e.g. the Weimar dynasty with the Prussian and Russian courts, the Coburgs with several European royal houses, the duchies enjoyed a political importance by far exceeding that due to their size, numbers, or material wealth. The Nazi party, even before assuming power, tried to implicate dethroned members of those dynasties, such as the last duke of Saxe-Coburg, and ex-king Ferdinand of Bulgaria, in its political activities. See Thuringia.

Edgar Stern-Eubarth, Ph.D.

Saxe-Coburg-Gotha, DUKE OF. Title held by members of the family of Wettin. Ernest I (d. 1844) was the first duke of this united duchy, and his son Ernest II (d. 1893) the second. Ernest's brother was Albert, prince consort, and when Ernest died childless the succession passed to the sons of Albert and Queen Victoria. The prince of Wales, afterwards Edward VII, having renounced the succession, it passed to his brother, the duke of Edinburgh (q.v.). On that prince's death in 1900, the duke of Connaught having renounced, the duchy passed to Leopold Charles, duke of Albany (q.v.), who was the last holder, abdicating in 1918.

Saxhorn. Brass musical instrument invented by the Belgian, Adolphe Sax (1814-94). For orchestral use, the saxhorn is sometimes pitched a tone higher than the

usual keys. With the exception of the tuba, which is the only member of the family which has found much acceptance in the orchestra, owing to the lack of blending with other instruments, the mechanism is based on that of the cornet, having three pistons which respectively lower the pitch one, two, or three semitones. In the tuba another valve is needed, which lowers the pitch a perfect fourth. The saxhorns are useful members of the military band.

E flat tenor saxhorn
Hawkes & Son

Saxicola (Lat. *saxum*, stone; *colere*, to inhabit). Genus of birds of the family Turridae. Natives of Europe, S. Asia, and Africa, two species, the stonechat (*S. torquata*) and whinchat (*S. rubetra*), are visitors to Britain. These birds are insectivorous, catching their prey on the wing, and are characterised by strong beaks and long, pointed wings.

Saxifragaceae (Lat. *saxum*, stone; *frangere*, to break). Family of herbs, including a few trees or shrubs, occurring mostly in the temperate and cold regions. They are of very variable habit, and are of little importance economically, though the genus *Ribes* includes the gooseberry and currants. From the gardener's point of view the family, which contains 90 genera and about 750 species, is important as containing such genera as *Hydrangea*, *Astilbe*, *Escallonia*, *Fraxinea*, *Cunonia*, *Heuchera*, and *Chrysosplenium*.

Saxifrage OR **SAXIFRAGA**. Genus of mostly perennial herbs of the family Saxifragaceae (v.s.). There are about 200 species, distributed throughout most of the regions of the world, except Australasia and S. Africa, and most frequent in the mountainous regions of the northern hemisphere. Many of the saxifrages bear their leaves in low-growing rosettes. The five-petalled flowers, usually white or yellow, but occasionally red or purple, grow in cymes. Twelve species are natives of Britain, including London pride (*S. umbrosa*) and meadow rockfoil (*S. granulata*), common in meadows and on sandy banks. Of the numerous alpine varieties many are now cultivated in Britain, their easy growth and compact foliage mak-

ing them favourite plants for a rock garden. Mother of thousands (*S. sarmentosa*) is a graceful basket plant. See London Pride; Mother of Thousands; Rock Plants.

Saxmundham. Market town and urban dist. of Suffolk, England. It is 20 m. from Ipswich, and is a rly. junction. The chief build-

Saxhorn. Compass and sounding values of seven instruments of the saxhorn type

ing is the church of S. John the Baptist, and the chief industry is a trade in corn and cattle. Market day, Wed. Pop. est. 1,300.

Saxo Grammaticus (fl. 12th century). Danish historian. Born probably in Zealand, he became secretary to Bishop Axel or Absalon, of Roskilde, later archbishop of Lund, and at his instigation wrote his *Historia Danica*. The first nine parts give a wonderful picture of ancient Denmark, drawn from sagas and legends, but are scarcely historical. The last seven parts, devoted to the author's own times, are among the most brilliant and graphic historical accounts ever written. The work, first published by Lave Urne, bishop of Roskilde, in 1514, was probably completed about 1208-23. The first nine books were translated into English by Oliver Elton in 1894, with introduction and notes by F. York Powell.

Saxonite OR **HARZBURGITE**. In geology, a variety of peridotite. They contain olivine, picotite, chromite, hornblende, etc., and are often porphyritic in texture. Typical rocks of this class are found in Cornwall, Ayrshire, Baste near Harzburg, N. America, etc.

Saxonite. Permitted gelatine blasting explosive which can be fired in a 9 p.c. methane-air mixture without causing the inflammable methane (fire damp) to ignite. This property is conferred

by incorporating into the mixture of 24 to 26 p.c. nitroglycerine and 32.5 to 34.5 p.c. ammonium nitrate about 25 p.c. of inert sodium chloride, which serves to reduce the temp. of the explosion. This is a strong explosive and is used with hard coal and rock.

Saxons. Teutonic people, whose territory has greatly varied in historic times. Their name probably signifies swordsmen. Ptolemy (c. A.D. 150) states that they inhabited Slesvig and three islands off its W. coast. In 286 they appear as pirates in the North Sea and English Channel, and by about 350 they had crossed the Elbe and extended their sway almost to the Rhine. In the 5th century they had made settlements at Bayeux and the mouth of the Loire, and according to Bede were associated with the Angles and Jutes in the conquest of Britain. The names Essex, Middlesex, Sussex, and Wessex, which contain their name, support the theory that their settlements were confined to S. England, but it is very doubtful whether any distinction can be made between the Saxon and Anglian settlers, as they all called themselves Angles, and were all called Saxons by foreigners.

In language, customs, and social organization the Saxons of England belonged to the Anglo-Frisian group, intermediate between Scandinavians and Germans, and differed markedly from the Saxons of Germany, or Old Saxons. This is probably explained by the fact that after the migration of part of the nation to England, and of part to the modern Hanover, Westphalia, and Prussian Saxony, the latter section amalgamated with the Chauci, Angrivarii, Cherusci, and other German tribes, and thus became Germanised. The Saxon federation extended from the Eider to the Harz, and from the Elbe to the Rhine delta. Its religious centre was the Irmsul at Eresburg, perhaps Marsberg. The Saxons stubbornly maintained their independence and religion, waged frequent wars with their neighbours, the Franks, and under their able leader Witikind were the most formidable enemies of Charlemagne, who conquered them only after 32 years' fighting (772-804). They were forced to adopt Christianity, and to become subjects of the empire, in which their territory afterwards formed a duchy.

Saxony. Former state of the German republic, until 1918 a kingdom, now a *Land* of E. Germany. The German name is

Sachsen, while the French form is Saxe. The area of the former state was 5,856 sq. m., and on its borders

Saxony. Arms of the former kingdom

were Prussia, Bavaria, and Czecho-Slovakia. Much of the district is hilly, the chief range being the Erzgebirge in the west. The great river is the Elbe; others are the Mulde, two

Elsters, and Spree. Dresden was the capital, but Leipzig is the largest town. The population numbers 9,800,000 (1950 est.).

Saxony was one of the great industrial areas of Germany. Agriculture flourished; rye, oats, wheat, barley, and potatoes were largely grown. In addition to Leipzig and Dresden, with their multifarious industries, other manufacturing towns were Chemnitz, Plauen, Zwickau. The mining industry flourished, coal, silver, copper, lead, and nickel being raised. Freiberg was the chief mining centre.

Early History

The Saxony of the Middle Ages originated in the 8th century in the land inhabited by the Saxons, one bounded roughly by the Rhine, Elbe, and Eider. The Saxons were conquered by Charlemagne, and after his empire was dissolved, about 850, a duke of Saxony appeared. Soon the dukedom became hereditary and a certain Otto held it. Otto's son was Henry the Fowler, who, in 919, was chosen German king, a dignity held by his son Otto the Great. Otto the Great deputed some of his duties as ruler of Saxony to another, and a new line of dukes was established.

About 1100 Lothair, who later became German king, was appointed duke, and the marriage of his daughter to Henry, duke of Bavaria, brought the duchy into the possession of the family of Welf. Henry's son was Henry the Lion. In 1180 he was crushed and the great Saxon duchy, the area of which had been extended by him, was broken up. The name Saxony was lost by the district now known as Westphalia and by other parts of medieval Saxony, but was retained by two small areas, Lauenburg and Wittenberg.

The two parts of the duchy were soon separated. After many changes Saxe-Lauenburg became, in 1728, part of Hanover, while from Saxe-Wittenberg developed

the modern republic. In 1356 its ruler was declared one of the seven electors, and in 1422 the last male of its ruling house died. The emperor bestowed the duchy upon Frederick, margrave of Meissen.

Under Frederick Saxony became one of the most important of the German states, but like so many of them it was weakened by partitions. The most decisive of these was made in 1485, by which the Saxon lands were divided between two brothers, Ernest and Albert, the two lines known to historians as the Ernestine and the Albertine being thereby established. Ernest, the elder of the two, received Wittenberg and Thuringia, while Albert secured Meissen. Ernest, who obtained the title of elector, was followed by his son Frederick. In his time came the Reformation, and this originated in Saxony. Luther was a Saxon and in Saxony was Wittenberg.

The war which these religious changes generated produced a curious result in Saxony. The elector, John Frederick, was one of the princes who, as members of the league of Schmalkalden, took up arms against Charles V. On the emperor's side, however, was Maurice, the ruler of the lands given in 1485 to the Albertine branch of his family. Maurice, although a Protestant, materially assisted Charles to crush his foes at Mühlberg in 1547, and his reward was the dignity of elector and a good part of Saxony, John Frederick being deprived of both. The Albertine princes, therefore, became electors, and later kings of Saxony, while the Ernestine princes were perforce content with the lands which later were divided among them as Saxe-Weimar, Saxe-Coburg-Gotha, etc.

17th and 18th cent. Saxony

In the Thirty Years War Saxony was at first neutral, but in 1629 assisted the Swedes. Victories were won, but the land was plundered first by the imperialists and then by the Swedes. The devastations of the latter were due to the peace of Prague, by which the elector deserted them and withdrew from the war. It has been estimated that by 1648 the population of the country had been reduced by half.

Saxony's rulers took their part in the decaying organization of the Holy Roman Empire and sent their soldiers to fight its battles. They also separated areas of the electorate to form principalities for younger sons, but after a time these junior lines became extinct and

once more electoral Saxony was whole.

Its ruler fought on the side of Austria during the Seven Years War, and the result was again loss and suffering, with nothing to place on the credit side. When France made war upon the Empire, the elector of Saxony entered the struggle as a German prince, but in 1796 he withdrew, making peace with the republic. In 1806 he joined Prussia in rising against Napoleon, and his men were in the force overwhelmed at Jena; after that, turning again to France, he received the title of king and became a member of the confederation of the Rhine.

Modern Saxony

Henceforward Saxony remained, on the whole, true to Napoleon, and Saxons fought for him at Leipzig. For this the allies made king and people pay. Russia and then Prussia was in possession of the country, and its fate was hotly debated at the congress of Vienna. At length about half the kingdom (7,800 sq. m.) was given to Prussia. In the 19th century the Saxons secured religious and civil liberties. In 1831 a new constitution, with an elected legislature and a responsible executive, was granted. In 1866 the Saxons threw in their lot with Austria. The land was overrun by the Prussians, and at the peace they were forced to pay a large sum of money. As a member of the N. German Confederation, Saxony's army came under Prussian control, and Saxony joined the German empire founded in 1871.

On Nov. 8, 1918, at the end of the First Great War, the king abdicated and the country was declared a republic. This became one of the federal states of Germany under the Weimar constitution; but Hitler's Unification Act of 1933 and his reformation of the Reich, 1934, deprived Saxony of all sovereign rights. After the Second Great War the whole area lay in the Russian zone of occupation, and in 1946 was made a *Land*, enlarged by parts of Silesia not Polish-occupied, W. of Görlitz and N. of Saxony's former border. See Germany; Luther; Reformation.

Saxony-Anhalt. *Land* of E. Germany, comprising mostly the former Prussian prov. of Saxony (v.s.). The capital is Halle-am-Saale. Area 9,400 sq. m. Pop. 4,250,000. See Anhalt.

Saxophone. Brass musical instrument. It was invented by Adolphe Sax, and has a mouthpiece similar to that of the clarinet and fitted with a single

Saxophone in alto size
Hawkes & Son

tra, the second for the military band. The compass is about the same as that of the oboe. The saxophone has tended to become confined to dance bands, though Glazounov wrote a concerto for it.

Say, JEAN BAPTISTE (1767-1832). French economist. Born at Lyons, Jan. 5, 1767, he passed some years in business in London. Having returned to France, he entered upon a literary career, and during 1799-1804 took part in political life. His later interests included the establishment of a cotton factory, but his main occupation was in economics, and, after having been professor at a conservatoire, he was, in 1831, chosen professor of political economy at the Collège de France. A follower of Adam Smith, whose views he made known in France, Say's great work is his *Treatise on Political Economy*, Eng. trans. 1821, which he expanded in an edition of 1828-30. He also wrote a book on England and the English, 1815. Say died Nov. 15, 1832.

Say, JEAN BAPTISTE LÉON (1826-96). French politician. A grandson of J. B. Say (*v.s.*), he was born in Paris, June 6, 1826, and adopted first a business career. He entered the chamber of deputies in 1871. During 1871-72 he was prefect of the Seine, and in 1872-73, 1875-79, and 1882 was minister of finance, being responsible for paying the indemnity to Germany. In 1890-91 Say was president of the senate. He died in Paris, April 21, 1896. Say, like his grandfather, a free-trader and in politics a Liberal, did a great deal to restore the prosperity of France after the war of 1870-71 with Prussia.

Sayansk Mountains. Extension of the Altai Mts., Central Asia, on the borders of Mongolia and Siberia. The range trends E.,

separating China from Irkutsk. It attains an average alt. of 6,000 ft., rising in Mt. Mungo-Sardyk to over 11,400 ft.

Sayce, ARCHIBALD HENRY (1846-1933). British philologist and Orientalist. He was born Sept. 25, 1846, and educated at Shirehampton, Glos, Bath, and Queen's College, Oxford, becoming a fellow in 1869. He was professor of Assyriology in the university, 1891-1919. Although making a special study of the ancient empires of the East, he did much to popularise the general results of comparative philology. His most important works were *Introduction to the Science of Language*, 1879; *Principles of Comparative Philology*; *Assyrian Grammar*; *The Archaeology of the Cuneiform Inscriptions*, 1907; *The Religions of Ancient Egypt and Babylonia*, 1913. In 1874-84 he was a member of the commission for the revision of the Old Testament. His reminiscences appeared in 1923. Sayce died Feb. 4, 1933.

Saye and Sele, BARON. English title borne by the family of Twisleton-Wykeham-Fiennes. Lord Saye and Sele is said to have been the title granted in 1447 to Sir James Fiennes, lord treasurer of England, who was killed by Jack Cade's rebels in 1450. His son William, 2nd lord, vice-admiral of England, was slain at Barnet in 1471. The title, which had hitherto been assumed on the summons of the holder to parliament, was confirmed and made hereditary by letters patent in Richard, 7th *de jure* lord and 1st baron, 1603. His son William was created a viscount in 1624. James, 2nd viscount, died without leaving a son, and the viscounty passed to his nephew William, and expired on the death of the 6th viscount in 1781. The barony had passed into abeyance on the death of the 2nd viscount, but this was terminated in the person of Thomas Twisleton, descendant of the 2nd viscount's daughter Elizabeth, who became 13th baron.

Sayers, DOROTHY LEIGH (b. 1893). British author. She was

Dorothy L. Sayers,
British writer

educated at Somerville College, Oxford, and first went into print with poetry called *Op. 1*, 1916. Detective fiction brought her fame, through the methods and conversation of

her Lord Peter Wimsey, hero of such tales as *The Unpleasantness at the Bellona Club*, 1928; *Five Red Herrings*, 1931; *The Nine Tailors*, 1934; *Gaudy Night*, 1935; and of a play, *Busman's Honeymoon*. Dorothy Sayers, who in 1926 married Atherton Fleming, wrote a more serious play, *The Zeal of Thy House*, 1937; and was praised in 1942 for *The Man Born to be King*, a cycle of twelve radio plays presenting the Gospel story in modern speech. *The Mind of the Maker*, 1941, was an essay on the idea of God as a creative artist. In 1946 appeared *Unpopular Opinions*; in 1947 *Creed or Chaos?*

Sayers, Tom (1826-65). English pugilist. Born at Brighton, May 25, 1826, he first became

Tom Sayers,
British pugilist

famous in the prize ring in 1849, and secured the championship in 1857. His only defeat was by Nat Langham, Oct., 1853. Sayers fought his famous battle with J. C. Heenan (*q.v.*), the American champion, at Farnborough, April 17, 1860, the fight ending in a draw after 37 rounds. This was Sayers's last appearance in the ring. He died Nov. 8, 1865, and was buried at Highgate. *See* Boxing.

Scab. Parasitic disease of sheep (*q.v.*). The word is also used for the hard raised surface which forms, by the clotting of blood and lymph, after an injury to the skin.

Scabbard (Old Fr. *escale*, shell; Ger. *bergen*, to hide or protect). Term applied to the sheath or case in which a sword or dagger is carried. Serving the double purpose of protecting the edges and point of the weapon and of making it portable, the sword scabbard is usually of metal, sometimes covered with leather, and is fitted with rings near the hilt end for attaching to the sword-belt. The sword fits sufficiently tightly to require slight force for its withdrawal. When swords were in more general use the scabbard was frequently ornamented with carving or chased work. *See* Celt colour plate; Sword.

Scabbard
of sword

Scabies. An itching skin condition caused by a spider-like eight-legged parasite *Acarus* or *Sarcoptes scabiei*, just visible to the naked eye. The female parasite burrows deep in the skin layers to deposit her eggs, some 30 in number; these mature in about 10 days. Scabies is a common skin condition, and is easily passed from one person to another by contact. The physician, not surprised to find it in children, often fails to diagnose it in the adult.

The burrows are scratched by the patient, as the irritation is extreme, and is made worse by heat at night. Thus secondary infection is caused. The commonest site of the disease is between the fingers, or in the folds of the wrist, though almost all parts of the body may be affected. The parasite can be recognized under the microscope. The treatment is a hot bath, followed by the application of benzyl benzoate all over the skin surface. Clothing and linen should be boiled.

Scabies is a notifiable disease in the U.K. A medical officer can insist on inspecting premises where an infected person has resided, and on examining suspects, if necessary treating any infected.

Scabious OR PINCUSHION FLOWER (*Scabiosa*). Genus of annual and perennial herbs of the family Dipsacaceae. Natives of Europe, W. Asia, and Africa, they

Scabious. Flower head of *S. arvensis*; top, right, of *S. succisa*

have opposite leaves, entire or deeply cut into lobes. They have small tubular flowers packed

into a head, and an outer series with flat rays. These are varied in colour, according to species, from blue, purple, and crimson to white. The Small Scabious (*S. columbaria*), the Devil's-bit Scabious (*S. succisa*), and the Field Scabious (*S. arvensis*) are well known British wild flowers; and the Mournful Widow (*S. atropurpurea*), wild in S.W. Europe, is a favourite English garden annual.

Scaevola, GAIVS MUCIVS. In Roman legend, a young Roman noble who, when the Etruscan

army under Lars Porsena was besieging Rome, made his way into the Etruscan camp with the intention of murdering Porsena (q.v.). Not knowing him by sight, he killed his secretary in error. Seized and threatened with torture by the king, the young Roman, to show his fortitude, allowed his right hand to be burned by a fire until it was useless. The king was so impressed by this heroic act, and also by the young man's statement that 300 other noble Roman youths had sworn to murder him, that he raised the siege and made peace. Gaius Mucius was ever afterwards known as Scaevola (left-handed); the appellation descended to his family.

Scaevola, QUINTUS MUCIVS. Distinguished Roman killed in the proscription of Marius, 82 B.C. According to Cicero he was the most learned lawyer of his time, being the first to establish a system of civil law.

Sca Fell. Mountain group of Cumberland, England. It is 11 m. from Keswick, at the E. end of Wastwater. It consists of two main peaks, Sca Fell Pike (3,210 ft.), the highest mountain in England, and another (3,102 ft.). The two are separated by a narrow ridge called Mickledore. The ascent is best made from Wasdale Head via Lingmell. During the First Great War, German prisoners improved the road leading to the

mountain. In 1919 Lord Leconfield presented the summit of the pike to the National Trust as a war memorial. See Lake District.

Scaffold. In general, a platform structure of temporary character designed for the use of men building or repairing a house. The term also applies to the raised platform on which a criminal is executed, either a simple structure on which the block or guillotine is placed, or the special contrivance with drop apparatus used in execution by hanging.

Scaffolding. Temporary framed structure with plank platforms from which building operations are carried out. The materials used are timber poles connected together with rope or wire lashings, and galvanised steel tubes con-

nected with couplings and other fittings. Steel is now more widely used than timber, especially for large buildings.

There are two main types: the bricklayers' or single scaffold, which is partly supported on the walls, and the masons' or double scaffold which has two lines of standards and is independent of the walls. The bricklayers' timber scaffold is made of poles placed horizontally, vertically, and obliquely, and lashed or fastened together for the support of platforms on which builders work, and to which materials and appliances are hoisted. The vertical members (standards) and the horizontals (ledgers and putlogs, the latter square or rectangular in section), form the principal framework; the diagonals (braces) strengthen it.

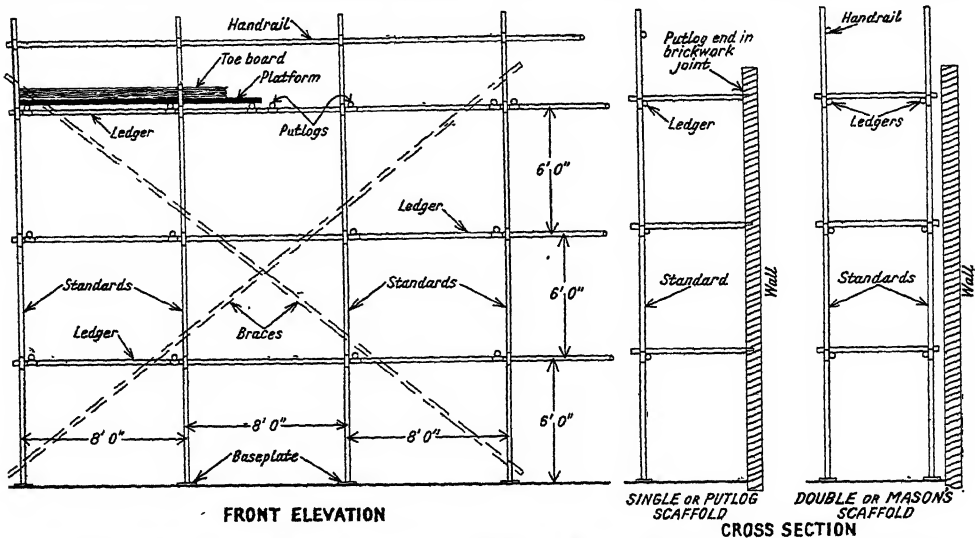

In bricklayers' scaffolds, the putlogs (short timbers of rectangular section placed at right angles to the ledgers to support the platform) rest at one end on the brickwork in course of construction; but scaffolding for masonry, to

Sca Fell, Cumberland. Sca Fell Pike, the highest mountain in England, 3,210 ft. above sea level

avoid disfiguring the stonework, must be independent of the wall, and have a double framework of uprights and ledgers. In constructing a bricklayers' scaffold, the first step is to erect the standards (singly or in pairs) in a line with each other and parallel to the walls, the poles being set at distances of 6 ft. to 8 ft., and standing 4 ft. to 6 ft. in front of the building. These uprights are sunk 2 ft. or more into the ground, or planted in barrels.

Next, the ledgers are lashed to the standards at a height of 5 or 6 ft. from the ground, and tied to each other where they meet. Then the putlogs can be placed, about 5 ft. apart, one end resting on the ledger, the other end on the wall, where they are given a "bearing" of about 6 ins. A putlog touching

Scaffolding. Diagram illustrating the lay-out of steel tubular scaffolding which has largely superseded wood spar erections. Below, dismantling a steel scaffolding from the Victoria Tower, Houses of Parliament, Westminster

a standard may serve as foothold for the next "rising standard." Across the putlogs, and longitudinally to the wall, the platform planks are laid, three to five abreast to form a platform three or four ft. wide, each end of each board being firmly supported by a putlog to prevent tilting under weight, no board projecting more than 6 ins. over a putlog.

Boards set on edge may form a rim to the ledger edge of the platform, and a guard-rail is fixed some 3 ft. 6 ins. above platform level. Poles are of pine, spruce, or larch, 30 to 50 ft. long, and 6 to 9 ins. in their largest diameter; putlogs, often birch, are usually in 6-ft. lengths. Platform boards are 12 to 14 ft. long, the ends being commonly bound with strap-iron to prevent splitting.

Three-strand Manila cords are best for lashing, and are tied in many different ways to meet various conditions, the clove hitch being used for tying ledgers to standards. Wire ropes are often used, and patent systems, with chains, clamps, screw-bolts, etc., are substituted often for lashings.

Steel tubular scaffolding is of two types, corresponding to the timber scaffolds already described. The members are connected together with steel couplings which are quickly secured by nuts and bolts. Advantages over timber are quicker erection and striking, longer life, consistent strength so that large scaffolds can be designed scientifically, and greater ease of handling and transport.

The tubular standards are fitted with base plates which stand direct on firm paving or can be nailed to timber soles. The standards are in 9 ft. lengths and can be built up by using pin couplers. Double couplers are used to connect standards to ledgers at right angles, and swivel couplers to connect diagonal braces to standards and ledgers. Steel putlogs are fitted with flat heads at one end and these can be inserted in

brickwork joints. Tubular struts and shores are made for strutting floors and ceilings, and these, too, are adjustable for length.

Special types of scaffolding are : (a) Cantilever scaffolds which are not built on the ground or floor but project from the upper part of the building, leaving the ground space unobstructed; the scaffolding is supported partly on sills and cornices and partly by passing ledgers through window openings and anchoring them back inside the building. (b) Suspended scaffolding, consisting of cradles fitted with handrails and hanging by wire ropes from projecting members fixed to the roof or passed through window openings, used for painting and repairs; these cradles can be raised or lowered with winches worked from inside the cradles.

A scaffold gantry is a strong staging built over the footpath and supporting the scaffolding above, while the public can continue to use the footpath. Another type of gantry is a staging used to support a crane.

Bracket scaffolds are sometimes used for light repair work. They consist of two or more steel brackets fixed to grapples driven into wall joints. Scaffold planks are then laid across the brackets.

Ladders, simple or extensible, are, in Western practice, the chief means of access to scaffolds, but, in India and elsewhere in the East, the workers go up and down a fenced incline, and the scaffolding is commonly of bamboo. In some

parts of Europe scaffolding is erected on the inside of the building, and in Britain stone buildings are often served from inner gangways supported on light scaffoldings. A detail of scaffolding, known as a "cripple," comprises a platform, consisting of a single board jutting out at right angles from a ladder, and supported in this position either by a bracket of wood or by an adjustable quadrant of metal. Ladders are occasionally combined as the chief members of light scaffolding, and this use has been systematised in several patented arrangements. Tower extension ladders, running on wheels, are in effect portable scaffolds, although they are less used in building operations than for gaining access to high-placed street lamp standards, overhead tramway wires, etc. See Building; Iron and Steel Construction. *Consult* Building Regulations under the Factory and Workshop Act (H.M.S.O.), 1946; Building Construction, G. A. and A. M. Mitchell, new ed., 1948.

Scagliola (Ital. *scaglia*, horn). Artificial decorative marble much used by early Florentine builders. Its manufacture is said to have been revived by Guido Sassi in the 16th century, and it was introduced into England about 1750 by James Wyatt. Apparently its basic constituent is plaster of Paris (*q.v.*), colour being added and the face hardened by old Italian processes that the makers prefer not to reveal. Its appearance is only slightly inferior to that of natural marble, and it is manufactured and extensively used in England. *Pron.* skal-yola.

Scala, LA. Opera house in Milan, Italy. Dating from 1778, and built on the site of the church

world. In connexion with it are a ballet school and a singing school. The theatre has been civic property since 1872. The building was restored in 1878 and again in 1922, when Arturo Toscanini became its director. Many famous Italian operas received their first performances here. During the Second Great War the Scala was gutted as a result of Allied bombing from the air in Aug., 1943. It was reopened in 1946, when regular opera seasons restarted.

Scalanova, GULF OF. Opening off the W. coast of Asiatic Turkey. From E. to W. 45 m. long, and of an average width of 20 m., it partially contains the island of Samos. It is overlooked on the S. by the Samsun Dag (Mycale).

Scalar. In mathematics, a term introduced by Sir W. Hamilton in the nomenclature of quaternions (*q.v.*). Quantities which, like forces, depend for their effect on direction as well as magnitude, are called vector quantities; those having only magnitude, such as area, are called scalar quantities.

Scala Theatre. London theatre, in Charlotte Street, Tottenham Court Road. It stands on a site where there has been a theatre since 1760. The old house was called the West London, then in turn the Regency, the Queen's, the Fitzroy, and the Prince of Wales's. The building, opened Sept. 23, 1905, under the management of Forbes-Robertson, was named after La Scala in Milan. Architecturally it is a magnificent building, but it failed to attract patrons, was for some years unused, and then became a cinema. Later it became a centre for amateur productions. Donald Wolfitt gave a Shakespearian season here in 1944 and there was a ballet season in 1948. The theatre seats 1,070.

Scald (late Lat. *excaldare*, to dip in hot water). Injury to the skin, mucous membrane, or deeper tissues, produced by boiling water, superheated steam, or other extremely hot fluids or gases. See First Aid.

Scale (Lat., *scala*, ladder). Term applied to various classes of

things that ascend, as it were, by steps, *e.g.* musical notes, fees. The word also denotes a line or an area on which marks indicate suc-

cessive units of length or area, *e.g.* a scale of inches.

A scale of fees for the services of professional men, such as solicitors or auctioneers, is usually determined either by an outside body, such as the supreme court, or by the body controlling the profession. Generally fees prescribed are the maximum that may be charged.

Scales of length, made of wood, metal, or plastic, are in general use for the preparation of drawings. They may be (a) scales of standard lengths, appropriately divided, *e.g.* of inches divided into tenths, eighths, etc., or metric scales showing centimetres, millimetres, etc.; (b) logarithmic scales, graduated according to the logarithms of the numbers indicated, such scales being an essential feature of the slide-rule (*q.v.*); (c) proportionate scales, used for the construction of reduced or enlarged drawings. On such scales the graduations bear a constant relation to the inch. They give immediately and directly the length required in a particular drawing to represent a stated length.

The scale of a map is the ratio between a distance on the map and the true distance, *e.g.* one in. to one m. (or "one-in." map, useful for pedestrians), six ins. to one m. (for town planning and other detailed work), 4 m. to one in. (motorists' map), 1 to 1,000,000 or 1 to 10,000,000 (for maps of countries). A scale can be shown as a representative fraction; *e.g.*, 1/5280, instead of one ft. to one m.

A scale of notation is a basis for giving to figures a positional value. Ordinarily we use a scale of 10, or a decimal notation; thus, reading from right to left, the successive figures of the number 11111 indicate unity 10^1 , 10^2 , 10^3 , 10^4 . In a scale of 7 the number 11111 would indicate $1 + 7 + 7^2 + 7^3 + 7^4$, i.e. 2801 in the decimal notation. See Duodecimal.

Scale. (1) A musical scale consists of the sounds which subdivide the interval of the octave, arranged in progressive order. It has varied, and still varies, in different nationalities and at different times. In the European system the sequence of the steps depends upon the mode, according as the 3rd and the 6th degrees form major or minor intervals with the tonic. The major or diatonic scale is composed of two disjunct tetrachords, each consisting of two tones and a semitone; the complete order is therefore tone tone, semitone, tone, tone, tone, semi-

La Scala, Milan. Main entrance to the opera house

of Santa Maria della Scala, it seats 3,600, measures 330 ft. by 122 ft., and is considered to have the best acoustics of any opera house in the

tone. From these tetrachords is developed the whole system of 15 keys.

The minor scale (harmonic form) has the 3rd and 6th degrees lowered a semitone.

In order to avoid the augmented second which thus results between the 6th and 7th degrees, both of these are subjected to the following modifications:

Ascending

Descending

These form the melodic minor scale. The chromatic scale proceeds wholly by semitones, of which there are 12 in the octave. In the early 20th century the whole tone scale was much exploited by Debussy, Schönberg, and other composers. As implied by the name, the semitone is eliminated. This scale is, of course, hexatonic.

Of other scales, the pentatonic—or more accurately the pentaphonic—is used in Gaelic, Chinese, and Japanese music in various forms, while in India the octave is divided into 22 portions, called s'rutis. In practice, however, the scales, like those in use in Great Britain, are heptatonic, either by filling up gaps with ornamental notes or by a process of selection. (See Harmony; Mode.)

(2) In organ-building, scale (mid. Eng., bowl of a balance, hence proportion) denotes the relation of the diameter or width of a pipe to its length, by which both amplitude and quality of sound are affected; the greater the diameter, the fuller and smoother the tone. A lesser diameter tends to produce a thinner and more pungent tone. In the pianoforte, the thickness of the strings in proportion to their length and tension is similarly a matter requiring careful adjustment, so that the quality of tone throughout the instrument may be evenly graded.

Scale (mid. Eng., shell, flake; Fr. *écaille*). Flat structure which occurs on or in the skin of many animals. In fishes and reptiles, the body is more or less covered with scales; birds have them

on the legs; butterflies and moths on the wings; and some mammals, e.g. the armadillo and the pangolin, have a protective coating of them. The tails of rats, mice, beavers, and some other mammals are provided with scales. In the fishes the scales are of a calcareous nature, and are secreted by the skin; but in reptiles, birds, and mammals they are of a horny character and grow out from the skin.

Scale Insects (*Coccidae*). Family of hemipterous insects including many species such as the Cottony Cushion Scale, San José Scale, Mussel Scale, etc. It is injurious to citrus fruits, apples, and other plants. Many kinds have a hard, scaly covering; others, called mealy bugs, have a waxy powdery exudation.

Scales. Weighing machine, described under that heading. See also Balance.

Scaliger, JOSEPH JUSTUS (1540–1609). French scholar. Born at Agen, he was the son of Julius

Joseph Scaliger,
French scholar
After Edelnick

Caesar Scaliger. His early education was directed by his father, but he later studied at the university of Paris. From 1563, with his patron Louis de Chastaigner, he was in Italy and England, then three years at Valence. A Protestant, Scaliger left France after the massacre of St. Bartholomew's eve, and in 1573 was professor at Geneva. In 1574, however, he returned, and until 1593 lived mainly with Chastaigner. At last he became a professor at Leyden, and he was still there when he died, Jan. 21, 1609. His last years were embittered by violent controversies with the Jesuits.

Inheriting a taste for study and spending a long life among books, Scaliger mastered with great rapidity and thoroughness Greek, Latin, and other languages. His work on chronology, which gives an idea, not only of his remarkable knowledge of ancient history, but of his gifts of judgement and application, was of supreme importance in fixing the dates of the leading events of the world, and his editions of Catullus, Manilius, and Eusebius bear further witness to his powers as a critic and com-

mentator. Consult History of Classical Scholarship, J. E. Sandys, vol. ii, 1908.

Scaliger, JULIUS CAESAR (1484–1558). French scholar. Born in Italy, he became a soldier in the

J. C. Scaliger,
French scholar

imperial service and fought in 1512 at Ravenna. In 1514, already something of a scholar, he entered the university of Bologna. In 1525 he settled at Agen, where he married and practised medicine, living there until his death, Oct. 21, 1558. Scaliger was a violent controversialist. Most of his works are Latin poems or commentaries dealing with the scientific works of Aristotle and other early writers. The erudition displayed made him the first scientist of his age, although no great discoveries have been attributed to him.

Scaling Ladder. Military ladder used in the assault upon fortified places. They were extensively used by commando parties during the Second Great War, in the battle for Fort Driant, Metz, and on a large scale during the battle for the Mareth Line. Similar ladders are used by fire brigades.

Scaling Ladders, as used in ancient warfare. 1 and 3, German. 2, Danish
From old prints

Scallop. Popular name for marine bivalve molluscs of the genus *Pecten*, of which about 20

Scallop with shell opened

species occur around the British coasts. The valves of the shell are more or less fan-shaped, and are winged at the hinge. They are usually brightly coloured, and the one valve is often convex while the other is flat. These molluscs can swim with some speed by rapidly opening and shutting the valves of the shell. There are a series of small ocelli upon the edge of the mantle. Probably all the pectens are edible, but only two species are eaten in Great Britain, the common scallop (*P. maxima*) and the quin (*P. opercularis*). About 200 living and nearly 500 extinct species are known. *Pron.* skol-lap. See Mollusca.

Scalp (Mid. Dutch *schelpe*, shell). Structure formed by the soft tissues which cover the vault of the cranium. It consists of three layers: the skin; the superficial fascia, a layer of fibrous tissue; and the occipito-frontalis muscle, with its aponeurosis or fibrous extension. Underneath the scalp is a layer of loose areolar tissue, which separates it from the periosteum or fibrous membrane, which is closely adherent to the bone.

The skin of the scalp is thicker than the skin in any other part of the body, and contains numerous sweat and sebaceous glands and hair follicles. The occipito-frontalis muscle moves the scalp and wrinkles the forehead. The scalp is abundantly supplied with blood-vessels, in consequence of which bleeding from wounds of the scalp is apt to be persistent and severe. Hence also such wounds tend to heal readily. See Anatomy; Brain.

Scalping. Custom of removing part of the skin, with hair attached, from an enemy's head. A substitute for the taking of head-trophies, it was practised by ancient Scythians, Celts, and Teutons. Developed in N. America in recent centuries, it was infrequent outside the Iroquois and Muskogee regions. Sometimes utilised as ritual offerings to sun or water, scalps were usually dried on hoops, painted underneath,

and displayed or worn as trophies, or mounted on poles for women's scalp-dances. The early white settlers encouraged scalping by bounties. See American Indians.

Scamander. Ancient name of the river Menderes (*q.v.*).

Scammony. Gum-resin obtained from the root of *Convolvulus scammonia* from Syria and Asia Minor. Scammony resin is a mixture of resins obtained from Ipomoea. The compound powder of scammony contains 50 p.c. of scammony resin. Scammony is a strong purgative and may be usefully administered in obstinate constipation, for threadworms, etc.

Scandal (Lat. *scandalum*, cause of offence). In law, a pleading or affidavit is scandalous which alleges anything unbecoming to the dignity of the court, or indecent, or offensive, or merely abusive—as where an allegation of crime, not material to the issue, is made. On application the court will strike out such a pleading or affidavit, and award costs against the party in fault. But however scandalous an allegation may be, if it is relevant to any issue in the case, it will not be struck out. See Libel.

Scanderbeg (c. 1403–67). Albanian hero. The son of an Albanian prince, his original name being George Castriot Swinamed. he early distinguished himself against the Turks, receiving from them the name of Scanderbeg, derived from Iskender, or Alexander, Beg, or Bey. After the overthrow of Albania by Murad II, Scanderbeg rose high in the Turkish service. In 1443 he returned to his people, and in a campaign of a single month recovered Epirus from the Turks. With his tiny army he defeated the 40,000 Turks who invaded Albania in 1444. Scanderbeg died of fever at Alessio (Lesh), Jan. 17, 1467.

Scanderoon. Alternative name for the Turkish seaport better known as Alexandretta (*q.v.*).

Scandinavia. Name of the European peninsula which is politically divided between Norway and Sweden. Denmark and Finland are sometimes understood to be included. The term grew from Scandia, an ancient name for the S. of Sweden, to which the term Scania (Swed. *Skåne*) is still applied. (See Denmark; Finland; Norse; Norway; Sweden.)

The Scandinavian lands are rich in antiquities. Human occupation of these lands and the Baltic shores lagged behind that of central Europe during the northward

retreat of the glaciers in early Palaeolithic times. S. Sweden was perhaps reached by wanderers in the Solutrian (*q.v.*) period, but rude stone and horn implements are scanty until, on the threshold of the Neolithic age, immigrants along the Atlantic coast penetrated to Jutland, and left traces of their semi-nomadic fisher life in the Danish kitchen-middens.

As the Stone Age progressed, the megalithic-building impulse reached Denmark and the opposite land. This culture may probably have felt the impact of bronze-using peoples shortly after 2000 B.C. Many implements betoken high skill, especially long Danish flaked daggers, rivalling those of predynastic Egypt. The prototypes of these daggers may have come from Bronze Age Britain, which apparently began to affect Scandinavia centuries before Norse influences came back in return.

Bronze Age culture apparently arrived with a new ethnic immigration along the Vistula and other routes from S.E. Russia, although other influences came along the amber routes from the Mediterranean. Interment in hollowed oak coffins, sometimes containing wool-len garments, was replaced by the burial in urns or cists of burnt remains. Although iron became general in S. Europe by 1000, several centuries elapsed before it began to displace Scandinavian bronze, which, like the flint-work, reached high levels of workmanship. Remarkable bronze war trumpets and diadems, as well as golden bowls, votive boats, and chariots, are extant. The material comfort arose from maritime and agricultural industry. Sailable ships, ox ploughs, and horse wagons are represented on rock-sculpturings, which also illustrate the sun-worship of the time. On the walls of a dolmenic tomb at Kivik appear engravings recalling the judgement scenes of the Egyptian Book of the Dead.

From about 500 B.C. iron appears, mostly at first in imported designs of La-Tène type. During the first four centuries A.D., Roman influence was pervasive. A massive silver bowl from Gundestrup, Jutland, bears hammered scenes in the classical manner. Hoards were deposited in moors, mostly with a votive intention, rather than in graves. One hoard from Vimose, of 4,000 objects, including a coat of mail, and dating to A.D. 250, is predominantly Roman; another 40 years later, from Thorsbjerg, and a still later

one from Nydam, including a clinker-built ship, 75 ft. long, mark the decline of Roman influence.

Local art became vigorous during the four centuries of the national migrations. This is often called the golden age, because of the large amount of gold remains, in the form of bars, collars, brooches, bracteates, and coins. Two golden horns, 3 ft. 9 ins. long, from Gallehus, Slesvig, melted down in 1802, but represented by reproductions, bore scenes of Valhalla and the underworld. This period was aided by the economic importance of the S. Baltic as the northern highway from the Atlantic to the Byzantine East.

The next three centuries cover the Viking time. During this, the silver age, Norse paganism was supplanted by Christianity, and the commingling of the two faiths is reflected in the contemporary art. Complete seagoing craft from ship-graves have greatly elucidated the seamanship of the time. It was then that Norwegian antiquities became most striking and plentiful. Silver filigree work displaying Irish influence was plentiful, and runic inscriptions preserve the history of rune-writing. The adoption of the Latin alphabet brought the Baltic lands into the general comity of Europe. *See* Bracteate; Denmark; Kitchen-midden; Norway; Rune; Sweden.

Scandium. One of the metallic elements. Its chemical symbol is Sc, atomic no. 21, atomic weight, 45.1. It is one of the predicted elements of Mendeléev. Its oxide was discovered by the Swedish chemist L. F. Nilson, in 1879, in euxenite, a form of mineral pyrochlore, occurring in Norway. Scandium is also found in monazite, thorite, and other rare minerals of Scandinavia, Finland, and Greenland; in tin ores and wolframite, generally with thorium, from which it is separated with great difficulty. It has been recognized in the solar spectrum. The oxide, a white powder resembling magnesia, is widely distributed.

Scania. Southern peninsula of Sweden. It comprises the area nearest to Denmark, and forms the S. portion of Gothland, differing in geological formation from the remainder of the country. The ancient kingdom of Scania, and now a province, it is a rich agricultural lowland, of which almost two-thirds is cultivated, and it exports butter and bacon.

Scansion (Lat. *scandere*, to climb). In prosody, the measuring into feet of a line of verse to test

its conformity with the laws of quantity or metre. *See* Metre; Prosody; Verse.

Scansores (Lat. *scandere*, to climb). Word formerly used by ornithologists for a division of the birds to include the parrots, woodpeckers, and others.

Scantling (Old Fr. *escantillon*). In joinery, shipbuilding, and masonry, the dimensions of a piece of timber or stone; by extension, a small piece of timber; also a trestle to support a cask.

Scapa Flow. Sea basin in the S. of the Orkney Islands, Scotland. It is almost entirely enclosed by Pomona, Burray, South Ronaldshay, Hoy, and Walls, and contains a number of small islands; 15 m. long, the breadth varies from 8 to 12 m.

During the early part of the First Great War Scapa Flow was the main base of the British Grand Fleet. The German fleet was interned here in Nov., 1918, and most of it was scuttled, June 22, 1919, several of the ships being subsequently salvaged. At the outbreak of the Second Great War it again became a great naval base, but, owing to delay in production, the anti-submarine defences were incomplete. On Oct. 14, 1939, a German U-boat penetrated the anchorage and sank the Royal Oak (*q.v.*). The greater part of the Home Fleet was then withdrawn, returning early in 1940, when steel-mesh nets and electrically-controlled minefields had been laid across the harbour entrances.

On Oct. 17, 1939, Scapa Flow was bombed by enemy aircraft and the old battleship Iron Duke

(*q.v.*) was hit and settled upright in shallow water; she remained in that position for the rest of the war, being used as an accommodation ship. On March 16, 1940, a heavy force of bombers attacked the Home Fleet at anchor, but, although the enemy claimed to have sunk ships to the value of £32,582,000, little damage was done. One of the bombs falling on the village of Wraith killed the first civilian to lose his life in an air raid on Great Britain in the Second Great War. Raids continued throughout the war, but were mainly of nuisance value, doing nothing to interfere with Scapa Flow, which continued to be the principal base of the Home Fleet and for vessels escorting convoys to N. Russia.

Scapegoat. Term in the O.T. (A.V.) for one of the two goats brought to the altar on the Day of Atonement (Lev. 16). While one was sacrificed to the Lord, the other was the scapegoat, or, as the R.V. reads, for Azazel (*q.v.*). The high priest having confessed over the head of the scapegoat all the iniquities of Israel, the animal was sent away into the wilderness to the evil spirit (Azazel). It is conjectured that the ritual served as a warning against the worship of evil spirits. Similar ceremonies have been noted among races other than Jews, notably in Borneo. The term is often applied to one who has to bear the blame of another, *e.g.* the scapegoat of the family, the child with whom fault is found whatever the brothers or sisters may do.

Scaphoid (Gr. *skaphe*, skiff). In anatomy, name given to two

Scapa Flow. Map of the land-locked harbour in the Orkney Islands. It was the principal British naval base of the Grand Fleet in the First Great War, and of the Home Fleet in the Second Great War

bones: one of the bones of the wrist and one of the smaller bones of the foot; also known as the navicular bone. *See* Wrist.

Scapolite. An isomorphous series of rock-forming minerals ranging from marialite, a complex sodium aluminium silicate with sodium chloride, to meionite, calcium aluminium silicate with sodium carbonate; including wernerite and dipyre. Scapolite occurs as tetragonal crystals or grains in metamorphosed impure limestones, gneisses, and amphibolites, or as secondary mineral after lime-rich plagioclase in igneous rocks.

Scapula OR SHOULDER BLADE. Bone of the upper and back part of the thorax. It consists of a flat triangular part or body, with two projecting portions, the coracoid process and the spine, which terminates in an expansion known

Near the top is a surface for the attachment of the long head of the biceps muscle. The coracoid process arises from the upper border of the head, and serves to give attachment to the coraco-brachialis muscle, the short head of the biceps, and the pectoralis minor muscle. *See* Anatomy.

Scapula (Lat., shoulder). Ecclesiastical vestment of the R.C. Church. Consisting of a cloak or surtout worn over the shoulders, it is made of two strips of cloth put on over the head so that one falls in front and the other behind. It originated in the working frock of the Benedictines, symbolising by its shape the yoke of Christ, and was later adopted by other religious orders, its colour and length now varying according to the brotherhood of the wearer. A smaller scapula, 3 ins. by 2 ins., is worn under the clothes, and entitles the wearer to certain indulgences.

Scapular. Small medal of pewter or brass. It carries on the obverse an image of the Sacred Heart and on the reverse an effigy of the Virgin Mary. A scapular is generally worn instead of the small scapula. *See* Medal.

Scar (Gr. *eschara*, hearth, mark of a burn). Mass of fibrous tissue which forms in the healing of a wound. A scar will develop wherever an injury has been deep enough to sever the true skin. Important medico-legal questions turn upon questions relating to scars. The age of a scar can be roughly judged from its appearance.

At first a scar is red; it may then pass through a stage when it is brownish; and eventually it becomes white and glistening. The intervals of time, however, at which these changes occur, vary within very wide limits. A scar once produced is permanent, but in course of time it may fade so much as to be difficult of detection. Often, however, by rubbing the

part, it can be made more obvious, since the scar remains white, while the surrounding area becomes red. A scar cannot be entirely removed without producing another scar, but 20th century plastic surgery has done much to assist in the "toning down" of disfiguring scars. The shape of a scar will sometimes furnish evidence as to the way in which it was produced.

Scarab. Ancient gem in the form of a dung-beetle, especially *Scarabaeus* (*Ateuchus*) *sacer*. It originated in predynastic Egypt as an amulet, was made of polished or glazed stone, metal, or glazed faience, and was perforated lengthwise for suspension.

Besides unnamed forms, about 7,500 in public collections bear, engraved in intaglio upon the flat oval base, names or figures of divine, royal, official, or private persons, together with mottoes and magical formulae. By the XIIth dynasty scarabs became generally used as seals, commonly $\frac{3}{4}$ in. long, worn as pendants or mounted as signet rings. Some examples, as much as $\frac{1}{2}$ ins. long, of the XVIIIth dynasty, commemorated royal hunts. During the New Empire, heart scarabs with religious inscriptions were used as mummy pectorals. Egyptian trade carried them to Mesopotamia, W. Asia, and the countries round the Mediterranean, where Etruscan types were locally developed from Egyptian models. *See* Cylinder Seal.

Scarabaeus. Genus of dung-eating beetles, found in Europe, Asia, and Africa. They collect pellets of dung and bury them as food for themselves and their larvae. There are over 60 recognized species. *See* Beetle.

Scaramouch (It. *scaramuccia*, skirmish). Stock character in old Italian comedy. He was a braggart and a coward, usually masked, and dressed in black, and received a sound drubbing from Harlequin. An English play, *Scaramouch*, by E. Ravenscroft, was produced in

Scapula. The garment (A) as worn by Benedictine monks

Scarab. Ancient Egyptian gem

Scapula. Left, the bone from behind. The glenoid cavity for articulation with the arm bone occupies the upper and outer angle. The spine ends in the acromion process. Right, front aspect of the bone; the coracoid process comes from the upper edge

as the acromion. The anterior surface, i.e. that directed towards the thorax, is hollowed out into the subscapular fossa, to which are attached the subscapularis and serratus magnus muscles. The posterior surface is divided by the spine into an upper and lower part.

The upper part, known as the supraspinous fossa, lodges the supraspinatus muscle. The lower, or infraspinous fossa, gives attachment to the infraspinatus muscle. Two smaller muscles attached near the margin of this surface are teres minor and teres major. To the spine are attached the trapezius and the deltoid muscles. The acromion process forms the point of the shoulder, and overhangs the shoulder joint. It articulates with the clavicle or collar-bone. At the outer angle of the body is a thickened part, known as the head, the surface of which is an expanded area articulating with the humerus.

Scarabaeus beetle

Scarborough, Yorkshire. Two views of this popular North Riding holiday resort : left, North Bay swimming pool, with Castle Hill behind ; right, South Bay and harbour, seen from the esplanade

By courtesy of the Scarborough Corporation

1677, and a 20th century novel by R. Sabatini had the title Scaramouche. The term, supposed to be derived from the name of the Italian buffoon Scaramuccia (d. 1644), meant a rascal.

Scarborough. Mun. bor., fishing port, and watering-place of the N. Riding of Yorkshire, England.

It lies around two extensive bays, divided by the Castle rock, a peninsula 300 ft. high, jutting into the sea. It is 42 m. from York and 230 m. from London, and is served by rly. It consists of an old town, with a tidal harbour and fish quay, and a new town, connected by two bridges. The old town rises in terraces from the bay, and behind is Oliver's Mount (500 ft.), surmounted by a fine obelisk memorial to the fallen of the First Great War, and ringed by a motor-cycle road race circuit. Steamers go to various places. The buildings include S. Mary's church, the earliest parts of which date from the 13th century, S. Martin's, the ruins of the castle, the municipal buildings, and the museum. There are three stone piers, promenades, a marine drive, an open air theatre seating 6,000, public gardens (total area 400 acres), two large swimming pools, and many large hotels. In the grounds of the Spa, with its concert hall, are chalybeate and saline springs. A cricket festival is held every September, and international tennis and golf tournaments are held periodically.

Scarborough, the Saxon Skarðbruge, was early made a corporate town. It had 2 M.P.s 1295-1885, and one 1885-1918 ; Scarborough and Whitby is now the name of a co. constituency. A Cistercian house was founded 1198, and the castle was important. In the 17th

century the waters of Scarborough became known, and in the 19th it became a popular holiday resort. Pop. (est.) 44,000, more than doubled in the summer season.

During the First Great War Scarborough was twice shelled by the Germans. Shortly before 8 a.m. on Dec. 16, 1914, the battle cruisers Derfflinger and Von der Tann appeared and began to bombard it. Then for 30 minutes they rained shells on the front and the Grand Hotel. Some damage was done, and the casualties totalled 18 killed and over 100 wounded. On Sept. 4, 1917, a German submarine killed 3 persons. See Hartlepool, Bombardment of ; consult The History of Scarborough, ed. A. Rowntree, 1931.

Scarborough Lily (*Vallota purpurea*). Bulbous herb of the family Amaryllidaceae, native of S. Africa.

Scarborough Lily. Scarlet flowers of the S. African amaryllid
S. Leonard Bastin

The strap-shaped leaves arise direct from the large bulb, and are two or three feet in length. The flowers are borne in an umbel at the top of a straight, leafless stem, as long as the leaves. They are large, funnel-shaped, and of a rich scarlet colour.

Scarborough, EARL OF. British title held by the Lumley family since 1690. The founder of the

family was Sir Richard Lumley, an ardent royalist who was made an Irish viscount, 1628. His grandson Richard, 2nd viscount, was a staunch adherent of William III, who created him earl of Scarborough in 1690. From him the present holders of the title are directly descended. Richard, 4th earl (d. 1782), was deputy earl marshal. John, the 7th earl, was rector of Winterringham and prebendary of York. The 11th earl, Lawrence Roger (b. July 27, 1896), inherited the title in 1945 on the death of his uncle. The earls of Scarborough are related to the barons of Savile and the family of Sitwell (qq.v.).

Scarlatina. Alternative name for scarlet fever (q.v.).

Scarlatti, ALESSANDRO (1659-1725). Italian composer. He was born at Trapani, Sicily ; his early years are obscure, but his first known opera, *L'Errore Innocente*, was produced in Rome, 1679. A protégé of Christina of Sweden, he became master

Alessandro Scarlatti, Italian composer

of the court music at Naples, 1684, returned to Rome, 1702, and again to Naples, 1713, where he enjoyed great success, and where he died, Oct. 24, 1725. He was a prolific composer, writing over 100 operas, many of which have been lost. Notable among the survivors are *La Rosaura*, 1690, *Pirro e Demetrio*, 1694, *Mitridate Eupatore*, 1707, *Tigrane*, 1715, and *Griselda*, 1721. He wrote also some 500 chamber-cantatas, and some fine church music, including 200 masses, also 10 oratorios and a large number of motets, madrigals, etc.

His freshness of melody and clear sense of structure are re-

markable, and his influence on Italian, and especially Neapolitan, musical development was of great importance. His son Domenico (1685-1757) was a harpsichordist, and an able composer. *Consult* Alessandro Scarlatti, Dent, 1905.

Scarlet (Pers. *sagalat*, cloth). Word used for a bright red colour, so named because the cloth was frequently dyed scarlet. It is the colour used for the hats of cardinals and for various academic robes and hoods. The scarlet woman of Rev. 17 has been associated by extreme Protestants with the papacy.

Scarlet dyes are now usually aniline dyes, also known as azo-colours, as they contain one or more azo-groups (N:N), linking together aromatic radicles. Many of them are used in dyeing various fabrics or colouring varnishes. *See* Dyes.

Scarlet Fever. Acute infectious disease. The micro-organism presumably responsible was identified in 1923, when it was shown that the disease is a local infection of the throat by a specific streptococcus. The affection occurs in all parts of the globe, and some cases are always present in large towns. Epidemics of varying severity arise from time to time, 90 p.c. of the cases occurring in children under 10 years of age. Popular opinion credits infection to the small particles of the cuticle which are shed in the peeling stage, but this is certainly true only of early peeling.

The incubation period is from one to seven days, oftenest two to four. The onset is generally sudden, with vomiting, rapid rise of temperature, which may reach 104° or 105°, and, not infrequently, convulsions. The throat is dry, the tongue furred, the face flushed, and the skin dry and hot. Usually on the second day a rash, in the form of scattered red spots, appears, and spreads rapidly until it involves the entire skin, giving it a vivid scarlet hue. After two or three days it begins to fade and becomes of a darker colour, and as a rule has disappeared by the seventh or eighth day. The tongue is at first red at the tip, and furred in the centre, the red papillae, showing through the white fur, giving it the characteristic appearance known as strawberry tongue. The throat is generally uninfamed and the tonsils swollen, and in some cases the pharyngeal symptoms are severe. The fever gradually subsides with the disappearance of the rash. The

cuticle, or surface layer of the skin, is then shed in small flakes.

Besides the ordinary form of the disease, there is a variety—malignant scarlet fever—in which the toxic symptoms are very severe, and high fever, headache, and delirium may terminate in death within 24 to 48 hours of the appearance of the symptoms. Occasionally in a toxic form there may be haemorrhages into the skin, bleeding from the nose, and blood in the urine. In another variety—the anginose form—the throat symptoms are exceptionally severe.

Wherever possible, the patient should be sent to an isolation hospital. If treatment is undertaken at home, unaffected children in the house should be sent away, and the patient isolated. Careful nursing is important. Concentrated anti-toxin should be administered at once, and is the essential treatment. In the haemorrhagic form blood transfusion may be required. With high fever, sponging with tepid water or a cold pack may be necessary. When desquamation begins, the skin should be well rubbed every day with carbolised vaseline. The patient should not be permitted to come in contact with his fellows for a least eight weeks, and not then if discharge from ear or nose persists, which it may do for a long period, rendering the victim a "carrier."

Scarlet Letter, THE. Novel by Nathaniel Hawthorne published in 1850. The earliest novel produced in America to take a position among the classics of fiction, it is an intensely powerful study of diverse characters in the 17th century New England. The principal character is Hester Prynne, condemned to wear on the bosom of her gown the scarlet letter A, as an adulteress.

Scarlet Pimpernel, THE. Romantic novel by Baroness Orczy (*q.v.*). First published 1905, at the author's risk, after its rejection by 12 publishers, it was the fore-runner of many sequels over the next 30 years. A dramatic version of the story, written in collaboration with the author's husband, was produced by Fred Terry and Julia Neilson at the New Theatre, London, Jan. 5, 1905. The play brought success to the book. It remained permanently the leading play in Fred Terry's repertoire, and he toured in it for many years. It was revived in London seven times between 1907 and 1929. A notable film version, 1936, had

Leslie Howard in the leading part. Other screen *Scarlet Pimpernel*s have been Barry K. Barnes and David Niven. The story, laid in the French Revolution period, is of an English aristocrat, Sir Percy Blakeney, who as the *Scarlet Pimpernel* heads a small group who set themselves at great personal peril to rescue French aristocrats from the guillotine. Sequels include *I Will Repay*, 1906; *The Elusive Pimpernel*, 1907; *El Dorado*, 1913; *Lord Tony's Wife*, 1917; *The League of the S. P.*, 1919; *The Triumph of the S. P.*, 1922; *Sir Percy Hits Back*, 1927; *Adventures of the S. P.*, 1929; *The Way of the S. P.*, 1933.

Scarlett, SIR JAMES YORKE (1799-1871). British soldier. A son of the 1st Baron Abinger, he was educated at Eton and Trinity College, Cambridge. In 1818 he entered the army, rising to the command of the 5th Dragoon Guards. Scarlett is chiefly known as the leader of the heavy brigade at Balaclava. In 1855 he was knighted, and, having held a post at Aldershot, he was adjutant-general of the army, 1860-65, and commander at Aldershot, 1865-70. Scarlett was M.P. for Guildford from 1836 to 1841. He died in December, 1871.

Scarpa, ANTONIO (1747-1832). Italian anatomist. Born at Motta, near Treviso, June 13, 1747, he was educated at Padua and Bologna, and became professor of anatomy, at Medina, 1772, at Pavia, 1783, and in 1814 director of the medical faculty at Pavia. He made special studies of the ear, nose, eye, and heart. He demonstrated that the latter is supplied with nerves, and that arteriosclerosis is a lesion of the inner coats of the arteries. Scarpa became internationally famous as a clinical surgeon, and died at Pavia, Oct. 31, 1832.

Scarpanto or **KERKE.** Greek island of the Aegean. Lying S.W. of Rhodes, its length is 30 m. and its greatest width 8 m. The interior is mountainous, peaks rising to 4,000 ft. Aperi is the chief town. Its Greek name is Carpathos (*q.v.*).

Scarpe. River of France. It rises a few miles E. of St. Pol, in the dept. of Pas-de-Calais, flows E., and is joined by the Deule some miles W. of Arras. Thence canalised, it flows in a N.E. direction past Douai, and joins the Schelde near the Belgian frontier just N. of St. Amand.

In the First Great War the fifth battle of Arras (*q.v.*) consisted of

two distinct parts: the first, the British advance N. and S. of the Scarpe which made possible the second, the operation known as the storming of the Drocourt-Quéant line. The former is often described as a separate battle, known as the Scarpe, and this is the official British nomenclature.

Scarron, PAUL (1610-60). French author. A Parisian, he was ordained priest, spent his

Paul Scarron,
French author

youth in dissipation, and about 1637 was attacked by a terrible disease which left him a helpless cripple; but he bore his sufferings with unflinching gaiety and courage, made his house a centre for writers and wits, and in his last eight years was carefully tended by his young wife, afterwards Madame de Maintenon. Though his humour found scope in farical comedy, e.g. *Jodelet*, 1645, it mainly took the form of burlesque, as in his best known work, *Le Roman Comique*, 1651-57, written in reaction against the aristocratic romances of the salons. Scarron died Oct. 7, 1660.

Bibliography. Works, 10 vols., 1737; S. et le Genre Burlesque, P. Morillot, 1888; The Comical Romance, T. Brown and others, with biography by J. J. Jusserand, 2 vols., 1892; S. et son milieu, E. Magne, 1905.

Scattery. Island of co. Clare, Eire. It is in the estuary of the Shannon, 3 m. S.W. of Kiltrush. S. Senan founded a monastery here in the 6th century, and there are ruins of six churches, a round tower, and a holy well. On the S. point is a lighthouse.

Scaup Duck (*Nyroca marila*). Wild duck, winter migrant to Great Britain. The plumage is glossy black on the head, neck, and back, brown on the wings and tail, and white beneath in the male; the female being more soberly garbed in brown, grey, and white. The bird is common around the coasts and at the mouths of rivers in winter.

Scaurus, MARCUS AEMILIUS (163-c. 89 B.C.). Roman politician. In the war with Jugurtha he was bribed to conclude a peace favourable to that monarch, but escaped condemnation by securing his own nomination to the commission of inquiry. During his censorship in 109 B.C. he began the

Aemilian Way (q.v.). His son of the same name was accused of extortion in Sardinia in 55 B.C., but was acquitted.

Scavage. Name of a tax or duty formerly collected by various cities and towns of England on all goods displayed for sale within their boundaries. The word is derived from O.F. *escauver*, to inspect, and an alternative form was shewage. Scavage was prohibited by Henry VII. A scavenger was originally the official who collected it.

Scenario (It.). Sketch of the libretto and general plan of an opera (q.v.); also the written text of a cinema film.

Scene (Gr. *skênē*, Lat. *scaena*, covered place, stage). In drama, a subdivision of an act in a play. The term is also applied to the setting of an episode in a story; and to a public demonstration of feeling. Before the introduction of the drop curtain and scenery as adjuncts to a theatre, a change of scene was indicated by the use of screened recesses at the rear of the stage, by the text, or by the exit or entrance of a leading character. Modern spectacular plays may contain many scenes to each act; but the general tendency is to reduce the number of scenes to a minimum. See Act; Drama.

Scenes of Clerical Life. Three stories by George Eliot which, after appearing in Blackwood's Magazine, were published under this title in 1858. They are *The Sad Fortunes of the Rev. Amos Barton*, *Mr. Gilfil's Love Story*, and *Janet's Repentance*. These stories were George Eliot's first essays in fiction, and their skilful technique and deep human interest immediately established her reputation.

Scent (M.E. *sentend*, from Lat. *sentio*, I perceive). In the sense of a fragrant liquid concoction, this is described in the article *Perfume*. Botanically, scent is an odour possessed by the essen-

tial or volatile oils of plants. The trail of smell by which dogs and other animals keep track of their quarry is also known as scent.

Scepticism (Gr. *skepesthai*, to consider, doubt). In general, the tendency to doubt, the reservation of judgement as to the truth of things commonly regarded as certain. Among the ancient Greeks the first impulse to scepticism was given by the Sophists (q.v.), but it was first systematised by Pyrrho (c. 365-275 B.C.) of Elis, after whom it has been called Pyrrhonism, and his followers Pyrrhonists. He declared that it was impossible to acquire certain knowledge.

The doctrines of the Sceptics are expounded in the works of Sextus Empiricus (3rd century A.D.). The chief arguments against dogmatism are: the uncertainty of sense-data, which are affected by circumstances and the individual; the discrepancy of opinion regarding the same object, which excludes certainty of proof; principles are uncertain, since the facts on which they are based are uncertain; all *a priori* reasoning is fallacious. In modern times scepticism was revived by Montaigne, Bayle, and Hume: its extreme result is seen in the French materialism of the 18th century. See Freethought; Rationalism.

Sceptre (Gr. *skeptron*, staff). Staff used as an emblem of authority, especially of sovereignty. It is seen among Egyptian hieroglyphics, tipped by the lotus, the papyrus flower, or other emblem. In Homer it is the staff of an old man, but the use of a rod for chastisement may be one source of the symbol. An oath sworn by the sceptre is of special solemnity in the Iliad. The Roman sceptre, probably of Etruscan origin, was borne by the kings. On certain occasions, consuls, and generals, at the celebration of their triumphs, carried ivory sceptres, from which the marshal's baton may be derived.

In medieval Europe sceptres were surmounted by globes, crosses, lilies, or eagles. In the British regalia there are three sceptres, all used in coronation ceremonies: S. Edward's staff, a long gold rod, shod with a steel spike and bearing a mound with cross; the sceptre with dove, an elaborately wrought gold staff surmounted by a dove with open wings; and a more slender staff surmounted by a globe and cross. The first two sceptres were made for Charles II. See Regalia; Staff. *Prom. septer.*

Scaup Duck. A migrant to Britain

Schacht (HORACE GREELY) HJALMAR (b. 1877). German economist and politician. He was

Hjalmar Schacht,
German economist

born Jan. 22, 1877, at Ting-leff, Slesvig. After studying economics, he entered the Dresdner bank. During 1908-15 he was its deputy director; and in 1914-15 became also head of the Belgian issuing bank. From 1916 to 1923 he was the head of a huge combination of German banking companies, and then was appointed Reich high commissioner of currency. In this post he succeeded in re-establishing a stable currency after the post-war inflation. He was then made governor of the Reichsbank, gaining prestige abroad as well as at home as a financial genius. Disagreeing with the govt., he resigned and got into contact with Hitler. Again governor of the Reichsbank, he participated in the London economic conference of 1933 and became minister of economics in 1934. He then inaugurated a financial and economic policy which, by exploiting the property of Jewish and other refugees, and by enforcing barter deals upon smaller countries, made possible big armament schemes and eventually war. In 1937, however, Hitler found Schacht's policy too "orthodox" and forced him to resign from the bank and his ministerial post. He remained a minister without portfolio but, disagreeing with some aspects of the Nazi regime, was put into a concentration camp after the July, 1944, plot against Hitler. Liberated by the Allies, he was indicted as one of the chief war criminals at Nuremberg. Acquitted there, he also successfully appealed against the sentences of German denazification courts. He pub. *Account Settled*, 1950.

Schaff, PHILIP (1819-93). Swiss-born American divine. Born at Coire, Jan. 1, 1819, and educated at Tübingen, Halle, and Berlin, he went to America in 1843 to join the staff of the German reformed theological seminary at Mercersburg, Pa. He was professor in the union theological seminary at New York from 1869 until his death, and in 1870 he formed the American committee which assisted in the revision of the Bible, acting as its president from 1871 onwards. He died Oct. 20, 1893.

Schaff wrote and edited works including an exhaustive Study of the Creeds of Christendom.

Schaffhausen. A canton of Switzerland. It occupies the northernmost part of Switzerland, N. of the Rhine, and comprises three portions separated from each other by German territory. The N. and E. are mountainous. Numerous streams drain to the Rhine through fertile valleys such as the Klettgau. Forests

Schaffhausen, Switzerland. Falls of the Rhine, two miles below the city. Top, square in the old part of the city

clothe the uplands. The canton joined the Swiss Confederation in 1501; local affairs are controlled by elective legislature and executive councils. Its area is 114 sq. m. The pop. numbers about 53,000, most of which consists of German-speaking Protestants.

Schaffhausen. City of Switzerland, capital of the canton of the same name. It stands on the right bank of the Rhine, 25 m. N. of Zürich, and nearly 1,300 ft. above sea level. Above the city is the dominating tower of Munot, a 16th century building with a splendid terrace; to the W. of it is the Fasnstaub promenade. Within the city the chief edifices are the 12th century Romanesque basilica, once an abbey church, the 17th century town hall, and the museum containing the bell which is said to have inspired Schiller's Song of the Bell. Thirty-seven people were killed when, April 1, 1944, the city was bombed in error by the Americans. The U.S.A. made substantial payment in

reparation, a first instalment of \$1,000,000 being paid within ten days. Pop. 21,118.

Schamir. In Oriental legend, a creature no bigger than a barley-corn, which nothing could resist

It is said to have been employed by Solomon in shaping the stones for the building of the Temple, for which he was forbidden to use metal instruments.

Scharlieb, DAME MARY DACOMB (1845-1930). British surgeon. Born in London, daughter

Dame Mary Scharlieb,
British surgeon
Elliott & Fry

of William Candler Bird, she married in 1865 a Madras barrister, William Scharlieb. She received her medical education at Madras Medical College and at the Royal Free hospital for women in London, graduating M.B. in 1882. The following year she returned to India and did much valuable work among the Indian women, opening a hospital for them in Madras, and also teaching. First woman M.D. of London. 1888, M.S., 1896, she was lecturer

on obstetrics to the school of medicine for women in London, and was consulting gynaecologist to the Royal Free and the South London hospitals for women. Her interest in promoting rational sex education found expression in such books as *How to Enlighten Our Children*, 1918, and *Sexual Problems*, 1924, of which she was editor. She published *Reminiscences*, 1924. Created D.B.E. in 1926, she died Nov. 21, 1930.

Scharnhorst. The name of two German warships. The first Scharnhorst was an armoured cruiser completed in 1907. Displacing 11,600 tons on a length of 449 ft. and a beam of 71 ft., she had engines of 26,000 h.p. to give her a maximum speed of 22½ knots. She was armed with eight 8.2-in., six 6-in., and 24 smaller guns, and mounted four submerged torpedo tubes. Flagship of von Spee's squadron when he sank the British squadron at Coronel, Nov. 1, 1914, in the First Great War, she was herself sunk by Sturdee's squadron at the battle of the Falkland Islands, Dec. 8, 1914.

Laid down at Wilhelmshaven and completed in 1939, the second Scharnhorst was a battleship displacing 26,000 tons on a length of 741 ft. and a beam of 98 ft. She was powered by geared turbines developing 35,000 h.p. to give a maximum speed of 27 knots. Her armament comprised nine 11-in., twelve 5.9-in., fourteen 4.1-in., and sixteen 37-mm. guns. She carried four aircraft launched by catapult and had a complement of 1,461 officers and men.

On Nov. 23, 1939, the Scharnhorst fought the first important naval engagement of the Second Great War when she sank the British merchant cruiser *Rawalpindi* (*q.v.*). She later took part in the German invasion of Norway in April, 1940. On June 13, 1940, she was bombed by the Fleet Air Arm, and a week later damaged by torpedoes from the British submarine *Clyde*. Towed into Kiel for repairs, she was there attacked by Coastal Command aircraft on July 2 and set on fire. Again repaired, she put to sea early in 1941 against Allied shipping in the Atlantic.

With the *Gneisenau* she docked for refit at Brest, but was so persistently bombed by the R.A.F. that she was moved to La Pallice, where she was again attacked and so seriously damaged that she had to return to Brest for major repairs. On Feb. 12, 1942, the *Gneisenau* and *Scharnhorst* cleared Brest and, despite British air and

sea attack in the Channel (*see Gneisenau*), reached Kiel, where she was further bombed by the R.A.F. Repaired once more, she sought refuge in Altenfjord in N. Norway, only to be repeatedly bombed by the R.A.F.

Again made fit for action, she put to sea on Dec. 26, 1943, to attack a British convoy bound for Russia. Within a few hours she was intercepted by the cruisers *Norfolk*, *Belfast*, and *Sheffield*, and forced under the 14-in. guns of the battleship *Duke of York*, which scored an underwater hit. This reduced her speed, and she was sunk by a torpedo from the cruiser *Jamaica*. Fewer than 50 of her crew survived.

Scharnhorst, GERHARD JOHANN DAVID VON (1755-1813). German soldier. Born in Hanover, Nov. 12,

G. J. D. von Scharnhorst, German soldier

1755, he first saw service with the Hanoverian contingent in the Low Countries, 1793-95. In 1801 he entered the Prussian service and fought with great distinction against the French during 1806-07. The disasters of that campaign having revealed grave defects in the military system of Prussia, a commission of reorganization was appointed with Scharnhorst at the head. As a result of the reforms due to this commission, notably the introduction of universal military service, Prussia was able to make a vastly more effective fight against the French in the next war, the turning point in which was the victory over Napoleon at Leipzig in 1813. Scharnhorst received a wound at the battle of Lützen, from the effects of which he died at Prague, June 28, 1813.

Schässburg. Former German name of the Transylvanian town Sighisoara (*q.v.*).

Schaumburg-Lippe. Former republic of N.W. Germany. Surrounded by the Prussian prov. of Hanover, its area was 131 sq. m. and pop. about 50,000. It is hilly in the N. and flat in the S. Agriculture is carried on and coal mined. Bückeburg was the capital; Stadthagen the only other town. It originally belonged to the dukes of Schaumburg, and before 1918 was a principality governed by a prince assisted by a Landtag. It sent one member to

the Reichstag and one to the Bundesrat. After the revolution of 1918 the constitution of March, 1919, continued the existing Landtag of 15 members. Schaumburg-Lippe originated as an offshoot of the principality of Lippe, which in 1813 was divided into three portions for the three sons of its ruler. The last ruling prince was Adolf, a nephew of the last kaiser. After the Second Great War, it lay in the British zone of occupation.

Scheduled Castes. Official designation for certain sections of the Hindu pop. of India, also called Depressed Classes (*q.v.*).

Scheele, KARL WILHELM (1742-86). Swedish chemist. Born at Stralsund, Dec. 19, 1742, he was apprenticed to an apothecary named Bauch at Gothenburg, and afterwards acted as assistant to apothecaries in Malmö, Stockholm, Uppsala, and at Köping, where he ultimately purchased the business, and where he died, May 19, 1786.

Whilst engaged in the practice of pharmacy Scheele conducted numerous chemical investigations upon definite lines. He prepared oxygen from manganese dioxide and sulphuric acid, and afterwards from red oxide of mercury, the discovery being made independently of Priestley. The importance of his discoveries was not appreciated until later.

Scheelite. In mineralogy, calcium tungstate (CaWO_4), one of the minerals of tungsten. It varies considerably in colour from white and flesh to pink and green, often resembling feldspar, but shows a characteristic fluorescence under ultraviolet light. Scheelite is found in contact metamorphic deposits, especially where limestones have been mineralised by tungsten-bearing solutions emanating from an adjacent granite magma; it also occurs in veins and as a secondary alteration product of wolframite (*q.v.*). Scheelite is named after K. W. Scheele (*v.s.*).

Scheer, REINHARD (1863-1928). German sailor. He was born Sept. 30, 1863, and, joining the

R. Scheer, German sailor

navy, he served in the cruiser *Bismarck*, 1884-86, and in 1909-11 was chief of the staff to Von Holtzendorf when the latter commanded the High Sea Fleet. Regarded as one of the most energetic and able officers in

the German navy, he was commanding a battle squadron at Kiel when the First Great War broke out, and continued in that position until the end of 1915, when he became commander-in-chief of the High Sea Fleet. He commanded the German naval forces at Jutland (*q.v.*), with Hipper as second in command. On Aug. 11, 1918, the latter took over the chief command, when Scheer was appointed to succeed Holtzendorf as chief of the admiralty staff. He resigned in Jan., 1919. Scheer's conduct of the operations at Jutland has been the subject of some criticism. He gave his own account of the battle in Germany's High Sea Fleet in the World War, published 1920. He died Nov. 26, 1928.

Scheffel, JOSEPH VIKTOR VON (1826-86). German poet and romancer. Born at Karlsruhe,

JOSEPH VON SCHEFFEL
German poet

Born at Karlsruhe, Feb. 16, 1826, and educated at Heidelberg, Munich, and Berlin, he entered the civil service, but in 1852 abandoned it for literature. He travelled in Italy, and

there wrote *Der Trompeter von Sackingen*, 1854, a story in verse of the Thirty Years' War, Eng. trans. by F. Brunnov, 1877, and by J. Beck and L. Lorimer 1893; and *Ekkehard*, 1855, Eng. trans. by F. Delfs, 1872, a vivid prose story of the 10th century. Both works enjoyed phenomenal success. *Gaudamus*, a collection of songs and ballads, appeared in 1867 and was translated into English by Leland. 1872. He died April 9, 1886.

Scheffer, ARY (1795-1858). French painter. Born at Dordrecht, Netherlands, Feb. 10, 1795, of German extraction, he studied under his father, and in Paris under Guérin. His subject pictures, historical and religious, correct in drawing, and sincere, if sentimental, obtained an enormous vogue. Also a portrait painter, he is amply represented at Versailles. Scheffer died at Argenteuil, June 15, 1858.

Scheherazade. Character who recounted to the sultan Shahriar the stories of the Arabian Nights' Entertainments (*q.v.*). She gives her name to a symphonic suite by Rimsky-Korsakov, composed in 1888, in which a solo violin represents the narrator. This provided the score for a ballet—presented by Diaghilev in Paris, 1910. One of

the most sensational of its time. *Scheherazade* was designed by Bakst, with choreography by Fokine; the chief parts were danced by Karsavina and Nijinsky.

Scheidegg OR **SCHLDECK** Two Alpine passes in Switzerland, in the Bernese Oberland. The Great Scheidegg connects Grindelwald with Meiringen and has an alt. of 6,434 ft., it carries a mule path. The Little Scheidegg, between Grindelwald and Lauterbrunnen and 338 ft. higher, carries a mt. rly. which connects with the Eiger Glacier and Jungfrau rly.

Scheidemann, PHILIPP (1865-1939). German politician. Born at Cassel, July 26, 1865, and starting his career as a printer, he joined the Social Democratic party, editing Socialist newspapers. He entered the legislature in 1903, and in 1912, when the Socialist party was in temporary command of the Reichstag, he was elected first vice-president of the chamber. As head of the Social Democrats he came out on the side of the Kaiser at the outbreak of the First Great War. In Nov., 1918, Scheidemann was appointed secretary of state and later minister of finance. He was prime minister for a short time in 1919, resigning because he disapproved of the peace treaty. With the access of Hitler to power, he fled from Germany, and died at Copenhagen, Nov. 29, 1939.

Schelde OR **SCHLDT** (Lat. *Scaldis*, Fr. *Escaut*). River of W. Europe. It rises near Le Câtelet, Aisne dept., France, flows N. and N.E. through the dept. of Nord, and enters Belgium after passing Condé. It runs through the W. part of Hainault, which it separates from W. Flanders, traverses E. Flanders, which for a time it separates from the prov. of Antwerp, skirts the Waesland, and, after passing through Antwerp, enters the Netherlands near Doel. It then divides into two main streams. (1) the Hond or W. Schelde, which flows W. to the S. of the islands of N. and S. Beveland, entering the North Sea by a broad estuary at Flushing; (2) the E. Schelde, flowing in a N.E. direction, separating N. and S. Beveland from Tholen and Schouwen, and reaching the sea about 15 m. N. of the other estuary. The two branches are connected by the passage of Sloe.

The chief tributaries are, in France, the Sensée, Rahonelle, Haine, and Scarpe, and in Belgium the Lys, Dendre, and Rupel. Easily navigable and connected with numerous canals and canalised

tributaries, the Schelde is one of the greatest economic assets of Belgium, and one of the chief waterways of W. Europe. The chief towns on its banks are Cambrai, Valenciennes, Condé, Tournai, Oudenarde, Ghent, Termonde, and Antwerp. Total length, 250 m., of which 206 are navigable. The tide is felt up to the lock gates at Ghent.

From early times political circumstances in the Netherlands have caused difficulties in connexion with the navigation of the Schelde. The treaty of Westphalia, 1648, closed the mouth of the river to commerce between Spanish possessions and the United Provinces. In the 18th century Austria's attempts to obtain the opening of the river failed, but the treaty of Paris in 1814 opened it to all nations free of tolls. The treaty of 1830 laid down the principle of free navigation under joint Belgian and Dutch control, but left certain rights in Dutch hands which were abolished in 1863, the Netherlands receiving compensation of £750,000 from the interested powers.

When the Allied armies moved into the Low Countries after Germany invaded them in May, 1940, the Schelde became of strategic importance. It is the most westerly of three rivers flowing N. in roughly parallel lines, the others being the Dendre and Dyle. After the German break-through at Maastricht, the British were compelled on May 6 to withdraw from their positions on the Dyle, E. of Brussels, and retire on the W. bank of the Schelde. Here the line was held by seven Allied divs. with two in reserve, but rapid enveloping movements by German armour rendered the position precarious, and on May 23 it was abandoned.

After the British 2nd army failed to reach the British 1st airborne div. at Arnhem in Sept., 1944, the Allied command decided to open the Schelde estuary so that Antwerp could be used to support a general advance to the Rhine. Antwerp itself had been liberated on Sept. 4, but the Germans were still in possession of both shores of the estuary. The Canadian 1st army crossed the Belgian-Dutch frontier into Zeeland-Flanders on Sept. 16, liberating Terneuzen on the 21st; and by an amphibious night assault across the inlet called the Braakman, to the W. of Terneuzen, reached the Schelde again on either side of Hoofdplaat on Oct. 9. Breskens fell on the 22nd, after bitter street fighting, Fort Fredrik-Hendrik, key to the German positions S. of the Schelde, on

the 25th, Cadzand on the 29th, Knocke on Nov. 1, which cleared the S. bank. Farther E. Canadians captured Woensdrecht on Oct. 11, cutting the only road connecting the islands with the mainland, and began to advance into S. Beveland. British and Canadian units, landed across the Schelde in the S. of S. Beveland on Oct. 26, took in the rear the Germans opposing the Canadian advance from Woensdrecht. The two Allied groups linked on Oct. 29, liberating Goes, and next day they were in control of the whole island and were pushing on over the causeway connecting S. Beveland with Walcheren, the fighting for which (described under Walcheren) lasted until Nov. 7. Minesweeping of the Schelde estuary began on Nov. 2, and on Nov. 26 the first Allied ships started unloading in Antwerp.

Schelling, FRIEDRICH WILHELM JOSEPH (1775-1854). German philosopher. Born at Leonberg, Württemberg, Jan. 27, 1775, he studied at Tübingen and Leipzig, and became professor at Jena, 1798, later occupying chairs of philosophy at Würzburg and Munich, and from 1841 at Berlin. He died in Switzerland, Aug. 20, 1854. His philosophical views exhibit two distinct phases. In the first, starting from Fichte, he is a subjective idealist. To Schelling the *Ego* (self) is the only reality, the absolute, the universal principle which is opposed to a non-*Ego* and can be realized only by self-division and opposition. In the second, he is an objective idealist. Nature, as well as the *Ego*, has a real existence. In the first or negative phase, mind, in the second or positive phase, Nature, stands first as the subject of philosophical inquiry. Schelling's works, 14 vols., 1856-61, include *The World Soul*, 1797-99, and *System of Transcendental Idealism*, 1800.

F. W. J. Schelling,
German philosopher
After: G. Begas

Schenectady. City of New York, U.S.A., the co. seat of Schenectady co. It stands on the Mohawk river, 18 m. N.W. of Albany, and is served by rlys. and the N.Y. barge canal. Here are the principal workshops of the American Locomotive co., and the laboratories of the General Electric co. As a result of the emphasis on scientific research, 6 p.c. of the pop.

have university degrees. In the laboratories are scientific workers of all nationalities, several of whom are Nobel prize winners. Permanently settled in 1662, Schenectady became a borough in 1765 and was chartered as a city in 1798. Pop. 87,549. *Pron.* Skenek'-tady.

Scherer, EDMOND HENRI ADOLPHE (1815-89). French critic. Born in Paris, April 8, 1815, he became successively Protestant minister at Strasbourg, and professor of theology at Geneva, but devoted himself to literature after his changed religious views had compelled him to leave the Church in 1850. His *Études Critiques sur la Littérature Contemporaine* and other critical writings are marked by sound scholarship, fine taste, and a pronounced ethical bias. He died March 16, 1889. His *Essays on English Literature* were translated by G. Saintsbury in 1891. *See* Life, O. Gréard, 1890.

Scherzo (It., a jest). Term applied to a movement in a symphonic composition having a playful, humorous, or capricious character. It may be said to have developed from the Haydn Minuet and Trio—in which form it is generally written—although the term was used before his time. Beethoven found in it a congenial channel of expression for his boisterous sense of humour, and in his hands it attained a recognized importance. Later composers have also written scherzos, though often their character is light and graceful rather than humorous. The term is occasionally given to an independent composition, such as Chopin's Scherzos for the piano-forte. *Pron.* skaartso.

Scheveningen. Watering-place of the Netherlands, in the prov. of S. Holland. It lies on the North Sea coast, 3 m. N.W. of The Hague of which it is a suburb and with which it is connected by rly., tram, and the fine Old Road, laid down in 1666. It is the principal bathing resort of Holland. The herring fishery from the port is important, and fishing nets, sails, etc., are manufactured. Off Scheveningen the English defeated the Dutch under Tromp, who was killed, in 1653, and the Dutch under De Ruyter defeated the English and French in 1673. It suffered damage during the Second Great War in the course of the construction of the German Atlantic defences.

Schiaparelli, GIOVANNI VIRGINIO (1835-1910). Italian astronomer. Born at Savigliano, in Piedmont, March 14, 1835, he was educated at Turin university,

Berlin, and Pulkova. He became assistant astronomer at Milan, 1859, and director 1862, a post he held until his retirement in 1900. He was awarded the Lalande prize of the French Academy, 1868, for his work on the connexion between comets and meteor showers. Schiaparelli is best known, however, for his discovery of the so-called canals of Mars, a discovery announced by him in 1877, and a subject of controversy among astronomers for many years. He died at Milan, July 4, 1910. *See* Mars; Mercury; *Pron.* Skyapparell'y.

Schicklgrüber. Original name of the father of Adolf Hitler (*q.v.*).

Schick Test. Test for determining susceptibility to diphtheria. Schick test toxin is obtained from the diluted filtrate of a mixture of *Corynebacterium diphtheriae*. A small amount of the toxin is injected between the layers of the skin, and an area of redness appearing in 24 to 48 hrs. indicates a positive reaction, i.e. insufficient diphtheria antitoxin in the patient's blood to render him immune to the disease. It is thus possible to determine if immunisation is required, or if a second injection of immunising serum is necessary.

Schiedam. Town of the Netherlands, in the prov. of S. Holland. It lies on the Schie, a tributary of the Maas, 3 m. by rly. W. of Rotterdam, and is the junction for the Hook of Holland and the Delt-The Hague rly. lines. The chief industry is the distilling of gin (Holland). Candles are also made and there is a large dry-dock. Pop. 62,624.

Schiehallion. Mountain of Perthshire, Scotland. It is 11 m. W.N.W. of Aberfeldy, and rises in a shapely cone to 3,547 ft. The ascent is straightforward. Here in 1774 Nevil Maskelyne conducted

Schiehallion, Scotland. The Perthshire mountain, from the north-west. In the foreground is Kinloch Rannoch

his experiments in determining the earth's mean density. *Pron.* Sheh'-ion.

Schiller. In mineralogy, term applied to a nearly metallic lustre shown by certain mineral surfaces, as in hypersthene, etc., caused by the interference of light reflected from thin plates of minute mineral inclusions within the host crystal.

Schiller, JOHANN CHRISTOPH FRIEDRICH VON (1759-1805). German poet and dramatist. He was born at Marbach in Württemberg, Nov. 10, 1759. His father was an army surgeon, and the boy's childhood was spent in several small Württemberg towns. Ultimately the family settled in Ludwigsburg, where, in 1773, the duke Karl Eugen of Württemberg claimed Schiller as a pupil of his newly established military school. The young poet was in the first instance educated as a jurist, but exchanged law for medicine as the lesser of two evils, and in 1780 began practice as an army surgeon in Stuttgart. In the following year his first play *Die Räuber* (The Robbers), which had been composed surreptitiously at school, was published, and shortly afterwards produced at Mannheim.

Its success was extraordinary, and Schiller decided to devote himself to literature; he fled from Stuttgart, and in the following years, amidst disheartening privations, completed two other plays, *Fiesco*, 1783, and *Kabale und Liebe* (Love and Intrigue), 1784, both, like the first, in prose. With these three plays Schiller established himself in the first rank. At Dresden and Loschwitz, Schiller completed *Don Carlos*, 1787, his first drama in classical form.

Through Goethe's agency he was appointed to an unsalaried professorship in the university of Jena, and in 1790 he married Charlotte von Lengefeld. For several years he abandoned dramatic poetry in order to study history and subsequently aesthetics. In 1788 he published the first volume of a *History of the Revolt of the Netherlands*, and in 1791 a popular *History of the Thirty Years' War*; while in the field of aesthetics his chief writings are the brilliant *Letters on the Aesthetic Education of Man*, 1795, and *On Naive and Sentimental Poetry*, 1796.

In 1799 Schiller again turned to dramatic poetry with *Wallenstein*, a powerful historical tragedy in three parts. This was followed by a series of dramas displaying an interesting variety both in the nature of their subjects and in the method

After A. Tischbein

of treatment. *Maria Stuart*, 1800, presents with insight the psychological conflict of Mary Stuart's last days; *Die Jungfrau von Orleans* (The Maid of Orleans), 1801, frankly described as a "romantic" tragedy, redeems France's most romantic heroine from the obloquy of Voltaire's treatment of her; *Die Braut von Messina*, 1803, a tragedy in classic form, even to the extent of being provided with choruses, contains some of Schiller's finest poetry; while in his last work, *Wilhelm Tell*, 1804, he produced a drama of panoramic breadth, filled with the new spirit of political liberty set free by the French Revolution.

From 1794 onwards Schiller enjoyed the intimate friendship of Goethe, which stimulated not merely his dramatic work, but also his wonderful series of ballads. The most familiar of these are *Der Taucher* (The Diver), *Der Handschuh* (The Glove), *Der Ring des Polykrates*, *Die Kraniche des Ibykus*, *Der Gang nach dem Eisenhammer*, *Der Kampf mit dem Drachen*, and *Das Lied von der Glocke* (The Song of the Bell). In poems again like *Die Kunstler*, *Der Spaziergang*, *Das Ideal und das Leben*, *Die Gotter Griechenlands*, Schiller clothed his philosophic ideas in lyric form. From 1799 till his death, May 9, 1805, he resided in Weimar.

Schiller is Germany's greatest dramatist, and by the Germans themselves is considered in a peculiar sense their national poet. The judgement of foreign lands has not, however, endorsed the high claims which his own countrymen make for his plays. His mastery of dramatic construction, the vitality

of his character-drawing, and his noble blank verse assure him the foremost place; his personal and political idealism forms a fitting close to a century that was dominated by the ideals of Enlightenment. *See Germany: Language and Literature. Pron.* Shiller.

J. G. Robertson

Bibliography. Works, 15 vols., ed. K. Goedeke, 1880-84; Eng. ed. Bohn's Library, 1846-49; Letters, 7 vols., ed. F. Jonas, 1892-96; Lives (in German), H. Duntzer, 1881, eng. trans. 1883; J. Minor, 2 vols., 1890; O. Harnack, 2nd ed. 1905; K. Berger, 2 vols., 1905-09; (in English) H. W. Nevins, 1889; T. Carlyle, new ed. 1899; C. Thomas, 1901; P. Carus, 1905; Schiller after a Century, J. G. Robertson, 1905; Schiller's Dramas and Poems in England, T. Rea, 1906; Schiller's Wallenstein in Eng. verse, A. F. Murison, 1931; The Prestige of Schiller in England, 1788-1859, F. Ewen, 1932.

Schipperke (Flem., little skipper). Small tailless dog. It is bred in Belgium, where it is kept as a watch dog on barges. It is black in colour, with upstand-

Schipperke. Esme of Greta, a champion of this Belgian breed

ing ears and a small ruff round the neck. It is of the same group as the Pomeranian and Eskimo dogs. It was introduced to Great Britain about 1880.

Schirach, BALDUR VON (b. 1907). German politician. He was born May 9, 1907, at Weimar, received a public school education and studied literature at Munich after joining the Nazi party in 1924. In 1928 he was appointed leader of the Nazi students' organization, and in 1930 was made head of the Nazi youth associations. In 1932 he became fuhrer of Hitler youth. Subsequently he entered the Reichstag and played an active part in the systematic anti-Christian movement among German youth, as well as in the party cabinet. He did some journalism, and wrote third-rate propaganda verse. In 1940, after serving in the army, von Schirach

was appointed Gauleiter of Vienna. His actions in this office brought him before the Allied war crimes tribunal at Nuremberg where he confessed to increasing doubts of Hitler and Nazi policy; he was sent to prison for 20 years.

Schism (Gr. *schisma* a rent, split). Theological term applied usually to a rupture or division in the Christian Church. Strictly speaking, it is only applicable to a revolt against the recognized ecclesiastical authority or a departure from the historic teaching or order of the Church. The great schism between the East and the West took place in 1054, when Pope Leo IX excommunicated the whole Eastern Church, the chief point of disension being the rejection by the Oriental churches of the doctrine of the Procession of the Holy Ghost from the Father and the Son. What is known as the Great Schism in the Roman Church existed from 1378 till 1417, having taken place at the election of a successor to Pope Gregory XI. From the point of view of the R.C. Church, all bodies of Christians who do not acknowledge the supremacy of the pope are in a state of schism. See Great Schism; Reformation. Pron. sizm.

Schist (Gr. *skhistos*, split). In geology, name given to metamorphic rocks of a fissile character. Such rocks consist of thin films or plates of such minerals as mica, or a fibrous one like tourmaline, tremolite, running through the main structure. Schistose rocks are highly crystalline, and the rocks are known as mica-schist, chlorite-schist, hornblende-schist etc., according to the characteristic mineral present. They are found in regions where there have been mountain-building movements, such as Scotland, Scandinavia, the Alps. See Metamorphic Rocks. Pron. shist.

Schizanthus. Genus of annual herbs of the family Solanaceae. They are natives of Chile. See Butterfly-flower. Pron. sky-zanthus.

Schizocarp. In botany, a dry fruit which splits either longitudinally or transversely into one-seeded portions. See Fruit.

Schizomycetes (Gr. *skhizein*, to split; *mykēs*, mushroom). Class of microscopic plants better known as bacteria. See Bacteriology.

Schizophrenia (Gr. *skhizein*, to split; *phrēn*, mind). Term coined by Eugen Bleuler, a Swiss psychologist, for a mental disorder (*q.v.*) characterised by detachment from the world without, and abnormal psychological reactions within.

The condition generally manifests itself in youth, some strain often bringing into the open a flaw already present in the mental structure. Heredity appears to have no part in the disorder, for which "shock" methods, *e.g.* administration of insulin, and frontal leucotomy (surgical separation of the forebrain), offer no remedy. The eccentric, withdrawn, difficult personality is more liable to fade into the condition, less likely to be restored to mental balance. The brain cells of schizophrenics examined after death exhibit no abnormality. Pron. skits-o-freen-ya. See Mental Disorder.

Schlegel, AUGUST WILHELM VON (1767-1845). German critic and Orientalist. He was born at Hanover, Sept. 8, 1767. Having studied theology at Göttingen, he abandoned it, and in 1798 became professor of literature and art at Jena. During 1801-04 he was lecturer at Berlin. He was secretary to the crown prince of Sweden, 1813-14, and from 1818 until his death, May 12, 1845, he was professor at Bonn. Translations of Shakespeare's plays, completed by Tieck, served to establish Shakespeare's renown in Germany, and form Schlegel's title to fame. Pron. Shlaygel.

Schlegel, CARL WILHELM FRIEDRICH VON (1772-1829). German literary critic and historian. He was born at Hanover, March 10, 1772, brother of A. W. von Schlegel, and studied at Göttingen and Leipzig. A passionate love affair suggested Lu-

Friedrich v. Schlegel,
German critic

comde, 1799, a novel which was never completed, but gained notoriety for its unconventionality. Later Schlegel collaborated at Jena with his brother in *Das Athenäum*, a journal devoted to the interests of romanticism, and wrote in it his brilliant *Fragmente*, descriptive of the Romantic doctrine, of which he was the foremost exponent. He joined the R.C. church and entered the Austrian public service. He died at Dresden, Jan. 11, 1829. Schlegel's greatest contribution to letters is *Ueber die Sprache und Weisheit der Indier* (*Language and Wisdom of the Indians*), 1808, written after five years' study of Sanskrit. It formed the groundwork for the study of Indian philology.

Schleicher, KURT VON (1882-1934). German politician. Born at Brandenburg, April 7, 1882, he joined the army in 1900, held staff posts during the First Great War, and in 1918 organized an anti-Communist volunteer corps. Head of the war ministry 1929, he was thought to have helped in engineering the fall of Brüning in 1932. He retired from the army to become defence minister under Papen. Hindenburg appointed Schleicher chancellor on Dec. 2, 1932, but his failure to reconcile the parties of Hitler and Papen led to his resignation within two months. In the "blood bath" of June 30, 1934, Schleicher and his wife were shot dead by the Nazis. Pron. Shly-her.

Schleiermacher, FRIEDRICH ERNST DANIEL (1768-1834). German theologian and philosopher.

F. Schleiermacher,
German theologian

He was born at Breslau, Nov. 21, 1768, and educated at Halle, where he became a professor in 1804. He took a prominent part with Fichte in founding the university of Berlin, where he was appointed professor of theology in 1810. He died Feb. 12, 1834. The great task of his life was an attempt at a reconstruction of theology, in which the systems of Spinoza, Kant, and Christianity should be reconciled. With him all knowledge is provisional, and any dogmatic statement taken literally becomes a myth. Even the personality of God is nothing more than a symbol. With him the good and the reasonable are identical. His chief work was *Ueber die Religion*, 1799. Pron. Shly-er-mah-her.

Schlestadt (Ger. *Schlettstadt*). Town of France, in the dept. of Bas-Rhin. It lies on the river Ill, 21½ m. by rly S.S.W. of Strasbourg, and is a rly. junction. There are industries in metal-working—notably wire gauze—soap, brewing, and hosiery, and a considerable trade in local vine and agricultural products. The Tour de l'Horloge is a massive tower, part of the old fortification, and the church of St. George, 12th-15th centuries, and of Sainte-Foi, founded in the 11th century, are noteworthy. Schlestadt was a royal fief in Merovingian times, and became a free city of the empire under the Hohenstaufens. Taken by the French in 1634, it was fortified by Vauban

in 1676, and, captured by the Prussians, Oct. 24, 1870, remained in German possession until 1918, its fortifications being demolished in 1872. Pop. est. 11,000.

Schleswig. Details of this German prov. will be found under its Danish spelling of Slesvig.

Schley, WINFIELD SCOTT (1839-1911). American sailor. Born at Richfields, Maryland, Oct. 9, 1839, he served in the Federal navy during the Civil War. In the Arctic, 1884, he rescued Greely near Cape Sabine. In 1898 he commanded the flying squadron and played a prominent part in the battle of Santiago de Cuba. Rear-admiral the same year, he was appointed c.-in-c. of the S. Atlantic station, and retired in 1901. He died Oct. 2, 1911. *Pron. Sly.*

Schlieffen, ALFRED, COUNT VON (1833-1913). German soldier. Born in Berlin, Feb. 28, 1833, he fought in the Prussian armies in the wars of 1866 and 1870, and served as chief of general staff from 1891 to 1907. While in that post he worked out what became known as the Schlieffen plan, which set out the strategy by which Germany should be enabled to win a European war. On the E. front it produced the victory of Tannenberg and the campaigns around Lodz and Warsaw. On the W. front, however, his conception of a wide encircling movement, leading to an attack on Paris from the rear, was modified and so did not attain its full effect. Schlieffen died Jan. 4, 1913, and so did not live to see his plan put into partial effect.

Schliemann, HEINRICH (1822-90). German archaeologist. Born at Neu-Buckow, Mecklenburg-Schwerin, Jan. 6, 1822, he spent some years in commerce, establishing himself in St. Petersburg, 1846, where he amassed a fortune during the Crimean War, having previously become a citizen of the U.S.A., 1850. Acquiring several European languages and ancient Greek, he settled in Athens, 1868, and devoted himself to digging ancient sites, thereby revealing a long-forgotten Aegean civilization. The treasure he unearthed at Hissarlik, 1870-73 (described in Troy and its Remains, 1875) was retained and sent to Berlin. That found at Mycenae, 1876, went to Athens. He subsequently dug Orchomenos, 1881-82, and Tiryns, 1884-85. He died at Naples, Dec. 26, 1890. *Pron. Shloemahn.*

Schlier. In geology, name given to deposits of blue-grey clay in Hungary and parts of S. Europe

Schlestadt, France. Tower of the church of S. George

A subdivision of the Miocene, the schlier is an important source of salt and gypsum. *Pron. Shleer.*

Schlippe's Salt. Sodium thioantimonate or sulphantimonate. It is prepared by dissolving antimony trisulphide, sulphur, and caustic soda in the requisite quantity of water and crystallising the salt which is formed. Schlippe's salt appears in the form of yellowish crystals and is employed in photography.

Schlüsselburg. Town of the R.S.F.S.R. It is 20 m. E. of Leningrad, and stands on the Neva, where it issues from Lake Ladoga. Under the name of Oryeshkek (little nut) it was originally founded as a defence against the Swedes, by whom it was captured in 1308, and renamed Noteburg (nut-town). In 1702 Peter the Great recaptured it. The old fortress is now used as a prison. On Sept. 7, 1941, German forces captured Schlussselburg, thereby cutting off Leningrad from land communication with the rest of Russia. The town was recaptured by the Russians in Jan., 1943. Pop. est. 8,000. *See Leningrad, Siege of.*

Schmalkalden. Town of E. Germany, in Thuringia, before 1945 in Prussia. It stands on the river Schmalkalde, in a valley of the Thuringian Forest, 45 m. S.E. of Cassel. It has important saline springs, and there are manufactures of steel and iron. In the Rathaus the articles of the League of Schmalkalden (*v.i.*) were drawn up during 1530-31. There is a monument to Karl Wilhelm (1815-73), the composer of the Wacht am Rhein, and a native of the town. The church of S. George

(1450) and the town hall (1419) are also noteworthy. After the Second Great War it came within the Russian zone of occupation. Pop. (1950) 12,500.

Schmalkalden, LEAGUE OF. Alliance of the German Protestant princes and imperial cities, together with Switzerland and Denmark, Dec. 31, 1530, and Feb. 27, 1531. Under the guidance of the elector of Saxony and the landgrave of Hesse, the alliance was formed to defend the Protestants against the political oppression of Charles V. So strong was the league and so embarrassed was the emperor by foreign wars that he bowed to the league in 1532 and granted the peace of Nuremberg. Luther drew up the Articles of Schmalkalden in 1536. In 1546 Charles V outlawed, and made war on, the league, whose forces, under the elector of Saxony, were defeated at Muhlberg, April 24, 1547. This broke up the league. Its work was, however, completed by Maurice of Saxony, who secured freedom of religion to the Protestants in 1552 by the treaty of Passau (*q.v.*). *See Muhlberg.*

Schmidt, JOHANN FRIEDRICH JULIUS (1825-84). German astronomer. Born at Eutin, he entered the Hamburg observatory 1842, was appointed assistant observer at Bonn, 1846; observer at Olmutz, 1853; and director of Athens observatory, 1858, a post he held till his death. In 1876 he discovered the new star in Cygnus, Nova Cygni. Schmidt made a special study of the moon, publishing a revised chart of its physical features, 1877, and a new chart, 1878, and of variable stars.

Schmidt Plate. Correcting plate invented by B. Schmidt in 1930 for astronomical telescopes. The paraboloid mirror such as is used in an ordinary reflecting telescope will bring to a perfect focus only rays from those stars within a few minutes of arc of its axis. Star images at the edge of the field of view are drawn out into comet-like patches by a defect called coma. The Schmidt telescope has a spherical mirror (which has no unique axis) and the resultant spherical aberration (*q.v.*) is corrected by a thin, specially figured plate of glass. Good images are thus obtained up to about 7° on each side of the axis, and fast cameras can be made for direct star photography and for spectrographic work. The biggest, on Mount Palomar (*q.v.*) in California, is 48 ins. across. Industrial applications of

the device include the projection of bright undistorted images in television.

Schnabel, ARTHUR (b. 1882). Austrian pianist and composer. Born at Lipnik, April 17, 1882, he

Artur Schnabel,
Austrian pianist

studied under Leschetizky in Vienna, and gave his first concert in 1896. A virtuoso performer especially of Beethoven (almost all of whose piano works he recorded for the gramophone), he achieved world fame and made repeated tours. He taught the piano at Berlin state academy of music, 1926-31. Schnabel wrote a piano concerto, string quartets, symphonies, piano pieces, and songs; edited violin and piano sonatas by Mozart and Brahms; and published *Reflections on Music*, 1935; and *Music and the Line of Most Resistance*, 1942.

Schnapps. Name for a spirituous liquor akin to gin. The word is the German form of Dutch *snaps*, a dram. See *Gin*.

Schneeberg (Ger., snow mountain). Name of several German and Austrian mts., the highest of which, alt. 6,900 ft., 40 m. S.W. of Vienna, has a cog wheel rly. for sightseers.

Schneeberg is also a town in Saxony, 11 m. S.S.E. of Zwickau. An impressive Gothic church, S. Wolfgang, 1516-40, has paintings by Lucas Cranach the elder, and there is a restored town hall of 1527-48. From the 16th century there has been mining, originally for silver, now for cobalt, bismuth, nickel, and uranium. The town is a centre of lace making, and produces a famous snuff. Pop. 9,492.

Schneekoppe. Mt. of Germany. It is the highest point of the Riesengebirge or Giant Mts., the loftiest section of the Sudeten Mts. Height 5,260 ft.

Schneidemühl (Pol. Pila). Town of Pomerania. It was a rly. junction of some importance, 150 m. E.N.E. of Berlin, and, surrounded by large woods, had a timber industry (its German name means sawmill), engineering works, starch, brick, and glass factories. A pleasant town with pre-1939 pop. 43,180, it was damaged during the Russian advance in 1945 when, surrounded by the Russians on Feb. 1, it did not surrender until Feb. 14. It lies in the part of Germany placed under Polish rule by the Potsdam agreement.

Schneider Trophy. International trophy presented in 1913 by Jacques Schneider (1870-1928), a member of the French firm of armament makers, an engineer, and an aeronaut, to encourage improvement of the speed and seaworthiness of seaplanes. It was open to competition by seaplanes of all nations.

The trophy race was flown in laps over a triangular course, and the competing aircraft underwent an endurance test by remaining anchored in the open throughout the night before the race. By winning the contest for the third successive time in 1931, Great Britain obtained permanent possession of the trophy. The winning seaplane, the *Supermarine*, was the basis of the R.A.F. fighter aircraft the *Spitfire* (*q.v.*). See *Houston, Lady*; *Sassoon, Sir P.*

the critical negotiations in July-Aug., 1914, was based on instructions from Berlin, which left him unable to produce any plan to avoid a rupture between France and Germany. Schoen published his memoirs in 1921, and lived until April 24, 1933.

Schnörkel (Ger., spiral). Device to prolong underwater endurance of a submarine. A submerged submarine depends for its motive power upon electric motors run by accumulators. These are charged by generators driven by the Diesel engine used for surface cruising. When recharging batteries the submarine normally must surface, as a running engine would not only absorb all the air, but its exhaust would create a poisonous atmosphere. Early in 1944 the German navy introduced the *Schnörkel*, two extendable shafts projecting

SCHNEIDER TROPHY WINNERS 1913-31

Year	Winner	Aircraft	Engine	Av. speed (m.p.h.)
1913	M. Prevost (Fr.)	Deperdussin	160 h.p. Gnome	45.75
1914	C. Pixton (G.B.)	Sopwith	100 h.p. Gnome	86.8
1920	L. Bologna (It.)	Savoia	550 h.p. Ansaldo	107
1921	G. Briganti (It.)	Macchi VII	200 h.p. Fraschini	111
1922	H. Baird (G.B.)	Supermarine	450 h.p. Napier	145.7
1923	D. Rittenhouse (U.S.A.)	Curtiss	465 h.p. Curtiss	177.38

Schnitzler, ARTHUR (1862-1931). Austrian dramatist and novelist. Born in Vienna, May 15, 1862, he studied medicine and practised as a doctor there for several years. He took deep interest in literature and the stage, and made a success with his witty series of short plays of Viennese life, *Anatol*, 1893 (paraphrased for the English stage by H. Granville Barker, 1911). Other plays of Schnitzler, marked by spirited dialogue and neat technique, include *Liebelel*, 1896, Eng. trans. 1914; *Reigen*, a series of ten dramatic dialogues, 1896-97; *Der Grune Kakadu*, 1899, Eng. trans. 1913; *Lebendige Stunden*, 1902; *Fink und Fliedermaus*, 1917. His fiction includes short stories, *Die Frau des Weisen*, 1898; *Bertha Garlan*, 1900, Eng. trans. 1913, and the novel, *Fraulein Else*, 1924. He died Oct. 21, 1931.

Schoen, WILHELM EDUARD, BARON VON (1851-1933). German diplomatist. Born June 3, 1851, he entered the diplomatic service in 1877, and was minister at Copenhagen, 1900-05, at St. Petersburg, 1906, and secretary of state, foreign office, 1907-10. As ambassador to France, his conduct of

some distance above the conning tower. The lower end of one tube is attached to the air intake of the engines, drawing air from the atmosphere by an extractor fan. The end of the other tube is fixed to the engine's exhaust, carrying the exhaust gases away. The tubes make it possible for the Diesel engine to run without harm to the crew while the submarine is submerged. After the Second Great War, the *Schnörkel* became standard equipment on British submarines. See *Submarine*.

Scholar (Anglo Fr. *escoler*, modified to correspond with Lat. *scholaris*). Word used in three senses: (1) A person attending a school; (2) a student at a school or an undergraduate of a university college who is partly supported by a grant from the endowments of the school or college; (3) a person who has attained accurate knowledge, critical ability, and powers of judgement in a particular field of learning.

Scholarship. Word used principally in two senses: (1) the characteristics of the scholarly person; (2) an endowment to enable a student to pursue his studies at a school, college, or

university. During the 20th century the application of (1) has been broadened. Formerly the classical tradition was so strong that Latin and Greek were the basis of any pretension to scholarship; now claims may rest on attainments in many other branches of learning.

The provision of scholarships to schools, colleges, and universities has been greatly extended. Medieval founders of colleges at Oxford and Cambridge invariably endowed them to enable "poor and needy scholars" to study there; some colleges have been richly endowed subsequently, or have gained wealth through the appreciation of their original endowments. Most of the older public schools were endowed with scholarships, but competition for them was so keen that the attainment of an "open scholarship" denoted excellence. Scholarships are liberally provided out of government funds by the ministry of Education or the ministry in cooperation with local authorities. The tendency is, however, to substitute the term "free place" or "maintenance grant" for the former word.

Large companies, benevolent trusts (e.g. Rockefeller Foundation, Nuffield Trust, Carnegie Trust), and individual benefactors, have bestowed on universities or colleges post-graduate scholarships to promote research, particularly in medicine, sociology, and technology. Cecil Rhodes founded a system of scholarships at Oxford for students from U.S.A., Germany, and British dominions and colonies. Another famous series of scholarships and exhibitions was founded by Sir Joseph Whitworth for the encouragement of engineering. See Bursar; Demy; Exhibition; Rhodes Trust; University.

Scholasticism (Gr. *scholastikos*, one who devotes his leisure to learning). The doctrines of the scholastics or schoolmen, the philosophical and religious teachers of the Middle Ages. They were so called because originally they taught the "seven liberal arts" in the monastic schools founded by Charlemagne. The history of scholasticism may be divided into two main periods, extending from the 9th century to the time of the Reformation. During the first period (9th to 12th century), its activity was at first devoted to the reconciliation of the claims of faith and reason, philosophy was pressed into the service of theology. The close study and analysis of the language of the classical writers and the fathers of

the Church led to an inquiry into the nature of the different elements of which language was composed; this resulted in the strife between Nominalism and Realism.

In the second period, acquaintance with the Aristotelian writings through Latin and Arabic translations introduced a new epoch. Metaphysics took its place as the equal, if not the superior, of religious dogma. But the abuse of dialectics and idle discussions on haecceity (thisness) and quiddity (whatness) and other unprofitable subjects led on the one hand to mysticism, on the other to the study of natural science. The old struggle between Nominalism and Realism (Scotists and Thomists), and the progress of science gradually brought about the downfall of scholasticism, although it held its ground in the Jesuit schools at the end of the 16th century. Amongst its chief representatives were Scotus Erigena, Anselm, Abelard, John of Salisbury, Albertus Magnus, Thomas Aquinas, Duns Scotus, Bonaventura, and Ockham. Interest in scholasticism has lately revived, and there is no doubt that, notwithstanding its pedantry, its lack of independent thought, and its subordination to theology, it deserves to be less harshly judged than is usually the case. In the words of Leibniz: "There is gold hidden even in the dunghap of scholasticism." See Nominalism; Realism.

Scholes, PERCY ALFRED (b. 1877). British music critic. Born at Leeds, he founded and edited the

Percy Scholes,
British music critic

Music Student (later the Music Teacher) in 1908, and was organist of the French church at Canterbury. During the First Great War he directed the music section of the Y.M.C.A., and was inspector of music in schools to London University. Associated with the B.B.C. from its foundation, he acted for some years as its music critic, having previously been music critic of *The Observer* and other journals, and was music editor of *The Radio Times*. He edited and published many histories and guides to musical appreciation, which became popular with the general public because of the way in which Scholes made the technicalities of music comprehensible. The best known of these works

was the Oxford Companion to Music. His biography of Burney won the James Tait Black prize in 1948. *Pron.* Skoles.

Scholiast (late Lat. *scholia*, marginal notes). Old term for a commentator or annotator, more especially an ancient annotator of the Greek and Roman classics.

Schomberg, FRIEDRICH HERMANN, 1ST DUKE OF (c. 1615–90). German soldier. Born at Heidelberg, he became a soldier, and during the Thirty Years' War fought for the Swedes and the French. Having been in the Dutch service, he went to France, whence he proceeded to

1st Duke of
Schomberg

Portugal to take command of an army against the Spaniards. Schomberg served France in the war that broke out in 1672 and was made a marshal, but the revocation of the edict of Nantes compelled him, a Protestant, to leave. For three years he commanded the army of the elector of Brandenburg, leaving Berlin to join William of Orange on his expedition to England in 1688. There he was made a duke and richly rewarded. As commander-in-chief he went to Ireland, where he won some successes, but was killed at the battle of the Boyne, July 1, 1690. He was buried in St. Patrick's Cathedral, Dublin. His son Charles, the 2nd duke, was killed in battle in 1693. See Boyne, Battle of the.

Schomburgk, SIR ROBERT HERMANN (1804–65). Anglo-German traveller. Born at Freyburg, in Prussian Saxony, June 5, 1804, he spent his early years in business in the U.S.A., and later travelled widely, drawing the provisional frontier between British Guiana and Venezuela and Brazil, known as the Schomburgk line, 1841–43. Knighted in 1844, he held various consular posts from 1845 to his death, March 1, 1865. He is chiefly known for his discovery of the *Victoria regia* lily. *Pron.* Shomboork.

Schönberg, ARNOLD (b. 1874). Austrian-born American composer. Born at Vienna, Sept. 13, 1874, he taught himself the elements of music, and composed chamber music and songs while at school. These works attracted the attention of von Zemlinsky whose pupil he became, and whose sister he married. He lived in

Berlin during 1901-03, and returned there in 1911, teaching at the Prussian Academy of Arts, 1923-33. The Nazi regime drove

Arnold Schönberg,
Austrian-born
American composer

Schönberg's early works included the Gurrelieder for chorus and orchestra (first performed 1913), the string sextet *Verklärte Nacht*, and a symphonic poem, *Pelleas and Melisande*. From about 1908 his music underwent a drastic change. In the first period he carried chromaticism to the limits of tonality, then dispensed with consonance and dissonance, and adopted a contrapuntal method. Later he broke away from accepted forms, and developed a new 12-note notation. In a third period he established formal principles governing the new material. His aims and methods are explained in his *Treatise on Harmony*. His pupils included Alban Berg, Egon Wellesz, and Anton von Webern, who followed the principles of "the Schönberg school." His outstanding works included the monodrama *Erwartung*, *Die glückliche Hand*; *Pierrot Lunaire*; *Friede auf Erden*; two chamber symphonies, 10 songs with orchestra, and 39 with piano. Almost all his wrote caused controversy.

Schönbrunn. Public building in Vienna, until 1918 a residence of the emperor of Austria. The first house was a hunting lodge, built by the emperor Maximilian II about 1570. This was destroyed by the Hungarians, but the emperor Matthias built another about 1618, which in its turn was destroyed by the Turks. The present building was begun by the emperor Leopold I in 1696, and was henceforward a regular residence of the emperors.

Various rulers, including Maria Theresa, made improvements and additions, including a zoological

and botanic garden. The palace contains about 1,500 rooms, and gardens of over 700 acres. The name means fine spring, there being a mineral spring here. It was occupied at one time by Napoleon, and in it his son the duke of Reichstadt was a prisoner. After the Second Great War it was used as British army h.q. in Austria until May, 1948.

Schönfeld, EDUARD (1828-91). German astronomer. Born at Hildburghausen, Meiningen, Dec. 22, 1828, where he was educated, he studied astronomy at Bonn. He was largely responsible there for the preparation of the *Durchmusterung* (catalogue) of the northern skies. He became director of Mannheim observatory, 1859, where he made a study of variable stars and nebulae. He was appointed director of Bonn observatory, 1875, where he eventually completed a star catalogue containing the places of nearly 150,000 stars. He died May 1, 1891.

Schongauer, MARTIN (1446-91). German painter, engraver, and goldsmith. Born at Colmar, he worked after 1488 at Breisach. The museum at Colmar contains the best of his religious compositions, but he is far better known by his engravings, technically the most accomplished works of his age. The British Museum owns a fine collection of these. He died Feb. 2, 1491.

School (Gr. *scholē*, leisure, place of philosophical discussion). In some form, the school has been part of the social organization of every community. Usually the school has developed first in relation to the maintenance of the priesthood and the Church or with the royal household, the exchequer, and the administration of the state. Throughout its evolution it has been strongly influenced by vocational considerations, that is, by what their elders think the young

should be taught to prepare them for their position in life. For the Greeks the school was a place where some of the boys might have the time and opportunity to let knowledge and reflection sink into the mind and permeate the whole life; but the early Greeks did little to organize schools in the modern sense. The Greeks of Alexandria, however, had schools which became the model for the Roman schools and, through them, the prototype of the medieval grammar schools of Europe. Their curriculum covered grammar (including literature), poetry, history, philosophy, and rhetoric or oratory, to which great importance was attached by the Romans.

With the decline of the Roman Empire schools became almost wholly the concern of the Church, and the pagan Greek culture was lost. Monasteries maintained schools for the instruction of novices; numerous chantry schools were endowed, in which poor children were taught and masses were sung for the souls of the founders.

SCHOOLS IN ENGLAND. Grammar schools, privately endowed and attended principally by the sons of nobles and freemen, were set up in medieval times in charge of the secular clergy, who sometimes gave instruction in reading and writing to the local children, particularly to choristers. Some grammar schools were really local schools founded to supply scholars to the university: e.g., Winchester College, to feed New College, Oxford. The Reformation brought the suppression of the chantry schools and many monastic schools, as well as the foundation of numerous grammar schools. For several centuries these offered to their pupils a very narrow curriculum, with Latin as its core, and sometimes as the only subject. Some of the schools attracted pupils from various parts of the country, and became known as public schools; the majority remained local in their appeal. Towards the end of the 17th century a number of non-conformist schools were founded. Increasingly the grammar schools failed to meet the changing needs of a growing industrial and commercial community, and in the 18th century numerous private schools were started offering a wider and more flexible range of instruction.

There was, however, no general provision for even elementary

Schönbrunn, Vienna. Main gateway and façade of the palace, formerly a residence of the emperors of Austria

instruction of the children of the labouring classes, and illiteracy was general. The first step towards compulsory education was the requirement in the Factory Act, 1802, that employers in cotton and other mills and factories should provide between 6 a.m. and 9 p.m. adequate instruction in reading, writing, and arithmetic during the first four years of apprenticeship (of poor law children). This provision was not fully observed; some employers furnished such instruction in Sunday schools. There were also various primary schools supported by voluntary contributions and by fees.

Origins of Primary Schools

Primary education in England was developed during the first half of the 19th century principally by two great educational organizations, the British and Foreign School society founded in 1808, and the National Society for promoting the education of the poor in the principles of the established Church (1811). Their schools were called respectively British schools and National schools. The former were undenominational. The early development of these schools was influenced by the "schools of industry," a type of charity school that "mixed labour with learning" and that had originated in the 17th century. In addition to the "three Rs," the curriculum included such activities as cobbling, tailoring, gardening and agriculture for the boys, and spinning, sewing, knitting, lace-making, and baking for the girls. Some of these schools, and some of the Wesleyan schools founded in great numbers from 1843, were very successful.

In 1862 government grants became payable, based on the attendance of children up to 12 years of age. Under the Elementary Education Act of 1870, district school boards were set up over the whole country. The boards had the duty of seeing that there was sufficient accommodation in public elementary schools for all children not otherwise provided for educationally; this necessitated the building of many public elementary schools to supplement the voluntary schools. In 1875 the payment of grants was much extended, and in the last two decades of the 19th century a new type of school, the higher grade, was developed, particularly in urban districts. This served older and abler children who could remain at school

until 15 or 16 years of age, and follow an organized course of science or art training.

In 1900 the board of Education which had been set up in 1899, established a new system of higher elementary schools for children between the ages of 10 and 15; these had a curriculum which included science, one foreign language, elementary mathematics, and drawing. By the Education Act, 1902, many of these schools were converted into county secondary schools. In 1911 the L.C.C. introduced central schools, providing secondary education with a slight commercial or industrial bias; later, central schools became general throughout the country. Various day trade schools were established from 1900 onwards; and in 1913 the board introduced junior technical schools which provided full-time courses for boys and girls for two or three years after they had completed their courses at public elementary schools; continued general education was combined with definite preparation for some industrial employment at 15 or 16. The Education Act, 1918, introduced the day continuation school, in which adolescents who are employed can continue general and physical education, and if desired receive some vocational training, during day periods in which they are freed by their employers.

Education from Cradle to Grave

The Education Act, 1944, treats education as a "continuous process from the cradle to the grave." It divides the process into three progressive stages: primary, secondary, and further education. Schools are accordingly classified as primary schools (for pupils up to 11+), secondary schools (from 11+ to 18+), and institutions or colleges of further education. In addition the Act provides for the setting up of nursery schools for children between two and five years of age; special schools (*v.i.*) for pupils requiring special educational treatment; and county colleges, where young persons not attending any school or other educational institution full-time can receive "such further education, physical, practical, and vocational training, as will enable them to develop their various aptitudes and capacities, and will prepare them for the responsibilities of citizenship." The Act requires that, eventually, employed adolescents under 18 years of age should be released by their employers to attend county colleges for the

equivalent of one day a week, unless acceptable alternative provision were made by their employers. (*See* County College; Grammar School; Modern School; Public School; Technical Education; *consult also* Guide to the Educational System of England and Wales, H.M.S.O., 1945.)

APPROVED SCHOOLS. The name adopted officially under the Children and Young Persons Act, 1933, for the institutions formerly called industrial schools and reformatories. (*See* Reformatory.)

SPECIAL SCHOOLS. The Education Act, 1944, made provision for the care of children who, by reason of physical or mental handicap, are obliged for educational reasons to live elsewhere than in their own homes. Local authorities were made responsible for ascertaining the number of such children in their area, and instituting special educational treatment for them. Blind, deaf, physically handicapped, epileptic, and aphasic children require special schools, which for blind and epileptic children must be boarding schools. Other handicapped children may be educated in ordinary schools, if certain prescribed conditions are fulfilled. Attendance at special schools is from 5 to 16 years of age.

Special schools are under the supervision and inspection of the ministry of Education. Local authorities provide accommodation for some 6,500 children, voluntary societies for some 8,000. Some handicapped children (*e.g.* those who are tubercular or crippled) are accommodated for long periods in ordinary hospitals.

More than 7,500 mentally defective children are cared for in institutions. The educational authorities are responsible for those who are educable; the others are dealt with under the Mental Deficiency Acts.

School Board. Body of men and women appointed in Great Britain, under the Act of 1870, to provide and supervise elementary education. School boards were constituted for all large towns and other populous areas, the members being elected by the ratepayers every three years. They were empowered to levy a rate. These bodies continued in existence in England until 1902, when the county and borough councils took over their duties, and in Scotland until 1918.

School for Scandal. THE FIVE-act comedy by Richard Brinsley Sheridan (*q.v.*), produced at Drury

Lane Theatre, May 8, 1777. Compacted of two short dramatic pieces, *The Slanderers* and *The Teazles*, on which Sheridan had been working for some time, it was an instant and brilliant success, and has been long regarded as the supreme standard comedy of English social manners and of witty dialogue. The contrasting characters are finely individualised and some of them, e.g. Charles and Joseph Surface, have come to be regarded as typical figures of their day. The play has been many times revived, noteworthy modern productions being at the Old Vic, 1933 (Malcolm Keen, Roger Livesey, Peggy Ashcroft); the Queen's, 1937 (John Gielgud, Michael Redgrave, Peggy Ashcroft, Leon Quartermaine); the New, 1949 (Sir Laurence Olivier, Vivien Leigh).

Schoolmaster, *THE*. Treatise on education, by Roger Ascham. It was published in 1570, two years after his death. Written at the suggestion of Sir Richard Sackville, the little treatise is sensible, practical, and an early example of masterly English prose.

Schools of Art. Institutions for technical training in the fine and applied arts. Establishments of the kind have existed in Italy since the early Renaissance. The oldest extant foundation in N. Europe is the *École des Beaux Arts*, Paris, organized by Mazarin as a state institution in 1648 and at first confined to painting and sculpture. In England, Kneller founded a school of design in 1711. It was followed by William Shipley's Academy in St. Martin's Lane, and later by the schools of the Royal Academy, 1768. Foulis's Academy, 1753, and the Trustees' Academy, 1760, were the Scottish products of the same period.

In 1837 a national art training school was opened at S. Kensington to provide training in design with a view to improving design in British manufactures and raising the level of taste throughout the country, by the training of teachers of design and of suitable industrial apprentices. The school was administered first by the Science and Art dept., then directly by the board (later ministry) of education. Throughout the next 60 years most of the art teachers in local art classes

held certificates awarded by S. Kensington. Regular art classes and smaller schools of art within the S. Kensington system sprang up all over the country, usually more or less related to the requirements of design in local industries. Some of these achieved notable success at different periods, especially those in the larger centres, e.g. Manchester, Leeds, Birmingham, and various L.C.C. schools of art, e.g. Central School; Camberwell. In 1901 the art school at S. Kensington was re-organized as the Royal College of Art. The training of teachers was to some extent decentralised, but students at the college itself could be awarded a diploma of associateship (A.R.C.A., Lond.), which ranked as the highest qualification for an art teacher. Associates are entitled to wear gown and hood, the latter lined with crimson brocaded silk. The emphasis in training was still upon the production of qualified teachers, to staff not only the local schools of art but secondary and grammar schools. The college gave advanced training, primarily in all branches of applied design but also in architecture, painting,

Schooner. Racing schooner under full sail

sculpture, and etching. After the First Great War, the fine arts received more attention than before, especially as the diploma of associateship was from 1921 awarded for success in one branch only, e.g. painting, possibly at the expense of design; and the college became more widely divorced from any true relation with industrial requirements. In 1948 the syllabus was again completely reorganized so as to remedy this. A licentiateship was introduced as the "standard" diploma for students, the associateship being reserved for those who demonstrate in the industrial field the practical value of their training.

From 1949 the college was administered under trust by a council, instead of directly by the ministry of education.

The Royal Academy schools and the Slade School (*q.v.*) remain the leading British institutions for training in the fine arts. The principal centre of training in Scotland is the Edinburgh College of Art.

Schools of Music. Institutions for the training of musicians. The oldest in Europe is the Paris Conservatoire (1784). Others with long histories include those of Prague (1811), Brussels (1813), Vienna (1817), Leipzig, founded by Mendelssohn (1843).

The oldest British equivalent is the Royal Academy of Music (1822). The Royal College of Music was founded as the National Training School of Music in 1873, and the City of London's own institution, the Guildhall School of Music, dates from 1880. The principal schools outside London include the Royal Manchester College of Music, and the Scottish National Academy of Music, Glasgow. In the U.S.A., Canada, and Australia, the best schools of music are usually associated with universities. See *Music*, Guildhall School of; *Music*, Royal Academy of; *Music*, Royal College of.

Schooner (Scott. *ecoon*, to skim). Type of sailing vessel. Schooners may have any number of masts from two to six; there are also schooner yachts. Two-masted merchant schooners are likewise called topsail schooners, because they have square topsails on the foremast. Four-masted schooners are fore and aft rigged throughout, and sail very quickly. Schooner yachts are usually fore and aft rigged on both masts.

Schopenhauer, ARTHUR (1788-1860). German philosopher, the apostle of pessimism. He was born at Danzig, Feb. 22, 1788, his father being a banker, his mother a well-known novelist. After studying at Göttingen and Berlin, he graduated at Jena in 1813. He passed the next winter at Weimar, with Goethe, later travelled in Italy, and in 1820 became lecturer at Berlin university. Failure as a teacher and the outbreak of cholera in 1831 caused him to remove to Frankfurt-on-Main, where he lived in private until his death, Sept. 21, 1860.

Arthur Schopenhauer. German philosopher. Sept. 21, 1860.

Schopenhauer's chief work, *The World as Will and Idea*, 1819, starts with the proposition that the world is only an intellectual phenomenon, objective only in reference to the knowing subject. We do not see the world as it is in reality, but only through the subjective forms of space and time. What, then, is the real thing, the thing-in-itself? Self-examination shows us ourselves as bodies in space and as will-exercising beings. Behind the world as *Idea* rises the *World as Will*, the only true external Being. But *Will*, though real, is unreasoning, originating in desire and discontent. Life is continual suffering. Pleasure is merely negative, absence or respite from pain; pain alone is positive. Is there no relief? Art, especially music, and a moral life based on sympathy, are palliatives, but will not end suffering. The only hope lies in the destruction by asceticism of the will to live. and, if this fails, retirement from the world into Nirvana. *Pron.* sho-pen-how-er. *See* Pessimism.

Bibliography. Works, 6 vols., ed. E. Grisebach, 1891, Eng. trans. T. Bailey Saunders, 5 vols., 1890-93; *Lives* (in German), E. Grisebach, 1897. W. Gwinner, ed. 1910. (in English), W. Wallace, 1890; *Kant's Ethics and Schopenhauer's Criticism*, M. Kelly, 1910. *Schopenhauer, His Life and Philosophy*, H. Zimmermann, new ed. 1932.

Schorl. Black variety of tourmaline (*q.v.*). Schorl rock is a quartz-schorl rock resulting from the tourmalinisation of graphite. *Pron.* shorl.

Schottische (Ger., Scottish). Once popular dance for the ballroom, somewhat like the polka, though the tempo was slower. The music was in 2-4 time. *Pron.* shot-teesh.

Schreckhorn. Peak of the Bernese Oberland, Switzerland, E. of the Grindelwald with alt. 13,386 ft. The ascent was first accomplished in 1861 by (Sir) Leslie Stephen; that of the Klein Schreckhorn, 1,910 ft. lower, in 1857 by Eustace Anderson.

Schreiber, Lady CHARLOTTE ELIZABETH (1812-95). Welsh

Lady Charlotte Schreiber, Welsh scholar

scholar. Daughter of the 9th earl of Lindsay, she was born May 12, 1812, and in 1833 married Sir Josiah Guest (d 1852) and in 1855, Charles Schreiber. During

1838-49 she issued a 3-vol. version of the medieval Welsh tales, commonly known as *The Mabinogion*, which marked an epoch in the study of Celtic literature, and was translated into French and German. She also did much to revive the Welsh Eisteddfod. She died Jan. 15, 1895.

Schreiner, OLIVE (Mrs. Cronwright-Schreiner) (1862-1920). A South African novelist. She was

Olive Schreiner, S. African novelist Elliott & Fry

born in Basutoland, daughter of a Lutheran missionary. The Story of an African Farm, 1883, published under her pseudonym of Ralph Iron, attracted great attention. Her other stories include *Dreams*, 1891; and *Trooper Peter Halket*, 1897. In *An English South African's View of the Situation*, 1899, she upheld the Boer position. *Woman and Labour*, 1911, was a strong expression of her feminist views. She died Dec. 12, 1920. *Consult* Not Without Honour, V. Buchanan-Gould, 1949.

Schrödinger, ERWIN (b. 1887). Austrian physicist. He was born at Vienna, Aug. 12, 1887, and educated there and at several German universities. He held academic posts at Stuttgart and Breslau, but in 1933 came to England and was for five years a fellow of Magdalen College, Oxford, being joint winner of the Nobel prize for physics with P. A. M. Dirac in 1935, because of his outstanding work on the theoretical basis of wave-mechanics. He refused to accept posts in Nazi Germany, and in 1940 became professor at the Dublin institute for advanced studies.

Schubart, CHRISTIAN DANIEL (1739-91). German poet and musician. He was born at Obersontheim, Württemberg, March 24, 1739. His musical gifts obtained him the position of organist and schoolmaster at Ludwigsburg in 1769, but his indulgence in satire cost him this post, and for a time he led an unsettled life in various towns. In Augsburg he produced a political paper, *Die Deutsche Chronik*, a satire which led to his imprisonment. He was visited by Schiller in prison, and there he wrote *Der Ewige Jude* (*The Wandering Jew*), several of his best poems, *Gedichte*, 1785-86, and his *Autobiography*, 1791-93. After his release he became mana-

ger of the theatre and poet-laureate at Stuttgart, where he died Oct. 10, 1791.

Schubert, FRANZ PETER (1797-1828). Austrian composer. Born in Vienna, Jan. 31, 1797, he displayed great musical gifts as a child, and in 1808 attended the imperial school which educated choristers for the court chapel. There he studied under Salieri, and composed in 1810 his first work, a piano fantasia. He was an usher in his father's school during 1813-15, then embarked on a career as probably the most prolific composer who ever lived. He subsisted chiefly by the generosity of friends, and during his lifetime, which was spent almost wholly in Vienna, his music was little known outside a small circle of admirers. Early in 1828 he gave his only public performance of some works, but he died on Nov. 19, and was buried near Beethoven.

Long Schubert

Of Schubert's eight symphonies, No. 7 in C is one of the most inspired ever written, and No. 8 is the "Unfinished," in B minor. Both mark Schubert's intense individuality. Among chamber music, the octet reveals the beginning of the composer's mature period; it preceded the fine string quartets in A minor, D minor, and G, the string quintet in C, the grand duo, and piano sonatas. Schubert was not only the originator of the modern song (*Lied*), but its unsurpassed master. His songs, over 600, range from the simplicity of the folk-song to the height of symphonic power. Among the most celebrated are *The Erl King*, *Gretchen am Spinnrade*, *Wanderers Nachtlied*, *Der Fischer*,

Jagers Abendlied, and the song-cycles Die Schöne Müllerin. Schwanengesang, and Winterreise—masterpieces appreciated at once by students and habitués of taverns, for whom indeed many were written. Of 13 completed operas, only excerpts are now performed, like the incidental music to Rosamunde. Apart from piano works mentioned above, there are the Moments Musicaux, impromptus, and the Wanderer fantasia.

The majority of these works were almost unknown until in 1838 Schumann discovered a number of MSS. Grove and Sullivan, in 1867, brought to light seven symphonies and quantities of smaller pieces. On their discoveries the authoritative edition of Breitkopf and Härtel was based.

Bibliography. The standard work is that of H. K. von Hellborn, Eng. trans. 1869, to which Grove contributed a chapter on his discoveries in Vienna. Lives and Studies are by N. Flower, 1928; K. Kobald, Eng. trans. 1928; C. W. Wilson, 1929; R. Bakes, 1934; E. Duncan, 1934; Hutehings, 1945; O. E. Deutsch, Eng. trans., E. Blom, 1947.

Schultz Powder. The first smokeless powder, invented in 1865 by Colonel E. Schultz. It is a compound of nitrocellulose, potassium, and barium nitrates, and is still an admirable sporting powder for medium and heavy shot loads. See Smokeless Powder.

Schuman, ROBERT (b. 1886). French statesman. Born June 29, 1886, in Luxemburg, of Lorraine parents, he studied law at Bonn, Munich, and Berlin, and practised as a barrister at Metz (which he was to represent as deputy from 1919). An officer in the German army, he went over to the French in 1916, and after the First Great War helped to arrange reparation settlements. Reynaud made him under-secretary for refugees from the evacuated French provs. in 1940, and he continued in office for a few weeks under Pétain, resigning in Sept. Imprisoned by the Germans at Metz, and sent to Germany 1941, he escaped the next year and joined the resistance movement in Lyons. A leading member of M.R.P., he was twice minister of finance, 1946; and prime minister Nov., 1947–July, 1948, and for a week in Sept. Foreign minister from Oct. 28, 1949, he produced in May, 1950, a plan for international control of W. Europe's coal and steel.

Schumann, CLARA JOSEPHINE (1819–96). German pianist. Daughter of Friedrich Wieck (1785–1873),

a noted piano teacher and maker, she was born at Leipzig, Sept. 13, 1819, first played on the platform in 1828, and appeared successfully in Paris. 1832.

She married Robert Schumann in 1840, appearing in London for the first time shortly before his death, 1856, and playing there frequently between 1865–88. From 1878 she taught the piano at Frankfurt conservatoire, and had many distinguished pupils. A pianist of wide accomplishment and interests, and the close friend of Brahms, she died May 20, 1896.

Schumann, ROBERT ALEXANDER (1810–56). German composer. Born at Zwickau, Saxony, June 8, 1810, the son of a publisher, he displayed literary and musical precocity, reading widely among the Romantics while at school and later at Leipzig and Heidelberg

Clara Schumann,
German pianist

Robert Schumann

universities, where he studied music when he was supposed to be working at law. He was taught piano playing by Friedrich Wieck at Leipzig, but an injury to his right hand in 1830 cut short his career. Schumann turned to piano composition and in an essay on Chopin, 1831 first stated his ambition to create a fusion of literary and musical ideas. Papillons, 1831, he openly declared to be a musical representation of a scene in Richter's novel, Flegeljahre. Between 1834, when he began his unhappy engagement to Ernestine von Fricken, and 1840, when he married the pianist Clara Wieck, he com-

posed for the piano Études symphoniques, 1834; the famous Carnaval, 1834–35; Phantasie-stücke, 1837; Kreisleriana, 1838.

Schumann was given a doctor's degree by the university of Jena in 1840, and that year turned to songs, composing in all 150. Before 1845 he finished a masterpiece, the lovely piano concerto in A minor. He became professor in the Leipzig conservatoire in 1843, in which year he wrote Paradise and the Peri, his first attempt at combining the vocal and orchestral. He began music to Goethe's Faust in 1844 (completed in 1853), but for two years suffered from acute nervous prostration bordering on insanity. After he had recovered he composed Genoveva, his only opera, and the music to Byron's Manfred. From 1850 came chamber music, sacred music, symphonies, songs and concertos. His illness returned in 1854, when he heard continually the note A sounding in his ears. Having thrown himself on Feb. 27 into the Rhine, from which he was rescued, he was confined to an asylum near Bonn, where he died July 29, 1856.

Schumann was the leader of the early Romantic school of German composers, as Brahms was of the later. As a composer of songs he was second only to Schubert, whose music he did more than any man to introduce to the world. He showed a mastery of the introspective, the dramatic, the purely lyrical. In pieces for the piano he brought descriptive composition to a high pitch of excellence. The piano quintet, cello concerto, and fourth symphony in D minor are other notable works.

Bibliography. Lives, Wasielewski, trans. 1878; G. T. Oldmeadow, 1905; J. A. Fuller-Maitland, now ed. 1913; F. Niecks, 1925; H. Bedford, 1925; J. Chissell, 1948; Letters, trans. 1907.

Schurz, CARL (1829–1906). American politician. Born in Germany, March 2, 1829, he was educated at Cologne, and the university of Bonn. In 1848 he rose against the Prussian authorities and had to leave his country, settling in America in 1852. In Wisconsin he became a politician on the republican side, and, having in 1861–62 been minister to Spain, commanded a division in several battles of the Civil War. The struggle over, he returned to journalism at Detroit and then at St. Louis. He started a Liberal Republican party, but broke away in 1884, when he led the Mugwumps (q.v.), and henceforward

took an independent line. During 1877-81 he was secretary of the interior, and he stood at every presidential election until 1904. He died May 14, 1906. Schurz wrote *Life of Henry Clay*, 1889; *Essay on Lincoln*, 1891; *Reminiscences*, 1906.

Schuschnigg, Kurt von (b. 1897). Austrian statesman. He was born at Riva, S. Tirol, Dec. 14,

Kurt von Schuschnigg,
Austrian statesman

1897, and educated at Fribourg and Innsbruck university. Practising as an attorney, he became a member of the Austrian parliament in 1927, being minister of justice during 1932-34. On the assassination of Dollfuss (q.v.), Schuschnigg became chancellor and minister of defence, and of foreign affairs, holding these posts during the difficult period when Nazi pressure against Austrian independence was steadily increasing. He planned a plebiscite, to ascertain if the people wished for union with Germany, but this was forestalled by Hitler, who in March, 1938, annexed the country and imprisoned Schuschnigg. The latter was released by the Allies in 1945. In 1948 he became professor at St. Louis university. He wrote an account of his experiences in *Farewell, Austria*, Eng. trans. 1938. A study by R. K. Sheridan appeared in 1942.

Schuster, Claude Schuster, 1st Baron (b. 1869). British administrator. He was born Aug. 22, 1869, and educated at Winchester, and New College, Oxford. Called to the bar in 1895, he entered government service and held various posts in the board of Education, becoming principal assistant secretary of its legal branch in 1911. He later joined the national health insurance commission, and from 1915 to 1944 was clerk of the crown in chancery and permanent secretary to the lord chancellor. Knighted in 1913, he was raised to the peerage in 1944, in which year he became director of the legal division of the British element of the control commission for Austria, holding this post for two years. An enthusiastic mountaineer, he wrote several books on the subject, the most popular being *Days in the Alps and Pyrenees*, 1931.

Schuster, Sir Arthur R (1851-1934). British physicist. Born at Frankfort-on-Main, Sept. 12, 1851, and educated at Geneva, Owens

College, Manchester, and Heidelberg, he made a study of spectroscopy, on which he became a leading authority. He led the British expedition in 1875 to Siam to observe the solar eclipse. Professor of physics at Manchester university, 1888-1907, he carried out many important researches on the sun, earthquakes, calorimetry, radiometry, and terrestrial magnetism. He was secretary of the Royal Society, 1912-19, and president of the British Association, 1915. He was knighted, 1920, and published *Theory of Optics*, 1904, and *Britain's Heritage of Science*, 1917, the latter with Sir A. E. Shipley. He died Oct. 14, 1934.

Schuyler, Philip John (1733-1804). American soldier and statesman. He was born at Albany, New

York, Nov. 11, 1733, and his first service was with the British army, with which he fought in the war against the French and Indians at Lake George in 1755. After

P. J. Schuyler,
American soldier
After J. Trumbull

the outbreak of the War of Independence, he was appointed a major-general in the revolutionary army, but was obliged by ill-health to give up the command of an expedition he had organized against Canada. Later, he took part in the fighting against Burgoyne, but, having been exposed to continual friction and jealousy, resigned in 1779. He held several civil appointments, and became one of the Federalist leaders after the war. He died at Albany, Nov. 18, 1804.

Schwabe, Samuel Heinrich (1789-1875). German astronomer. Born Oct. 25, 1789, at Dessau, and educated at Berlin as an apothecary, he turned his attention in 1826 to astronomy. He made a special study of sunspots, and was the first man to suggest their 11 year periodicity. The importance of Schwabe's discovery was not recognized by astronomers for many years after his first announcement in 1843. He died April 11, 1875.

Schwarz, Berthold (d. c. 1380). German monk, to whom was wrongly attributed the invention of gunpowder. He was probably born at Freiburg-in-Breisgau, early in the 14th century, his name being originally Konstantin Ancklitzen, but exact facts have never been satisfactorily established. He is supposed to have disposed of his

invention of heavy artillery weapons to the Venetians in 1378, and an old tradition says that, as a punishment for his dangerous ingenuity, he was blown up with gunpowder by the emperor Wenceslas.

Schwarzburg. Ancient German family, members of which ruled until 1918 over the principalities of Schwarzburg-Rudolstadt (360 sq. m.; pop. 105,000) and Schwarzburg-Sondershausen (330 sq. m.; pop. 90,000). The name was taken from the village of Schwarzburg. They claimed descent from the Frankish kings, and were important in the 13th and 14th centuries, where one of them, Gunther, was chosen German king in opposition to Charles IV. The family possessions were subdivided to form inheritances for several sons, but in 1599 only two of these lines survived; later both counts were made princes of the empire. In 1909 the Sondershausen branch died out and the prince of Rudolstadt inherited his crown. In 1918 the two principalities, which had been notable for their health and pleasure resorts, were merged into the state of Thuringia.

Schwarzenberg, Felix Ludwig Friedrich, Prinz von (1800-52). Austrian statesman. Born at Krumau, Oct. 2, 1800, he served six years in the army and 24 in the diplomatic service, but his importance is in the fact that on Metternich's retirement in 1848 he held the empire together in the face of revolution. A pronounced reactionary, he caused the emperor Ferdinand to abdicate in favour of Francis Joseph, and restored the German diet and Austria's position of dominance therein. Schwarzenberg died in Vienna, April 5, 1852.

Schwarzenberg, Karl Philipp, Prinz von (1771-1820). Austrian soldier. Born in Vienna, April 15, 1771, he entered the army and fought against Turkey and France. Present at several of the great battles, he then helped to arrange the marriage between Marie Louise and Napoleon, a circumstance which earned for him the emperor's friendship. He led the Austrian contingent in the invasion of Russia in 1812, but was soon fighting once more against France. He commanded the Austrians at Leipzig, and his services were richly rewarded with gifts and titles. He died Oct. 15, 1820.

Schwarzhorn (Ger., black peak). Name of several peaks in Switzerland. The highest is in the Monte Rosa group, 13,882 ft. The Grindelwald S., 9,610 ft., commands

extensive views; the Flüela S., 10,335 ft., is an easy climb from the Flüela Pass; the Augstbord S., 10,512 ft., is easily ascended from the Augstbord Pass.

Schwarzwald. Forest region lying along the Rhine in Baden. It is better known in English as the Black Forest (*q.v.*).

Schweidnitz (Pol. Swidnica). Town of Silesia. It lies in the area of Germany placed in 1945 under Polish administration. It stands on the left bank of the Weistritz at the foot of the Riesengebirge, 28 m. S.W. of Wrocław. The Rathaus has a tower, built in 1548, and an oriel window, dating from 1716. The town, famous for its beer, had manufactures of cloth, linen, gloves, tobacco, and leather. Pop. (1939) 31,000.

Schweinfurt. Town of Bavaria, Germany. It stands on the Main, 50 m. N.W. of Nuremberg. The Rathaus, built 1570-72, was considered one of the best examples of the German Renaissance style. One of the oldest cities of Germany, dating from 791 or before, it became in the 20th century a centre of the ball-bearing industry. As such it was during the Second Great War frequently bombed by British and U.S. aircraft. When the U.S. 7th army captured it April 11, 1945, it was found to be virtually destroyed. Pop. 39,400.

Schweinfurth, GEORG AUGUST (1836-1925). German explorer. Born at Riga Dec. 29, 1836, and educated at Heidelberg and Berlin, he travelled in Egypt during 1864-68. He explored the oases of the Libyan desert in 1874, and his observations then led him to visit many of the oases of Arabia, of whose flora he made profound study. His explorations included the White Nile, and Barca coast. He died Sept. 19, 1925.

Schweitzer, ALBERT (b. 1875). German theologian, musician, and doctor. Born Jan. 14, 1875, at Günsbach, Alsace, he was educated at the universities of Paris, Berlin, and Strasbourg, becoming curate of the church of S. Nicolaus in the last-

Albert Schweitzer,
German theologian

named city, and later principal of the theological faculty and professor of religious philosophy at the university. A musician of international repute, from 1902 to

1912 he was organist to the Bach Society of Paris, and attained a European reputation with the publication in 1905 and 1908 of a masterly study of J. S. Bach. Other works, reflecting his extraordinarily varied interests, included *The Quest of the Historical Jesus*, 1911; *On the Edge of the Primeval Forest*, 1922; *From My African Notebook*, 1939. In 1905 he abandoned a brilliant academic career to study medicine. Having qualified as a doctor, he became a volunteer medical missionary in the Gabun prov. of French equatorial W. Africa, 1913. At Lambaréné, where he remained for the greater part of his life, he founded, equipped, and maintained a hospital, returning to Europe periodically to give organ recitals in order to raise funds. For many years he was engaged in writing a treatise on the philosophy of civilization, 2 vols. of which were published in English in 1923. *Consult* Lives, O. Kraus, Eng. trans. E. G. McCallman, 1944; G. Seaver, 1947.

Schwerin. Town of E. Germany, in the *Land* of Mecklenburg, capital of the former republic of Mecklenburg-Schwerin. It stands on the lake of Schwerin, 50 m. E. of Hamburg. The Gothic cathedral (1170-1416) had some fine stained glass and Flemish brasses. The palace is on a small isle on the site of an old Wendish fortress of the Obotrite princes. The town, founded by Henry the Lion, 1160, passed to Prussia in 1759 and was taken by the French in 1806. After the Second Great War it came within the Russian zone of occupation. Pop. 90,240.

Schwyz. A canton of Central Switzerland. It is adjacent to Lakes Zurich, Lucerne, and Zug, and contains Lake Lowerz. It is one of the three original cantons of the federation, and also one of the four forest cantons. As a result of the leading part played by Schwyz in the early history of the confederation, its name from about 1450 came into general use as the name for the country. It is largely pastoral and agricultural, its area is 351 sq. m. Pop. 65,000.

Schwyz. Town of Switzerland, capital of Schwyz canton. It lies at the foot of the Gross Mythen, 24 m. by rly. E. of Lucerne. The 16th century town hall is adorned with frescoes and has a valuable MS. library. Brunnen, on the Lake of Lucerne, is its port. Pop. est. 8,000.

Sciaccia. City of S.W. Sicily. It is in the prov., and 45 m. by road N.W., of Agrigento. The neighbouring hot springs of Monte

San Calogero (1,272 ft.) were known to the Romans as the *Thermae Selinuntinae*. Pop. 25,000.

Sciatica (Gr. *ischiadikos*, from *ischion*, hip-joint). Painful affection of the sciatic nerve. It is most frequent in adult males, particularly those who suffer from gout or rheumatism. Exposure to cold and wet is sometimes the cause. In some cases the pain is due to pressure of a tumour on the sacral nerves, or to disease of the hip-joint, and in rheumatic cases to changes in the sheaths of the muscles. The pain is felt at the back of the thigh, and in severe cases may extend down to the foot. In prolonged cases there is wasting of the muscles, and the hip-joint and knee-joint may become permanently bent. Treatment consists in attacking the basic cause and in rest and warmth. Pain is mitigated by suitable drugs, and the nerve may be temporarily put out of action by injection.

Scioli. Town of Sicily. It is 5 m. S.W. of Modica in the prov. of Syracuse, and is near the ruins of ancient Casmenae or Sciathus. Cheese and cloth are made.

Science. Systematised knowledge; truths ascertained by observation, and organized by classification, description, and definition to disclose causal relationships. Experiment is an attempt to extend and control observation. Science is theoretical knowledge. Skill in applying such knowledge may be an art or a craft. Science traces order in nature, by ascertaining what are the characteristics common to different types of things and what are the causes and consequences of those characteristics. It is concerned with the general, not with the particular, which it studies only to gain more exact knowledge of the general.

A scientific law is merely the most exact statement the scientist can give of what has been observed; any scientific law may be shown by further observation to need correction. Science has progressed principally through the correction of such laws and the recognition of relationships between laws that previously were not known to exist. Indeed, its history is strewn with laws that have been discarded as false.

Though science is a unity, it is convenient to speak of the sciences, and to attempt to group them. They are commonly classified (as suggested by Herbert Spencer and Karl Pearson) into the abstract and the concrete, which deal respectively with the mode and with

the content of perception; the concrete are further divided into biology (living things) and physics (inanimate things). The principal branches of science receive separate entries in this Encyclopedia.

Science Museum. THE. Institution in Exhibition Road, S. Kensington, London. First proposed by Albert, prince consort, after the Great Exhibition of 1851, the National Museum of Science and Technology has grown from a modest collection illustrating foods, animal products, examples of structures and building materials, and educational apparatus (opened to the public 1857) to its present fame as a centre of study in scientific and technical development of world-wide interest, with over a million visitors each year. Until 1899 the art collections and the science and engineering collections together formed the South Kensington Museum, but in that year the name was changed to the Victoria and Albert Museum, and in 1909 the Science Museum acquired its separate character and home, to which a new extension was opened 1928. Since 1948 it has been organized in seven departments: physics; chemistry and geography; land transport and communications; motive power; air and water transport; industries; astronomy and geophysics. A science library of 344,000 vols. is attached to the museum.

Scientific and Industrial Research. DEPARTMENT OF. Government agency of the U.K. In 1915 the committee of the privy council was created by order in council a body corporate, the Imperial Trust for the Encouragement of Scientific and Industrial Research, to administer funds provided for research. The dept. of scientific and industrial research (D.S.I.R.) was created Dec. 15, 1916, to serve the committee. The lord president of the council is president of the committee of the privy council, which has an advisory council of eminent scientists and a secretary who is head of the D.S.I.R.

The dept.'s research work is divided into 12 main branches, each with its own laboratory and research station, as follows: building; Garston, near Watford; chemical, Teddington; fire, Boreham Wood; food, with research stations at Cambridge (low temperature) and Aberdeen, and laboratories at East Malling and Covent Garden; forest products, Princes Risborough; fuel, Greenwich; hydraulics, London; mechanical engineering, London; pest

infestation, Slough; radio, Slough; road, Harmondsworth; water pollution, Watford. The dept. is responsible for the geological survey of Great Britain, and maintains the museum of practical geology. Much research in pure and applied science is carried out by the National Physical Laboratory (q.v.).

Applied scientific research is also undertaken on a large scale by private industrial concerns maintaining their own laboratories and staffs of scientists. Research of this kind showed a tenfold increase from 1930 to 1950; the greatest amount was done in aeronautical and automobile engineering; and next came the chemical industries.

A National Research Development Corporation was set up under the Development of Inventions Act, 1948.

Scilla. Genus of about 100 species of bulbous perennials of the family Liliaceae, popularly known as squills. Natives of the temperate regions of the Old World, they have long strap-shaped leaves, and blue or purple flowers forming a raceme on a leafless scape. There are three British species, of which the commonest is the bluebell (q.v.). The others are the sea onion (*S. verna*), found among grass on rocky coasts in spring, with intensely blue flowers; and the autumnal squill (*S. autumnalis*). The squills of the druggist are derived from the large bulbs of *Urginea scilla*, an allied plant of the Mediterranean.

Scilla OR SCIGLIO. Former seaport and town of S.W. Italy, in the prov. of Reggio di Calabria. It stands on the Strait of Messina, 17 m. N.N.E. of Reggio. It was partly destroyed by an earthquake in 1783 and almost entirely in 1908. Before then it had a pop. of 5,000 and was noted for silk and wine. The neighbouring rocky headland is associated with Scylla (q.v.).

Scilly Isles. Group of islands lying off the coast of Cornwall, England. They lie about 25 m. W.S.W. of Land's End, and have a total area of 6½ sq. m. The group consists of five inhabited islands—St. Mary's, Treco, St. Martin's, St. Agnes, Bryher—and Samson, Annett, and some 30 others. In addition, there are about 100 islets and rocks, on one of which is the lighthouse, Bishop Light. Hugh Town, the capital, is on St. Mary's, also Star Castle, an Elizabethan fortress. The inhabitants call themselves Scillonians. Pop. 1,450.

The climate is mild and equable, with mean temp. in Jan. 49° F., and the vegetation most luxuriant, semi-tropical trees and flowers growing in the open air. Many sea birds, seals, and basking sharks haunt the islands. The inhabitants are mainly employed in growing flowers and vegetables for the English market, and in fishing. The islands form part of the county of Cornwall. Steamboats sail regularly from Penzance to Hugh Town, and there is an air service from Land's End.

Scilly Isles. Map of the island group off the Cornish coast

Supposed to have been the Cassiterides, or tin islands, of the ancients, the Scillies have numerous Celtic remains. Many wrecks have occurred off the islands, notably on Oct. 22, 1707, when Sir Cloudesley Shovell and about 2,000 men met their deaths. Since 1337 the islands have belonged to the duchy of Cornwall, but were allowed by royal grant to the abbey of Tavistock and by lease from Elizabeth to Francis Godolphin. In 1835 they passed to the family of Dorrien-Smith. The duchy of Cornwall now administers all except Tresco. Legend associates the islands with Lyonesse (*q.v.*). In fiction they figure in Besant's *Armored of Lyonesse* and Quiller-Couch's *Major Vigoureux*. Consult *The Isles of Scilly*, A. and H. Gibson, 1932; *The Fortunate Islands*, E. L. Bowley, 1945; *the Scilly Isles*, G. Grigson, 1950.

Scimitar (Per. *shimshir*). Short Oriental sword of peculiar shape. Its blade, which broadens from the handle, is one-edged and much curved, the cutting edge coming to a point, while the heavy back is considerably shorter. See *Sword*.

Scintillation (Lat. *scintillare*, to sparkle). Twinkling of the stars. This is due entirely to irregularities in the earth's atmosphere and is usually conspicuous near the horizon (where the starlight traverses a great depth of air) and small overhead. Different

Scimitar. One-edged sword of Turkish pattern

strata of the atmosphere at varying temperatures and pressures refract starlight differently, concentrating it at some places at the temporary expense of others. As these strata are carried across the line of sight by the wind, the star appears alternately bright and faint. Colour changes seen when bright stars are near the horizon are due to optical interference temporarily destroying some wavelengths in the light and reinforcing others. The planets do not usually twinkle, because the different points of their disks do not keep step with one another in their scintillation; thus the total light remains practically constant.

Scioppius or **SCHOPPE**, KASPAR (1576-1649). German scholar. He was born at Neumarkt, Upper Palatinate, May 27, 1576, and studied

at Heidelberg. Becoming in 1598 a Roman Catholic, he devoted his energies to violent attacks on Protestantism and his former associates, particularly on Scaliger and James I of England in *Ecclesiasticus Auctoritatis Jacobi Regis Oppositus*, 1611. He died Nov. 19, 1649. An eminent scholar, he is credited with trying to bring about a European war by his *Classicum Belli Sacri*, 1619.

Scipio, LUCIUS CORNELIUS (c. 190 B.C.). Roman general, brother of Scipio Africanus Major. He was appointed to the command of the Roman forces sent against Antiochus, his brother Africanus accompanying him as legate, and his defeat of Antiochus at Magnesia in 190 B.C. gained for him the surname of Asiaticus. On his return to Rome, Lucius was found guilty of corruption.

Scipio, PUBLIUS CORNELIUS (d. 211 B.C.). Roman general. When Italy was invaded by Hannibal, Scipio endeavoured to check his progress, but was completely defeated at the battle of Ticinus in 218 B.C. Thereupon he proceeded to Spain, where, along with his brother Gnaeus, for the next few years he kept the Carthaginians so busy that they were unable to send reinforcements to Hannibal. The two brothers, however, were defeated in 211 by Hasdrubal.

Scipio, PUBLIUS CORNELIUS, called **SCIPIO NASICA SERAPIO** (d. 132 B.C.). Roman statesman. In 149 B.C. he was sent to Carthage to arrange the surrender of arms to the Romans, and was consul in 138. A pronounced aristocrat, he was one of the bitterest opponents of Tiberius Gracchus, whom he boasted that he had slain. This so enraged the people that he was sent by the senate on a mission to Asia, and died at Pergamum in 132.

Scipio, PUBLIUS CORNELIUS, known as **SCIPIO AFRICANUS MINOR** (c. 185-129 B.C.). Roman general and statesman, son of Lucius Aemilius Paulus, the conqueror of Macedonia, but adopted into the Scipio family. He served in Greece under his father, and later in Spain. When the third Punic War broke out in 149 B.C. he at first served in a subordinate capacity, but after his consulship in 147 was given the governorship of Africa, and he brought the war to a successful conclusion with the taking of Carthage 146. In 134 he was appointed governor of Spain, and ended the war by taking Numantia (133).

It was during his absence in Spain that Scipio's brother-in-law, Tiberius Gracchus, the reformer,

met his death, but so far from showing regret, Scipio was prominent on his return to Rome in the opposition to the commissioners appointed to carry out the agrarian reforms. This brought him great unpopularity, and one morning he was found dead in his room. Scipio was a patron of letters.

Scipio, PUBLIUS CORNELIUS, known as **SCIPIO AFRICANUS MAJOR** (237-c. 183 B.C.). Roman general.

On the outbreak of the second Punic War in 218 B.C. Scipio, young as he was, fought in the Roman armies, and so distinguished himself that in 210 he was chosen

Scipio Africanus Major, Roman general

by the popular voice to take the command of the Roman army in Spain, and in three years destroyed the Carthaginian power.

Scipio, on his return to Italy in 206, urged a direct attack upon Carthage itself. The ordinary forms were set aside, and Scipio was made consul in 205, organized his forces, carried them to Africa in 204, destroyed the forces of Syphax, the great ally of the Carthaginians, and on Oct. 19, 202, met Hannibal himself and annihilated his army in the decisive battle of Zama, which ended the war and finally destroyed the Carthaginian power. For this, the greatest triumph of the Roman arms, Scipio was awarded the title of Africanus. He died at Laternum in Campania. Consult *Scipio Africanus: A Greater Than Napoleon*, B. H. Laddell Hart, 1930.

Sciron. In Greek legend, a robber who preyed upon the country on the frontier between Attica and Megaris. It was his custom to compel travellers to wash his feet, and, while they were doing so, to kick them into the sea. He was killed by Theseus.

Scirrhus (Gr. *skirros*, hard swelling). Form of cancer in which the tumour is hard and does not grow very rapidly when faced by connective or fibrous tissue. The slowness of growth is due to the fact that cancer cells produce a toxin which disintegrates the cells lying along their path; and this toxin is less effective in dissolving the cells of the harder tissues. See *Cancer*.

Scissors (Old Eng. *cissors*, from Old Fr. *cisaires*, Lat. *cisorium*). Instrument for cutting cloth, paper, etc., consisting of two blades and handles screwed or

10 0 50 100

Scissors. 1. Tailor's scissors. 2. Surgical scissors, which take to pieces for sterilizing. 3. Button-hole scissors. 4. Curved nail scissors

riveted together, so that they open like the letter X. Each blade and handle are made from one piece of steel, the thumb or finger holes being forged. Tailor's scissors, of which there are three sorts, according to size, shears, trimmers, and cutters, have the shanks made of iron and welded to the blades. Other kinds of scissors include button-hole, with gaps in the blades so that the cut will not reach to the edge of the stuff, nail scissors, sometimes with the points bent upward, and with a file along the back, surgical scissors. Larger types are often termed shears (*q.v.*).

Scitamineae. Family of herbs, also called the plantain family. Chiefly perennials, they are natives of warm regions. The leaves are large and their stalks are usually expanded at the base so that they wrap around the stem or younger leaves. The flowers are irregular. The order includes several distinct tribes, and a number of valuable economic species, as ginger (*Zingiber*), arrowroot (*Maranta*), plantain and banana (*Musa sapientum*).

Sclerosis (Gr. *sklēros*, hard). In pathology, a hardening of a tissue. The term is usually restricted to a morbid condition of nerves followed by degeneration of nerve and loss of function, or to hardening of arteries (arteriosclerosis).

Scoliosis (Gr. *skolios*, bent). Lateral curvature of the spine. It is often due to rickets or simple weakness of the muscles and bones in rapidly growing adolescents,

especially when their habitual posture is wrong. See Spinal Column.

Scone. Cake of flour, butter, and milk, raised with carbonate of soda and cream of tartar. In Scotland barley or oatmeal is also a constituent, and the cake is baked on a griddle. *Pron.* sconn.

Scone. Parish and village of Perthshire, Scotland. Standing on the left bank of the Tay, 2 m. N.E.

of Perth, it consists of Old Scone, famous for its historical associations, and New Scone. In the 8th century Scone was the Pictish capital, and from 1153 to 1488 was the coronation place of the Scottish kings. In 1651 Charles II was crowned here. From its ancient abbey, destroyed

in 1559, the stone of destiny was carried to Westminster in 1296. The palace, begun by the earl of Gowrie, passed to the ancestors of the earl of Mansfield (*q.v.*), and was rebuilt about 1800. Pop. 2,559. See Coronation Stone. *Pron.* Scoon.

Scopas. Greek sculptor of the 4th century B.C. Born probably at Paros, he worked at Tegea, at Athens, and at other Greek cities, and in Asia Minor, where he decorated the mausoleum (*q.v.*) of Halicarnassus. With Praxiteles and Lysippus he revolutionised Greek sculpture. Several of his pieces are preserved at Athens.

Scopolamine. Another name for an alkaloid of henbane also called hyoscyine. See Henbane.

Score. In music, the simultaneous presentation of the constituent parts of a composition. They are all written on appropriate staves, so that they can be read by one person. The English name is derived from the fact that the staves are "scored" through by the barlines. A short or piano score has the parts written on two staves, as shown here

The same passage would be in open score if each part were written on a separate staff (right).

A full or orchestral score gives the parts for all the instruments each on its proper staff, except

that for those which run in pairs, such as flutes, oboes, clarinets, bassoons, etc., the parts for each pair are written on one staff. The instruments are grouped according to character, and arranged in each group according to pitch. The plan of the average full score is, beginning at the top, (a) wood wind, (b) brass, (c) percussion, (d) strings. If vocal parts are included

they are placed in the string group, between the violas and the cellos. An organ part would come lowest of all.

To score a work means (a) to orchestrate it from the piano sketch, or (b) to transcribe the separate parts so that they can be read together, a proceeding necessary for forming an

idea of the value of music which exists only in separate parts.

Scoresby, WILLIAM (1789-1857.) British explorer. The son of a whaler, he was born Oct. 5, 1789, near Whitby, and soon made voyages, being mate on his father's vessel, the Resolution, in 1806. From then until 1822 the two Scoresbys continued their voyages; in the latter year the younger made the first accurate chart of the E. coast of Greenland. In 1824 he was elected F.R.S., and next year took holy orders, becoming vicar of Bradford. He travelled to Australia in 1856 to make observations in terrestrial magnetism, and died March 21, 1857.

Scoresby Land. Portion of Greenland. It is on the E. coast N. of Scoresby Sound, and was named after William Scoresby.

Scoria (Lat., *slag*). In geology, name given to the ashy masses ejected by volcanoes. The crusts found on lava flows resembling punice in their construction are also called scoria.

Scorification. In metallurgy, a process for separating one metal from another in the molten state. When oxygen of the atmosphere combines with the molten mass, it forms a scoria or slag which can be skimmed off the top of the latter. The oxidation of lead is such a process in the manufacture

Scone, Scotland. The palace, rebuilt about 1800

William Scoresby, British explorer

of litharge. It is akin to cupellation, but differs from it in that the oxidised metal, the scoria, is removed in that state instead of being absorbed in the cupel. Silver is separated from lead by scorification, and the process is much used by the assayer. See Cupel; Lead; Silver.

Scorpion (Lat. *scorpio*). Eighth sign of the Zodiac. The claws of the constellation occupy the space called Libra by the Romans. The chief star of the constellation is Antares, a first magnitude red star. It is a double star, possessing a green companion of the seventh magnitude. There are many other double stars, a triple star in ξ Scorpii, and a quadruple in ν Scorpii. There are several well-known globular clusters containing many variables, and a nebula near Antares. The constellation has been remarkable for its new stars. See Constellation; Zodiac.

Scorpion. Order (Scorpionidae) of animals, of the class Arachnida, in the phylum Arthropoda. In general appearance they resemble a small lobster with a long, jointed tail, and are common in S. Europe and the tropics. One anterior pair of the body appendages is developed into nippers. The tail, or hinder portion of the

Scorpion from Central Africa, showing the sting at the end of the tail

abdomen, bears a venomous sting, and is usually brought forward over the back of the body, so as to threaten an enemy approaching from in front. The sting can inflict a serious wound, but it is rarely fatal to a man in good health. Scorpions lurk during the day under stones, and range at night in search of their prey, small insects and spiders. The young are brought forth alive. See Arachnida.

Scorpion-fly (*Panorpa*). Small group of insects with slender bodies, thread-like antennae, beak-like mouth-parts, and narrow mottled wings. They form the family

Scorpion-fly. *Panorpa communis*, common British species

P. communis is brown-black, measuring about 1 in. across the wings, and haunts shady hedgerows.

Scorzonera (*S. hispanica*). Perennial edible-rooted plant of the family Compositae. It was introduced in 1576 to Great Britain from S. Europe, where it grows wild. The roots are parsnip-shaped, and white fleshed, with a dark skin. Scorzonera is cultivated in the

same way as salsify (*q.v.*), except that a greater space, say 18 ins., should be allowed between the rows, and about 12 ins. between each plant. Scorzonera has a sweet, sugary flavour, and may be cooked in the same way as salsify, or boiled like other root vegetables.

Scot and Lot. Term used in England in the Middle Ages and later for the share of a tax paid by persons in chartered towns. They were assessed to scot and lot, and in certain boroughs the payment of scot and lot was a condition of the franchise. The phrase comes from an A.S. word for a payment, and lot, a share.

Scotch Corner. Junction on the Great North Road. At this point, 5 m. N. of Catterick Bridge in the N. Riding of Yorks, motorists for Scotland have a choice of taking the right fork, A1, through Newcastle-on-Tyne, or the left, A66, through Carlisle.

Scotch Mist. Term applied to the heavy drizzle associated with thick mist. It often occurs when the cloud base is adjacent to the ground, conditions most frequently encountered in hilly districts, e.g. the Scottish uplands, and the moors of Devon and Cornwall where it is known as mizzle.

Scotch Snap. In music, the name given to a rhythmical effect obtained by syncopation, and

Panorpidae of the order Mecoptera. In the male the hind end of the body can be upturned like that of a scorpion. Three species, together with the flightless *Boreus*, are British.

characteristic of the Strathspey dance.

Scotch Terrier. Small breed of rough-haired terrier. One of the hardest of the domesticated breeds, the Scotch terrier is a determined hunter, especially of vermin of all

Scotch Terrier. One of the hardest and keenest breeds of terrier

kinds, and is one of the best rat-tors. It has exceptionally large teeth for a dog of its size, and was formerly in use for hunting the fox among the rocks in the Highlands, where the going is too hard for the average foxhound. Remarkably intelligent and faithful, the Scotch terrier has always been much in favour as a companion. See Dogs, colour plate; Terrier.

Scoter (*Melanitta*). Genus of wild ducks, of which three species occur in Great Britain. The plumage is black and glossy, in some species spotted and barred with white. The common scoter (*M. nigra*) is 20 ins. long, and is numerous about the coasts of Great Britain in the winter, a few pairs still nesting in the N. of Scotland. It is marine in habit, an accomplished diver, and deep sea feeder. The velvet scoter (*M. fusca*) has a white patch behind the eye and a white bar across the wing. The surf scoter (*M. perspicillata*) is a passage migrant and winter visitant to Great Britain.

Scoter. Specimen of British wild duck

Scotists. The followers of Duns Scotus, as opposed to the Thomists, the followers of Thomas Aquinas. The Scotists were realists, who explained the existence of material things by the union of matter and form, with the co-operation of an eternal third element, which was the cause of both. See Realism.

SCOTLAND : ITS TOPOGRAPHY, HISTORY, ETC.

A. D. INNES, M.A., T. F. HENDERSON, and Others

This Encyclopedia contains articles on all the counties, cities, and other places of importance in Scotland; also on its kings, statesmen, poets, and others. See also Celt; Gaelic; Presbyterianism; and other articles on matters affecting the country. The history is continued from 1707 under United Kingdom. See also the colour maps facing pp. 7372-73, and the maps of the several counties

Scotland is the northern portion of the island of Great Britain. With an area of 30,405 sq. m.,

Royal arms

of which 609 sq. m. is covered with water, it comprises three areas, the highlands, lowlands, and southern uplands. The highlands, which make up the N.W. half of the country, consist of very old rocks, the relic of an ancient continent and related in this respect to the mountainous backbone of Scandinavia. On the average the land is about 1,500 ft. above sea level, while a number of heights rise above 4,000 ft., the culminating point being Ben Nevis, 4,406 ft. Among 186 islands are the Hebrides, Orkneys, and Shetlands groups.

Strictly there are neither mountain peaks nor mountain ranges; viewed from the glens the heights present a mountainous aspect, but seen from a height the highlands appear as smooth-contoured rounded masses of considerable extent, all of which attain almost the same level. The land is in reality an old plateau carved out by the erosive agents, ice and water. The character of the steep-sided glens; the lochs, whether long, narrow, deep lakes, or equally narrow fjords; erratic boulders, and striations on the rock surfaces, combine to indicate that N. Scotland suffered considerable destruction during the Ice Age. The Hebrides are detached fragments of the plateau, the Outer being separated from the Inner by the rift valley of the Minch. Skye, Mull, Rum, and Arran islands, and the peninsula of Ardnarmurchan are all carved out of the remnants of Tertiary volcanoes. Other islands such as Staffa and Eigg are remains of a great plateau of lava flows poured out in Tertiary times. The Northern Highlands are cut off from the Grampians by the tear-fault of Glen More, in part occupied by the long, narrow, and deep lochs Ness, Oich, and Lochy.

The Grampians present a steep face, running N.E. to S.W., to the Central Lowlands, which are bounded by a similar less con-

tinuous and less elevated scarp, where the Southern Uplands begin. These scarps mark the faults or cracks in the earth's crust at the edges of the widest of the Scottish rift valleys, i.e. the lowlands, which include the plains of the Forth, the lower Clyde, and Tay, Strathmore, and the Carse o' Gowrie, and the minor heights of the Ochil and Sidlaw hills, and the Campsie Fells. Volcanic material produced these hills, and the plains are largely of glacial drift, boulder clay, which has filled up the ancient river channels and caused a rearrangement of the river systems. The rift subsidence and the glacial overlaying have preserved within the limits of the lowlands the rocks of the Carboniferous series, with the consequence that here are the Scottish coal-fields.

Southern Uplands

The Southern Uplands have a mean height of less than 1,000 ft. and a maximum, in Mt. Merrick, of 2,700 ft. Like the highlands, they are the relics of a plateau, but while the northern heights are heather-covered moorlands, the southern are grass-covered. Their valleys also differ in being wider and less steep-sided than the northern glens, and there are neither inland lochs nor fjords. The Southern Uplands, with the Pennines of England, form a continuous elevation, the central uplands of Britain.

Scotland, S. Andrew's Cross, as the national banner

Exceptions to this three-fold division of the country are the county of Caithness, and the Orkneys and Shetlands in the far north. These areas are detached portions of the same general character as the lowlands, but they are without the coal and the climate is more insular.

Rivers differ with their location: the longest, Spey, Dec, and Tay, rise close to the highest point of the highland plateau, and are swift torrents whose valleys form the main lines of communication by road and rail. The meandering Forth is a lowland stream. Southern streams are shorter; the chief are the Tweed, Clyde, Annan, and Nith. Loch Leven is a lowland

lake, Loch Lomond is part lowland and part highland. Lochs Katrine, Erich, Rannoch, Tay, and Earn are the chief lakes of the highland glens.

The origin of the surface features has profoundly affected human occupations. The highlands are the land of the crofters. They are mainly grouse moors and deer forests, where cattle rearing and a little tillage of rough patches of reclaimed moor are the main remunerative occupations. The southern uplands are grazing land, particularly useful for sheep; in the S.E. they form the finest sheep-rearing country in the world; nowhere, except perhaps in Kent, are there so many sheep per square mile. The lowlands are the arable lands and, on the coalfields, the industrial areas.

Fertile land in Scotland is comparatively scarce, and consequently some 2,000,000 acres are devoted to deer forests, and on a great deal more sheep only are reared. On poor land, too, the crofters eke out a precarious livelihood; the same reason accounts for the fact that oats is the country's chief crop. On the rich land of the south, where is some of the most fertile in the world, wheat and barley are grown, and horses and cattle reared. Fishing has long been one of the main occupations of the Scots. An indented coast and the uninviting nature of much of the interior combined to mass the people in a long string of coastal villages, especially on the W., where they could reap the rich harvest of the sea.

Industries Old and New

If deer stalking and grouse shooting are not the fashionable pastimes they once were, angling still brings its devotees to Scotland. Mountain climbing, though not organized as in the Alps, attracts others; there are some of the world's finest golf courses; and the development of motor touring brought into being a hotel and catering industry which ended all ideas of Scotland being a preserve of the wealthy holiday-maker.

The industrial prosperity of Scotland is due to the opening of the coalfields. The great coalfield is the Lanarkshire one bearing Scotland's principal industrial area

There are also valuable mines in Fife, Ayrshire, and Midlothian. Iron ore is produced in much the same areas. Still more recent is the industry of obtaining oil from shales, carried on in West Lothian and Midlothian. Granite is quarried in the north. In the 1930s large power stations were put up in the Highlands, rivers and lochs being dammed, with a view to increasing the industrial potential of the country. (See Highland Development Scheme.)

The near presence of coal and iron, the deepening of the Clyde, and the development of trade with America have made Glasgow and neighbourhood one of the world's great industrial areas. Here are manufactures of chemicals and cottons, including sewing thread at Paisley, and engineering works. The same reasons have made the Clyde famous for its shipbuilding.

Other industrial centres are Dundee, where linen, jute, and hemp are made, and the Stirling district with its ironworks. Kirkcaldy is the centre of the sugar-refining industry. Distilling of whisky is widespread. Edinburgh is a centre of the printing and publishing trade; Perth is noted for dyeworks; there are textile industries at Dunfermline and elsewhere. The exports and imports of the country pass chiefly through the ports of Glasgow and Leith. In 1923 the railways of Scotland were amalgamated

SCOTLAND: THE 33 COUNTIES

with the English companies, and the country was served by L.M.S. and L.N.E.R. until under nationalisation the Scottish Region of British Ryrs. was formed in 1948. The canals of Scotland are the Caledonian, the Crinan, the Forth and Clyde, and the Union.

The pop. of Scotland at the census of 1931 numbered 4,842,554,

more than one-fifth of whom lived in Glasgow. The return showed a slight decrease since 1921. Estimates for the end of 1947 are given in the accompanying table. There are 33 counties. Four cities which have populations in excess of 100,000—Glasgow, Edinburgh, Aberdeen, and Dundee—also rank as counties of themselves. Perhaps 10,000 persons speak Gaelic only, and 150,000 speak both English and Gaelic.

ADMINISTRATION, ETC. The union of the crowns of England and Scotland in 1603, and to a greater extent the union of the parliaments in 1707, brought about changes in the government of Scotland in the direction of bringing it under the authority of England, but in many respects the kingdom retains its own system of government. Under the Act of 1918, and up to the general election of 1945, it has been represented in the parliament of the United Kingdom by 74 members, of whom 38 represented the counties, 33 the burghs, and 3 the universities; 16 Scottish peers, elected by their fellows, sit in the house of lords. Although no longer the seat of a parliament, Edinburgh is the capital and contains the government offices.

For the general control of Scottish affairs by the government there is a secretary, who since 1926 has ranked as a secretary of state. Certain British state

Scotland. Strath Broom, West Ross-shire, characteristic of the unrivalled scenery of the north-west Highlands
Photo: R. N. Adam

departments, e.g. the Home office and board of Trade, have authority in Scotland, but for other branches of public work there are separate Scottish departments, these including education and agriculture. Revenue is collected by branches of the revenue departments, including the post office. Scotland retains its own legal system, which is quite different from that of England, although there is an appeal to the house of lords and the lord chancellor acts for all Great Britain. (*See Scots Law.*) Its ecclesiastical system, too, is quite different and distinct. (*See Church of Scotland.*) The land question has given rise to an organization of courts adapted to the peculiar needs of the country. Local government was remodelled as far as the burghs were concerned in 1835, and for the counties in 1889. The system was revised in 1929 and to a lesser extent in 1947. The burghs, which may be divided into three classes, royal, parliamentary, and police, were placed under elected councils, their constitution being made uniform, although, as in England, the larger ones have more extensive powers than the smaller ones. The various local government areas are now counties, counties of cities, large burghs, and small burghs. Each county has a council elected every three years. Each burgh has a town council, the councillors also being elected for three years, but one-third of them annually retiring. The area of each county council is divided into districts each with its council. Councillors who represent the electoral divisions in the district are *ex officio* members of the district council, but others are elected.

HISTORY. In 55 B.C., broadly speaking, the whole island of Britain was under the domination of Celtic tribes, belonging to one of two great divisions, the Brythonic from the Channel to the Firth of Forth and Clydemouth, and the Goidelic or Gaelic beyond that line. A little later we find the name of Picts applied to the northern tribes and to the people of Galloway; it is still disputed whether the Picts were Gaels or Brythons, and possibly they were an earlier indigenous people.

The division of the whole island of Great Britain into the N. and S. portions corresponding to what we now call Scotland and England dates from the Roman occupation (ending A.D. 410), which was effective only as far as Hadrian's Wall, although Roman armies marched

over Scotland and planted their garrisons and fortified walls as far N. as the Forth. By the end of the 6th century the chaos which followed the Roman withdrawal was beginning to subside, and N. of the Humber and the Dee we have in effect a division into four kingdoms, the old Celtic Strathclyde on the W., the new English Northumbria from Humber to Forth on the E., the Celtic Scottish kingdom of Dalriada—roughly Argyllshire—and the Pictish kingdom covering the rest of Scotland beyond the Forth. The Scots were Gaelic Celts from Ireland who had established themselves in their corner during the preceding two centuries.

Formation of the Kingdom

During the 7th and 8th centuries the Angles dominated the E. lowlands and perhaps the E. coastal districts beyond the Forth, but there was no disappearance of the Celtic population, and in the W. lowlands the Celtic element predominated. The N. was Christianised by S. Columba and other Irish missionaries of the Celtic Church, which in the eyes of Rome was unorthodox. The Solway-to-Tyne division reasserted itself. Northern Strathclyde was parted from southern Cumbria, and northern Bernicia (Forth to Tyne) from southern Deira, though Bernicia was counted English.

Then during the 9th century Kenneth MacAlpin, half Scot and half Pict, became the king both of the Pictish and of the Scottish kingdom; everything beyond the Clyde and the Forth became the kingdom of Scotland or Alban. Strathclyde remained independent, and at the same time there began the period of the raiding and settlement of Northmen, who dominated the English part of Scotland. The Northmen also swept down the W. coast, making settlements on the islands.

For some two centuries the two sons of Kenneth and their offspring ruled Scotland, the two houses alternating. They acquired an uncertain dominion over Strathclyde, and periodically one or another of them did homage to one or another of the English kings, a homage which may or may not have implied recognition of a general sovereignty, but certainly did not imply any general submission. During the early 11th century, when Canute was king of England, Malcolm II wrested Bernicia (Lothian) from its English or Danish earl, and annexed it to his own kingdom,

with the result that from this time it tended to attract to itself the seat of government, to acquire a political predominance, and to be what the English meant by Scotland, though to the Gaels it still remained Sassenach or Saxon.

A turning point came a few years later. Malcolm II tried to establish his own line permanently; his grandson Duncan, having succeeded to the throne, was killed in 1040 by Macbeth, stepfather and guardian of the infant claimant of the rival house. In 1057 Macbeth was overthrown by Malcolm Canmore, son of Duncan. With Malcolm's accession, the dynasty was permanently established, though trouble was made periodically by claimants of the other house, who habitually appeared as champions of Celtic against English Scotland.

Though Malcolm was a Celt on the father's side, his mother was a Dane, a daughter of Earl Siward of Northumbria; also during the reign of Macbeth he had been bred among the Anglo-Danes of Northumbria, and, after his first marriage, he took to wife Margaret, the sister of Edgar Atheling, the representative of the house of Alfred the Great. The Scots kings from his time for another 200 years held estates in England, and now and then paid homage to the Norman or Plantagenet kings, for their crown according to the English chronicles, for their English estates according to the Scots.

English and Celtic Elements

With Malcolm and Margaret the process of Anglicising southern Scotland definitely set in. The third of his sons who wore the Scottish crown, David I, carried the process further and Normanised the country, giving great estates to Norman barons from over the border. Still both the new baronage and the Church, which Margaret's influence had Anglicised, intended to retain their independence of all claims to authority secular or ecclesiastical on the part of England. Scottish institutions developed independently.

The general result of these conditions was that there were really two Scotlands, the English-speaking feudalised lowlands and the Gaelic-speaking Celtic highlands, with a fringe extending over Caithness and the Isles, where there was a large Viking element, and the descendants of Somorled Lord of the Isles professed allegiance to the king of Scotland, or the king of Norway, or to neither. The extent of the crown's authority depended

mainly on the strength of arm of the king for the time being. Scotland, however, prospered under a series of princes, most of whom were men of ability and character, who evaded both open rupture with England and definite recognition of the suzerainty claimed by English kings. The one exception was William the Lion, who raided England in the reign of Henry II, was taken prisoner, and compelled formally to do homage for his crown in 1174, in order to recover his liberty. This treaty of Falaise, however, was abrogated 15 years later, at a price, by Richard Coeur de Lion. The last Celtic claimant to the throne of Scotland was suppressed under William, and the pretensions of the king of Norway were finally withdrawn after the battle of Largs in 1263, in the reign of Alexander III, under whom Scotland attained the zenith of her early prosperity.

The death of Alexander III in 1286 was the beginning of troubles, for he left no sons; his heiress was his daughter's daughter, the child Margaret called the Maid of Norway; nor was there anyone else living who could claim to be descended from a king of Scotland later than David I, who had died in 1153. Moreover, there was reigning in England an able king, Edward I, whose statesmanship aimed at forming the whole island into one consolidated kingdom.

Intervention of Edward I

A simple solution suggested itself to him in the project of marrying his own heir to the Maid of Norway; thus the crowns would have been united, and Edward's great work as a constitution builder in England would have extended its benefits to Scotland in the natural course. But the little queen died in the Orkneys on her way from Norway in 1290, and straightway a dozen different claims to the succession were brought forward. Edward bided his time. The law of succession was undefined; the Scots barons and prelates invited the king of England to arbitrate between the claimants; and Edward, having an armed force ready to throw across the border, announced his readiness to deliver judgement on condition that the assembled barons and prelates in general and the claimants individually should acknowledge his overlordship.

The claim was formally acknowledged, and after due inquiry Edward gave judgement in favour of John Baliol, in priority to Robert Bruce, both of whom descended from David I. But when it became apparent that Edward

intended to assert his sovereignty in actual practice and to treat Baliol as though he were really his vassal, barons and prelates were no longer acquiescent. Baliol treated Edward's sovereignty as a dead letter; whereupon Edward marched into Scotland, deposed Baliol as a recalcitrant vassal, declared the crown of Scotland forfeit under feudal law, assumed it himself, and set up an administration of his own, in 1296. The climax in Baliol's offences had been his entry upon a treaty with France.

Now in all these arrangements the people of Scotland had not been consulted. The national council, which had assumed authority when there was no king to act, was an assemblage of lay and clerical magnates, among whom the lesser folk, men of small estates, tenants of the crown, and free burghers, had no voice. When Edward covered Scotland with garrisons, a soldiery who treated the population at large as a conquered people, the spirit of resistance was aroused, and, while the great barons hung back, found its leaders among the gentry, who had neither paid nor promised allegiance to Edward. Andrew Moray in the N. and William Wallace in the S. gathered in moorland and mountain fastnesses bands of valiant freemen who would not bow to the new tyranny; the strength of the resistance was demonstrated when Wallace's company shattered the chivalry of the English governor at Stirling Bridge, Sept. 11, 1297.

Wallace's success brought Edward back in person, and, by the combination of archery and cavalry, he shattered the ranks of the Scottish spearmen at Falkirk, July 22, 1298. Without active support from the nobles Wallace could not maintain an effective resistance, although Edward could not compel a consistent submission. In 1305 Wallace was betrayed into the hands of the English authorities; the champion of liberty was hanged, drawn, and quartered as a traitor.

Bruce becomes King

But Wallace was hardly dead when a new champion arose in the person of Robert Bruce (q.v.). In 1306 Bruce committed himself by the sacrilegious murder of John Comyn in the church of Dumfries. His own life being forfeit, he promptly made up his mind to fight for his own life, for the vacant throne of Scotland, and for national liberty. Supported by a handful of patriots, he was crowned king of Scotland at Scone. His little following was dispersed at the fight of Methven, but early in 1307 he surprised the English in

his own earldom of Carriok, from which he expelled them.

Edward marched north to crush resistance once for all; but died before he could cross the border, and his degenerate son Edward II broke up the army and left the subjugation of Scotland to subordinates. While he for the next six years was quarrelling with his baronage, the Scots nobles were gathering to the standard of King Robert, who, with his captains Douglas and Randolph, conducted a war of surprises, capturing one English stronghold after another till in 1314 Stirling alone was left. Then Edward gathered the mighty army which on June 24 met at the hands of Bruce with defeat at Bannockburn. A year before the great liberator's death in 1329, Scotland's independence was formally acknowledged by the treaty of Northampton.

Feudalism and the Crown

Between the death of Robert Bruce in 1329 and the accession of Charles I in 1625 all but two out of the ten monarchs who wore the Scottish crown were children at the date of their accession, unless we except also James IV, who was in his 16th year. The two exceptions were Robert II and Robert III, both of whom were over 50. Therein lies the key to the fact that a strong central government was never established; every minority was a period of strife for ascendancy between factions of the nobility. Scotland was a prey to the feudalism which in England was habitually kept down, partly by strong kings and partly by parliamentary institutions.

Of the few strong kings in Scotland, none lived long enough to establish a royal supremacy capable of surviving through his successor's minority, and parliamentary institutions were embryonic. In England they developed primarily from the need of a heavy national expenditure which the king could not meet out of his own resources, so that he had to appeal to parliament for money; whereas in Scotland the king could live "of his own." The disintegrating force of feudalism in the S., and the clan system in the N., prevented the unification of Scotland and kept the magnates virtually independent of effective control. The natural effect would have been the absorption of Scotland by her more powerful and far wealthier southern neighbour, from which some of the magnates were from time to time by no means averse, but for the fact that the people, as distinguished from the magnates, preserved an enduring hatred of

the idea of English rule; so that threats of English invasions and renewals of English claims to suzerainty were invariably defied.

Robert Bruce was succeeded by an infant son, David II. For a time the regency remained in the capable hands of Thomas Randolph, earl of Moray, but after his death a directing head and hand were lacking. Edward Baliol, the son of King John, supported by the oxiled Anglicising nobles, and with English aid, was actually able for a time to expel David and call himself king of Scotland, professing allegiance to Edward III of England. Yet he was unable to hold his own against the stubborn resistance of the Scots who refused to acknowledge his authority, and from 1338 onwards the English king was too much occupied with his French wars to deal strenuously with Scotland. Baliol was finally ejected, and David was restored in 1341. In 1346, when Edward was engaged on the Crecy campaign, David invaded England and was taken prisoner at Neville's Cross, and in Feb., 1356, Edward III made a great raid into Scotland known as the Burnt Candlemas; but the Scots were none the readier to acknowledge his claims to supremacy, and refused point blank to make terms for the release of their king which involved any submission to England.

The House of Stewart

David, the degenerate son of a great father, was ultimately released on the partial payment of an exorbitant ransom which was never completed. He died in 1371 and was succeeded by his nephew, Robert II, the high steward, the son of his elder sister, Marjory, the first king of the Stewart dynasty. The history of Scotland becomes for the most part the story of feuds between powerful nobles whom the kings could not control, varied by occasional conflicts with the English of the border, such as the notable battles of Otterburn, 1388, and Homildon Hill, 1402, in both of which the leaders were Douglasses and Percies.

In 1406 young James, the heir to the throne, was kidnapped on his way to France, and was detained thereafter as a prisoner in England for 18 years. During the greater part of that time his uncle Robert of Albany was regent of Scotland, his father, Robert III, having died a few days after the boy was captured. The most notable incident of this regency was the battle of Harlaw, 1411, where Donald of the Isles was heavily defeated by the earl of Mar. Soon after the Scots were providing great

contingents to fight in France against Henry V; they won a notable victory over the English at Baugé in 1421, though afterwards they were badly beaten at Cravant and Verneuil.

The release and return to Scotland of James I in 1424 were the signal for the opening of a struggle, not between baronial factions, but between the Crown—supported by the Church—and feudalism. James had seen in England a country which was under the reign of law, whereas in Scotland he found a country in which each of the great nobles sought to be a law to himself and to his neighbours. He himself ruled with a strong hand, arbitrarily, not without vindictiveness, but at least with a general resolve to protect the oppressed. Also, he promulgated sound laws derived from England which remained practically a dead letter.

Rivalry of the Douglasses

James was murdered in 1437, and 15 years later James II, barely grown-up, slew with his own hand the head of the mighty house of Douglas, which brought to a head the rivalry between the Crown and its most powerful subjects. In the next three years the Black Douglasses were nearly exterminated, but another branch, the Red Douglasses, earls of Angus, rose to power in their place, when the vigorous young king was himself killed in his 30th year by the bursting of a cannon, 1460. The nobles, whose power might have departed altogether if James II had lived for another 10 or 20 years, completely recovered their independence under his feeble son, James III, who was killed in 1488 when in flight from the battle of Sauchieburn, where he had been defeated by the insurgent barons.

A period of comparative progress and prosperity set in under his son, James IV, a popular prince whose marriage in 1503 to Margaret Tudor, daughter of Henry VII, gave the crown of England to his great-grandson exactly 100 years later. But the reign of James IV ended with disaster, for in 1513, as the ally of France, with which Henry VIII was at war, he invaded England and was killed, with the flower of the Scottish nobility, on the fatal field of Flodden, leaving his crown to a three-year-old infant, James V.

The reign of James IV is a landmark in Scottish history, partly because it is on the border-line between medieval and modern Scotland, partly because it brought the royal family of Scotland into the direct line of succession to the English throne which it was to occupy.

Scotland never during the Middle Ages was a homogeneous nation. The Scottish dynasty before Malcolm Canmore had brought the whole South under its control; but with Malcolm himself, and increasingly under his descendants, the dynasty ceased to be in fact Celtic; the Anglicising and feudalising of the whole South proceeded apace, though with a much stronger Celtic survival than in England; while the North remained almost entirely tribal and Celtic in speech and in customs. Celtic Scotland never amalgamated with feudal Scotland, but preserved the clan system and the customary jurisdiction of the chiefs. It was to this system that the Vikings also assimilated themselves, several of the most powerful clan chiefs being of a Viking descent. The Scotland known to the English was feudal Scotland exclusively.

Another point to observe is that no king in Scotland was able to centralise power in his own hands as Henry II centralised it in England; therefore none was able to rule in the tyrannical or arbitrary fashion attempted by John and Henry III; therefore there were no constitutional movements like those of the 13th century in England for defence against the illegal overriding of recognized law, no assertion of the rights of a national council in limiting the activities of the Crown, though a national council existed which, in John Baliol's time, borrowed from England the name of parliament.

The Scottish Parliament

The constitution of parliament itself was exceedingly fluctuating, nor was there any call for its frequent assembling, since it was only on exceptional occasions that special financial levies were required. Taxation and legislation, the two principal functions of the parliament in England, made such small demands in Scotland that there was normally very little for a parliament to do. Though the lesser folk were given rights of attendance, they had no desire to exercise them, and hence, before the first Stewart king was on the throne the practice had begun of parliament delegating its functions to a committee known as the Lords of the Articles, who were to all intents and purposes selected by the magnates who at the moment had the strongest armed backing behind them. For practical purposes the parliament existed only to register the decisions of the Lords of the Articles, who were themselves not elected representatives but the nominees of the faction dominant for the time being, whether it

happened to be the king's faction, or the Douglas faction, or some other. Nor did the parliament ever adopt the English practice of dividing into two chambers; it sat and passed its measures as a single chamber. And the commons represented in it were only the tenants-in-chief holding their lands from the crown, who still bore the general name of barons, and the burgesses.

Relations with England and France

After Flodden, chaos resumed its sway. The queen-mother Margaret Tudor took for her second husband the young earl of Angus, the head of the house of the Red Douglasses. Each faction now engaged in endeavouring to obtain control of the person of the young king, and with it a claim to act as the supreme authority in the state. Henry VIII interested himself chiefly in fostering these feuds; and almost the only permanent factors were the steady hostility of the clergy, headed by Archbishop James Beaton, to English influences, and—partly as a consequence—the close alliance of the crown and the Church, as soon as King James V was old enough to escape from his would-be guardians and assert himself. For the boy was imbued from the first with a deep distrust of his uncle Henry's intentions towards himself, while the Douglasses were Anglophile and anti-clerical.

James escaped from the Douglas tutelage in 1528, at the moment when Henry VIII was on the point of embarking on his quarrel with the pope, and used his new liberty to sweep the Douglasses away and to associate himself closely with the churchmen, who, very soon, guided by Cardinal David Beaton, were opening a persecution of the Protestantism which was just beginning to make headway. James sought to draw closer the old alliance with France, the constant rival of England, and to repress with extreme rigour the chiefs in the highlands and on the English border, who had hitherto been accustomed to an excessive liberty. The principle of establishing a central control was undoubtedly right; but again James was not given time to carry the work to completion, and the immediate effect of his policy was to revive in all its intensity the old antagonism between the feudatories and the crown, and to alienate the churchmen from the baronage as well as from the commons, who were assimilating heretical doctrines.

The lay magnates of Scotland turned greedy eyes upon the wealth of the Church, and saw therein the best of arguments for ranging

themselves on the side of the Reformation. Thus their attitude towards England became extremely fluctuating. England had thrown off the Roman allegiance, and therefore the Reformers looked to England for support, but the hostility to an English domination was still ineradicable. The well-warranted suspicion that the English government was only awaiting its opportunity to assert that domination still stood in the way of active cooperation between the growing party of the Reformation and England, while the monarchical and clerical party clung the more closely to the French connexion.

James died Dec. 14, 1542, and his daughter Mary, just a week old, became queen. The attempt of Protector Somerset in 1547 to force the Scots at the sword's point to marry their little queen to the young king Edward VI played into the hands of the anti-English party. Mary was sent off to France, while her mother, Mary of Lorraine, a Guise whose brothers headed the ultra-Catholics in France, presently succeeded in capturing the regency of Scotland. By seeking to turn the French alliance into a French ascendancy, and persisting in the clerical policy, she revived the strength of the opposition; Scottish nationalism was no more inclined to accept a French than an English domination.

Progress of the Reformation

The Reformation in Scotland was not as in England imposed by the authority of government, but was essentially a popular movement, with fierce conviction at the back of it, led by fearless zealots such as John Knox, and fervently embraced by anti-clerical magnates who formed themselves into a league, and assumed the title of lords of the congregation. In 1559 the struggle between Mary of Lorraine and the lords of the congregation developed into civil war; in 1560 Elizabeth sent military aid to the Reformers, the regent died, and the victory of the lords of the congregation was sealed by the treaty of Leith and the complete withdrawal of the French, leaving the government in the hands of the lords of the congregation—headed among the Reformers by John Knox, among the laity by Lord James Stewart (afterwards earl of Moray). In 1561 Mary returned to Scotland.

For seven years the queen strove vainly to establish her own authority; in 1568 she fled to England, where she passed the remaining 19 years of her life in captivity, while Scotland once more suffered from the evils of a pro-

longed regency. The country assimilated the Reformation in the acutely Calvinistic form which gave to it an extremely democratic ecclesiastical organization. The Presbyterian system is described elsewhere. Here we may observe that its root idea was the spiritual independence of the Church from lay control, and the spiritual authority of the Church over morals.

The General Assembly of the Church became in fact the organ of Scottish democracy as it had never been possible for the parliament to be, and the lay magnates soon found the pretensions of the clergy more embarrassing than those of the churchmen of old, while they themselves, as before, were torn by factions. The young King James VI, brought up in an atmosphere of civil turmoil, with dissimulation his own single safeguard, developed, not indeed high qualities of statesmanship, but an exceeding craftiness, turning the factions against each other and against the clergy on the general principle *divide et impera*, while he succeeded in introducing an episcopal element into the government of the Church.

His position gained strength when, as the great-grandson of Margaret Tudor, he succeeded to the throne of England on the death of Elizabeth in March, 1603. Under his manipulation, the Lords of the Articles, always the official legislature of Scotland, had come completely under his control; he could make sure that they were all king's men. He had procured a law under which the General Assembly of the Kirk could only be summoned by the king's authority; and in 1610 he secured for his bishops something like a predominant voice in that assembly. In effect, he ruled in Scotland with an absolutism unknown to any of his predecessors since the days of Robert Bruce. And he was shrewd enough, by the Articles of Perth in 1618, to carry his ecclesiastical victory just up to but not over the limits, the crossing of which would have aroused forcible resistance. The distribution of Church lands among the laity had reconciled the recipients to the king's ecclesiastical policy.

Policy of Charles I

Charles I lacked his father's cunning. He alienated the landholders by revoking to the crown the grant of ecclesiastical lands; and then in conjunction with Laud he went far beyond the Articles of Perth in ordering on his own responsibility the adoption in the Scottish churches of the Anglican ceremonial observances which were an abomination to Scottish Protestants. Men of almost all shades of

opinion combined in the signing of the National Covenant, 1638, declaring their loyalty to the crown but binding themselves to maintain the national religion. For the time the Scots acted as a united nation, obeying the governing committees which they appointed, and the General Assembly, though none had any constitutional powers. When the king threatened coercion he found that the Scots could oppose him with a better-organized army than any he could himself raise. In 1639 terms were agreed upon, but neither party took the requisite action to carry them out. Next year, when the unsatisfied Scots had marched into the N. of England practically unopposed, and the king, unsupported by the English parliament, could take no effective steps to coerce them, Charles found himself obliged to give way. In 1641 Charles visited Scotland again, and left it with the government and the military forces wholly in the hands of the Covenanted leaders, from whom the critical situation of the monarchy in England as well as in Scotland had now caused a considerable royalist secession.

Solemn League and Covenant

When the Civil War broke out in England in 1642, Scotland, a separate kingdom, at first stood aloof; but during 1643 the conviction gained ground that the victory of Charles in England would more than restore the royal domination in Scotland. The Scots entered upon the Solemn League and Covenant with the English Parliament for the maintenance of pure religion, but with a renewal of the protestations of loyalty embodied in the National Covenant. Next year the Scots army entered the N. of England, and in conjunction with Manchester and Cromwell won the battle of Marston Moor, which was practically the turning point of the Civil War. Royalism in Scotland now made its one desperate and brilliant effort under the leadership of Montrose, an effort which opened with his victory at Tippermuir on Sept. 1, 1644, and ended with his defeat at Philiphaugh, Sept. 13, 1645, when the king's cause had been lost in England at Naseby.

Charles chose to surrender himself to the Scots army, and the Scots in their turn handed him over to the English parliament and withdrew over the border. But Scotland had no confidence either in the Presbyterian politicians at Westminster or in the Independents of the army; Scottish Presbyterianism was intolerant of sectaries. The king, though in confinement, maintained active intrigues and offered

to the Scots terms which transformed many of them (known as the Engagers) into Royalists, who, in conjunction with the old Cavaliers, temporarily gained the upper hand in the government of Scotland in 1648. An army of Engagers entered England, but was completely shattered by Cromwell at the battle of Preston, and the Covenanters, headed by Argyll, recovered their ascendancy, but did not renew their former amicable relations with the English leaders, who proceeded to the execution of the king in defiance of the terms of the Solemn League and Covenant.

Cromwell's Victories

Scotland, then under its covenanted government, exercised its right as an independent state to negotiate with the dead king's exiled heir, and to receive and recognize him as King Charles II on his acceptance of the National Covenant, after Montrose's failure in an abortive campaign to restore him unconditionally. But the English Commonwealth could not afford to have Charles seated on the Scottish throne. Cromwell was dispatched to the north. The rout of Dunbar, where the military judgement of Leslie was overridden by the fanaticism of a clerical committee which attended the commander in the field, did not carry with it the subjugation of Scotland, but that result practically followed when the Scots army marched into England and was annihilated by Cromwell at Worcester, Sept. 3, 1651.

Monk had been left behind in Scotland as Cromwell's lieutenant. In the course of a few months he made himself master of the country, and, while the executive administration was assigned to him, an Act of the English parliament of 1652 incorporated Scotland with the English Commonwealth, and gave her representation at Westminster in place of her own national parliament, with full freedom of trade. Scotland yielded only a sombre acquiescence. Representation in the Commonwealth parliaments did not carry with it the idea of an independent political life, so dear to the Scottish heart. The benefits of commercial equality could not at once make themselves actively felt. In Scotland the administration remained dominated by Englishmen, and the sanction of the new government was provided mainly by English troops.

With the Restoration in 1660 the temporary union was dissolved. All Acts of Parliament since 1641 were cancelled and the status of that year was ostensibly restored. But the Royalist reaction was more uncompromising in Scotland than

in England. The Scots parliament reverted to its position as a body for registering the legislation of a committee who were in effect crown nominees, while the executive government was in the hands of a committee of the privy council, in which the extremist Archbishop Sharp was predominant. Scottish politics resolved themselves into a struggle in which moderate men sought freedom in religion, while the government enforced conformity to doctrines and practices wholly alien to the people of Scotland, and the extreme Covenanters denounced all departures from their own forbidden doctrines and practices with a virulence for which the only excuse was the flagrant tyranny with which the government enforced its own repressive measures. The persecution raged, especially in the western lowlands, practically throughout the reigns of Charles II and James VII, so that Scotland as well as England was ready to offer the crown to William and Mary when James took flight to France in Dec., 1688. The Jacobites (*q.v.*) found a brilliant leader in Claverhouse; but his death at Killiecrankie, July 27, 1689, ended all immediate hope of a Stuart restoration.

Effects of the Revolution

The Revolution gave to Scotland what it had never before enjoyed, a free parliament, not hampered by the Committee of the Articles controlled by the Crown; moreover William, realizing that to be an Episcopalian in Scotland was equivalent to being a Jacobite, assented to the abolition of the episcopal element in the Scottish Church altogether, and the establishment became Presbyterian without qualification, the condition being the toleration of nonconformity. Scotland then at last had a government less arbitrary and more nearly resembling that of England than she had ever before known. But her relations with England were unsatisfactory. William was in the first place a Continental statesman, the stadtholder of Holland, and in the second place king of England, a power very valuable to him in his European projects. To Scotsmen it appeared that the continued union of the two crowns would mean the effective subordination of Scottish to English interests.

Barriers put up in the interest of English trading interests throttled the commerce of Scotland, and she had no means of retahating. The massacre of Glencoe was attributed to the king's disregard of Scottish affairs; the disastrous failure of the Scottish Darien scheme (*q.v.*) was

laid at the door of English commercial rivalry. Jacobite sentiment was much stronger in the ancient kingdom of the Stuarts than in England, and was coupled with a passionate hostility among many of the clans to the typically Whig clan of Campbell. William himself and sundry intelligent statesmen in Scotland saw the solution of the various problems in an incorporating union which would secure to Scotland equality and freedom of commerce, her national institutions, and her national Church. The obvious alternative, a prolonged continuation of the existing system being impracticable, was a complete severance of the two kingdoms, probably to be accompanied by a Stuart restoration in Scotland.

Treaty of Union

However much reason might favour an incorporating union upon fair terms for Scotland, Scottish national sentiment persistently dreaded the subordination of Scotland to England under any conceivable scheme, while England remained apathetic, and English merchants were very little disposed to make any commercial concessions whatever. But with the accession of Anne in 1702, and the immediate necessity for both countries to fix upon the heir or heirs who should succeed her, the postponement of a decision was no longer possible. In both countries statesmanship triumphed over sentiment and prejudice; and in 1707 the treaty of Union was ratified by the two parliaments. England and Scotland were united in the single state of Great Britain with a single parliament, though in certain respects with separate administration, and without detriment to the institutions of either. The separate history of Scotland as a sovereign state ends formally with the Union, though the permanence of the Union remained in the balance until Jacobitism received its death-blow on the field of Culloden in 1746.

LANGUAGE AND LITERATURE. In Saxonised Scotland, the northern dialect of Early English became largely modified by borrowings from the speech of the various races—Cymric, Pictish, Gaelic, Norse—who collectively may have included the bulk of its inhabitants, and while, later, the close relationship between Scotland and France introduced many French phrases and idioms into the language, the forms and methods, as well as the language, of Scottish verse were further affected by Chaucerian and other English influences. Thus by the 15th century the Scottish language had acquired a somewhat more varied and expressive vocabulary than contemporary English, though, owing to the break in the continuity of the vernacular literature and the increasing intercourse with England, many words and phrases gradually became obsolete.

Early Romantic Literature

Only fragments survive of the earlier patriotic minstrelsy, and only isolated stanzas of the older ballads. Also the rhymed prophecies and other poetic remains fathered on the famous Thomas the Rhymer lack authenticity, though he is the possible author of the meritorious romance of Sir Tristan. Of later date are certain surviving alliterative romances, some of which are attributed by Wyntoun to Huchown of the Awle Ryale, who may have been the Sir Hew of Eglinton of Dunbar's Lament. These romances partly affected the forms of later verse; but the distinctively Scottish literature properly dates from The Bruce of John Barbour, which, while it owes much to its patriotic theme, manifests a glowing enthusiasm and graphic force, quite absent from the rhymed Chronicle of Andrew of Wyntoun. The later Wallace of Henry the Minstrel (d. c. 1492), though fabulous more than historical, is metrically a great advance on The Bruce, and shows distinct evidence of indebtedness to Chaucer.

This great English master may have been introduced to Scottish versifiers by James I, to whom there is old authority for ascribing The Kingis Quair, written in the Chaucerian manner, and in a modified form of the Chaucerian dialect. James I has also been credited with those piquant pictures of the rude

horseplay of the rustic Scots in At Beltane and Christis Kirk, on which much later verse—including that of Fergusson, Ramsay, and Burns—was modelled. They further indicate the early existence of a school of native verse of more vital force than the Chaucerianism which later was partly engrafted on it. While Robert Henryson, with whom begins the golden period of Scottish verse terminated by the Reformation, shows himself in Orpheus and The Testament of Cresseid the mere disciple of Chaucer, his poetic individuality is better revealed in his purely Scottish Fables and minor verse, including the classic Robene and Makyn; and it is similarly so with his contemporaries and successors.

His contemporaries include Sir Richard Holland, author of a curious political romance, The Howlat, in the alliterative stave; John Affleck and John Clerk, who were mourned by Dunbar, and to the latter of whom five pieces are attributed in the Bannatyne MS., including the humorous wooing of Jok and Jynny, prototype of many subsequent songs, among others the modern Duncan Gray; Patrick Johnstoun, author of the severely didactic Three Deid Powis (Polls); Mersar, some of whose love ballads, praised by Dunbar, still survive; and Sir John Roulis, whose mock excommunication of The Stelaris of his Fowlis lacks nothing in coarse denunciatory vigour.

Of purely Scottish, and probably earlier, growth are those humorous burlesques of the romances, The Taill of Rauf Collyear, the extravaganza of Cockellio's Sow, King Berdok, the grim tale of The Gyre Carling, and the gentle *geist* (ghost) of Lord Fergus (Ghost).

Dunbar and Lyndsay

But head and shoulders above both his Scottish predecessors and contemporaries stands William Dunbar, a master metrist in a great variety of staves. Of Walter Kennedy, his chief contemporary, no very definite judgement can now be formed, only five pieces besides his vituperative *Flying with Dunbar* being now preserved. Strikingly contrasting with both is the grave and erudite Gavin Douglas, notable for his translation of the *Aeneid* into heroic couplets. Sir David Lyndsay, though a partial disciple of Douglas, was, like his great master Dunbar, a more trenchant moralist. Yet clever versifier—if not poet—though he was, he owed a popularity, which survived the Reformation, merely to his satiric exposure of Catholic corruptions, and indeed, foreshadowed the peculiar Protestant obsession which,

for a time, was to obliterate all interest in merely secular literature.

In the later verse of the Scottish Anacreon, Alexander Scott, and that of the less poetical, though metrically accomplished, Alexander Montgomerie, there is evidence of a close connexion with contemporary English poetry, which, but for the Reformation, might have resulted in a new school of Scottish verse wider in scope than the old one.

But these two names, with the lesser one of the genial moralist and satirist, Sir Richard Maitland, properly terminate the list of the old poets, for neither the patronage of James VI, nor his royal precepts nor example, could avail against the withering blasts of Protestant Puritanism. The Reformation also hindered the development of a native prose literature, which, for many generations, was exemplified mainly in the Scots-English of Knox's graphic History, the vivacious Chronicle of Lyndsay of Pittcottie, Bishop Leslie's History, and that curious political medley, The Complaynt of Scotland.

The character of the old popular songs is partly mirrored in the pietistic parodies of them in The Gude and Godly Ballatis of the Reformation. Other lyrics imperfectly preserved in Allan Ramsay's versions, as well as various fragments in floating tradition, indicate that the Godly Ballatis did not wholly extinguish the predilection for the old songs; but, with some slight exceptions, as Robert Semple, author of Habbie Simson, the Scottish poets of the 17th century were, like Drummmond of Hawthorneden, entirely Anglicised. Even, however, before Ramsay, interest in vernacular verse had begun to revive, as is witnessed by the songs of Lady Grizel Baillie, the Hardyknute of Lady Wardlaw, the verse of William Hamilton of Gilbertfield, and the publication of James Watson's Choice Collection of Scottish Poems.

Ramsay and Burns

But a new national impetus to the revival was given by Ramsay, through his publication of specimens of the older pieces from MSS., his versions of old songs, and his own vernacular and semi-vernacular verse. He had various contemporaries, including his rival in rancid humour, Alexander Pennecuik, Robert Crawford, author of The Bush Aboon Traquair and other Scots-English lyrics, William Hamilton of Bangour, author of The Braces of

Yarrow, and three woman song writers, Alicia Cockburn, Jane Elliot, and Lady Anne Barnard. Ramsay's main successors were the short-lived Robert Fergusson, a more refined and better disciplined versifier than Ramsay, and Burns, with whom the revived vernacular school culminated. Immediate predecessors of Burns were the excellent song writers, Alexander Ross, John Skinner, and Alexander Geddes.

The brilliant triumphs of Burns created a further host of aspirants, and by his editorship of Johnson's Museum and his support of Thomson's Scottish Airs he greatly stimulated enthusiasm for Scottish song. Here it is that we have the best examples of the later Scottish muse. Prominent among his contemporaries were Hector Macneill, Mrs. Grant of Carron, and the voluminous Lady Nairne. As poets, James Hogg and even Scott have won probably a more lasting renown by their songs—not, however, all quite Scottish—than by their poetical romances. Among other later versifiers are the sweetly sentimental Tannahill, the accomplished parodist Allan Cunningham, the boisterous humorist Alexander Boswell, and the strenuous realist William Watt, author of The Tinkler's Waddin, and Kate Dalrymple. The vernacular revival, however, was never more than a partial imitation of the old versifiers. It was ennobled by the unique achievements of Burns, but otherwise was limited in scope and tended to become more so, though it has still accomplished representatives.

Scotland, BANK OF Institution founded by an Act of the Scottish parliament in 1695 with the exclusive privilege of banking for 21 yrs., and the first bank to be established in Scotland. It absorbed the Central Bank of Scotland in 1868, the Caledonian Banking Co., Ltd., in 1907. In 1948 it had 228 branches throughout that country, and two offices in London. Head office, The Mound, Edinburgh.

Scotland, CHURCH OF. This subject is treated under Church of Scotland.

Scotland, COMMERCIAL BANK OF. Limited company established in 1810 by royal charter. Its head office is in George St., Edinburgh, and it has more than 300 branches throughout Scotland, with a chief office in Glasgow at 113, Buchanan St. It possesses several offices in London and engages in all forms of commercial banking, as well as issuing its own notes.

Scotland, NATIONAL BANK OF. This bank was established by royal charter in 1831 and incorporated as a limited company in 1882. In 1918 almost the whole of its share capital was acquired by Lloyds Bank, with which it maintains the closest association. Besides its head office in Edinburgh, it has branches in all the principal towns of Scotland and in the City and West End of London. It possesses a small note issue.

Scotland, ROYAL BANK OF. Incorporated by royal charter in 1727, this bank is unusual in that it has since 1924, by purchase or otherwise, set up extensive banking connexions in England. That year it absorbed the old concern of Drummmond and co., Charing Cross; in 1930 a substantial interest in Williams Deacons Bank was acquired, and the private banking business of the Bank of England at Burlington Gardens was transferred to the Royal Bank of Scotland; in 1939 the latter acquired the capital of Glyn, Mills and co. The bank has head offices in both Edinburgh and Glasgow, numerous branches throughout Scotland, and a foreign department in London.

Scotland, SECRETARY FOR. Official appointed in 1885 to be responsible to parliament for the public business of Scotland, hitherto shared by a number of government departments. Since 1926 he has ranked as a secretary of state and has had a parliamentary under-secretary. His offices are at Fieldden House, 10, Great College St., Westminster, S.W.1., and St. Andrew's House, Edinburgh. From 1707 to 1746 there was a secretary of state of Scotland.

Scotland, UNION BANK OF. Institution founded in 1830. The head office is in St. Vincent Street, Glasgow, and in addition to branches throughout Scotland, this bank has offices in London, and issues its own notes.

Scotland Yard. Familiar name for the headquarters of the Metropolitan Police in London, more correctly described as New Scotland

Yard. The headquarters were formerly at Great Scotland Yard, connecting Whitehall and Northumberland Avenue. This site was once occupied by a palace built for the reception of the kings of Scotland when they visited London—hence the name; Margaret, sister to Henry VIII, was its last occupant. It fell into ruin in Elizabeth's reign. The official residence of the surveyor of works to the crown was here, and residents included Milton, Inigo Jones, Sir J. Denham, and Sir J. Vanbrugh. See Criminal Investigation Department; Detective; Flying Squad; Metropolitan Police; New Scotland Yard; Police.

Scots Fusiliers, ROYAL. Regiment of the British army. The senior British fusilier regt. and the second oldest Scots regt. of foot, it was raised in 1676 by Charles, 5th earl of Mar, for the suppression of border lawlessness. From its hoddie grey uniform the regt. was nicknamed Mar's Grey-Breeks. In 1684 the regt. went

Scots Fusiliers badge

to the Netherlands for service against the French, and returned to Britain in 1694, when it was numbered the 21st Foot. It was given its title, the Royal Scots Fusiliers, in 1713.

Serving through Marlborough's campaigns, the 21st Foot earned particular distinction at Blenheim, and at Ramillies totally destroyed the Picardie regt. It covered the forces besieging Mons in 1709, and fought at Dettingen, 1743, and Fontenoy, 1745. Hastily shipped home, the 21st Foot formed part of the army that defeated Charles Stuart at Culloden. Its next major campaign was in the American War of Independence, and in 1794 it gained the honour Martinique. In the Napoleonic wars, a second battalion was raised, the regt. serving in Egypt, Sicily, Italy, and Holland. As a reward for its expert marksmanship in the American War of 1812-14, a sleeve badge of crossed muskets was granted, since adopted as the army's marksmanship badge.

Three honours were gained in the Crimean War, and one for the Zulu War of 1879. The regiment fought in the Boer War of 1880-81 and the Burma campaign of 1885.

It took part in the Tirah campaign of 1897, and served throughout the S. African War of 1899-1902. Eighteen battalions of the Royal Scots Fusiliers were raised for service in the First Great War and earned for the regt. the battle honours: Mons; Marne, 1914; Ypres, 1914, '17, '18; Somme, 1916, '18; Arras, 1917, '18; Lys; Hindenburg Line; Dorian, 1917, '18; Gallipoli, 1915-16; and Palestine, 1917-18. In 1926, to mark its 250th anniversary, the regt. was granted permission for its pipers to wear the Erskine tartan. In the Second Great War it served in France (1940), N. Africa, Sicily, Italy, Madagascar, and Europe. The regimental depot is at Ayr.

Scots Greys, ROYAL. Regiment of the British army. The only surviving regular cavalry regiment, the Scots Greys originated in three troops of dragoons raised in 1673 to hunt out the Covenanters. In 1681 three more troops were raised and the six regimented as the 2nd Royal Regiment of Dragoons of Scotland. From the colour of its uniform, not that of the horses, the regiment received its name; not until some years later was it mounted on grey chargers. The regt. served in Flanders under William III and was present at all Marlborough's victories. At Waterloo the Scots Greys charged with the Gordon Highlanders clinging to their stirrups, and Ensign Ewart captured single-handed the standard of the French 45th regiment. In commemoration of the exploit, the Scots Greys were awarded their eagle badge. They rode with the Heavy Brigade at Balaclava, and served in the S. African War.

Scots Greys badge

In the First Great War, the Scots Greys fought both as cavalry and dismounted troops, and earned the battle honours: Mons; Marne, 1914; Aisne, 1914; Ypres, 1914, '15; Arras, 1917; Amiens; Somme, 1918; Hindenburg Line; Pursuit to Mons. Stationed in Palestine at the outbreak of the Second Great War, they took part in the Syria campaign of 1941 as lorried infantry, and in 1942 were mechanised as an armoured regiment. They led the 8th army's advance from Alamein to Tripoli, and were first ashore at Salerno. The regt. was one of the first to land in Normandy in 1944; held

the Arnhem-Nijmegen "island"; and at Wismar, May 2, 1945, made the first contact of British troops with the Russians. The regimental depot is at Colinton, Edinburgh.

Scots Guards. Regiment of the British army.

Scots Guards badge

Raised in Scotland in 1641 by Charles I for service in Ireland, the regt. declared for the royalist cause in the Civil War and in 1651 was destroyed at the battle of Worcester. After the Restoration it was reformed in Scotland as the Scotch Fusilier Guards, and in 1686 moved into England. At the Union in 1707 it came on to the British establishment as the 3rd Foot Guards. The regt. gained its first honour at Namur in 1695 and then served in Marlborough's campaigns. It fought at Dettingen; was in Egypt in 1801; gained five honours in the Peninsula; and was with the Guards Brigade at Waterloo. In the Crimea it fought at Alma, Inkerman, and Sevastopol; it was at Tel-el-Kebir in 1882; and served throughout the S. African War.

Three battalions of Scots Guards served in the First Great War and won the honours: Mons, 1914; Marne, 1914; Aisne, 1914; Ypres, 1914, '17; Festubert, 1915; Loos; Somme, 1916, '18; Cambrai, 1917, '18; Hindenburg Line; France and Flanders, 1914-18. In the Second Great War the regt. served in Norway, N. Africa, and Italy, and with the Guards armoured div. in the liberation of Europe. It was a bugler of the Scots Guards who sounded cease fire in Europe on May 8, 1945. When in full dress, the regt. has tunic buttons grouped in threes, and no plume in the bearskin.

Scots Law. Law that prevails in Scotland. Up to the 14th century Scots law was substantially the same as English, apart from local customs. In the 16th century, however, Roman law permeated the whole structure of jurisprudence with the renaissance of letters, this change being mainly due to the fact that trained lawyers took the place of territorial chieftains in legal administration. During the 19th century Scots law again became more and more influenced by English law, although Scotland's separate jurisprudence was secured by the treaty of Union of 1707.

The supreme court in Scotland is the court of session created in

1532, whence lies an appeal to the house of lords. The sheriff courts are the county courts of Scotland, but the sheriff is both a civil and a criminal judge, and in most civil matters his jurisdiction is unlimited. This fact renders justice less expensive in Scotland. Solicitors practise before the sheriff almost exclusively, and court fees are not high. Appeal lies from him to the sheriff principal, or to the court of session.

Justices of the peace have civil jurisdiction only in claims for debts not over £5. They have criminal jurisdiction over all breaches of the peace and over the less serious crimes. They grant liquor licences. The magistrates of a burgh have a jurisdiction corresponding to that of justices.

Criminal prosecutions are under the charge of advocates-depute under the lord advocate and the solicitor-general. In every district there is an official prosecutor, the procurator-fiscal. Private prosecutions are almost unknown. There is, in Scotland, no preliminary public hearing, the preliminary investigation always being conducted in private.

The law in mercantile matters, e.g. sale of goods or bills of exchange, has come to be almost the same as in England, but Scots law does not regard consideration as essential to a contract. Great differences exist, however, between the laws of the two countries relating to land and wills. A man cannot by his will deprive his widow or children of all share in his estate. The widow may claim terce and jus relictæ and the children legitim. A widower may claim courtesy and jus relictii. For both husband and wife, these rights arise also on divorce.

The marriage laws formerly differed greatly, many forms of irregular marriage—such as the "Gretna Green" marriage—being recognized in Scotland; but in 1939 nearly all these forms were abolished and marriage before an authorised registrar became standard. From 1937, the laws of the two countries in divorce became more alike, although some differences continued.

Scotsman. THE. Scottish daily newspaper. Established in Edinburgh as a weekly, Jan. 25, 1817, it became a bi-weekly in 1823, and a penny daily in 1855. In its first 100 years it had only two managers, John Ritchie and James Law and six chief editors.

The Scotsman's first offices were two rooms in the High Street

In 1904 it moved to palatial offices erected in North Bridge Street. It has branch offices in Glasgow and London. The Weekly Scotsman and The Edinburgh Evening Dispatch, established in 1886, belong to the same firm, the Scotsman Publications, Ltd. See Cooper, C. A.

Scots Pound. Scottish gold coin, originally of the same value as the English pound. Through debasement of the coinage its value sank after 1355, till in the 17th century it was worth only 1s. 8d. It disappeared after the treaty of Union of 1707.

Scott, CHARLES PRESTWICH (1846–1932). British journalist.

C. P. Scott,
British journalist;
Holier

Born at Bath, Oct. 26, 1846, and educated privately and at Corpus Christi College, Oxford, he was editor, 1872–1929, of the Manchester Guardian (q.v.), of which he became governing director in 1921. The history of the Manchester Guardian during the period named is aptly described as the history of his mind, and he will be remembered as one of the most distinguished journalists of his time. He was Liberal M.P. for Leigh, 1895–1906. He died Jan. 1, 1932. His life, by J. L. Hammond, appeared in 1934.

Scott, CHARLES WILLIAM ANDERSON (1903–1946). British airman. He was born in London, Feb. 13, 1903, and joined the R.A.F. in 1922.

During 1927–30 he was engaged in Australia as an air-mail pilot. In 1931 he flew from England to Australia and back, taking 9 days 4 hours on the outward journey and 10 days 22 hours on the return. The following year he beat the England to Australia record by 5½ hours, his journey taking only 8 days 20 hours. In 1934, with T. Campbell Black, he won the Melbourne air race, covering 11,296 miles in 2 days 23 hours. His autobiography, Scott's Book, appeared the same year. He died April 15, 1946.

Scott, CLEMENT WILLIAM (1841–1904). British dramatic critic. Born in Hoxton, Oct. 6, 1841, and educated at Marlborough, he

began life as a clerk in the War office. Soon, however, he drifted towards journalism and dramatic criticism, and eventually became dramatic critic to the Daily Telegraph, being regarded as the best judge of acting of his time. His own efforts to write for the stage were not particularly successful, nor was The Free Lance, a paper which he founded after he had left the Daily Telegraph in 1898. He died June 25, 1904. Scott was the originator of a more picturesque style of criticism than former generations had known; but though his opinions carried weight, his work was often marred by personal prejudice. Consult Old Days in Bohemian London. Mrs. Clement Scott, 1919.

Clement Scott, British
dramatic critic
Elliott & Fry

Scott, CYRIL MEIR (b. 1879). British composer and writer. Born at Oxtou, Cheshire, Sept. 27, 1879, he studied composition in Germany, where his first symphony was performed at Darmstadt, 1899. He wrote many songs and ballads, and did valuable work in discovering, noting down, and scoring English folk-songs. His compositions included a piano concerto, a concerto for two violins, a cello concerto, La Belle Dame Sans Merci (first performed at Leeds, 1934), Neptune (symphonic poem), and an opera The Alchemist. He published several volumes of verse, e.g. The Celestial Aftermath; The Vales of Unity; his prose works included An Outline of Modern Occultism, and memoirs, My Years of Indiscretion.

Cyril Scott,
British composer

Scott, DAVID (1806–49). Scottish painter. He was born in Edinburgh, Oct., 1806, the son of Robert Scott, the engraver. He became an engraver himself about 1825, but the work was distasteful and he soon left it for imaginative design

David Scott,
Scottish painter
From a bust

In 1827 he helped to found the Edinburgh Life Academy Association, and in 1828 he exhibited a painting at the Scott'sh Academy. In 1831 he completed Monograms of Man, a series of six designs in outline, and commenced a series of outline drawings for *The Ancient Mariner*, published 1837. He died March 5, 1849. *Consult* Memoir, W. Scott, 1850.

Scott, DUKINFELD HENRY (1854-1934). British palaeobotanist. He was born in London, Nov.

D. H. Scott,
British scientist
Lafayette

28, 1854, a son of Sir George Gilbert Scott (*q.v.*), and educated at Christ Church, Oxford, and at Würzburg. From 1882 to 1885 he was assistant professor of botany at University College, London, 1885-92 at the Royal College of Science, then until 1906 honorary keeper of the Jodrell laboratory at Kew. He cooperated with W. C. Williamson in researches into fossil plants, and wrote *The Evolution of Plants*, 1911; *Extinct Plants and Problems of Evolution*, 1924. He died Jan. 24, 1934.

Scott, DUNCAN CAMPBELL (1862-1947). A Canadian poet. Born at Ottawa, Aug. 2, 1862, he went to Stanstead College and thence into the civil service at 17. When he retired in 1932 he was deputy superintendent of the department of Indian affairs. Secretary of the Royal Society of Canada from 1910, he was chosen president in 1921. In 1934 he was made C.M.G. He died Dec. 19, 1947. Scott, who published his collected poems in 1926 and another vol., *The Green Cloister*, nine years later, is held by many Canadians to be their foremost poet, his lyrics and Indian pieces being particularly distinguished.

Scott, SIR GEORGE GILBERT (1811-78). British architect. He was born at Gawcott, Bucks, and articled to an architect in London.

The writings of Pugin gave him an insight into the principles of Gothic architecture, of which he became the leading English exponent. His buildings in-

Sir Gilbert Scott,
British architect

clude the Martyrs' Memorial at Oxford, the station and hotel at St. Pancras, some buildings of Glasgow university, and the Albert Memorial. He did an immense amount of restoration work on English cathedrals and churches, some of which was afterwards regarded as being unduly destructive of ancient work. He was elected A.R.A. in 1855 and R.A. in 1861. Scott, who was knighted in 1872, died at South Kensington, March 27, 1878, and was buried in Westminster Abbey. *See* Albert Hall; Albert Memorial; Doncaster; Glasgow illus. p. 3783; Harrow; Scott, Sir Giles.

Scott, SIR GILES GILBERT (b. 1880). British architect. Grandson of Sir George Gilbert Scott (*v.s.*), he was born Nov. 9, 1880, and educated at Beaumont. After a year's practice he designed successful plans for the Anglican cathedral at Liverpool, 1903, a dignified essay in modern Gothic. In addition to many ecclesiastical buildings, including the nave of Downside abbey, chapels at Charterhouse and Ampleforth abbey, his works include Battersea power station, the library at Cambridge university, and extensions to the Bodleian, Oxford. His design for the new Waterloo Bridge was accepted in 1934. Scott was appointed architect when Coventry in 1942 prepared plans for a new cathedral to replace that destroyed in 1940 by German bombs, but in 1947 he resigned because the committee would not approve his designs. Elected R.A. in 1922, he was knighted in 1924, was P.R.I.B.A., 1933-35, and was awarded the O.M., 1944.

His brother, Adrian Gilbert Scott (b. Aug. 6, 1882), was also educated at Beaumont. He designed many churches, his principal work being Cairo cathedral. The brothers were associated in the design of the new house of commons, and in 1945 Adrian was appointed successor to Lutyens as architect of the R.C. cathedral at Liverpool.

Scott or Soot, MICHAEL (c. 1200). Scottish reputed wizard. The facts of his life are obscure, but it is believed that he was of a Fife family, studied at Oxford and in Paris, and entered the service of the Emperor Frederick II. At Toledo he apparently gained suffi-

cient knowledge of Arabic to translate part of Aristotle into Latin from an Arabic version, and he is said to have introduced this translation to Oxford and other universities. According to Italian traditions he died in Italy, but other accounts, which Sir Walter Scott follows in *The Lay of the Last Minstrel*, make him return in the last years of his life to his native Scotland, being buried in Melrose Abbey. Among the supposedly authentic works attributed to him are treatises on generation, physiognomy, and alchemy. In Scottish folk lore many wonders were ascribed to his supposed powers.

Scott, MICHAEL (1789-1835). Scottish novelist. Born at Cowairs, Oct. 30, 1789, and educated at Glasgow university, he spent some years in the West Indies, but settled in business in Glasgow in 1822. His fame rests chiefly on *Tom Cringle's Log*, first published serially in *Blackwood's Magazine* between 1829 and 1833. It won the praise of Coleridge, and is still read. *The Cruise of the Midge* also appeared serially in *Blackwood* 1834-35. Both novels appeared anonymously, and Scott's authorship was not made known till after his death on Nov. 7, 1835.

Scott, SIR PERCY MORETON (1853-1924). British sailor. He was born July 10, 1853, and educated at University College, London. Entering the navy, 1866, he was promoted captain in 1893, and rear-admiral 1905. A member of the ordnance committee in 1894-96, he came into prominence by reason of the excellent shooting of the *Scylla* and *Terrible*, which he successively commanded, and for which the training of gunners by his "dotter" was largely responsible. He improvised the mountings for the heavy guns for *Lady'smuth* in the S. African War. He was captain of the *Excellent*, the R.N. gunnery school, 1903-05, inspector of target practice, 1905-07, and commanded cruiser squadrons, 1907-09. In 1910 he was created K.C.B. and in 1913 a baronet. He retired with admiral's rank, but rejoined on the outbreak of the First Great War, being some time in charge of the A.A. defences of London. Scott died Oct. 18, 1924.

Scott, ROBERT FALCON (1868-1912). British Antarctic explorer. Born at Outlands, Devonport, June 6, 1868, he was trained for the navy, and served as midshipman in the *Monarch*, and as lieutenant in the *Rover*, *Amphion*, *Sharpshooter*, *Vernon*, and *Vulcan*. 1887-92.

In 1900, having reached the rank of commander, he was selected to lead the national Antarctic expedition,

Robert F. Scott,
British explorer

commanding the *Discovery*, specially built for the expedition. The expedition sailed from London, Aug., 1901, returning Sept., 1904. Several discoveries of first importance were made (see Antarctic Exploration), and on his return, after many adventures, Scott was created C.V.O., and promoted to captain.

After several naval appointments, including the command in succession of a cruiser and two battleships, his last Admiralty service was as naval assistant to the second sea lord.

Scott left England on a second polar expedition in 1910, finally sailing from New Zealand on Nov. 29 of that year in the whaler *Terra Nova*. Winter quarters were established at Cape Evans, in McMurdo Sound, and a sledging journey was undertaken to lay depots before the winter set in, the ship meanwhile returning to New Zealand.

Scott himself made a spring western journey, and the great southern journey to the Pole itself was started by a pioneer party under Lieut. Evans in Oct., 1911, with motor-sledges, which were not a success. Scott himself followed in Nov. with ponies and

dogs. The supporting parties were left behind according to plan in $81^{\circ} 15'$, $83^{\circ} 37'$, $85^{\circ} 7'$, and in $87^{\circ} 35'$ the last supporting party bade good-bye to Scott on Jan. 3, 1912.

The final march was made by Scott, Wilson, Oates, Bowers, and petty-officer Evans, who continued over the great polar plateau until they reached the S. Pole, Jan. 18, 1912, only to find that they had been forestalled by Roald Amundsen (*q.v.*), who had reached the pole barely a month before. After this bitter disappointment Scott's party was overwhelmed in a blizzard on the return journey, when he and his party perished. Evans died first, Feb. 17. A month later came the heroic death of Oates (*q.v.*). The remaining three fought on, but were beaten, brought to a standstill, and died about the end of March. Their bodies were discovered by a search party, along with Scott's diary, which told the whole tragic story of great hard-

ship endured heroically but in vain. The diary is now in the British Museum. The news of the disaster did not reach Great Britain until nearly a year later.

Scott married in 1908. The king conferred posthumously the K.C.B. upon Scott, whose widow became known as Lady Scott. In 1922 she married Sir E. Hilton Young, later Lord Kennet (*q.v.*). She died July 25, 1947.

In his last letter to his wife Scott asked that their son, Peter Markham (b. Sept. 14, 1909), should be taught natural history. Peter distinguished himself as a painter of bird-life (exhibiting regularly at the R.A. from 1933), and during the Second Great War was a lt.-cmdr. in the Royal Navy.

SIR WALTER SCOTT, BART.

Eric Linklater, LL.D., Scottish Novelist and Biographer

This Encyclopedia contains articles on the separate works of the great Scottish poet and novelist, e.g. Ivanhoe; Talisman; and on places associated with his life, e.g. Abbotsford. See also English Literature; Novel

Born in Edinburgh, Aug. 15, 1771, the son of a writer to the signet, Walter Scott was the great-great-grandson of that heroic figure, Auld Wat of Harden, whose prowess in Border forays made him a theme for ballads. The Scotts of Harden were an offshoot of the noble family of Buccleugh; Walter's mother was a Rutherford, whose family had longer roots in the marches than the Scotts themselves; and in his pedigree with Highland Campbells and MacDougals were names so notable in Border history as Murray and Swinton. His ancestry is closely related to his work, for it inspired his imagination and from boyhood he was familiar with much of the material on which he built his narratives in verse and prose, out of which he fashioned his characters, and which in his powerful re-creation became for countless readers an image of Scotland itself.

A childish ailment left him lame, but he grew to a robust pugnacious boyhood. He was a voracious reader, and far in front of his years for genius showed clearly in him at six. Circumstance prepared him for his vocation by surrounding him with a plenitude of books, female relations who had long memories and a taste for poetry, and the congenial scenery

of the Scottish capital and his grandfather's farm on Tweedside. Shakespeare and Spenser and Percy's Reliques, translations of Tasso and Ariosto, gave him more than his formal education at the High School and Town's College of Edinburgh, and apprenticed to the law at fifteen, in his father's office, he acquired early the habit of concentrated work. Legal drudgery, however, was relieved by the hearty social pleasures of the day, and he learnt to drink deep and carry his wine while still a boy. He had time enough, also, for exercise that abetted his natural vigour and gave him signal strength and uncommon physical endurance. He was admitted to the Faculty of Advocates in 1792, and five years later married Charlotte Carpenter, the daughter of a French refugee, who made him an admirable wife.

In 1799 he was appointed sheriff-deputy of Selkirkshire, in 1806 a clerk of session, and for the remainder of his life his professional duties constitute a necessary and important part of its pattern. Another part, of increasing significance, is composed of land, houses, and complicated financial affairs. His married life began modestly enough in rooms in George Street, but soon expanded to a house in North Castle Street and a cottage

Robert Falcon Scott. Statue of the Antarctic explorer, executed by his widow and erected in Waterloo Place, London

at Lasswade, half a dozen miles out of Edinburgh. The cottage was exchanged in 1804 for a lease of Ashieston on the Tweed, where the habit began of that prodigal hospitality which characterised his years in Abbotsford. It was in 1812 that he bought a farm on the road between Melrose and Selkirk and began to build the mansion that became, as wings were added and fields and farms accumulated, his dearest romance. Into the building of Abbotsford went his creative impulse, love of the Border, pride of family, the desire to leave both a habitation and a name; and it cost him more than £70,000. His financial interests began in 1805, when with a legacy he bought a third share of James Ballantyne's printing business; The Lay of the Last Minstrel had been published a few weeks before.

Scott's Poems

His discovery of a new romantic literature in Germany had first persuaded Scott of his own ability to write, and his Border piety led him, after some apprentice work, to gather and edit, to patch and mend the ballads which he published in his magnificent Minstrelsy of the Scottish Border in 1802. In The Lay of the Last Minstrel he became a poet on his own account, and its vivid energy brought him instant fame and popularity, which Marmion confirmed in 1808, and The Lady of the Lake enhanced in 1810. Twenty thousand devoted readers bought that captivating tale, and in the lustre of its author's genius Loch Katrine gleamed more brightly, the Trossachs became a place of pilgrimage. But poetry has its fashions, and these swift and gallant stories no longer stir the critic's admiration nor the ordinary reader's appetite. To the contemporary eye their poetic content seems thin and artificial, their psychological interest is scanty, their historical attraction has waned, and their economic background must infuriate the Marxist. But such is their dexterity, their picturesque and dashing vigour, that it is easy to imagine the enthusiasm they evoked, though in the temper of our time it may be impossible to share it.

Other narrative poems followed, of a diminishing quality, and before Scott began his major work, with Waverley in 1814, he had edited Dryden in eighteen volumes, Swift in nineteen, Somers's Tracts in thirteen, and done lesser work of a like nature, the sum of which revealed prodigious energy, unflinching delight in men and history,

and a glowing abundance of good sense. He was forty-three when Waverley heralded the succession of novels which raised him to the enduring eminence where he remains despite all the attacks that his hasty composition invites, that is provoked by his broad indifference to an intellectual conception of the art of novel-writing. His faults are obvious, but no more than occasional clouds do they obscure his Olympian virtues. His heroes and heroines may be little better than well-mannered puppets, his plots are sometimes ill-jointed; but he filled a world with characters—gallant and crotchety, generous and shrewd and grim—whom he made as human beings are made, with their feet on the earth and thoughts of their own and native speech, and with magnanimous invention he domiciled them in great stories where they jostle each other and come to grief, or escape it, as in the world itself. He had a vast, practical knowledge of humanity, he knew how men and women behaved, and he understood the material conditions of their life that influenced behaviour; he was not much interested, however, in the innermost springs of personality, and many of his leading figures who seem to require analysis are flatly idealised instead, and a story that might have been driven more convincingly to its conclusion by the compulsion of character, will depend upon a brilliant management of events. But how superb is the flux and compass of events, how splendid the background of courts and cities and darkling landscape!

In Waverley the tragedy of a lost cause is interwoven with a high-spirited comedy of manners; it was followed by Guy Mannering, written in six weeks, in which the old theme of a missing will inspires a narrative of tremendous gusto, and Dandie Dinmont and Pleydell the lawyer and Meg Merrilies are created with such vitality as seems almost to give them independent being. The Antiquary came next, a comedy of humours and country life, and the Mucklebackits, Jonathan Oldbuck, and Edie Ochiltree

enter the gallery of characters. Old Mortality dealt with the troubled times of the Covenanters, a grim and moving story in which can be studied, with pleasure and profit, the rich variety of Scottish speech and Sir Walter's surpassing skill in it. Rob Roy came in 1818, its weak construction redeemed by Bailie Nicol Jarvie, Andrew Fair-service, and Rob himself, and then the broad and crowded canvas of The Heart of Midlothian, that many count as the best of his novels; but whoever has a favourite tale is likely to defend it with a warmth that literary merit by itself does not provoke, and Goethe put Waverley beside "the best things that have ever been written in the world." The Legend of Montrose added Dugald Dalgetty and a loose but swiftly moving tale to achievement, and The Bride of Lammermoor a well-made tragedy played under a darker sky than usual. The pageantry of Ivanhoe no longer pleases, but was once most popular; The Abbot retrieved the failure of The Monastery, and was followed by the

Walter Scott

From the portrait by Raeburn

strongly drawn and richly decorated tale of Kenilworth. The dullness of The Pirate was forgotten in the brilliance of The Fortunes of Nigel, with its marvellous portrait of James I, whose learned kingliness has a proper companion in Louis XI of Quentin Durward, a novel that won the enthusiastic approval of the French. St. Ronan's Well and Redgauntlet, Woodstock and The Fair Maid of Perth, all have their lively merits and the former pair their devotees who give them distinguished praise; but now the drama of Scott's own life was coming to a more poignant and heroic close than any of his fictions.

His estate had survived more than one crisis before he was buried in the huge financial ruin of Constable, the publisher, and the London firm of Hurst and Robinson, with whom Scott and Ballantyne, the printer, had for long been deeply and untidily involved. Scott, who had been careless as well as extravagant, found himself liable for a debt initially estimated at £130,000. He accepted his re-

sponsibilities, and set to work to pay it. Within four years his creditors had received nine shillings in the pound and Scott was a dying man, killed by an heroic effort that made of his last writing not words, but deeds. He had always esteemed action more highly than books, set honour above the claims of art; and none of his Border ancestry ever showed, in extremity, a starker sense of honour.

He came home, after a voyage to the Mediterranean in the battleship *Barham*, and dying Sept. 21, 1832, was buried in the ruined abbey of Dryburgh. That his critical faculty was often inferior to his creative power is evident alike in his writings and his excessive adornment of Abbotsford; but the scope and generosity of his power are indisputable, and he was a great good man.

Bibliography. Among many editions of the *Waverley Novels* may be mentioned that edited by Andrew Lang, 1907-13; also the *Fine Art Scott*, 28 vols., ed. J. A. Hammerton, 1911. The *Poetical Works* were ed., J. L. Robertson, 1894. Indispensable to the student are *The Journal of Sir W. S.*, 1829-32, ed. Prof. Tait, 3 vols., 1947; *The Private Letter Books of Sir W. S.*, ed. W. Partington, 1930; *Letters of Sir W. Scott*, 11 vols., 1936. Lives include those by J. G. Lockhart, 1838; G. E. B. Saintsbury, 1897; A. Lang, 1906; John Buchan, 1932 (7th edn., 1947).

Scott, WINFIELD (1786-1866). American soldier. Born near Petersburg, Virginia, June 13, 1786, he received a commission in the artillery in 1808. Taken prisoner by the British in 1812, he was exchanged after a few months, and then distinguished himself in the battles of Chippewa and Lundy's Lane. He became commander-in-chief of the U.S. army in 1841, and conducted the successful war against the Mexicans, occupied Mexico City, Sept. 14, 1847. He died May 29, 1866.

Scott Glacier. Antarctic glacier in the Australian quadrant. It emerges by Cape Hoadley, 40 m. E. of the Denman Glacier, was discovered by the Mawson Expedition, 1911-14, and was named after Robert Falcon Scott (*q.v.*).

Scottish Borderers, KING'S OWN. Regiment of the British army. Raised at Edinburgh by the Earl of Leven in 1689, it was formed from a number of companies of Presbyterians who had opposed the Stuart attempt to impose episcopacy. The regt.'s first action was against Claverhouse's highlanders at Killie-

crankie (July 17, 1689) and for its gallantry was then accorded the privilege of marching through

King's Own
Scottish Borderers
badge

Edinburgh with colours flying and drums beating. The regt. later fought at Steenkirk and Landen and gained its first battle honour, Namur, in 1695.

It was part of the Gibraltar garrison in 1727-28, and was one of the British regts. at Minden. Further honours were gained at Egmont-op-Zoom and Martinique. The regt. served in the Afghan War of 1878-80, in the Chitral and Tirah campaigns, and throughout the S. African War. Twelve battalions of the K.O.S.B. were raised in the First Great War and gained the honours: Mons; Ypres, 1914, '15, '17, '18; Loos; Somme, 1916, '18; Arras, 1917, '18; Soissons-Ourcq; Hindenburg Line; Gallipoli, 1915-16; and Gaza. In the Second Great War the regt. fought in France (1940), N. Africa, and Italy, and had an airborne battalion at Arnhem. The depot is at Edinburgh.

Scottish Council (DEVELOPMENT AND INDUSTRY). Body formed in 1946 by the amalgamation of the Scottish development council—established in 1931 to promote economic development in Scotland—and the Scottish council on industry, set up in 1942 to safeguard and promote Scottish industrial development during and after the war. The Scottish council's aim is to promote the well-being of Scotland. It represents the local authorities, the central committee of Scottish chambers of commerce, the Scottish T.U.C., and the Scottish banks, membership being open also to firms, cooperative societies, trades councils, corporate bodies, officials, and private individuals. The council is completely independent, but cooperates with govt. depts. as well as with all responsible Scottish bodies.

Scottish Education Department. British government department through which the secretary of state for Scotland initiates legislation relating to education, the employment of children and young persons, children in need of care or protection, and public libraries. The Scottish universities, however, fall within the province of the chancellor of the exchequer and the university grants committee.

Under the Education (Scotland) Acts and other enactments the secretary of state makes codes, regulations, orders, and schemes relating to the conduct of schools, the training of teachers, the school meals service, the school medical service, approved schools, etc. The schemes of education authorities are subject to his approval, as are many proposals on points of detail. The dept. conducts the annual examination for the senior leaving certificate. It maintains close contact with the progress and development of education in Scotland through inspectors of schools stationed throughout the country. The dept. is in constant touch with other govt. depts. in Scotland, England, and N. Ireland about matters of common interest.

Scottish Geographical Society, ROYAL. Learned society founded in 1884. Its headquarters, which include a fine library, are at Synod Hall, Castle Terrace, Edinburgh. Members, ordinary and associate, receive the society's publication, *The Scottish Geographical Magazine*, and may borrow books from the library, and attend the lectures, which are delivered in Edinburgh, Glasgow, Aberdeen, and Dundee.

Scottish Home Department. Body whose functions include most of those assigned to the Home office in England. Its responsibilities include prisons and borstal services, questions of criminal justice and public order and the royal prerogative of mercy, after-care of offenders, administration of the licensing acts and shops acts, and (through the local authorities) police administration. Other activities include the administering of the general law relating to local govt. and administration, fisheries administration, and cooperation with English depts. which have no Scottish equivalent.

Scottish Horse. Territorial regiment of the British army. Raised in 1900 for service in the

S. African War, it came on to the territorial establishment in 1902. In the First Great War it served in Gallipoli, Egypt, Palestine, and France, and in 1921 was converted into an artillery unit. It was later remounted, but on the outbreak of the Second Great War was again

Scottish Horse
badge

converted to artillery, and served in N. Africa and Italy. In 1947 it was amalgamated with Lovat's Scouts as a divisional regt. of the Royal Armoured Corps.

Scottish Office. British government department. The office of secretary of state for Scotland is discharged by four main administrative depts. based on Edinburgh—the dept. of agriculture, the Scottish education dept., the dept. of health, and the Scottish home dept. The secretary of state, as "Scotland's minister," represents interests of Scotland in matters in which the responsibility throughout Great Britain rests with other ministers. The day-to-day administration of the Scottish depts. is conducted from Edinburgh, but each dept. has representatives in London for parliamentary duties and for maintaining liaison with English and U.K. depts.

Scottish Rifles. Alternative name for the regiment better known as the Cameronians (*q.v.*).

Scott Report. Report of committee on land utilization in rural areas. The committee (chairman, Lord Justice Scott) was appointed in Oct., 1941, and issued its report on Aug. 15, 1942. It considered the conditions which should govern building and other constructional developments in country areas consistently with the maintenance of agriculture, especially factors affecting the location of industry. After making the basic assumptions that govt. policy included the establishment of a central planning authority, the encouragement of industry and commerce, the maintenance of a prosperous agriculture, the resuscitation of village and country life, and the preservation of amenities, the committee declared that the drift of population to the towns could be countered by improving living conditions, and equalising economic, social, and educational opportunities in town and country, so that those preferring country life would no longer find themselves at a disadvantage. The land of Great Britain, it was declared, should be both useful and beautiful, and a number of proposals were put forward for the improvement of village living conditions. There must be ease of access for all to the countryside, but this must not interfere with the proper use of land. When industries come into rural areas they should be located in existing or new small towns rather than in villages or the open countryside; but rural trades and crafts or

hand-manufactures should be located in villages. The use of good agricultural land for building should be avoided whenever possible. (A minority report by S. R. Dennison expressed the view that the introduction of industry into the countryside might be of considerable benefit to rural communities, and some measure of it should be encouraged under effective control.) The committee recommended that a five-year plan should be formulated for the carrying-out of their proposals. This report, together with the Barlow and Uthwatt Reports (*q.v.*), led to the passing of the Town and Country Planning Act, 1947. *See* Town Planning.

Scour. Term applied to the washing away of friable material by the action of running water, as in the case of rivers, or the cleaning and maintenance of estuary channels by means of water released from sluicing basins. Scour in rivers tends to undermine the foundations of bridges, embankments, and other riverside works, and great care has to be exercised by engineers when interposing obstructions which may divert the current or otherwise modify the natural conditions, *e.g.* the construction of a bridge, pier, or other structure, or the reduction of the natural width of a stream in one place, may set up serious scour even at a distance, entailing extensive protective works to counteract its effect. *See* River.

Scouting. Term which originally referred to the ability of the Zulus and N. American Indians to track down their enemies by observing signs and deducing the course they had taken from the condition of the ground. In the military sense, scouting consists of sending small formations of lightly armed troops ahead of or out from the flanks to gain information. Until armies were mechanised, the scouts were usually cavalymen, but in 20th century warfare scouting is by light armoured cars or aircraft. In the Second Great War, a special scouting unit, the Reconnaissance Corps (*q.v.*) was raised. The term scouting is also used to describe the activities of the Boy Scouts (*q.v.*).

Scranton. City of Pennsylvania, U.S.A., the co. seat of Lackawanna co. It stands on the Lackawanna river, 135 m. N.W. of New York, and is served by the Delaware, Lackawanna and Western and other rlys. Among prominent structures are the U.S. government building, and the

Albright and public libraries. Anthracite coal mining is the staple industry, the mines underlying most of the city. Pop. 143,433.

Scraper-board. Prepared cardboard used by artists as an alternative to using pen and ink. The boards, cut to standard sizes, are primed with hard white china clay, on which is superimposed a soft black surface. The drawing is done with needles or scrapers of various widths, which remove the black surface as required, somewhat in the manner in which a block is prepared for wood engraving, leaving sharp white lines particularly suitable for reproduction.

Scrap of Paper. Popular name for the Quintuple Treaty, the breach of which was the immediate cause of the entry of Great Britain into the First Great War. The treaty was signed in 1839, and by it the neutrality of Belgium was guaranteed by Austria, France, Great Britain, Prussia, and Russia. It was in the interests of the major powers to make Belgium perpetually independent, and the Quintuple Treaty imposed a moral obligation on each signatory to respect its provisions irrespective of whether these were violated by others. Strictly, there were two treaties: the first, signed in 1820, wherein the king of the Netherlands agreed with the five powers to recognize the existence of Belgium as an independent and perpetually neutral state, bound to observe neutrality towards all other states; and the second, which was not signed by the Netherlands, whereby the five powers guaranteed the provisions of the first treaty. When the Franco-Prussian War broke out in 1870, the British govt. asked the belligerents to state their intentions with regard to Belgium, and duplicate treaties were signed in which both Germany and France reiterated their intention to respect Belgian neutrality while Britain undertook to declare war at once on any party infringing the proviso. When Germany broke the treaty by invading Belgium in 1914, and Great Britain announced that she would declare war, Bethmann-Hollweg, imperial chancellor, made to the British ambassador the historic remark: "Just for a scrap of paper Great Britain is going to make war on a kindred nation." *See* First Great War.

Screamer (*Chauna*). Small group of birds, including about three species. They are placed by zoologists between the ducks and the heron sub-orders. In size and

Screamer. The crested screamer, a bird of S. America
W. S. Berridge, F.Z.S.

build they somewhat suggest the turkey; and their name derives from their harsh cries. They are restricted in range to S. America. Each wing is provided with two strong spurs. The horned screamer has a curious hornlike growth, about 5 ins. long, upon the forehead, and the plumage is grey and black with a greenish reflection. Other members of the group are without the horn. The birds are found in flocks about the borders of lagoons, where they scream through the night. Though not web-footed, they swim readily. See Horned Screamer and illu.

Scree. Accumulation of loose rock fragments at the foot of cliffs, etc. Scree is formed by the breaking off and falling of pieces of rock by frost action in colder regions, and by temperature changes between night and day in desert areas. Scree is always being replenished from above and tends to slide down into valleys, there to be carried away by streams.

Screen. In ecclesiastical architecture, a wall of wood, metal, or stone, having no structural function in regard to the rest of the building, and designed only to partition off one part of the church from another. Thus a private chapel may be shut off from the transept, and the chancel or the choir from the body of the church, by a screen, which may be carried round two or more sides of the part it is intended to seclude. The choir, or the choir and sanctuary, being the most important part of the medieval church, artistic ornament was lavished more freely on the screens protecting it than on any other part.

This was particularly true of the rood screen or *jube*, shutting off the choir from the nave or transept, which was generally a beautiful example of open or close Gothic workmanship, with a gateway in the centre and rood cross above it. The rood loft was at the top of this screen, with a staircase leading to it.

The screen round the choir at Chartres cathedral, enclosing it on the N. and S., is a fine example of 16th-cent. work. Notre Dame, Paris, Amiens cathedral, and the cathedrals of Lincoln, York, Canterbury, Durham, and Exeter provide good examples of the ornamental screen. Parish churches, such as those of Northfleet (Kent), Handborough (Oxon), Fyfield (Berks), retain wooden Gothic screens of attractive, if less sumptuous character. The term choir screen, when it is restricted to the barrier for the W. end of the choir, is synonymous with rood screen. The phrase "a screen of columns" is used of a detached colonnade. See Cathedral.

Screen. East side of the altar screen in Durham Cathedral, dating from 1372-80. Top, right, triple-arched choir screen in Exeter Cathedral, built in the early 14th century by Bishop Stapeldon

Screen. In photo-mechanical reproduction, a ruled glass grating that is placed between the photographic plate and lens in a camera to break up the negative of the copied picture into dots of various sizes for carrying the ink on the printing surface of the resultant half-tone block, corresponding to the light and shade in the drawing or photograph to be reproduced. It consists of two pieces of optically perfect glass, sealed together with Canada balsam, the inner surface of each being ruled with fine lines, cut by means of a diamond-point ruling machine, the lines of one glass running at right angles to the lines on the other when placed together. These lines are filled up level to the surface of the glass with an opaque ink so that the screen is formed of minute squares of light.

The screen is placed in a carrier in the camera, on runners, so that it can be placed nearly touching the photographic plate, or racked out to a given distance marked by a millimetre gauge, and the

reflected light from the drawing through the lens passing through the screen's minute squares of clear glass impinges dots on the photographic plate, larger or smaller according to the amount of light or shade in the drawing that is being reproduced. The screen rulings vary from 50 to 400 parallel lines per inch, according to the texture of paper the blocks are to be printed on. The thickness of the black line is about equal to the clear spaces between, in a half-tone screen. For photo-gravure plates a much finer line screen, with three times as much clear glass, is used.

A mezzograph screen has irregular dots instead of lines. A wavy line screen is occasionally

used for portraits (see Half-tone). Colour screens are another name for light filters placed in or in

attached to a frame so suspended that it may be shaken to and fro. In the Briart screen the bars oscillate to and fro, at the same time rising and falling, so that when one bar is at its lowest point the two adjacent ones are at their highest. The coal is thus lifted as well as shaken backward and forward. Gyrotory and revolving screens are also used, though the capacity of the latter is comparatively low, as only a small surface of the screen can be in operation at one time. Electromagnetic screens, of wire meshes vibrating when an electromagnet works on alternating current, are increasingly favoured.

brightness of the projected image when seen from the side. In sound films, the screen has a number of small, evenly spaced holes so that acoustic transmission from the loudspeaker behind it is uniform. Cinema and magic-lantern screens are generally made of linen, but metal foil can be used. A radar screen consists of a sheet of glass upon which the received messages appear as spots of light. See Cinematography; Radar.

Screw. Mechanical device consisting of a cylindrical or conical body around which is formed a spiral rib or "thread." The invention of the screw is ascribed to Archimedes (*q.v.*), and its use is very ancient, though it was narrowly limited until the invention of machinery made possible the cutting of screws on wood or metal bodies with precision and cheapness. The screw is employed as a fastening for wood and metal; as a member for gripping objects or parts, feeding work to a machine, causing one member to approach or recede from another; and as a means of transmitting or changing motion—when so used, the screw is usually termed a worm (*q.v.*).

Wood Screws. Figs. 1-5 show various forms. The first is a dowel, to be screwed into one wooden part *e.g.* a curtain rail, and to have another member then screwed onto the projecting worm. Figs. 2 and 4 show wood screws of which the heads are wholly or partly sunk into the surface of the wood. In both these forms the outer part of the hole is countersunk—shaped to a counterpart of the sharply tapering underside of the screw-head. Fig. 4 (raised head) is not flush with the surface, but allow a slight projection. The patterns shown by Fig. 3 (round head) and Fig. 5 (cheese head) have the entire head raised above the surface. The cheese-head screw is little used for wood, but often for metal.

Early wood screws lacked the gimlet point which is now an essential feature; as a result, after a suitable hole had been bored, the screw had to be started by hammer

Screen. Common types employed in coal mining. See text

front of the lens when taking negatives, from which colour printing blocks are made. Filters are made from dyed sheet gelatine, or may be liquid dye in thin glass tanks, or even dyed glass. In three-colour negative making, each of the three colour screens used is dyed to a colour representing one different portion of the light spectrum that is divided up into three parts, for one screen violet blue, second screen green, and third orange-red. See Colour Photography; Colour Printing; Process Engraving.

Screen. In mining and metallurgy, an apparatus to separate the products of the mine according to size. Screens are used on a large scale for cleaning and grading coal. A common form for coal consists of plain iron bars set parallel in a frame which is fixed at an incline. The coal from the pit is discharged on to the screen at the top and falls down the incline; the dirt and small coal passing between the bars, while the good coal is delivered off the bottom of the screen into wagons. Special forms of bars prevent choking of the screen and facilitate separation.

In modern forms the separation is assisted by some mechanical movement of the screen. The simplest is the jigging screen, formed of strong iron wire netting

In most designs, arrangements are made by which the space between the bars can be quickly changed and the size of the grading altered, without dismantling the entire apparatus. Screens are essential parts of gold-mining mills, and important adjuncts of most ore or stone breaking machines.

The figures show various types of screen. Fig. 1 is a common fixed inclined screen. The bars are closely set together in one part, and only allow dust and fine material to pass through. A wider spacing of the bars allows passage to small particles. In Fig. 2 is shown the Briart rising and falling bar-screen in cross section, and Fig. 3, the jigging screen. In the latter *a*, *b* are suspending, flexible rods; *c*, the jigging gear. Fig. 4 shows the Greenwell continuous chain and bar-screen. (See Stamp Mill.)

SCREEN, CINEMA.

A white, flat surface on to which the photographic image on a film is projected. The screen must have a high coefficient of diffuse reflection, and the deflection can sometimes be directed normally from the screen, reducing the

Screw. Patterns in common use. Fig. 1. Dowel for uniting pieces of wood end to end. Fig. 2. Countersunk. Fig. 3. Round head. Fig. 4. Raised head. Fig. 5. Cheese head

blows. The gimlet point of the modern screw enables it to cut its way into the wood, once a suitable hole has been bored; the hole must be smaller in diameter than the outside of the screw-worm, so that the thread can cut a counter-part in the timber and hold itself fast against a direct pull. The screw can then be withdrawn only by a twisting movement, the reverse of that by which it was driven in. Wood screws are right-handed, though screws for metal may in certain cases be left-handed (when a right-hand thread might result in the screw being unintentionally drawn out or loosened by movement of the parts secured together). Screws are made in diameters known by gauge numbers and standardised. The proportions of the various parts are also standardised. British Standard Specification No. 1210, of 1945 (see Fig. 6), governs the form of wood screws of mild steel and brass.

Coach screws are formed with a square or hexagon head to be turned by a spanner. Ordinary wood screws have a slotted head to receive a screwdriver blade. Various alternatives have been tried, including a head with a square-tapered recess and needing a driver of counterpart form. One of the most commonly adopted (mainly for metal) has a hexagonal recess formed in the head; a key made from rod of hexagonal cross section is used to drive or withdraw this type. A modern development, brought about by the widespread use of softish light alloys which permit a steel screw to cut its own thread in the metal member, is the screw which needs no tapping of a thread in a counterpart hole. It is inserted and turned home, and can be used in some of the synthetic plastics as well as some metals. The "drive-screw," of which one form is used for securing steel roofing sheets to wood members, is a cross between a screw and a nail; it has no gimlet point, and is driven home with hammer blows, and twists as it enters the timber. Ordinary wood screws are made in many metals and alloys; steel ones are finished with brass, nickel, chromium, or

copper coatings where the strength of steel is necessary and a more ornamental or rust-resisting coating is desired.

Screw. Fig. 6. British Standard Specification for screws for wood. 1. Countersunk. 2. Round head. 3. Raised head. See text

mechanical devices. Among commonly adopted screw-thread systems are the following: British Standard Whitworth; British Standard Fine; British Association; International Standard (Metric). In the U.S.A. a different series of standards was long used, though the divergences from the British forms were generally small. Following difficulties in wartime cooperation, it was agreed in 1948 to standardise the threads of British, U.S., and Canadian screws, nuts, and bolts.

Unless a corresponding nut is employed, a hole for the screw is drilled, and afterwards tapped by a steel tap which has the form of the screw to be inserted. The tap cuts away part of the metal around the hole to form a counterpart of the screw thread. When plain, unthreaded members are to be screwed into a tapped hole, or into a nut, a screw thread is cut on the member by means of a die or a screwing tool. Screws are made in a lathe-like machine, if the thread is to be actually cut. Other types of machine form screw threads by rolling the metal of the blank without cutting it. Screw threads on metal can also be formed by grinding.

THE SCREW AS A MECHANICAL POWER. Fig. 7 shows that, mathematically, the screw consists of an inclined plane applied around a

Screw. Fig. 7. Diagram illustrating principle of inclined plane applied to screw. See text

cylinder, and it may be regarded as a travelling inclined plane. This interpretation may be illustrated by cutting out a right-angled triangle in paper and wrapping it about a round ruler. In the figure the base of the triangle ABC lies entirely in a plane at right angles to the axis of the cylinder, and the hypotenuse AC traces out the spiral line Bb, b_1, c, c_1 , etc. The power is applied parallel to the base of the plane, and the plane is made to slide under the weight so as to raise it. The distance from thread to thread of the screw, measured parallel to the axis, is called the pitch of the screw, and this is the distance which the screw advances for one turn of the screw head or of the lever arm which is placed at the head, as in a screw press.

Screw Press and Lathe

The screw press was a very early application of the principle of the screw for applying pressure, by causing one member to approach another. It was used for the wine press by the ancients, and persists today in many appliances of the same class. In early printing presses the platen was pressed down on to the type bed by a screw. About 1797 Henry Maudslay (*q.v.*) introduced the screw-cutting lathe, of which the salient feature was a long and accurately cut "lead-screw" which moved the cutting tool along the lathe bed and enabled screws identical in pitch with the lead-screw to be cut mechanically. The use of alternative gear wheels, brought into engagement between the headstock of the lathe and the lead-screw, enabled screws of differing pitch to be cut by arranging the appropriate ratio of advance in relation to the revolutions of the headstock drive mechanism.

The improvements which followed made possible, in turn, the cutting of yet more accurate lead-screws and other screws to form part of machines. One outstanding application may be mentioned—the dividing engine, in which rules and parts of instruments are graduated with an extreme degree of accuracy. Here the lead-screw governs and controls the advance of the cutting tool which inscribes the graduation lines on the work. See Lathe.

J. St. D. Reed

Screw OR MARINE PROPELLER. Contrivance for propelling vessels by rotating sections of an archimedean screw against the resistance of the water. Claimed on doubtful authority to have been used in conjunction with man power by the Chinese in ancient days, it was suggested by Van Drebbel and Hooke in the 17th cent. and by Du Quet, Bernouilli, Bushnell, and Bramah in the 18th with no practical success, although William Lyttleton in 1794 did actually move a ship with one in a London dock. Among a number registered were, in France, the patent of Frederic Sauvage (1832) and, in the U.K., those of John Ericsson, a Swede, and F. P. Smith, a British farmer, both 1836. The early ideas were opposed on the ground that it would be impossible to steer a vessel pushed from astern.

Sir Francis Pettit Smith's first screw propeller

Double-threaded screw propeller as subsequently fitted in the Archimedes

A modern propeller

Screw. Primitive and modern types of screw propellers

By the 1840s a number of different types of screw had been invented; inefficient by 20th cent. standards, they were a great improvement on the paddle wheel. Twin screws, tried by Col. Stevens in New York in 1804, were not greatly favoured until the power of steamers increased to a point where there was a danger of breaking the propeller shaft if it were transmitted to a single screw. Later triple screws were introduced for special purposes, and even quadruple screws came into use for very high powers.

Most screws patented were three-bladed, the four-bladed type, once popular, being virtually restricted to cargo vessels with slow running machinery. When the turbine was first tried afloat, the

high speed at which it had to be run, with the engine directly coupled to the shaft, made it necessary to design propellers of special shape with a large blade area; the introduction of reduction gearing between the turbine and the shaft gave far better results and made it possible to fit the more normal type of screw. Observed experience and tank tests led to great improvements between 1920 and 1940, particularly in the evolution of the aerofoil blade in which each section is given the shape and curvature best suited to the water conditions at each point from the shaft to the tip.

Propellers are measured by their diam. and pitch, the latter being the distance through which the propeller would advance in one revolution if it acted on a solid medium. The slip is the difference between this pitch and the actual advance of the ship, which varies widely with different types of propeller and under differing conditions at sea.

The airscrew is described under that heading.

Screw Pine (*Pandanus*). Genus of trees and shrubs of the family Pandanaceae (q.v.). They are natives of tropical countries, chiefly of Malaya. Their stems are rough with the bases of the shed leaves. The leaves are leathery, mostly very long and slender with spiny margins and midribs. Some of the shrubs are used in a young state for conservatory and table decoration. *P. utilis*, a native of Mauritius, where it is known as Vacana, is cultivated for the sake of its leaves, which are plaited to make sacks for exporting raw sugar. The species with trunks are much disposed to the production of aerial roots which strike straight down into the soil. When firmly rooted the base of the stem dies away.

Scriabin, ALEXANDER NICHOLAIEVICH (1872-1915). A Russian composer. Born at Moscow, Jan. 10, 1872, he studied at the conservatoire there under Taneiev and Safonov, and later achieved a European reputation as a pianist. Professor of the piano at Moscow conservatoire during 1898-1904, he afterwards devoted himself to composition. His earlier work for piano was delicate and poetical, but in his larger orchestral works he was strongly influenced by Wagner. He introduced a revolutionary system of harmony, involving the absence of the major and minor modes and

the key-signature, subordinating his music to his mystic philosophy. His major orchestral works included *The Divine Poem*, 1905; *The Poem of Ecstasy*, 1908, and *Prometheus*, 1910. His piano pieces, some of which are now regarded as classics, included the *Poème Satanique*, études, and sonatas. He died at Moscow, April 14, 1915. His nephew was V. M. Molotov (q.v.). Consult *Lives* by A. E. Hull, 1916; A. Swan, 1923.

A. N. Scriabin, Russian composer

Scribe (Lat. *scriba*, clerk or secretary). Term used in the Bible for a writer or secretary, but more especially for the official copyists and expounders of the Law of Moses. As a distinct class or profession, they arose about the time of Ezra, when it became necessary to translate the Hebrew scriptures into Aramaic. Their most important function was to give counsel and advice in all points of difficulty or doubt about the observance of the law; and they might be described as ecclesiastical lawyers. They were closely connected with the Pharisees, the religious teachers of the nation; and their influence in N.T. days was very great. Leading scribes conducted schools or colleges, in which they taught their principles and methods to their disciples. Many of them sat in the Sanhedrin, and some appear to have acted as local judges. They were supposed not to accept payment; and some of the greatest of them are known to have earned a livelihood by trade. They were among the bitterest opponents of the mission and teaching of Christ. See *Inkhorn*; *Writing*.

Scribe, AUGUSTIN EUGÈNE (1791-1861). A French dramatist. Born in Paris, Dec. 24, 1791, he was educated for the law, but turned to writing for the stage in 1811. During the following half century he produced, alone, and in collaboration with numerous other writers, upwards of 400 plays, including comedies, e.g. *Le Mariage d'Argent*, *Une Chaîne*; emotional dramas such as *Adrienne Lecouvreur*; historical dramas such as *Bertrand*

Eugène Scribe, French dramatist

et Raton, Le Verre d'Eau; farces and vaudevilles, such as La Demoiselle à Marier; and opera-librettos, such as La Juive, Les Huguenots, Le Prophète. His immense success was due to his technical dexterity, but his methods were mechanical and the literary value of his work is very slight. He died in Paris, Feb. 20, 1861. Consult Eugène Scribe and the French Theatre, N. C. Arwin, 1924.

Scriblerus Club. Literary group formed by Jonathan Swift (*q.v.*) in 1714. It was directed towards the satirising of "the abuses of human learning in every branch" and the ridicule of pedantic writing. Its members included Pope, Bolingbroke, John Gay, Thomas Parnell, and John Arbuthnot, whose satire, *Memoirs of Martinus Scriblerus*, appeared among Pope's works in 1741.

Scribner's Sons, CHARLES. American publishing house. It was founded in 1846 in New York

Charles Scribner,
American publisher

by Charles Scribner (1821-71), and Isaac Baker, and has been carried on since by Scribner's sons, being incorporated in 1903. In 1865 the firm established a periodical called *Hours at Home*, which in 1870 became *Scribner's Monthly*, under the control of a separate company. It was sold in 1881 and re-named *The Century Magazine*. *Scribner's Magazine* was started in 1887 by the younger Charles Scribner (1854-1930), who became identified with *Charles Scribner's Sons* in 1875, and was first president of the American Publishers' Association. In 1928 the firm was chosen to publish the 20 volumes of the *Dictionary of American Biography*.

Scrip (abbrev. of subscription). In finance, an allotment letter or other document provisionally entitling a person to certain stocks, shares, or other securities. It is usual, when new stocks and shares are allotted, to send to the applicant documents stating the amount of shares he is entitled to, the money he has already paid and the money he has still to pay, with the date of payment. This can be changed for a certificate when the transaction is completed.

These scrip certificates, to which the term scrip is usually applied, must be stamped, 2d. if less than £5. a shilling if more.

Script (Lat. *scriptum*, written). In law, an original document, as opposed to a copy. Script is also a term for any style of handwriting; in printing, type imitating cursive writing. It is also used of the MS. of a play, a film scenario, or a radio feature. See Writing.

Scriptorium (Lat. *scribere*, to write). Room in ancient religious houses where manuscripts were copied or written. The term originally meant a metallic stilus used for writing. See Abbey.

Scripture. Alternative term for the Bible, sometimes in the plural form, the Scriptures. Hence the word is commonly used in schools for the study of the Bible as a classroom and examination "subject." Equivalent terms in this sense are Divinity and Religious Knowledge.

Scripture Reader. A name given to lay workers in connexion with certain religious and philanthropic organizations, who read the Scriptures in the homes of the bedridden poor and others willing to receive their message.

Scrivener (Lat. *scriba*, a scribe). Literally, one who writes. It was generally used for one who drew up contracts or copied out documents. See Scribe; Writing.

Scrivener's Company, THE. London city livery company. With records dating back to 1357, it

Scrivener's Com-
pany arms

obtained its first charter in 1617, the original members being notaries and attorneys. Its hall, in Noble Street, and most of its records were destroyed by fire in 1666, the rebuilt hall being sold to the Coach and Coach Harness Makers' co. in 1703. The office is at 56, Victoria Street, S.W.1.

Scrofula. In human beings, a complaint associated with the enlargement of the lymphatic glands in the neck. Known to be a form of tuberculosis, it is most usual in children, but is sometimes seen in adults. The treatment consists in invigorating the system with tonics and maintaining the patient's strength. Streptomycin, penicillin, and sulpha drugs have proved useful; incisions to relieve suppuration are sometimes advisable. See Tuberculosis.

Scroggs, SIR WILLIAM (1623-83). An English judge. Born at Deddington, Oxfordshire, and educated at Oriel and Pembroke Colleges, Oxford, he was called to the

bar at Gray's Inn, 1653. He became a king's serjeant, 1669, a justice of the court of common pleas, 1676, and lord chief justice, 1678-81. He died Oct. 25, 1683.

Sir William Scroggs,
English lord chief
justice

Scroggs was notorious for his conduct of the Popish Plot trials. He showed an animus against those on trial so great that it led him to subvert the law, and he exhibited a gloating savagery to those found guilty which has never been exceeded in English courts. The attitude of Scroggs underwent a sudden and complete reversal at the trial of Sir George Wakeman and others, the reason for which has never been satisfactorily explained. See Oates, Titus; Popish Plot.

Scroll. Roll of paper or parchment. It is used by analogy for a writing in the form of a roll. In hydraulics a scroll is a spiral waterway placed round a turbine to regulate the flow of water. In

Scroll in ornamental ironwork

architecture it is an ornament of a spiral or volute (*q.v.*) pattern. It is sometimes used of the volutes of the Ionic capital. See Ionic Order.

Scroll Clutch. Machine-tool chuck in which the jaws are moved in and out by the action of a scroll-shaped or spiral member, having teeth cut in it which engage with corresponding teeth in the jaws. See Lathe.

Scrolls of the Law. Documents kept in every Jewish synagogue. They contain the five books of Moses, hand-written on parchment, as they were in the synagogues of the Babylonian Dispersion. Wound on two short sticks, which protrude through rich velvet or silken covers to receive finely-wrought clusters of small silver bells, the scroll is unwrapped for the public reading by the minister of the "portion of the law" for each Sabbath and festival. It is then held aloft and turned about for all to see, re-

covered, and returned to the Ark, in which it is kept.

Special scribes earn their living by writing these scrolls. No ancient examples exist, because by Jewish law directly a single letter becomes obliterated, the scroll must be buried in consecrated ground.

Scrooby. Village of Notts, England. It is 2 m. by rly. S. of Bawtry, and was once a post town

Scrooby, Nottinghamshire. Manor house in which lived William Brewster, a leader of the Pilgrim Fathers

on the Great North Road. Here the archbishop of York had a palace, of which there are some remains. William Brewster (c. 1560-1644), one of the leaders of the Pilgrim Fathers (*q.v.*), lived at the manor house here.

Scrooge, EBENEZER. Chief character in Dickens's story *A Christmas Carol* (*q.v.*). A harsh, miserly old man, he is transformed into a cheerful, warm-hearted, and beneficent citizen, by a series of ghostly visits to the Christmases of the Past, Present, and To Come. On stage and screen the part has been notably played by Sir Seymour Hicks.

Scrope, RICHARD LE (c. 1350-1405). English prelate. Son of the first Baron Scrope of Masham, he was ordained in 1377, became bishop of Coventry and Lichfield, 1386, and was translated to York, 1398. After the deposition of Richard II, in 1399, popular discontent and the desire of Richard's supporters for revenge resulted in various rebellions against Henry IV, one of which Scrope headed with the earls of Northumberland and Nottingham, May, 1405. Treacherously persuaded to disband their force, Scrope and Nottingham were arrested, hastily and irregularly tried, and sentenced to death by Henry's order. Scrope was beheaded near York, June 8, 1405. The first archbishop to suffer as a traitor, he was regarded as a man of high character.

Scrophulariaceae. Large family of herbs and shrubs, natives of all climates. They have opposite or whorled leaves, and irregular flowers. The fruit is usually a capsule, containing many seeds. Some of them provide medicines, purgative or emetic. *Digitalis* (Foxglove) is a sedative, much used in heart complaints, but very poisonous. Other well-known plants comprised in the order are

Mullein (*Verbascum*), Snapdragon (*Antirrhinum*), Musk (*Mimulus*), Veronica, Eyebright (*Euphrasia*), Calceolaria, and Pentstemon.

Scrub. Term applied to land adjacent to woodland, covered with bushy shrubs and small trees. In Britain the shrubs are mainly those of a thorny character, such as furze, blackthorn, white-thorn, wild rose, and bramble. In the S. of Europe and Asia acacias are dominant. Along the Mediterranean the scrub is known as maquis. In E. Africa, euphorbias and cacti are mixed with acacias. Australia has several sorts of scrub: the brigalow and the mallee, the cane and the nettle. The brigalow scrub consists chiefly of *Acacia excelsa*; the mallee of *Eucalyptus dumosa*.

Scruple (Lat. *scrupulus*, a small stone). Unit of apothecaries' weight. It is 20 grains or minims, and the twenty-fourth part of an ounce.

Scrutiny (Lat. *scrutari*, to search out). In general, a close examination. In elections, a scrutiny is the examination by some recognized authority of the votes cast, so that any wrongly given may be rejected. A scrutiny is one of the methods used in the election of a pope.

The French term for voting by papers or balls is *scrutin*. In French electoral procedure since the Revolution, two alternative methods of voting have been employed. *Scrutin d'arrondissement*, or election by single member constituencies, was adopted in 1792, 1820, 1831, 1852, 1875, 1889, 1919; *scrutin-de-liste*, or election *en bloc* of all the deputies allotted to a department, was the method in 1795, 1799, 1801, 1817, 1848, 1871, 1885, 1919, and 1945.

The reasons for these frequent changes of procedure are somewhat obscure. Gambetta was a vehement advocate of *scrutin-de-liste*, as tending to give a less parochial spirit to the popularly elected assembly, but the system was not changed until after his death, owing to the fear of his becoming inconveniently powerful through the wholesale election of his nominees. See Ballot; Election; Proportional Representation.

Scud. Word used to describe ragged fragments of low cloud (*fractostratus*) carried along rapidly by a strong wind, generally beneath a layer of raincloud.

Scudéry, MADELEINE DE (1607-1701). French romance writer. Born at Havre, Nov. 15, 1607, she was left an orphan, and after a good education joined the literary circle of the Hôtel Rambouillet in Paris, becoming one of the leading *précieuses*. Her prolix romances, *Ibrahim*, *Artamène, ou le Grand Cyrus*, *Clélie*, etc., were written with the help of and in the name of her eccentric brother Georges (1601-67). With their chivalrous adventures, high-flown sentiment, and thinly veiled allusions to personages of the day, they enjoyed immense popularity. She died in Paris, June 2, 1701.

Madeleine de Scudéry, French author

Sculling. Propelling of a boat by one man, or occasionally two men, each with a pair of sculls, the blades of which are more concave than an ordinary racing oar, and have shorter looms. The art of sculling differs in some degree from ordinary rowing, in which one oar only is handled by each rower, and there is a cox to steer the boat. A good oarsman is not necessarily a good sculler. Sculling demands a greater knowledge of oarsmanship; hence the finest exponents have invariably been professionals.

It is necessary for the hands to work perfectly in unison, and for both sculls to be put in the water exactly together, with equal power applied to both. Failing these essentials, the stern of the boat will swerve from side to side. Some landmark should be noted and an endeavour made to keep the boat's end in a perfectly straight line with it. This must be steadily practised until the boat can be propelled without causing it to make the least deviation from a straight

Sculling. Principal positions in carrying through a stroke. 1. Forward position. 2. Half-way through stroke.

3. Blades extracted and wrists turned. 4. Coming forward

From *The Complete Oarsman*, by R. C. Lehmann, by courtesy of Methuen & Co.

course. The sculls should be as light as possible; length about 9 ft. 9 ins., and width of blade 6 ins. The sculls should be kept feathered until the full extent of the swing is reached, at which point the blades should be turned square at the exact moment of being dipped into the water. The art of sculling consists in keeping the boat going smoothly and continuously; there should be no jerky movement, especially at the beginning or finish of a stroke.

World professional sculling championships have been held in various countries, many on the Paramatta river, N.S.W., over a

course of 3 m. 330 yds. The championship course on the Thames is from Putney to Mortlake, and measures $4\frac{1}{2}$ m. The amateur championship of the Thames is also sculled over this course, the event being known as the Wingfield Sculls. The Diamond Sculls is one of the events at Henley Regatta (*q.v.*), over a course of 1 m. 550 yds. Other races are the University Sculls at Oxford, and the Colquhoun Silver Sculls, and the Lowe Double Sculls at Cambridge. In English sculling the Barry family have made the greatest name. *See Boat; Rowing.*

Praxiteles; the Renaissance in Italy the supreme Michelangelo, Donatello, Verrocchio, and Bernini; the Medieval in England such masters as William Torel, John of St. Albans, and Peter the Roman. Besides these familiar names, one recalls great statues which they made. The Parthenon marbles, the Hermes of Praxiteles, and the Charioteer of Delphi. The Venus de Milo is perhaps the most famous marble in the world; like the Victory of Samothrace, it is now in the Louvre, Paris. Then there are Michelangelo's Slaves, his Pieta in S. Peter's, and his colossal David, carved out of a block of Carrara marble 18 ft. high. Donatello made the bronze equestrian at Padua called Gattamelata, and Verrocchio the equally remarkable equestrian in Venice called the Colleoni. The exquisite statues of the kings and queens of Judah on the West Portal of Chartres will be remembered by all visitors to France, and the effigy of Henry III by Torel in Westminster Abbey is one of the world's finest bronze figures.

Sculpture is of all scales. It is sometimes colossal, sometimes diminutive. The Egyptians cut great statues in the solid rock, as at Abu Simbel (*q.v.*). The Sphinx is enormous, and is one of the sights of Egypt. Most well known of the Greek examples is perhaps the Colossus of Rhodes, a gigantic statue in bronze which stood with one foot on each side of the harbour and permitted the passage of ships between the striding legs. Eastern cultures provided many colossal Buddhas. There are the tremendous statues on Easter Island, the origin of which is not known but which bear testimony to a highly developed people.

SCULPTURE AND SCULPTORS

Charles Wheeler, R.A.

See also the separate articles on great sculptors, e.g. Donatello; Michelangelo; Pheidias; and the many illustrations of pieces of sculpture throughout this Encyclopedia, e.g. Apollo; Colleoni; Ixstern; Hercules; Laocoon. See also under Archaeology; Art; Babylonian; Egypt; Greek Art; Roman Art, etc.

Sculpture is the art of carved and moulded form and may therefore be divided into glyptic sculpture and plastic sculpture. The art has been practised as long as man has been civilized. It is the most durable of the arts, and sometimes it is only by their sculptural remains that a civilization is known to have existed. Like the other arts, it reflects the customs, thoughts, and feelings of the men of the time and place of its production. It is a stony mirror in which are reflected the men who made it and the men for whom it was made.

The ancient cultures fostered sculpture. The Egyptians, Babylonians, Assyrians, Greeks, Romans in the West, the Chinese and Indians in the East, all produced sculpture of a high order. The Renaissance people, especially in

Italy, and the medieval people all over Europe were remarkable for their sculpture. Down to the present day in all countries of the world, sculpture exists here and flourishes there in spite of wars, and political, social, economic, and religious upheavals. It is a form of human expression which will not be denied, so that nowadays when the steady flow of tradition has given way to a mere violent movement, sculpture manifests itself in a multitude of diverse and experimental ways. Modern sculpture, like modern painting, continues to portray as it has always done the character of contemporary times and people.

Associated with all great cultures are the names of their great sculptors. The ancient Greek produced Pheidias, Lysippus, and

Sculpture. Varying 20th century styles as revealed in the remarkable open-air exhibition of sculpture in Battersea Park, London, throughout the summer of 1948. No. 2, representing Spring, is the work of Charles Wheeler, R.A., writer of this article. The others are by: 1, Maillol; 3, Laurens; 4, Maurice Lambert; 5, F. E. McWilliam; 6 (designed as a door jamb), Modigliani; 7, Henry Moore

Travellers to New York will not forget the colossal Liberty at the entrance to New York harbour. Diminutive sculpture is represented by Chinese jade carving and the ivory carvings of the Gothic peoples. Of the former, the jade horse from the wonderful Eumorfopoulos collection now in the British Museum is known everywhere, and the numerous madonnas, many retaining in their design the shape of the tusk from which they were carved, will be recalled by visitors to museums in every part of Europe and America.

Sculpture is made either by chiselling down from a block of marble, stone, or other solid matter until the desired shape is achieved (the glyptic method), or it is made by adding piece to piece of some plastic material until the design is accomplished. There are no other ways except a combination of both, as happens when cast concrete is finished by chiselling. The second, or plastic, method usually requires to be cast in another material than that in which it is built up, so that it may become hard and per-

manent. Clay or wax becomes plaster or bronze or concrete. The resultant forms often differ in character, carved work tending to be fuller and modelled work thinner.

The process of casting sculpture has not varied through the centuries. The waste-wax or *cera perdata* method described by Benvenuto Cellini in his Memoirs being the same today and the one most suited to fine sculpture. Bronze is the best alloy for sculpture because of its ductile qualities, its strength, and its colour. With age it takes on lovely patinas which are frequently artificially made by chemical treatment.

Marble and stone are most generally used for carved sculpture, though granite, wood, and ivory are also commonly employed. Semi-precious and extra hard stones are less frequently carved or rubbed into sculptural shape. Marble was made famous by such names as Pentelicos and Paros in Greece and Carrara in Italy. Granite and basalt, sandstones and limestones were used by the Egyptians, the Renaissance scul-

tors, and those of the Middle Ages and today. When wood was used, it was generally covered with gesso and coloured. All sculpture was, until about 300 years ago, coloured, monochromatic sculpture being comparatively recent.

Nine-tenths of sculpture deals with the human form and draperies, and portrays gods, heroes, virtues, and famous men. Animals are also a popular subject, and the lions of the Egyptians and Assyrians, the horses of the Greeks and Chinese, the strange beasts taken from the medieval bestiaries—all appear in their respective places. In recent years, together with the art of painting, sculpture has produced exercises in so-called abstract form. Throughout the ages sculpture has been an expression of man's intelligence calling for the skill of his hands, the keenness of his eyes and mind, and the depth of his feelings.

Bibliography. A History of Sculpture, E. H. Short, 1907; Sculpture of Today, K. Parkes, 2 vols., 1921; A History of Sculpture, G. H. Chase and C. R. Post, 1924.

Scunthorpe. Borough of Lincolnshire, England. It is 25 m. by rly. W. of Grimsby and has iron and steel works, blast furnaces, etc. Market days, Fri. and Sat. Pop. est. 51,500.

Scurf. Popular name for dandruff, the tiny scales shed from the skin of the scalp. A certain amount of scurf is normal; excess can be caused by several organisms: the acne and the bottle bacilli, and the staphylococcus albus. In all skin diseases it is most important to clear the scalp of scurf; many skin affections of face and body occur and persist because of infection from scurf dropped from the scalp. Scurf, which tends to recur, is treated by rubbing weak ammoniated mercury ointment well into the scalp before washing the hair; by using a suitable lotion containing mercury and salicylate, and by washing the brush and comb every day.

Scurvy. Disease due to a disturbance of metabolism, resulting from the absence of vitamin C (ascorbic acid) from the diet. Scurvy was formerly very prevalent among prisoners, armies in the field, and sailors on long voyages, all unable to obtain fresh food. The onset of the symptoms is insidious, the early indications being loss of weight, increasing weakness, and anaemia. The gums become swollen and spongy, and bleed easily. The teeth may fall out and necrosis of the jaw occurs. The skin becomes dry and rough, and subcutaneous haemorrhages are present. The spleen is enlarged, and the urine contains albumen.

Treatment consists in adding to the diet foods rich in vitamin C, to make good the deficiency recognized as the cause of the disease. Most cases are cured by giving doses of vitamin C by injection, the juice of two or three lemons daily, and plenty of meat and fresh vegetables and salads. If the stomach is disordered, and unable to absorb readily, scraped meat and milk and lemon-juice should be given. For the gums a mouth wash of potassium permanganate or dilute carbolic acid should be used. For the prevention of scurvy, the board of trade requires all ships to take on board a sufficiency of anti-scorbutic articles of diet. Scurvy is one of the few morbid conditions in which the preventive is known, as well as the certain cure.

Scurvy Grass (*Cochlearia officinalis*). Perennial herb of the family Cruciferae. It is a native of N.W. Europe and the Polar

regions, growing near the sea and on mountains. From the root-stock many fleshy stems arise, also spoon-shaped leaves. The stem-leaves are stalkless, angled, and their bases clasp the stem. The four-petalled flowers are white. Eaten raw, e.g. in a salad, it is a valuable anti-scorbutic medicine.

Scurvy Pea (*Psoralea*). Large genus of shrubs and herbs of the family Leguminosae. They are

Scurvy Pea. Leaves and flowers of Jesuit's Tea

like flowers are blue, purple, or white, clustered in heads, spikes, sprays, or bundles. *P. esculenta*, a N.W. American species, has a turnip-shaped farinaceous root, which the French voyageurs called Pomme blanche or Pomme de Prairie. They are boiled for eating, but are rather insipid. *P. glandulosa* (Jesuit's Tea), a native of Chile, is applied as a poultice to wounds, and an infusion of the root is emetic.

Seutage. Term used in feudal times to describe the money payment made by a knight in place of following his lord on military service. It comes from the Latin word *scutum*, a shield, and is literally shield money. As conditions of warfare changed, it was often irksome for owners of land to render their customary military service; they were glad to commute it for money, and the kings were often equally glad to receive this money. In England it was first paid in the time of Henry II. See Feudalism.

Scutari or SHKOVËR. Town of Albania. Situated on the Bojana (Boyana), S.E. of Lake Scutari, it lies 12 m

Scurvy Grass. Flower-head and leaves

from the Adriatic. It has woollen manufactures, and exports maize, tobacco, hides, and sumach. Pop. 29,209. In the first Balkan War the town was besieged by the Montenegrins, and afterwards by the Serbians; but the place held out until April, 1913. During the First Great War it was occupied at first by Montenegro, but after Serbia and Montenegro were overrun in 1915-16, it was seized by the Austrians, who held it until Oct.-Nov., 1918. Lake Scutari, partly in Albania and partly in Yugoslavia, is 27 m. long, and its greatest width 10 m. See Albania.

Scutari. This town of Asiatic Turkey is described under its alternative name of Uskudar.

Scutum Sobieski. One of the smaller S. constellations. It lies in the Milky Way between Aquila and Sagittarius. The constellation includes the well-known horse-shoe or ω nebula, a number of star clusters, and the variable star R Scuti. The constellation was so named by Hevelius in 1690, in honour of King John Sobieski of Poland. See Constellation.

Scylla and Charybdis. In Greek mythology, a sea monster and a whirlpool on opposite sides of the Straits of Messina at the narrowest part. Scylla had twelve feet and six heads, and snatched sailors from the decks of the ships that passed too near, while Charybdis three times a day sucked down the waters and threw them up again. Ships that tried to avoid Scylla ran the risk of being swallowed in the whirlpool of Charybdis on the other side. Odysseus and Aeneas were among the heroes who successfully negotiated the perils of Scylla and Charybdis. Another legend regarding Scylla relates that she was originally a sea nymph. Jealous of the love of Glaucus for her, Circe (*q.v.*) put poisonous herbs in a well where Scylla bathed, and the lower part of her body became the tail of a serpent surrounded with barking dogs. The town on the rock, now known as Scilla, was destroyed by earthquake in 1908. *Pron.* Silla; Karib-dis.

Scylla. Rock on the Calabrian coast where the monster of classic fable was supposed to dwell

Scyros or **SKYRO**. Greek island in the Aegean Sea. It is 24 m. N.E. of Euboea, is one of the N. Sporades, and has an area of 80 sq. m. It comprises two mountainous peninsulas, culminating in the S. at 2,700 ft. Most of the people live in Skyro or St. George, on the site of the ancient Scyros. Goats and sheep are reared; wine, wheat, and oranges are produced. Pop. 3,500.

Scythe (A.S. *sithe*, cognate with Lat. *secare*, to cut). Hand implement for cutting grass or corn.

The long, curved blade has a ridged back, and is cranked on at rather less than a right angle to a long wooden handle or snath, which is held by small gripping handles. The snath may be either straight or, more usual, curved. For the cutting of corn a sort of cradle is often attached. The angle of attachment of the blade can be adjusted, and in whetting a scythe the whetstone must be kept flat upon the blade, or the edge will be ground off. See Reaping.

Scythia. Name given in ancient times to an indeterminate region lying N. and N.E. of the Black Sea. Its confines differed from age to age according to different writers, of whom Herodotus was the fullest; but the physical boundary was always the edge of the forest, and the term Scythian was usually applied to any barbarian—i.e. non-Hellenic—inhabitants of this region. These inhabitants, according to ethnologists, appear to have been a mixture of Scythians proper from upper Asia, and Cimmerians, the previous occupants of the land.

The Scythians, who appeared in the 7th century B.C., gave their name to the country, but were absorbed among the Cimmerians. About the same time another horde of invaders who have been identified as Scythians appeared in Media, but this identification is not undisputed. About the end of the 6th century B.C., Darius I, the Persian king, attempted an invasion of European Scythia, but without any permanent result. From the middle of the 4th cen-

tury the power of the Scythians declined before that of the Sarmatians, new invaders from the east, who occupied their country, and by the 1st century B.C. the name Scythia had ceased to have any political significance. The Scythians of early times were a nomadic people, but with the progress of time agriculture was developed and a smattering of Greek culture introduced.

The classical history of Scythia has been greatly expanded and elucidated by modern archaeology. Sculptured figures at Behistun and Persepolis, 6th century figurines from Memphis, and vase-scenes from the kurgans of Russia, depict a physical type inclined to squatness and corpulence, wearing tall caps, loose breeches tucked into soft boots, and skin cloaks. Such garments needed no fibula; it is the torcs and armlets that are characteristic. The short dagger, socketed celt, unequal bow, three-sided arrow-heads, and bowcase (gorytus) were such as an Altaian mounted nomad would naturally adopt. The women lived under servile conditions. During migrations they occupied felt tents or yurts mounted upon ox-drawn wagons, pointing to their being non-nomadic Iranian captives. The food embraced the products of the chase, besides horse-flesh, soured mare's milk (koumiss), beans, and onions, and ox-haggis. The cooking pots were pedestalled metal cauldrons.

The religion was interpenetrated by central Asian shamanism, just as many social institutions and customs—hemp vapour-baths, blood brotherhood—were of nomad origin. On the death of a chief his women-folk, grooms, and horses were immolated with his funeral car. Gold, commoner than bronze, was stamped into plaques for sewing upon clothing and horse-trappings. Gold jewelry, often of supreme excellence, was produced by Greek artisans for the Scythian market; in one grave-mound—Kul Oba, near Kerch—the gold weighed more than 120 lb. The beast-motive—griffin, lion, bird—developed out of eastern material, and passed to Scandinavia and Britain, becoming absorbed into the art of early Ireland, and the Anglo-Saxon graves. Thus Scythian denotes a medley of racial and cultural elements, Altaian and Iranian. See Scythians and Greeks, E. H. Minns, 1913. *Prom. Sithia*.

Sea. Name of a portion of the ocean. The use is general in the phrase the South Sea Islands, but

more particular in North Sea, Caribbean Sea, Mediterranean Sea, where the land provides more or less precise boundaries. By extension the word is applied to inland bodies of salt water, e.g. Caspian Sea, Dead Sea, and Sea of Aral. See Ocean.

Sea Anemone. Name given generally to the Anthozoa or Actinozoa family of the coelenterate animals, abundant in rock pools on the coast. In structure they may be said to consist of a short thick tube, enclosed in a leathery skin and firmly attached to the rock by a sucker-like disk at the base. They can, however, very slowly change their position by a gliding motion. Around the mouth they have rings of tentacles, usually forming a multiple of six. These are of the most varied and beautiful hues, and when expanded give the animal the appearance of a flower. They can be retracted when the animal is alarmed, or for the purpose of enfolding food, and the creature then resembles a blob of jelly.

Anemones are carnivorous and feed largely on the minute organisms, such as crustaceans, which come within reach of the tentacles, while some of the larger species can take in mussels and other molluscs, as well as pieces of dead fish. Some of the smaller species take up their abode on the shells of gastropod molluscs and the carapaces of crabs, and it is common to find an anemone and a hermit crab sharing an empty whelk shell. The remarkable difference in size in the anemone when expanded and retracted is due to the fact that the body cavity is largely filled with fluid; in contraction this is expelled through the tentacles, which are hollow and provided with fine holes at the tips. In many species the tentacles have stinging cells which paralyse the prey, and in some of the tropical species are capable of inflicting a very severe sting on man. The British species, numerous and varied in both form and colour, are quite harmless except to small organisms.

Reproduction usually takes place from eggs, but often the larval stage is passed within the body of the parent. Some species propagate by a kind of budding or division of the basal disk. The sexes may be either separate or united in the same individual. Anemones are easily kept in a marine aquarium, but they should if possible be introduced attached to the stone or rock on which they

Scythe. Implement for cutting long grass

were found. The water should be well supplied with minute crustaceans, or food may be provided

Sea Bream. Edible fish found round the coasts of the British Isles
W. S. Berridge, F.Z.S.

in the form of small fragments of raw fish. See colour plate facing p. 7404; Animal.

Sea Bass (*Morone labrax*). Fish of the family Serranidae, native of S.W. Europe and the Mediterranean, extending to S. England and Eire, and occasionally found farther N. It is a fine fish, 2 ft. or more in length, and weighing 15 lb. The back is bluish grey, paling to silver on the sides and white beneath. The body is compressed, not so deep as in the related perches, and the upper outline straighter. The first dorsal fin has eight strong spiny rays. The fish spends the winter in the deep sea, but in May seeks shallower water for spawning, retiring again in Oct. or Nov. The eggs are buoyant (pelagic). Young bass frequent harbours and ascend rivers, feeding upon the smaller fishes and crustaceans. The flesh is esteemed for food by some; others consider it too coarse, and the fisherfolk in Cornwall reject it on account of the bass's predilection for feeding at the outlet of sewers. The stone bass (*Polyprion americanus*) is a shorter, deeper-bodied fish with the first dorsal fin long and low. It inhabits the deep waters of the tropical parts of the Atlantic and Pacific, whence it migrates to Great Britain. These migrants are about 18 ins. long and as many pounds in weight; but in the Mediterranean they have been recorded up to 1 cwt. See Bass.

Seaborg, GLENN THEODORE (b. 1912). American chemist. He was educated at California university, and at the end of his student career was taken on the research staff, becoming professor of chemistry in 1945. During the Second Great War Seaborg, who had already done brilliant work on nuclear chemistry, joined the team of scientists experimenting with plutonium (*q.v.*) at Chicago university. He was the first to identify americium and curium, two other elements artificially

made by radio-activity. See Atomic Bomb.

Sea Bream (*Pagellus centrodontus*). Marine fish of the family Sparidae. A native of the Mediterranean and the North Sea, it occurs in coastal waters all around the British Isles, especially on the S.W. With a deep, thick body and high dorsal fin, it presents a superficial resemblance to the fresh-water perch. The upper parts are red and the sides and under parts silvery, with a conspicuous black spot above the gill-covers. The front teeth are formed for cutting and the side teeth for grinding. Food is principally sand-stars, brittle-stars, and small crabs. The young are known as chads. This is an admirable food-fish.

Sea Buckthorn OR SALLOW-THORN (*Hippophaë rhamnoides*). Small tree of the family Elaeagnaceae. A native of Europe and Asia, it has alternate, lance-shaped leaves, silvery on the underside and dull green above. The male and female flowers are on separate plants. They are very small and green; the males clustered, the females solitary. The latter are succeeded by small orange-coloured berries, made into preserves in some countries. Many branches harden into a long thorn.

Sea Buckthorn. Twig of leaves; right, the orange berries and thorns

Sea Cadet Corps. British voluntary organization for training boys for the Royal and Merchant navies. Established as the Navy League Boys' Brigade in 1899, it received Admiralty recognition in 1919, when it assumed its present title. Besides being a training organization, the corps is a youth

movement preparing boys for citizenship. Each unit is administered by a local committee, and capitation grants for each efficient cadet are paid to units by the Admiralty. Officers, generally ex-members of the navy or merchant service, are granted unpaid commissions in the R.N.V.R. The corps has 400 units and some 50,000 cadets, with h.q. at 37-41, Gracechurch Street, London, E.C.3.

Seacombe. This district in the English co. of Cheshire is part of the co. bor. of Wallasey (*q.v.*).

Sea Cucumber. Another name for trepang or Bêche de Mer (*q.v.*).

Sea Disturbance. Term applied to the effect of wind upon the surface of the sea. Details of the scale used for sea disturbance on the high seas, and the corresponding heights of waves, are given in the table below. See Gale.

Beaufort Number (wind)	Description of sea	Av. height of waves in ft.	Code Figure (sea)
0	Calm—glassy	—	0
1	Calm—rippled	$\frac{1}{2}$	1
2	Smooth wavelets	$\left\{ \frac{1}{2} \frac{3}{4} \right\}$	2
3	Slight	5	3
4	Moderate	9	4
5	Rough	14	5
6	Very rough	19	6
7	High	25	7
8	Very high	$\left\{ \frac{31}{37} \right\}$	8
9	*Phenomenal	$\left\{ \frac{45}{or more} \right\}$	9

**e.g.* at the centre of a hurricane

Sea Elephant. Alternative name for the Elephant Seal (*q.v.*).

Seaford. Urban dist. and sea-side resort of Sussex, England. It stands on the S. coast, 3 m. E. of Newhaven and 58 m. S. of London, with a rly. station. Beautifully situated on a bay sheltered by cliffs, it has golf links and other attractions. The chief building is the church of S. Leonard, mainly Perpendicular. Seaford was at one time a seaport, as here the Ouse formerly entered the sea. It was also a smuggling centre. It early became a borough, and retained its corporate rights until 1883. In 1824 and 1866 inroads of the sea did much damage, and continued attention is given to sea defence. In 1928 Seaford Head, a famous headland, was bought by the urban council. The town suffered air raids in the Second Great War. Pop. 9,232.

Seafort. Type of A.A. artillery position built offshore in the Thames estuary during the Second Great War to defend the estuary and keep the Port of London open by driving off German mine-laying aircraft. Of seven such forts four

were manned by the navy and three by the army. Each fort consisted of a 36 ft. square concrete gun platform 50 ft. above water and mounted on concrete piles. The platform carried one 3·7-in., three 40-mm., and six 20-mm. A.A. guns. See Flak.

Seaforth. Scottish sea loch. It is on the E. side of the island of Lewis-Harris in the Outer Hebrides, and forms part of the boundary between Lewis and Harris. Its length is 14 m.

Seaforth. Dist. of Lancashire, England, forming part of the urban dist. of Waterloo and Seaforth. It stands on the Mersey, 4 m. N. of Liverpool, and is a seaside resort served by an electric rly. The name is taken from the Scottish sea loch (v.s.). Pop. 14,736.

Seaforth Highlanders. Regiment of the British army. It was formed in 1881 by the amalgamation of the 72nd Foot (Duke of Albany's Highlanders) and the 73rd Foot (Ross-shire Buffs) which had been raised by the earl of Seaforth for service in the Seven Years' War (1756-63). Both regts. were disbanded at the end of the war, but the 72nd was re-formed in 1778 and the 73rd in 1793. The former saw its first active service in India, where both took part in the Mahratta War of 1803. For special gallantry at Assaye the

Seaforth Highlanders badge

Sea Heath. Small leaves and flowers of the salt marsh plant

72nd was granted a third colour. Both regiments fought in the Crimean War and the Indian Mutiny, and in the Afghan War accompanied Roberts on his march from Kabul to Kandahar.

On amalgamation the 72nd Foot became the 1st battalion and the 73rd the 2nd battalion of the new

regiment. In 1882 this was at Tel-el-Kebir, then joined the Chitral expedition of 1895, and in 1897 was back in the Sudan. In the S. African War the regiment incurred heavy losses, especially at Magersfontein. Twenty-six battalions were raised for service in the First Great War. In the Second Great War the Seaforth Highlanders served in Malaya, Burma, N. Africa, Sicily, and N.W. Europe. The regimental tartan is that of the Mackenzie clan, and the depot is at Fort George, Inverness-shire.

Seagull. The various kinds of gull are described under that heading.

Seaham. Seaport and urban dist. of Durham, England. It is 5 m. S. of Sunderland, with which there is rly. connexion. There are three collieries, and a modern harbour, from which coal is shipped. An old church, S. Mary's, contains a little Saxon work. Seaham was a village until the opening of the coal mines. About 1823 the marquess of Londonderry began work on one harbour here, and during the 19th century the place grew rapidly. On July 11, 1916, it was shelled by a German submarine. In the Seaham harbour div. in 1935 the former prime minister Ramsay MacDonald lost a remarkable election to Emanuel Shinwell. Pop. 26,000.

Sea Hare. Popular name for the marine gastropod molluscs of the genus *Aplysia*. They have the general appearance of broad slugs—with upstanding tentacles supposed to resemble the ears of a hare. The shell is small, flattened, and concealed by the mantle. One species (*A. punctata*) is common in shallow water around the British shores, and has the power of ejecting a purple fluid when disturbed.

Sea Heath (*Frankenia laevis*). Perennial herb of the family Frankeniaceae. A native of W. Europe, Africa, and Asia, it is found in salt marshes and plains. The downy stem leans upon the ground and sends up wiry jointed branches. The tiny, opposite leaves are oblong in shape, but do not appear so owing to the margins being rolled back from the sides. The small rosy flowers are produced singly in the forks of the branches. They are succeeded by a three-sided capsule.

Sea Holly or **Eryngo** (*Eryngium maritimum*). Peren-

nial herb of the family Umbelliferae. A native of sandy seashores on the Atlantic, Mediterranean, and Black Sea coasts, it has a stout, creeping and branching rootstock, and large roundish root leaves, cut into three lobes, with spiny teeth. The leaves are all stiff and leathery and of a glaucous tint. The bluish-white flowers are stalkless, so that instead of producing the umbels characteristic of the Umbelliferae, they have them massed in a dense head, with spiny bracts at the base. Under the name of Eryngos the roots were formerly candied.

Sea Horse (*Hippocampus hippocampus*). Small fish (about 7 ins. long) related to the Pipe-fishes (q.v.). It is a native of the Atlantic and Mediterranean, occasionally appearing on the S.W. coasts of Great Britain and Eire, and rarely in the North Sea. Like the pipe-fishes it has a bony exterior, and the body is quadrangular, flattened from the sides. The large head ends in a long snout which has the small mouth at its extremity.

The fore half of the body is twice the depth of the hinder half; this, in conjunction with the bending of the head, produces a curious resemblance to the head and neck of a horse. The fish swims with the body vertical, motive power being provided by its solitary fin—the dorsal, which is small. There is no tail fin, but this end of the body is narrowed and coils around the seaweeds among which it lives. The males have a brood pouch (marsupium) on the lower side, in which they carry the eggs until hatched. The related Japanese seahorse (*Phyllopteryx equus*) has long ragged outgrowths from the body which mimic seaweeds.

Sea Kale (*Crambe maritima*). Perennial herb of the family Cruciferae, native of European sea coasts. It has a creeping rootstock, spreading branches, and large,

Sea Horse. The small bony fish W. S. Burridge, F.Z.S.

Sea Kale. Wild form of the edible seashore plant

wavy-edged leaves. The white flowers are produced in corymbs, succeeded by roundish one-seeded pods. Originally eaten in its wild state, for 200 years it has been cultivated in Great Britain as a food plant; the numerous young shoots in spring being forced and blanched. These are served up after the manner of asparagus. Plants may be raised from seed sown in March or April, thinned out 6 ins. apart, and in late autumn replanted in sandy soil, 2 or 3 ft. apart.

Seal (A.S. *seol*). Popular name for a group of marine carnivorous mammals, constituting the sub-order Pinnipedia or fin-footed animals. They have become adapted specially for marine life, the body being elongated and tapering from the shoulders to the tail, and covered with long, coarse hair. The limbs are converted into paddles, the greater part of their length hidden beneath the skin of the body, and the hands and feet fully webbed. In the true seals the hind limbs are united to the short tail and are useless for locomotion on land. Except in the sea lions there is no external ear. The one or two (almost invariably one) young are born on land, and are at first white. They are found in all seas except those of the tropics, but abound chiefly in the Arctic and Antarctic regions. The sub-order comprises three families: Phocidae or true seals, Otariidae or sea lions (*q.v.*), and Odobenidae or walrus (*q.v.*).

Several species of the true seals (Phocidae) visit the British coasts from time to time, and the common or harbour seal (*Phoca vitulina*) is a resident around Scotland, Ireland, Wales, and the N. and S.W. of England. It is between 4 ft. and 5 ft. long, yellow grey in colour, spotted with brown. It haunts the mouths of salmon rivers destroying many of the fish, and pursues them far up into fresh water; it sometimes inhabits inland lakes. The larger harp seal or Greenland seal (*P. groenlandica*), hunted extensively off Newfoundland, has been reported occasionally on the British coasts; its lighter coat is decorated above by two rugged black crescents extending from the shoulders to the thighs; the face also is black. The ringed seal (*P. foetida*), about 4½ ft. long, with the back marked by whitish ring-spots, is a very rare visitor to the Hebrides, N.E. Scotland, and E. England. It furnishes the Eskimos with food and clothing, and may have suggested the form of their huts, for it builds similar retreats in the ice.

The great grey seal (*Halichoerus grypus*), which visits the Hebrides, Argyllshire, the Irish coasts, and, more occasionally, England, is 8 ft. or 9 ft. long, yellow grey in colour, with darker spots and blotches. Its range is restricted to the Atlantic. The hooded or bladder-nose seal (*Cystophora cristata*), 8 ft. or 9 ft. long, is another rare visitor, whose headquarters are between Iceland and Greenland. It is dark bluish grey with lighter spots, and reaches a length of 10 ft. Its distinctive character is an inflatable sac about a foot long, on the face, which it distends for the purpose of terrifying aggressors. This species is more closely related to the elephant seal (*q.v.*). The only example in the Mediterranean is the monk seal (*Monachus albiventer*). Found only in the Antarctic are the leopard seal (*Stenorhynchus*), the crab-eating seal (*Lobodon*), Weddell's seal (*Leptonyx*), and Ross's seal (*Ommatophoca*).

Seals feed upon fishes, crustacea, and molluscs; occasionally upon birds. The thick blubber with which they are coated, like the whales, can be boiled down into oil, and for the sake of this product and their skins seals are persistently hunted. See Baffin Bay; illus. facing p. 7405.

Seal (Lat. *sigillum*, little sign or mark). Mass of wax, lead, or other substance, bearing a device or words impressed upon them by a die; also the die itself, often called a matrix. The latter is retained for exclusive use by one person or corporation for the purpose of authenticating documents, and preventing the unauthorised opening of envelopes, boxes, doors, etc. The die, usually of a hard stone or metal, is generally incised, and is often fitted to a finger ring, when it is called a signet.

Seals have been used from remote antiquity. Specimens belonging to the early Egyptian dynasties have been found, and also the stamps of royal seals on Assyrian clay records. In Rome the symbols often formed a pun on the bearer's name. In the Middle Ages seals were usually of a religious or heraldic character. Royal and ecclesiastical seals were usually large and elaborate, having both an obverse and reverse, in which the gold, silver, lead, or wax seal was moulded, a complete impression having ornamented front, back, and edges, a silken ribbon, cords or strip of parchment being embedded in it to facilitate attachment to a document. Seals of the 13th and 14th cents. were very fine.

In England, specimens of the royal state seals have been preserved from the time of Edward the Confessor, and form a valuable historical record. Besides the great seals, in the keeping of the chancellor of the realm, the kings had privy seals, smaller in size, and from the reign of James I special seals for various household and state depts. The great seals and most of the privy seals from the time of Richard I are armorial. See Anselm, S.; Chancellor; Edward the Confessor; Privy Seal; consult English Seals, J. H. Bloom, 1906; Seals, W. de G. Birch, 1907.

Seal. Name of a British submarine, 1,520 tons, complement 55, built in 1938. She was captured by the Germans May 5, 1940, while mine-laying in the Kattegat. Her commander, Lt.-Cdr. R. C. Laisdale, R.N., and junior officer, Lt. T. A. Beet, R.N., tried by court-martial at Portsmouth April 9-11, 1946, for failure to prevent the capture of the ship, were honourably acquitted.

Sea Lavender (*Statice*). Genus of mostly perennial herbs of the

Sea Lavender. Flower spikes of shore plant

family Plumbaginaceae. They are natives of sea-shores and salt districts of temperate regions. The leaves spring directly from the stout root-stock, and the small, abundant flowers are

borne on tall, branching stems. The calyx is of a tough, parchmenty character which retains its form long after the seeds have been shed. Many species are grown for the purpose of drying the flowers for winter decoration. The name is derived from the blue-purple colour of the common European species (*S. limonium*).

Sealed Orders. In time of war, or when it is desired that a ship's destination should not be generally known, the captain's orders are handed to him in a sealed envelope, which he is instructed not to open until the vessel has reached a given place at sea. In such circumstances the ship is said to be "sailing under sealed orders."

Sea Level. The surface which the sea would assume were it stag-

nant and without fluctuations due to waves, swell, tides, etc. Although there is considerable variation in the amplitudes of the oscillations from place to place and from time to time, it is believed that the mean sea level is virtually constant at a given place in the open ocean. The standard datum for M.S.L. around the coasts of the U.K. is at Newlyn, Cornwall.

Sea Lily. For this class of the Echinodermata, see Feather Star.

Sealing Wax. Composition for fastening letters, parcels, etc., and taking impressions of seals on documents. In the 16th century it was made of beeswax, turpentine, and colouring matter, and was known as Spanish wax, having been imported into Europe through Spain. It is now made of shellac (*g.v.*) and Venice turpentine, coloured with vermilion, ivory-black, or other colours. A coarser sealing wax, made of resin with a proportion of beeswax, is used for sealing corks into bottles.

Sea Lion (Ger. *Seelöwe*). Code name used by the Germans for their plan of operations for the invasion of England in 1940. Discovered in Berlin, and published by the Allies, Sept. 26, 1945, it is described under Invasion.

Sea Lion or Fur Seal (*Otariidae*). Family of seals, natives of the temperate and Arctic regions of both hemispheres. They are distinguished from the true seal (*g.v.*) by having a more distinct neck, by the muzzle being more pointed with the nostrils at its extremity instead of on the upper surface, by having small external ears, and a close, woolly fur under the long coarse hairs. In addition, the hind limbs are free from the tail and can be turned forward so as to be used on land, enabling the creatures to get over the ground speedily, though awkwardly.

They are less exclusively aquatic than the true seals, and on land associate often in great numbers, especially in the breeding season, when every old male herds from 15 to 20 females in his harem. The younger males (under six years) and females congregate in thousands on separate "hauling grounds" apart from the "rookeries" or breeding grounds. Fierce conflicts take place between the old bulls for the possession of cows. Roughly speaking, the sea lions may be said to be intermediate between the true seals and the land carnivora. Among the best known species is the southern sea lion (*Otaria jubata*) of the Falklands and S. Pacific, the Californian sea

lion (*O. gillespiei*) and the northern fur-seal (*O. ursinus*) of Alaska, Bering Sea, and Labrador. The last named is the chief source of the highly-prized sealskin of commerce, and has been the cause of serious international disputes. Fully developed males are from 6½ to 7½ ft. in length and weigh from 400 to 600 lb., with a thick deposit of blubber around the neck and shoulders. During the three months of the breeding season they take no food, and they return to the water thin and weak. An account of this species is given in An Arctic Province: Alaska and the Seal Islands, by H. W. Elliott, 1886. The sea lion of the menageries is the black Californian sea lion (*Zalophus californianus*). See illus. facing p. 7405.

Sea Lord. Title of five officials of the British board of Admiralty. Whereas the first lord of the Admiralty directs policy, and is a civilian appointment held by a member of the govt. of the day, the sea lords are naval officers exercising administrative control over the affairs of the Royal Navy. Their full titles are: first sea lord and chief of naval staff; second sea lord and chief of naval personnel; third sea lord and controller; fourth sea lord and chief of supplies and transport; fifth sea lord and deputy chief of naval staff (air).

Sea Lyme-grass (*Elymus arenarius*). Tall, coarse, perennial grass of the family Gramineae. It is a native of Europe, N. Asia, and N. America. It has a stout, creeping rootstock which sends out runners and helps to bind the loose sand among which it grows. The stout stems are 3 to 6 ft. high, and the wax-coated leaves rigid and sharp-pointed. The flowering spikelets are in two compressed rows.

Seam. In mining, a layer of mineral which has been deposited originally in a horizontal position and usually more

or less by the aid of water, as distinguishing a vein or lode, which cuts across seams or strata. A seam may be only an inch or so in thickness, or 4 ft. to 5 ft., as in some coal mines, or 100 ft. or more, as in some rock salt and iron ore deposits, though such thick deposits are usually described as beds rather than seams. See Coal.

Seaman. Term for a sailor. More strictly it is used for one who is employed to navigate a ship at sea, but is below the rank of an officer. In the U.K. the law relating to the employment of British seamen is contained in the Merchant Shipping Acts. A seaman is any person (except a master, pilot, or apprentice) employed or engaged in any capacity on board any ship. The Merchant Shipping Acts have considerably improved the conditions of life in the merchant service. A seaman must be engaged on an agreement in a form approved by the board of trade, and this agreement must set out plainly the conditions of service, nature and length or extent of the voyage, the capacity in which the seaman is to serve, a scale of provisions to be furnished, etc.

A foreign-going seaman must be discharged and paid in the presence of a board of trade superintendent, and the master of the ship must give him a discharge certificate. When the sailor leaves his foreign-going ship at the end of his engagement, he is entitled to be paid £2, and the balance within two clear days. A home seaman is not entitled to the £2 immediately. Advance notes are restricted to one month's pay; and a sailor who wishes his pay to be allotted from time to time, say to his wife, must have it stated in his agreement. No allotment can be made except to a near relative or to a savings-bank. A seaman may not by any agreement forfeit his lien on the ship for his wages, nor forgo his right to wages in the event of the ship's being lost; and he is entitled to wages up to date if the ship is wrecked or lost, or if he has to be put ashore for sickness, but if he neglects or refuses to work for a time he forfeits his wages for that time. There are many other provisions protecting the seaman's wages. A master can no longer discharge a seaman at a foreign port and leave him stranded. He must provide for the man's return to the port at which he signed on.

Medical attendance must be provided in case of injury or sickness; and adequate and proper food must be supplied. Speaking generally

See text pp. 7403-04

ally, the seaman on British ships is now, as far as legislation can accomplish it, saved from being fleeced or ill-treated. On the other hand, a seaman who does not obey lawful orders, or who refuses to return to his ship, is liable to punishment, and even to be compelled to complete the voyage. See Merchant Navy; Navigation.

Seaman, Sir OWEN (1861-1936). British journalist and poet. Educated at Shrewsbury and Clare College,

Sir Owen Seaman,
British writer
Mills

Cambridge, he was Porson prizeman in 1882, first class in the classical tripos, and captain of Clare boats, in 1883. Appointed a master of Rossall School in 1884, he was professor of literature at Durham College of Science, Newcastle-upon-Tyne, in 1890. While an undergraduate he collaborated with Lancelot Speed and Horace Monro in a volume of satire on university life, *Paulopostprandials*.

In 1894 appeared his first contribution to *Punch*, a parody of Kipling. In 1897 he joined the staff of that periodical, becoming assistant editor in 1902, and editor from 1906 to 1932. A barrister of the Inner Temple in 1897 and hon. fellow of Clare in 1907, he was knighted in 1914, and created a baronet in 1933.

Seaman published many works of satire and light verse, but was most generally known for topical verses which appeared in *Punch* almost weekly for many years over the signature "O.S." During the early days of the First Great War these were widely quoted, and many spoke of Seaman as an unofficial poet laureate. He died Feb. 2, 1936.

Sea Milkwort OR **BLACK SALT-WORT** (*Glaux maritima*). Perennial herb of the family Primulaceae. It is a native of Europe, Asia, and N.

America, growing on seashores and estuaries and in inland salt districts. It has a fleshy, creeping rootstock from which a number of short stems arise, clothed with oval-oblong, stalkless, fleshy leaves in pairs. The flowers are produced in the axils of the upper leaves, and

Sea Milkwort, or Black Saltwort. Leaves and flowers

have no petals, the coloured part being the pink sepals.

Sea Mouse (*Aphrodite aculeata*). Popular name for an annelid worm of the order Polychaeta (many bristled). It is fairly common

Sea Mouse. Underside of the annelid worm, common about British shores

around the British shores, living in the sand below tide mark, and is often cast up after storms. It varies from 3 to 5 ins. in length, and has an oval body covered above with broad plates and iridescent bristles, and below bears many pairs of "feet" ending in bunches of bristles.

Séance (Fr., a sitting). Term applied, especially by spiritualists, to a gathering for the purpose of inducing psychical phenomena, particularly communication with a disembodied intelligence. See Planchette; Psychical Research; Spiritualism.

Sea Otter (*Lutra lutris*). Carnivorous mammal, related to the true otters, but placed in a separate genus. It differs in the number and form of the cheek teeth, and is a much bulkier and heavier animal, with a body about 3 ft. long, flipper-like hind feet, and a rather short tail. Its dark brown fur is one of the

most valuable in the trade, a fine specimen having realized £200 in the European market. The sea otter ranges the coasts on both sides of the N. Pacific, being chiefly found about Alaska and the Aleutian Islands. A strong swimmer, it has been found 15 miles from land. Its food consists of molluscs, sea urchins, and crabs. It is not gregarious; more than two specimens are rarely seen together.

Sea Pen. Popular term applied to a family (Pennatulidae) of alcyonarian corals. In the general form of the stock of polyps has a resemblance to a feather or quill. The term has also been used for the rudimentary shell in some of the cephalopods, as in the genus *Loligo*.

Sea Perch OR **COMBER** (*Serranus cabrilla*). Food fish related to the sea bass (*q.v.*). A native of the E. Atlantic, Mediterranean, and Red Sea, migrating to S. England, it is hermaphrodite in sex, and measures about 10 ins. in length, the body compressed and deep, of a pale red colour with two or three blue or whitish waved lines running

Sea Perch. A species of bass
Cambridge Natural History (Macmillan)

from head to tail along the sides. The jaws, of which the lower is the longer, are well furnished with irregular, incurved teeth. The two dorsal fins are united, but are distinguished by the stouter spines of the fore-portion. It is constantly

Sea Otter of the Northern Pacific Ocean

captured in crab-pots, which it enters in quest of the bait, and as a rule it is used by the crabbers for baiting them afresh.

Seaplane. Aeroplane capable of taking off from, and alighting on, water. The term embraces floatplanes and flying-boats. The floatplane resembles the landplane, but its wheeled undercarriage is replaced by one or more large floats (U.S., pontoons), normally with additional float support under the wing-tips and/or tail unit. The flying-boat (*q.v.*), the commoner class since the First Great War, is in general a larger aircraft, and is supported on the water by

a boat-like hull, again usually with wing-tip floats. Amphibians (capable of flying from land or water) may be of either type.

Seaplanes are heavier than comparable landplanes, and this detracts from speed and performance generally, but in many parts of the world operation from a stretch of water is both more economic and more efficient than providing costly runways for land aircraft. The characteristic deep hull form of many flying-boats also allows a heavy payload and a high degree of comfort for passengers.

Although other nations—the U.S.A. with the Boeing and Martin Clipper classes and the wartime Catalina, France with the Latécoère and other flying-boats, and Italy with several successful floatplanes—have made contributions, British constructors such as Short Brothers, Blackburn, Vickers-Supermarine, and Saunders-Roe have been outstanding in developing marine aircraft for peace and war. The contest for the Schneider Trophy (*q.v.*) for seaplanes only was won outright in 1931 by the Supermarine S6 floatplane. See *Aeroplane*.

Sea Power Phrase meaning the command of the sea, first popularised by A. T. Mahan, of the U.S. navy, in a series of works, of which the first was published in 1890, pointing out the decisive influence which sea power has exercised on the course of wars and the events of history. There was nothing new in this. The importance of sea power had been understood at a very early date; the mysterious Cretan empire under Minos had been based on a command of the Mediterranean; the defeat of the Persians by the Greeks (490–479 B.C.), and of the Athenians by the Spartans (431–405 B.C.), was known to have been achieved by sea power, which very term in its Greek form occurs in the contemporary Greek historian Thucydides.

The triumph of Rome over Carthage was mainly due to the Roman preponderance at sea, which exercised a decisive influence in the second Punic War, notwithstanding Hannibal's victories on land. In the Middle Ages and later, the command of the Mediterranean by the Venetians was the source of their power and wealth. The importance of sea power was ever present in the minds of the rulers of Tudor England, who had the signal example of it in the defeat of the Spanish Armada, 1588. It was illustrated in the wars with Holland under the Commonwealth and

Charles II. British command of the sea was mainly responsible for the defeat of the Bourbon states, France and Spain, in the wars of the 17th and 18th centuries; a disputed command of the sea, through the intervention of the French and Spanish navies during the British struggle with the 13 colonies in America, brought the British defeat and the independence of the United States. In the wars of the French Revolution, 1793–1815, British sea power was once more the decisive factor, and the blockade which it enforced was the deeper cause of Napoleon's overthrow.

The value of Mahan's works lay in this, that they brought out facts which had almost been forgotten by 1890. Mahan laid down certain principles of sea power; the control of the sea "does not imply that an enemy's single ships or small squadrons cannot steal out of port, cross more or less frequented tracts of ocean, make harassing descents upon unprotected points." It is achieved by defeating or blockading in their ports the main forces of the enemy. To secure such a result, he taught that naval force should not shun battle or seek "ulterior objects" — to which practice he ascribed the failure of the French. Destruction of the enemy's commerce by raiders and commerce-destroyers would never be decisive so long as the main naval forces of that enemy remained intact. Ships, colonies, well-placed bases, and a great commerce he regarded as necessary conditions of sea power; and he pointed out that an island empire with possessions scattered over the globe, sundered by sea, could not survive attack if it was not superior to the assailant in naval force.

In all recent conflicts down to the Second Great War the truth of these principles was emphasised by results. In the American Civil War (1861–65) the sea power of the North paralysed the Confederacy. In the China-Japan conflict of 1894–95 the decisive battle was that in which the Chinese fleet was defeated at the Yalu. In the Spanish-American war of 1898 Cuba was lost to Spain when the Spanish fleet was destroyed at Santiago; the Philippines were lost when another U.S. fleet defeated the Spaniards in the battle of Manila. In the Russo-Japanese War of 1904–05, command of the sea enabled the Japanese to invade Manchuria and take Port Arthur; the battle of Tsushima, 1905, in which a large Russian fleet was de-

stroyed, led Russia immediately to decide on peace. This war was important as illustrating the difficulties of a navy which possesses no chain of fuelling stations and bases, and which has to undertake operations at an enormous distance. The Russian fleet, to reach the Japanese, had to steam 10,000 miles, and when it arrived was foul and in bad fighting condition.

The First Great War saw the use of sea power on a vast scale; to the British blockade the Germans mainly attribute their defeat. The effect of this blockade was far-reaching; it deprived them of raw materials, such as rubber and copper, which they could not replace; food supplies, which their depleted man-power could not grow; ammunition and weapons, which the Allies could freely import, thereby setting free large numbers of men for the field; and of the power of exporting German products, such as chemicals, and thereby obtaining gold. It enabled the Allies to move enormous forces from Canada, Australia, and the U.S.A. Admittedly there was a point in the war when the Allies commanded the surface of the sea—from which they had driven all the German surface ships—but were unable to control its depths, which the German U-boats used as their means of egress.

Again in the Second Great War the Germans did their utmost to overcome Allied superiority at sea by submarine attack on commerce. Once this menace had been removed, the pressure exerted by sea power, and the ability which it confers on the possessor to move troops and supplies freely, inevitably led to victory. See *Air Power*; *Navy*.

Richmond, 1934; Modern Naval Strategy, Sir R. Bacon, 2nd ed. 1941; The Ocean in English History, J. A. Williamson, 1941; Statesmen and S.P., Sir H. Richmond, 1946.

Search. In general, the act of examining to find some person or object. The term is applied to the examination of cargo or baggage for customs purposes, and to the investigation of public records for legal purposes. In international law, the right of search is the right by which a commissioned warship of a belligerent state can stop and examine a merchant vessel not actually in neutral waters for contraband of war.

A constable has a right to search a prisoner who is violent, if this is necessary for the protection of prisoner or constable. He may also search a prisoner if the latter is likely to have any stolen property or articles. When a court fines a person, it may order him to be searched and any money found may be taken to pay the fine. An unauthorised search is a trespass to the person. No premises may be searched without a search warrant, which is an order or written authority given by a magistrate. In emergency, *e.g.* in connexion with suspected offences against the Official Secrets Acts, a police superintendent may give a written order having the same effect as a search warrant.

Searchlight. Apparatus for projecting a powerful beam of light in any direction. Searchlights are used in lighthouses, ships, fortresses, and for military operations in the field to project the light of an electric arc. The body of a searchlight consists of a short metal cylinder strengthened at both ends by angle-iron rings. A silvered mirror of parabolic shape is attached to the back ring and protected by a removable cover. The front ring carries a door glazed with narrow vertical strips of plain glass, which are free to expand independently in all directions. At the top is an opening, covered by a light-tight hood, to permit hot air to escape; similar openings at the bottom admit cold air. In the sides are cleaning doors and small windows through which the arc may be observed.

The lamp mechanism, fastened to the bottom of the body, has two long arms projecting through a horizontal slit to hold two carbon rods in the axial line of the cylinder. The positive carbon in which the luminous crater is formed points at the centre of the mirror, and is so adjusted that the crater lies exactly in the reflectors' focus. At their bases the arms are controlled by magnets which automatically separate the carbons when current is first turned on and "strike" the arc, and keep them the correct distance apart as the ends waste away.

Body and lamp are balanced on horizontal trunnions at the sides bearing on arms attached to a circular table, which is revolved easily by hand or gearing on a ring of balls in the upper face of the base. Current is conveyed to the lamp through insulated slip-rings in the base with which

brushes on the table make contact. Insulated wires run from the brushes up the arms almost to the trunnions, and thence to the terminals of the lamp, to allow the lamp to be moved freely through about 90° of a vertical circle.

Under some conditions moderate illumination over a wide angle is preferable to a concentrated narrow shaft of light. This may be obtained by means of a "disperser," fitted to the front and composed of a number of narrow, vertical lenses, each having the same section from top to bottom,

passed to the next light, and so on, to illuminate it for guns or aircraft. British military searchlights are operated by battalions of Royal Engineers and are mobile, the power for the light being supplied by a generator. Searchlights on warships light up small surface targets at night. On fortifications they illuminate areas liable to sudden attack.

In the Second Great War a small "invisible" searchlight was developed for use by snipers. It sent out a beam of infra-red rays, invisible to the naked eye, which

Searchlight. Type used for aircraft illumination. It is elevated and traversed by electric motors, and mounted on a trailer

Courtesy of the London Electric Firm

but curving from the centre line towards the edges. The rays are scattered laterally only. The double disperser has two parallel sets of lenses, one behind the other.

The diameter of searchlights ranges from 15 to 60 ins., and the focal length from 7 to 25 ins. Direct current of 40-60 volts is used at 20 to 150 amperes, according to the size. The candle-power of the largest projectors is 160,000,000 approx.

Searchlights are used by ships to light up intricate channels when navigating at night, but their principal application is in warfare, particularly for A.A. work. A.A. searchlights are ranged on their target by means of sound locators synchronised with the light's turntable, the light being centred through a ring on the locator. When the target is picked up by searchlight it is

showed the ground to a maximum distance of 80 yds. when viewed through a telescope sensitive to infra-red rays.

Seascale. Seaside village of Cumberland, England, notable for its sandy beach. It is 12 m. W. from Sca Fell Pike, and has a rly. station. The buildings include a late 19th century church in Norman style, with some fine work in glass and stone, and a 17th century manor house. A mile from Seascale a stone marks the site of a Stone Age circle.

Seascape. In art, a picture of the sea, usually with shipping. Originally written *seaslip*. Seascape as a branch of painting first attained importance in the hands of W. Van der Velde, Jakob Bakhuysen, and other Dutch masters of the 17th century, and was popularised in England by Turner. Among later seascape artists have

been C. Napier Hemy, H. Mesdag, Julius Olsson, and W. R. Wyllie.

Sea Scout. Member of the nautical section of the boy scout movement. Sea scouts have the same basic training as ordinary scouts, but with the addition of specialised marine activities and proficiency tests. *See* Boy Scouts.

Sea Serpent. Supposed marine animal. Stories of animals of immense size inhabiting the ocean

subjects to fish and navigate there and to pass over it; exceptionally a stretch of foreshore may be private property, either as part of a manor or as a grant from the crown. More loosely, the seashore is the marginal area between the land and the sea, and in this sense includes the land covered by exceptionally high tides.

Shores are continuously affected by the denuding and transporting

shore birds in temperate latitudes, and penguins live on the margins of the frozen oceans. *See* Coast.

Sea-Sickness. Form of illness due to the motion of a ship. Air-sickness and travel sickness are similar terms appropriate when the journey is by aircraft or train. The symptoms are vertigo and nausea, often followed by vomiting and physical prostration. Sufferers about to travel should abstain from heavy meals for some days before the journey, avoiding milk, chocolate, pork, and foods which make heavy work for the liver. Various drugs have a sedative effect upon the nervous system and lessen the likelihood of sickness. The most useful are phenobarbitone and derivatives of belladonna, which should be started in small doses two days before the journey. A firm belt, an eye bandage, and ear plugs all help to diminish the sense of motion.

Seaside Grape (*Coccoloba uvifera*). Small evergreen tree of the family Polygonaceae, native of the West Indies. It attains a height of about 20 ft., and has roundish heart-shaped, leathery leaves, and

Seaside Grape. Leaves and flower-spike of the tree; inset, below, fruit; above, single flower

fragrant white flowers. The floral envelope, or perianth, becomes pulpy, of a violet colour, and acid flavour. The whole plant is astringent, and an extract may be used as a substitute for kino.

Sea Slug. Name popularly applied to various marine gastropod molluscs in which the shell is either absent or is concealed under the mantle. For these the term is not inappropriate; but it is erroneous when applied to the holothurian echinoderms, e.g. the bêche de mer, which belong to a different phylum of the animal kingdom from the molluscs. *See* Mollusca

Sea Snake (*Hydrophidae*). Family of aquatic reptiles. It includes 10 genera and about 50 species, natives of the tropical portions of the Indian and Pacific

Sea Serpent. Marine creature sighted from the Earl of Crawford's yacht Valhalla, in the South Atlantic Ocean, off Para, Dec. 7, 1905

From a drawing by M. J. Nicoll, a naturalist on board

have been told since remote times, but the first historical account of the sea serpent occurs in the 16th century, Olaus Magnus's History of Serpents describing a monster 200 ft. long and 20 ft. in circumference. Thereafter the sea serpent became a common sailor's story. Some zoologists believe that there exists in the ocean some marine reptile thought to have become extinct thousands of years ago; against this theory is the fact that the sea serpents alleged to have been observed differ too greatly in appearance to belong to any particular species. Moreover no remains have ever been discovered.

In every instance where it has been possible to ascertain facts, the alleged sea serpent has proved to be something else—e.g. porpoises swimming in Indian file; a mass of seaweed half awash; ribbon or oar fish, which sometimes attain a length of 30 ft.; sea lions breaking surface for breath; or giant squids, which are sometimes 50 ft. in length. *Consult* The Case For The Sea Serpent, R. T. Gould, 1930.

Sea Shanty. Type of song otherwise spelt chanty and so entered in this Encyclopedia.

Seashore or **FORESHORE.** By English law, that portion of the land between the limits of an average high and an average low tide. High and low water marks are found by taking ordinary tides and not spring or neap tides. All foreshore belongs normally to the crown, subject to the rights of all

activities of the sea, and the slow, secular movements of the earth's crust, whereby the relative level of land and water is disturbed. Waves, currents, and tides continuously fret the shore, and redistribute the accumulations of detritus brought down by rivers or collapsed from coastal cliffs; sand or shingle banks may arise and transform a wide estuary into a brackish lagoon, bounded seawards by a straight shore, and thus miles of land once seashore are removed from tidal activities.

Low shores are often characterised by salt marshes in temperate lands, or by mangrove swamps in tropical countries. Growths of such plants and the more ubiquitous seaweed tend to be circumscribed within tidal limits, since the plants require a sea-water habitat and yet cannot exist under deep sea water.

Sea Slug. *Elaysia viridis*, the green sea slug of British waters

Animal life is abundant. Insects in the sands, starfish, sea anemones, shellfish are typical of British shores. On the fringes of the warm oceans the shores are dominated by the work of the coral polyp. Sandpipers, plovers, and curlews are

Oceans. A single exception to their marine habit is afforded by a species found in freshwater lakes of the New World. They vary in length between 3 and 8 ft., and are mostly brightly coloured, often in contrasting rings of black and white, olive and yellow, green, etc.

Sea Snake of the Bay of Bengal and Malay Archipelago

Drawn from the Cambridge Natural History (Macmillan & Co.)

Instead of the rounded or flattened underside of the land snakes, these have the belly keeled like many fishes, and the tail compressed to serve as a paddle, though it can be used also for taking hold of coral or seaweed. The small scales do not overlap. The small head is pointed; the eyes, small with round pupils, are almost useless when the snake is on land.

The poison from their permanently erected short fangs is so virulent that the muscles of a bitten fish are relaxed instantly, so that it can be swallowed without danger from erected spines. Owing to the great development of their lungs and the possession of a valve to the nostrils they are able to remain under water for considerable periods. Their movements on land are awkward. All the species produce living young.

Season (Lat. *satio*, a sowing). Period into which the year is divided by the sun's changes in declination. Near the equator, temperature is so evenly distributed that the year is usually divided into the wet and dry seasons. In temperate latitudes the year is divided into four seasons, spring, summer, autumn, and winter. This is due to the fact that during the year the height of the sun and the temperature of the air vary considerably. In the British Isles the seasons according to the "farmer's year" are: winter (Dec.-Feb.) for tilling; spring (March-May) for sowing and early growth; summer (June-Aug.) for maturing and harvesting, and

autumn (Sept.-Nov.) for cleaning and preparing.

The cause of the varying height of the sun is the tilting of the earth's axis. On June 21 the position of the earth with regard to the sun is such that the north pole is tilted towards the sun, causing the latter to appear higher in the sky in the northern hemisphere than in the southern, and to be overhead at the tropic of Cancer. On Sept. 23 the sun is overhead at noon at the equator. By Dec. 21 the earth in its journey round the sun has reached a position opposite to that of June 21. Although it is then 3,000,000 miles nearer the sun than in June, the fact that the north pole is now tilted away from the sun gives winter in the northern hemisphere and summer in the southern. By March 21, the vernal equinox, the earth and the sun are in the same relative position as on Sept. 23, the autumnal equinox. There is a lag behind the sun in temperature variations of the seasons, so that the hottest month is July and the coldest Jan. in northern latitudes, and vice versa in southern latitudes. See also Close Time.

Season Ticket. Ticket purchased by a single payment, permitting the holder (whose name is usually written on the ticket) to use

Sea Trout. Silvery fish regarded as a migratory form of the brown trout
W. S. Berridge, F.Z.S.

a specified stretch of railway, etc., for a certain time—week, month, quarter, or year—irrespective of the number of journeys made. In U.S.A. a railway season-ticket holder is called a commuter, because he has commuted his fares by taking a commutation ticket. Season tickets are also issued for a series of concerts and other events.

Sea Squirt. Popular name for ascidians, the first order of the class Tunicata. See Animal colour plate; Ascidians.

Seaton. Urban dist. and watering-place of Devon, England. It stands on the Axe, 7 m. by rly. S.W. of Axminster. There are hotels, bathing, and golf links. Pop. est. 2,500.

Seaton, JOHN COLBORNE, 1ST BARON (1778-1863). British soldier. Born at Lyndhurst, Feb. 16,

1778, and educated at Christ's Hospital, he entered the army in 1794, and in 1809 joined the forces in Spain. During the Peninsular War he was present at Busaco, Albuera, and at Ciudad Rodrigo. In 1814 he was at Toulouse, and at Waterloo he commanded the 52nd Foot. In 1838, as lieut.-governor of Upper Canada, Colborne crushed the Canadian revolt. For this service he became Baron Seaton, and in 1860 field-marshal. He died at Torquay, April 17, 1863. In 1933 James Ulysses Graham Colborne-Vivian (b. April 20, 1863) inherited the title as 4th baron.

Seaton Carew. Parish within the co. bor. of West Hartlepool, Durham, England. It has a rly. station, fine level sands, and is a sea-bathing resort. Pop. est. 2,500.

Sea Trout or **SALMON TROUT.** British fish. Formerly considered a distinct species, it is now more generally regarded as an anadromous or migratory form. It is placed in the same species as the brown trout, *Salmo trutta*. In habits

it is much like the salmon (*q.v.*), going to the sea to feed, where it gets a silvery coat and attains a length of 3 ft., returning to fresh water for breeding, spawning from Sept. to Nov., and going back to the sea as

a kelt. It is found in the N.E. Atlantic, Mediterranean, and Caspian Sea.

Seattle. Largest city of Washington State, U.S.A., the co. seat of King co. The nearest port to the Orient and Alaska, it is the commercial, industrial, and financial centre of the Pacific North West, and the headquarters of federal government services there. It is the largest city of its age in the world, having been founded as late as 1852, and claims to be the healthiest. Seattle is beautifully situated on a neck of land, with the snow-capped Olympic Mts. and Puget Sound on the W., and Lake Washington and the Cascade Mts. on the E. and S.E. It lies 865 m. N. of San Francisco by water; 185 m. N. of Portland by rly. It is the terminus of trans-continental rlys.,

1st Baron Seaton, British soldier
After J. Richmond

Seattle, Washington State, U.S.A. Business centre of the city looking across Puget Sound to the Olympic Mountains

of airlines, and the home port of steamship fleets.

The fine salt-water outer harbour is connected by a ship canal with Lake Washington through Lake Union, in the heart of the city. The port ranked twelfth in the country in 1945 by volume of cargo handled. Most of the gold from Alaska and the Yukon is brought here. Exports include lumber, flour, canned fish, machinery, scrap metal, copper, agricultural and dairy products, livestock and fruit. Seattle has long been a great lumbering centre. A Boeing aircraft plant turns out Clipper flying-boats here. Factories are in the Puget Sound area. Cheap electric current and hydro-electric power are plentiful.

There are 3 sq. m. of parks and recreation grounds and a system of scenic boulevards. The university of Washington has a campus which borders on Lakes Union and Washington. At Bremerton, 15 m. S.W., is the nation's largest graving dock for the construction of battleships. There is a naval air station on Lake Washington. Seattle was little more than a lumber camp and fishing village until news of the Klondike gold discovery arrived in 1897. Its Oriental trade began to develop about the same time. The city has seen labour troubles, including massacres and general strikes. Citizens have the rights of initiative (*q.v.*) and referendum. Pop. 368,302. *Pron.* See-atle.

Sea Urchin (*Fr. oursin*). Popular name for several genera of Echinoderms. In it the principal organs are enclosed in a stony casket armed with long spines not unlike those of the hedgehog (*Fr. hérisson*), sometimes called an urchin, whence the name. See Animal colour plate; Echinoidea.

Seaweed (*Algae*). General term embracing several classes of the

great group Thallophyta—plants of simple structure without true leaves, stems, or roots, wood, or vessels. They are reproduced by spores, which are in some cases the result of the fusion of two sexual cells. The entire surface of the plant is capable of absorbing nutriment from the medium in which it lives. What appear to be roots in many species are merely grapples or suckers which attach the plant to rocks or other support, but do not feed it.

In the Rhodophyceae the chlorophyll is in most species masked by a red pigment. In some genera (*Corallina*, *Jania*, and *Lithothamnium*) an external layer of carbonate of lime is secreted, which conceals their vegetable nature and caused them until recently to be classed among corals. Some few species are used as food; others provide fertilisers; and many are valuable as a source of iodine. See *Algae*; *Botany*; *Coralline*; *Dulse*; *Irish Moss*; *Laver*.

Sebastian (255–288). Christian saint and martyr. Born at Narbonne, he went to Rome and entered the army, becoming a captain in the Praetorian Guards in the reign of Diocletian. Not long afterwards he was charged with being a Christian, and the emperor ordered him to be shot to death by archers. He was left for dead, but recovered under the care of a Christian lady named Irene, and

afterwards remonstrated with the emperor, who then had him beaten to death with cudgels. His body was found by another Christian lady named Faustina, and buried in the catacombs, the basilica of S. Sebastian being afterwards built upon the spot. His martyrdom at the archers' hands has been a frequent subject for artists.

Sebastian (1554–78). King of Portugal. The son of Prince John and of Juana, daughter of the emperor Charles V, he was born at Lisbon, Jan. 20, 1554. He succeeded his grandfather, John III, in 1557, and as soon as he came of age began to carry out his dream of a new crusade against the Muslims. Collecting a small army of mixed nationality, he embarked for Tangier, June 25, 1578. On Aug. 4 he met the superior army of the sultan of Morocco, Abd-el-Meleck, and was slain on the field.

Sébastien, François Horace Bastien, Count (1772–1851). French soldier. Born in Corsica, he served under Napoleon at Marengo, 1800; Austerlitz, 1805; in the war in Spain; in the Russian invasion of 1812; and at Leipzig, 1813.

Count Sébastien, French soldier After Winterhalter

Created a count of the Empire in 1807, Sébastien made his peace with the Bourbon regime in 1814, but fought again for Napoleon in 1815. He was eventually restored to his status, and from 1835 to 1840 was French ambassador in London, being made a marshal of France on his retirement. He died in Paris, July 20, 1851.

Sebastiano del Piombo (1485–1547). Italian painter, whose surname was Luciani. Born at Venice, he studied under Giovanni Bellini (*q.v.*) and Giorgione (*q.v.*), and from about 1512 worked in Rome under Michelangelo. Sebastiano, who was known as Piombo, from his office of keeper of the leaden seal to the pope, excelled as a portraitist and religious painter. He died in Rome.

Sebastopol. Variant spelling of the Russian fortress better known as Sevastopol (*q.v.*).

Sebek or SOBEK. Egyptian deity. Originally a crocodile totem, he is represented as crocodile-headed, with sun-disk and uraei. At Kom Ombo he shared the local worship with the hawk-headed Horus. At Arsinoë (Crocodilopolis)

Sea Urchin. Common species found on the coasts of the British Isles

in the Fayum sacred crocodiles were fed and adorned with jewels.

Sebenico, Ital. form of the name of the Dalmatian town described under its Yugoslav form Sibenik.

Secchi, ANGELO (1818-78). Italian astronomer. Born at Reggio, in Lombardy, June 29, 1818, he was educated at the Collegio Romano, where in 1849 he was appointed professor of physics and astronomy. He made a special study of spectrum analysis and of the physical constitution of the sun, moon, and planets, and was one of the earliest astronomers to record solar prominences by daylight. His system of classifying the spectra of stars, which he promulgated in 1863, was accepted by astronomers, and forms the basis of that in current use.

Secession (Lat. *se*, aside; *cedere*, to go). Act of withdrawing. It is used chiefly for ecclesiastical and political movements of this kind. The Presbyterian churches in Scotland have had a number of secessions, and the term Secession Church is specially applied to those who, in 1733, left the established Church, Ebenezer Erskine being their leader. In 1847 they united with the Relief Church to become the United Presbyterian Church, which, from 1900, was part of the United Free Church of Scotland.

Secker, THOMAS (1693-1768). English prelate. Born at Sibthorpe, Nottinghamshire, he was educated

Thomas Secker,
English prelate

at Exeter College, Oxford, and at Leyden. He studied medicine and took a medical degree before, having abandoned the Nonconformist faith of his parents, he joined the Church of England and was ordained. He held livings in Durham and in London, and in 1735 was made bishop of Bristol. In 1737 he became bishop of Oxford; in 1750 dean of St. Paul's; and in 1758 archbishop of Canterbury. Secker died Aug. 3, 1768.

Second. Division of time, one-sixtieth of a minute. It is also an angular measurement, a second of arc, the 360th part of a degree. In fencing, duelling, boxing, etc., seconds are the assistants of a principal, or act for that principal in certain formalities and during the contest. In linear measurement, a second is the twelfth part of an inch. The word is used

in many phrases, *e.g.* second lieutenant, for those acting in a subordinate capacity. *See* Time.

Second. Musical interval comprising but two letters, and therefore occupying adjacent positions on the staff. It has three qualities: minor (1 semitone), major (2 semitones), and augmented (3 semitones).

Second Advent. Theological term for the expected reappearance of Jesus Christ on earth. In theory the Christian life is lived in expectation of this. The early Church believed the event was imminent; modern teaching goes no further than emphasising the belief that the Second Advent will come suddenly. Matt. 24-26; 2 Thess. 2, v. 2; Zech. 14, v. 4 have a special bearing on the question. *See* Adventists; Antichrist; Last Judgement; Messianic Hope; Millennium; Parousia.

Secondary. Term, no longer in common use, applied to a subordinate or auxiliary official, *e.g.* the vicars choral or minor canons of cathedrals. In London the secondary is a corporation officer who carries out in the city the duties performed by the undersheriff in a county, *e.g.* the summoning of juries.

Secondary. In electricity, the secondary winding of a transformer or induction coil is the winding which is not connected to the supply. Transformers (*q.v.*) have usually two windings; the primary which is the winding connected to the source of power, and the secondary which is the winding from which the transformed supply is taken. The secondary winding may have a larger or smaller number of turns than the primary, according to whether the transformer is for "boosting" or reducing the voltage. A transformer may have two or more secondaries, *e.g.* many radio sets have a transformer with a primary wound for mains voltage, and two secondaries, one giving a higher voltage for the valve H.T. supply, and one giving a low voltage for filament heating. There are also windings known as tertiaries, not to be confused with extra secondaries, their purpose being not to give a supply, but to suppress harmonics in the waveform. Auto-transformers have the primary and secondary combined into one electrically continuous winding.

Secondary Enrichment. Term for improvement of a primary ore deposit by a later geological condition. *See* Ore Deposit.

Secondary Rocks. Term formerly used in geology for rocks laid down before the Tertiary period. The term is now obsolete, and is replaced by Mesozoic era.

Secondary School. In England and Wales any institution for the general education of pupils between the ages of 11 plus and 18 plus. The public schools are, in fact, secondary schools, but the term is most commonly applied to those schools under the control of local education authorities, or those receiving direct grants from the state. Before the Education Act of 1944 came into operation fees were paid at the majority of these schools, though there was a generous proportion of "free places." Under the 1944 Act the term has become more clearly defined as comprising the free state-controlled grammar, modern, and technical schools. Until 1951 pupils were prepared for examinations for the general schools and higher schools certificates, with exemption respectively from university matriculation and intermediate B.A. or B.Sc. From 1951 these certificates were replaced by a comprehensive school report and a general certificate of education. *See* Certificate in N.V.; Grammar School; Modern School.

Second Ballot. Electoral device for securing an absolute majority. It is held if the first ballot results in failure to elect the candidate or candidates by an absolute majority. At this stage the candidates are the leaders in the first ballot, the remainder falling out.

Second Chamber. Term used for the upper, usually advisory, house in a legislature of two houses. Method of selection of members varies from country to country: they may be directly elected, indirectly elected, nominated, chosen by birth or status. Examples of second chambers are the house of lords in the U.K. and the senate in the U.S.A.

Seconded. Word the meaning of which varies with the syllable accented. A motion at a public or other meeting is *secon'ded* by its formal supporter; a civil servant, *e.g.*, is *secon'ded* to a dept. other than his own when he is lent, without being transferred, to it.

Second Empire. Name given to the period of French history between Dec. 2, 1852, when Louis Napoleon, having destroyed the Second Republic by a *coup d'état*, was proclaimed emperor, and Sept. 4, 1871, when the Third Republic was proclaimed after his surrender to the Prussians at Sedan.

THE SECOND GREAT WAR, 1939-1945

IRENE CLEPHANE, Associate Editor, The Second Great War

This article gives a general account of the course of military operations of the war in all fields and phases. Detailed accounts of the separate campaigns will be found under their own headings, e.g. Atlantic Battle; Burma Campaign; East Africa Campaign; Europe, Western, Liberation of; Italy, Allied Campaign in; North Africa Campaigns; Pacific War; Russo-German Campaigns. Outstanding episodes are described separately, e.g. Alamein; Ardennes, Fighting in the; Arnhem; Britain, Battle of; D-Day; Pearl Harbour; Rhine; Second Great War; Walcheren; Second Great War; Warsaw; Second Great War. See also Air Raids; Flying Bomb; Mulberry; Radar; Rocket Propulsion; Strategy; Second Great War, and numerous other articles on subjects relating to the war, as well as biographies of leading commanders and statesmen, e.g. Alexander, Viscount; Chernyakhovsky; Churchill; Eisenhower; MacArthur; Montgomery, Viscount; Rokossovsky, Konstantin; Roosevelt, F. D.; Stalin, as well as those of Goering; Hitler; Mussolini, etc.

Fighting in the Second Great War started with Germany's invasion of Poland in the early hours of Sept. 1, 1939, though the war's beginning might well be put back to the Japanese invasion of Manchuria in 1931, and the failure of the League of Nations to stop that act of aggression. The Italian attack on Abyssinia, before which the League proved equally helpless; the German, Italian, and Russian intervention in the Spanish Civil War; Japan's undeclared war on China; Germany's series of invasions of the neutralised Rhine, of Austria, the Sudeten lands, Czechoslovakia itself, and Memel; and Italy's invasion and conquest of Albania were further operations of this opening phase. It is arguable that the war might have been prevented by decisive action against the aggressors at any point in this long succession of aggressive acts; but whereas the aggressors had a single purpose—to increase their territorial possessions, riches, and power—the governments opposed to them were entirely pacific in intent, willing to go to any length to ensure peace, and therefore in no state of preparedness to issue an ultimatum backed by military strength.

German Ultimatum to Poland

By the summer of 1939 Germany under Hitler's leadership was convinced that nothing it could do would lead to serious war, and that if war did come Germany could win easily. That France should actually declare war in support of Poland when she had failed to stand by her ally Czechoslovakia, and that Great Britain should fight for Poland after encouraging France's betrayal of her ally at Munich, was not to be anticipated.

Late on the evening of Aug. 31, 1939, Germany presented to the Polish ambassador an ultimatum of 16 points, to which his govt. was given no time to reply before German aeroplanes and German tanks and soldiers were over the

frontier in the dawn of Sept. 1. Great Britain and France declared war in support of Poland on Sept. 3, and within a week Australia, New Zealand, S. Africa, and Canada had declared war beside the mother country. In three weeks the precarious life of the Polish state was extinguished. Russia, under a secret clause of the Russo-German pact of Aug. 23, 1939, had advanced, on Sept. 17, from her 1921 frontier, to occupy the area E. of the Curzon line which Poland had wrested from her under the treaty of Riga, and Germany was in occupation of the rest of the country.

Russian Expansion in the Baltic

Russia next presented demands to Estonia, Latvia, Lithuania, and Finland for bases. The first three acceded, and then accepted the status of soviet republics of the U.S.S.R. Finland refused, and during the winter, Nov. 30, 1939–March 12, 1940, the Russians fought a brief campaign against her which secured to Russia, in case of German attack, a few more miles of land cover for exposed Leningrad. That it may have had the further purpose of deceiving the rest of the world as to Russia's strength is possible, considering the way in which this war was waged, and the Finns' opening successes. On the other hand, it may be that the Russians underestimated Finnish strength and determination.

Throughout the winter of 1939–40 western Europe was uneasily quiescent. A British expeditionary force of 250,000, with all its transport and equipment, had safely crossed the Channel in mid-Sept., 1939, and taken up its position along the Belgian frontier. There were occasional forays by the French or the Germans in the no man's land between the Siegfried and Maginot lines, but no action of importance. Only at sea was the British navy alert to prevent supplies reaching Germany, and to ensure that supplies did reach the U.K. The Americans, looking on

from their grandstand across the Atlantic, thought the whole thing a farce put on for one of Europe's inscrutable purposes, and named it in inelegant slang the "phoney" war.

But as soon as the weather was once more propitious, the German armies marched again. On April 9, 1940, they invaded Denmark, where they met no military opposition, though later they were to encounter strong passive resistance. From Denmark they crossed the narrow waters to Norway, where in Oslo fifth columnists caused a confusion that enabled the Germans to secure control of the capital within 24 hrs. In the N., from below the hatches of ships that had sailed through coastal waters with the appearance of peaceful merchantmen, well-armed Germans emerged with their guns and seized the chief ports. British and French forces were landed, but not in sufficient strength to be effectual. They were withdrawn; Norwegian armed resistance was rapidly overcome; and King Haakon and the Norwegian govt., who had moved from Oslo to Hamar, fled to England, where they remained the centre of active Norwegian resistance throughout the war. On May 10 British troops occupied Iceland, lest it should be seized by the Germans and thus become a base for U-boats already preying on Atlantic shipping, and for aircraft to cover them.

Invasion of the Low Countries

On the same day, May 10, the Germans marched a third time, to the W., not in direct attack through the Siegfried line on the Maginot line, but against the scrupulously neutral lowlands, Belgium and Luxembourg, their victims in the First Great War, and now also the Netherlands. During the First Great War it had been worth Germany's while to preserve the neutrality of the Netherlands in order to have an assured entrance and exit for goods and information to and from the

beleaguered heart of Europe; convinced in 1940 of the inevitability of her conquest of the whole of Europe, including the British Isles, within a very short space of time, Germany found such forbearance not worth while. Besides, it seems that Hitler genuinely supposed that the Netherlands would welcome absorption into a greater Germany, and was genuinely surprised and affronted at the resistance with which they met his followers and his ideas.

First Campaign in the West

The campaign in the W. lasted seven weeks. The planned defence of the provs. of North and South Holland—heart of the Netherlands—behind the historic water defences was frustrated by the Germans' use of parachute troops, who seized the vital bridges at Moerdijk before they could be broken as planned, and so gave German armour an easy road into the citadel. The ruthless bombing of Rotterdam, May 14, carried out before any reply had been received to an ultimatum to surrender, and the threat that the same fate was in store for The Hague, Amsterdam, and other cities—a fate the small but courageous Netherlands air force was powerless to avert, for its aeroplanes (fewer than 100) were destroyed on the ground—brought the surrender of the Dutch c.-in.-c. four days after invasion; but not before the Queen, much against her will, the royal family, and the cabinet had been brought out of the country to England, there to continue Dutch participation in the war.

The Belgian armies held out, as did some Dutch troops S. of the Schelde; but the uncertainties of French command, and the contradictory orders of Weygand, weakened collaboration between the Dutch, Belgian, British, and French troops available, and led to a break in the line of defence—which at its best would not have been strong, since it was improvised, owing to the determined neutrality of the Dutch and Belgians until they were attacked. Through this break German armour poured, isolating the Belgian army, which surrendered May 28, and also isolating the British and a considerable French army in French Flanders. By the remarkable calmness of the Channel, all but a few thousand of these 375,000 troops were during May 26–June 4, with the help of the British and French navies and of thousands of small and large British merchant and pleasure

ships, lifted from Dunkirk across to England in what Winston Churchill called "a miracle of deliverance." Most of the French elected to be repatriated and were sent back to southern France. A few remained to continue the fight from the U.K. Another British brigade was actually landed in Normandy at this time, when the French had a plan to hold the Brittany peninsula; but this plan came to nothing, and British troops remaining in France after the Dunkirk evacuation were got out through Cherbourg and other ports of the Cotentin peninsula.

Meanwhile the Germans swept on, cutting ruthlessly through the massed refugees fleeing S. before them from Belgium and N. France, whose presence on the roads had impeded all forward action by the less ruthless French and British. The French continued to fall back. The Maginot line, on which they had spent millions, had been effectually turned and was now a disadvantage, for its guns and defences pointed E. instead of W. Nevertheless, while Paris was declared an open city, June 13, abandoned by govt. and troops, and occupied by the Germans June 14, small detachments in the Maginot line fought on determinedly even after Pétain had replaced Reynaud as premier and authorised the signing of the armistice at Compiègne on June 22.

Escape of De Gaulle

Reynaud's attempt to persuade the govt. to move to Algiers, Churchill's inspiring call for a union between France and Great Britain, his visit to the disheartened French govt. at Tours, had failed to stiffen the weak will of a divided govt. which, all too conscious of the terrible losses France had suffered through the First Great War, dreaded prolonged war far more than an ignominious surrender. But one member of Reynaud's govt., who had joined it only on June 6, was flown out of France by the R.A.F. at the last minute. He was General of Brigade de Gaulle, a man almost unknown in his own country, though well known in Germany for the excellence of his book on the use of tanks in warfare, which had been a textbook in German military training. He reached London on the day of the armistice, and was given immediate facilities to broadcast an appeal to the French to continue resistance, to come out of France and join the army, navy, and air

force groups of Free Frenchmen then already in process of formation on British soil.

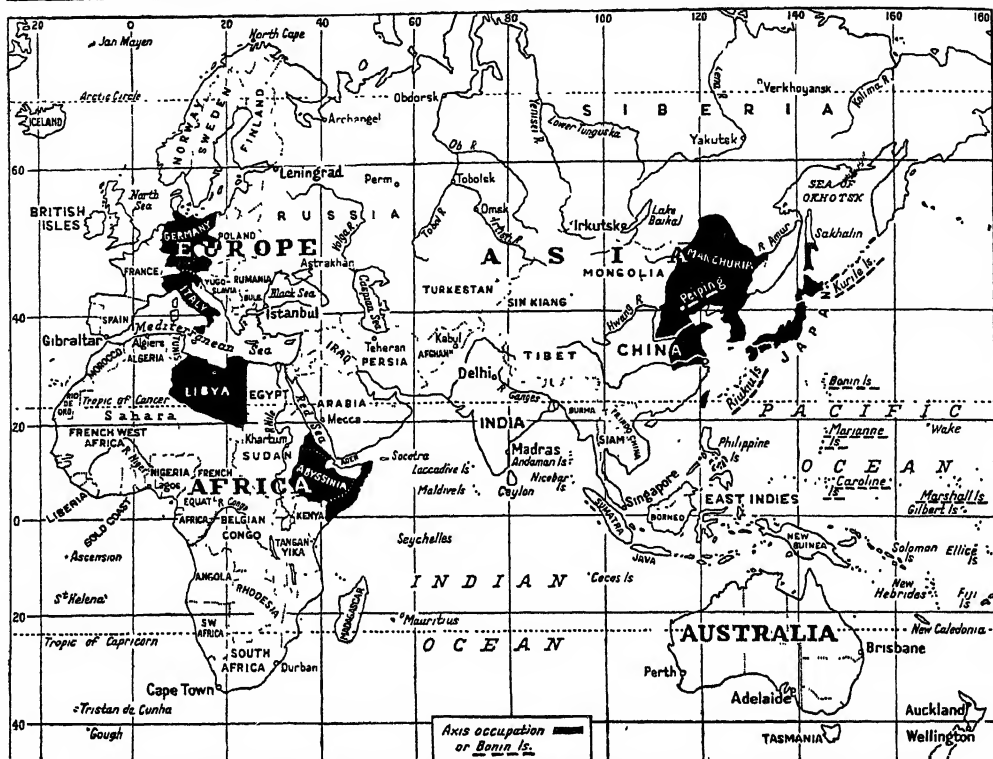

Under the terms of the armistice Germany occupied the N. and W. coasts of France (see map, page 3530). On June 10 Italy had declared war on France and Great Britain, believing both to be defunct. Italian soldiers marched over the border: Mussolini entered Nice in triumph; and Italy was allowed to remain in occupation of French territory to a depth of a few miles along the Italian border. The remainder of France, some third of the total, was left unoccupied, under the rule of Pétain's govt., which moved to Vichy.

The Battle of Britain

For a few weeks there was again quiescence. Grim, but less uneasy; for Great Britain and the British Empire alone stood against Germany and Italy, bottom seemed to have been reached, and there was an atmosphere almost of light-heartedness in Great Britain, now dependent only on herself and the dominions, as she waited for Germany's onslaught. As soon as Germany had established her air force in forward bases, it began. First on ports and shipping, then on aerodromes, and then, when these attacks failed of their object, on London and the industrial centres of the Midlands and the N., the German air attack fell. In the U.S.A. well-wishers and ill-wishers of the U.K. and the British Empire alike waited for the end.

But the air attacks were beaten off by the valiant persistence of the R.A.F.'s few pilots, returning again and again to combat with scarcely a respite. Germany shelved her invasion plan. Heavy air raids continued almost nightly, until the great fire raid on London of the night of Dec. 29–30. Then the Germans drew back to take stock and consider their next move. With Great Britain unconquered and still in command of the seas, Germany had need of all her ingenuity to make good the shortages caused by the now complete sea-blockade of the German-occupied coasts of Europe.

While Germany had been attacking Great Britain, in the full anticipation that her surrender could not be long delayed, Italy struck at the British in Somaliland, Aug. 4 (evacuated by the British Aug. 19) and in Egypt, Sept. 13. In Oct. Italy invaded Greece. But in the Balkans and in Africa Italy found herself in retreat until Germany came to

Second Great War. Extent of territory in the possession of Germany, Italy, and Japan, August, 1939

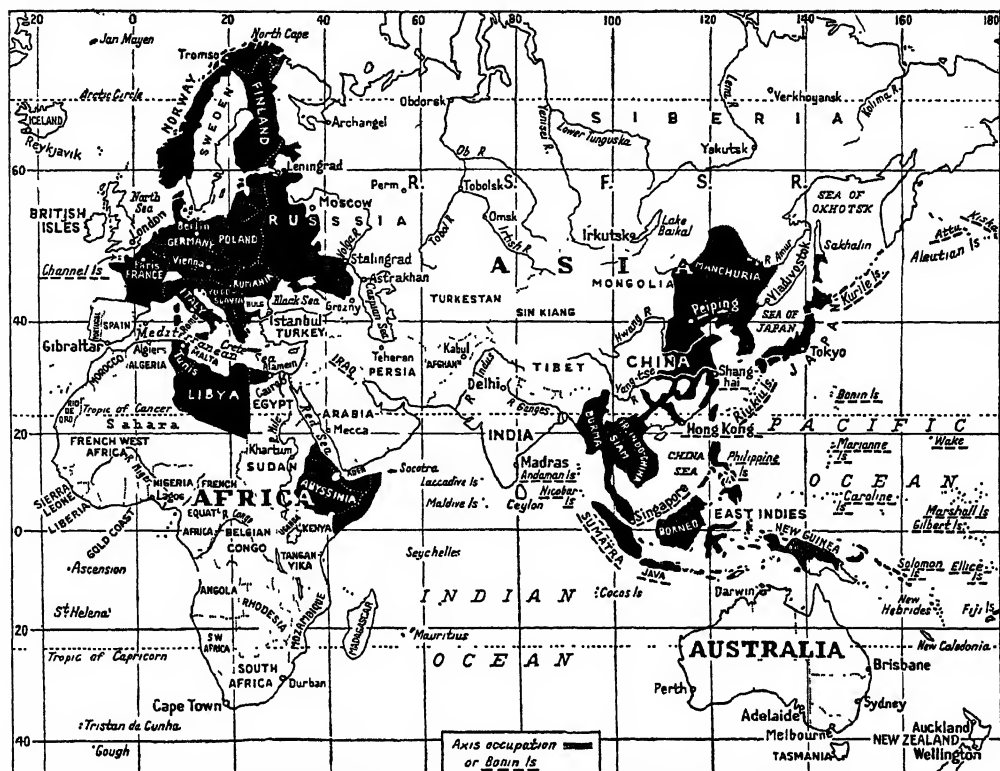

her aid and during March and April, 1941, conquered Yugoslavia and swept the hastily improvised force of British, New Zealanders, and Australians which had been rushed to the aid of Greece out of the Balkan peninsula, and then out of Crete; and, in N. Africa, drove Wavell's inadequate remaining forces there back to the Egyptian border and beyond, leaving only besieged Tobruk of Italian Libya in British hands. The British, meanwhile, having reconquered British and Italian Somaliland, went on to invade Abyssinia, capturing Addis Ababa, the capital, on April 5, 1941, and compelling the surrender of the Italian viceroy, the duke of Aosta, on May 18. Fighting continued in the Gondar area until that fortress surrendered on Nov. 27; but the British conquest of Italian E. Africa was virtually completed with the surrender of the viceroy.

Another pause in Europe followed the German conquest of Yugoslavia and Greece. Then on June 22, 1941, with no declaration of war, Germany crossed the Russo-German border in occupied Poland. Churchill, putting at rest

any doubts there might have been in British and American minds as to his govt.'s attitude in the new situation, declared the same day that all possible aid would be given by the U.K. to Russia. In less than a week the Germans were on pre-war Russian territory, and advancing rapidly. Finland, smarting from her earlier defeat, declared war on Russia on June 27; so did Hungary. The convoys of arms, tanks, ammunition, and aeroplanes, which continued summer and winter to the end of the war in Europe, began their hard passage between Great Britain and the far N. of Russia, battling through the waters off the Norway coast, not only against the weather, often inclement even in summer, but also against submarines, air attack, and mines.

Within three months of the invasion, German forces threatened Leningrad; within four they threatened Moscow; and the Russian govt. moved to Kuibishev in Oct.; but stubborn Russian defence, costly in lives, held the Germans off these two great cities, and the main German pressure was diverted to the S.

The onset of winter gave the Russians an advantage of which they made immediate use. The hitherto unconquered Germans had expected to annihilate the Russian armies long before the snows, and their forces were unprepared to meet the bitter conditions of a Russian winter. The Russians regained some part of the land that had been overrun, action slowed down, and the Germans went into winter quarters in the towns they had captured. But they held a large part of the grainlands of the Ukraine, and were investing Sevastopol. With the spring they decided that the coal and iron of the Don basin, and the oil of the Caucasus, were of more importance than the actual and the former capitals of Russia, and though pressure was maintained against Leningrad, which, except for transport across Lake Ladoga, was for two years cut off from the interior of Russia, they devoted their chief energies to offensives in the S. Sevastopol was overcome, after a seven months' siege, on July 3, 1942; by mid-Sept. there was fighting in the outskirts of Stalingrad, the great iron

Second Great War. Farthest limits of occupation of territories by the Axis powers

and steel centre of the Volga port created out of the former Tsaritsin, and it was invested N., W., and S. by an army under General von Paulus; the Caucasus was invaded, the Germans reaching Nalchik, only 60 m. from Grozny, one of the principal oil centres, on Nov. 2. The Russians had retreated eastwards $2\frac{1}{2}$ times the distance from the Franco-German frontier to the western seaboard of France; and they were prepared if necessary to retreat into Asia, whither they had during the autumn and winter of 1941–42 transferred most of the industrial workers as well as most of the machinery from the Don basin before it was overrun.

By 1942, however, an entirely new factor had come into the war. Japan, fighting to conquer China since 1937, decided in 1941 that the time had come when she was strong enough, and her potential opponents weak enough, for her to take on also the U.S.A. and the British Empire. On Dec. 7, while her envoys were conducting discussions in Washington, Japan made an attack by seaborne aeroplanes on the U.S. naval base of Pearl Harbour in Hawaii, in

which she sank nine vessels, put out of action six others, and rendered the U.S. incapable not only of offence but of defence in the Pacific. On the same day Japan invaded Siam and seized Shanghai; Japanese forces landed in Hong Kong and Malaya; on the 10th in the Philippines. On the 10th also the only two powerful British war vessels in the Far East, the Prince of Wales and the Repulse, were sunk off Malaya by attack from seaborne aircraft, and the British fleet in the Pacific was rendered as helpless as the American. Hong Kong fell to the Japanese on Christmas day, 1941, Singapore on Feb. 15, 1942; the Netherlands East Indies, invaded first by parachute troops at Palembang, Sumatra, on Feb. 14, were in Japanese hands with the surrender of the Dutch in Java on March 9. Bataan in Luzon, largest island of the Philippines, held out until April 8, Corregidor, the small, strongly-fortified island at the entrance to Manila Bay, until May 6.

The British evacuated Burma on May 15, 1942. The Japanese landed at Rabaul in New Britain Jan. 23, 1942, and in New Guinea

at Lae and Salamaua, on March 8, but here they did not make such rapid progress as they had done elsewhere: the Australians, seeing invasion of their continent imminent, stubbornly defended first Australian-mandated New Guinea, then Australian New Guinea (Papua). During the year the Japanese seized Attu and Kiska in the far north, and numerous other islands in the central and southern Pacific, turning some of them, as well as groups of islands administered by them under League of Nations mandate, into powerful naval and military air bases.

The U.S.A., startled out of complacency by the shock of the Japanese attack, and the ease with which Japan proceeded to conquer in a few months so vast an area of the Pacific, set to work with intense energy. Tokyo in its turn was startled by an air raid on April 18, 1942—Col. Doolittle, leading a formation of aircraft from the U.S. carrier Hornet, bombed not only the Japanese capital but Nagoya, Kobe, and Osaka also, and flew on to land in China, now one of the Allies. Lease-lend, introduced

by Roosevelt for the benefit of Great Britain in March, 1941, was extended to Russia with the entry of the U.S.A. into the war in Europe, and a stream of armaments from the U.S.A. flowed overland through Persia (which had been partially occupied by Russian and British troops since Aug., 1941) into Russia, supplementing the supplies sent by the British northern convoy route.

The Americans were ready to strike in the Pacific in Aug., 1942, and on the 7th they landed on Guadalcanal and others of the Japanese-occupied Solomon Islands. The Japanese, still advancing in New Guinea, reached Iorabaiwa, only 32 m. from Port Moresby, on Sept. 15. But fifteen days later they were forced to withdraw to the N. The U.S. landing on Guadalcanal and the retreat of the Japanese from Iorabaiwa marked the turn of the tide in the Pacific.

Benghazi to Alamein

In North Africa, meanwhile, fortunes had varied. The British, driven back inside the Egyptian border in April, 1941, took the offensive again in Nov., shortly before the surrender of the Italians at Gondar, relieved Tobruk Nov. 26, and advanced to take Benghazi on Christmas eve. But now the Germans were in N. Africa in force; they recaptured Benghazi on Jan. 29, 1942, and the British withdrew to Gazala in early Feb. A German offensive in Libya, under Rommel's command, beginning on May 26, drove the British back to Alamein by July 1, and included the capture in a few hours on June 21 of Tobruk, which had held out during the previous year for more than seven months.

The British situation in N. Africa appeared so unsatisfactory that Churchill visited Cairo in Aug., on his way to Moscow, to see for himself what needed to be done. He found the fault to lie with insufficient tanks, guns, ammunition, and men rather than with the commanders or their troops; but he felt that success could not be counted on under the commanders whose names had become associated with retreat. New commanders were appointed; additional troops were sent out to be trained in desert warfare; large numbers of tanks and guns were sent from the U.S.A. on the long voyage round the Cape of Good Hope and through the Red Sea; and on Oct. 23 Gen. Alexander, with Lt.-Gen. Montgomery in

operational command, attacked Rommel at Alamein, and in the 16-day battle of Egypt drove the Germans back into Libya. This was the turning point in the W., and the beginning of the 2,000 m. German-Italian retreat across N. Africa which ended in Tunisia in May, 1943.

In Stalingrad, a strip of the city along the Volga waterfront still remained in Russian hands when on Sept. 23, 1942, a Russian counter-offensive N.W. of the city slightly relieved the German pressure on it. In mid-Oct., however, the Germans made a determined new attack on Stalingrad, with intense air and artillery bombardment. The Russians opened a counter-offensive inside Stalingrad on Nov. 1, using arms and fresh troops brought by night across the Volga, and a powerful new offensive outside the city on Nov. 22. They crossed the Don N.W. of Stalingrad on Dec. 5. This was the turning point in Russia. General von Paulus's 6th army, surrounded and cut off from the W., were annihilated by Feb. 2, 1943, by which time the fighting front was nearly 200 m. to the W.

Another Russian offensive opened in the Caucasus on Dec. 24, 1942, while the siege of Leningrad was raised on Jan. 18, 1943, with the capture of Schlüsselburg from the Germans (though the blockade was not completely broken for another year). There were German counter-offensives in March, 1943, in which the Russians lost reconquered Kharkov and Bielgorod, and on the Orel-Kursk-Bielgorod front in July; but save for these setbacks the Russians advanced consistently during 1943 and 1944.

British Raids on French Coast

War operations in western Europe consisted throughout the second half of 1941 and the whole of 1942 of occasional not very heavy air attacks by the Germans on the U.K., and air attacks of mounting strength on German centres of industry and communications, both in Germany and in German-occupied countries; and British commando raids on Boulogne and Le Touquet on June 4, 1942, and a British reconnaissance in force on Dieppe on Aug. 19, 1942. These landings achieved little except to prove that the Germans had strongly fortified and garrisoned the French ports, and that very careful preparation and very powerful forces would be needed to effect a suc-

cessful landing on the French coast. But plans for an Allied invasion of Europe began to be discussed between Roosevelt and Churchill and the chiefs of staff of their two countries when in June, 1942, Churchill visited Washington for the second time since the U.S.A. entered the war. The Americans favoured an immediate attack in Europe. Russia, unaware of the immense problems and risks attending an invasion from the sea, also appeared to expect an invasion of W. Europe already in 1942. But Churchill, fully alive to all the difficulties, persuaded Roosevelt to agree to an invasion first of French N. Africa, which was under the control of the Vichy govt., in order to assist the intended British attack in Egypt.

Allied Landings in N. Africa

Allied forces, mostly American with some British, under the American Lt.-Gen. Eisenhower in supreme command, were transported, some from the U.K. and some from the U.S.A., in two large convoys which made landfall on Nov. 8, 1942; the day Rommel, defeated in Egypt, started to retreat westwards. Contrary to their expectation, the Americans, who landed first, met some opposition from the French troops in Algeria; but in less than a week Darlan, Vichy minister of defence, who happened to be on a tour of inspection in N. Africa at the time, came to terms with the invaders. (In France, the Germans made Darlan's change of front the excuse for occupying the whole of the country, Nov. 11, 1942.) The delay, however, had been long enough to enable the Germans to rush in to Tunis by air and sea from Sicily and Italy sufficient forces to prevent the Allied troops—relatively few in number, and most of them fresh to battle—from taking possession of Tunisia by simply marching into it.

The Allies were within 15 m. of Tunis by the end of Nov., and there they were held and then driven back. The 8th army, after a spectacular advance from Alamein which included periods of rushing, to keep up with the retreating Axis forces, interspersed with bloody battles, entered Tunisia on Jan. 29, 1943. Only then did the Allied forces from the W. make further progress; and there were still more than three months of hard fighting before, on May 12, the last Axis forces in Africa surrendered in the Cape Bon peninsula.

Two months later, on July 10, 1943, the western Allies invaded Sicily. Churchill was convinced that Italy was "the soft underbelly" of the Axis. So far as the Italians were concerned, he was right. The conquest of Sicily was achieved in 39 days instead of an estimated 90. The rapidity with which Sicily was being overrun so upset the morale of the Italians that Mussolini, fresh from conversations at Feltre with Hitler, who had refused to supply troops to defend Italy for the Italians unless they gave up all the peninsula below Lombardy, was compelled to resign, July 25. The new govt., under Badoglio, promptly opened secret negotiations with the British and Americans, and Italy's unconditional surrender was signed at Cassibile on Sept. 3, the day Allied troops landed in Italy itself, in Calabria. The surrender was kept secret until Sept. 8, the day before the Allies made their third landing in Italy, in the Gulf of Salerno; but by then the Germans, who had suspected Italy's intentions from the moment of Mussolini's overthrow, were in control of the country to a line running somewhat S. of Salerno and Foggia.

Campaign in Italy

The Allied troops landed in Calabria, and others, landed on Sept. 9 at Taranto, advanced against little or no opposition; but the landings at Salerno met fierce German resistance, and from Salerno to Bologna the campaign in Italy proved one of the bitterest and most long-drawn-out of the whole war. Churchill had expected that the Germans would not think Italy worth defending; when he found that they did, and that almost every mile had to be fought for, he came to regard it as simply a diversionary field of operations, and the Allied commanders in Italy found themselves deprived of their seasoned troops, which were taken for service in other fields, and left with new battalions fresh to war to fight grim battles in gruelling country which had been heavily fortified.

For by the time Italy was invaded, plans were well ahead for the invasion of France. At the first Quebec Conference, Aug. 17-25, 1943, Roosevelt and Churchill and their chiefs of staff had considered both the Pacific and the European war, and had decided on further action in both fields. The South-East Asia Command was set up, with Lord Louis Mountbatten as supreme com-

mander, on Aug. 25. This decision was announced. But another decision, not announced, was to invade France. The date set at first was May 1, 1944, and a planning staff was set up in London under Lt.-Gen. Sir F. E. Morgan. In spite of the continuing U-boat campaign in the Atlantic, U.S. troops had begun to arrive in Northern Ireland in Jan., 1942; and ever increasing numbers, eventually totalling several millions, safely reached the U.K. U.S. air forces began operating from their first stations in the U.K. in Aug., 1942. Details of the coming campaign were gradually worked out, and its material needs supplied by invention and hard work—many of them, including the greatest surprise of all for the Germans, the artificial harbour given the code name Mulberry, made in the U.K. Further discussions between Churchill and Roosevelt at Cairo before they went on to meet Stalin at Teheran were followed by the announcement towards the end of 1943 that Eisenhower had been chosen supreme allied commander of the European expeditionary force. He left the Mediterranean, his place being taken on Jan. 8, 1944, by Gen. Maitland Wilson, and came to London, where he arrived Jan. 15, his actual appointment as supreme commander dating from Feb. 14. Montgomery, who had led the 8th army in virtually unbroken triumph from Alamein to the river Sangro, and was to be in operational command of the ground forces taking part in the invasion, had arrived in London during Dec., 1943.

Shortage of Landing Craft

The invasion plan as first made provided for simultaneous invasions of Normandy and of the French Riviera, the first to be the main onslaught, the second a strong diversionary operation. In Italy, when Maitland Wilson took over, the Allied advance had been held by determined German opposition in the Liri and Sacco valleys on the W. and below Pescara on the E. Gen. Alexander, in operational command, had urged on Eisenhower in Oct., 1943, the desirability of a landing behind the German line, if possible in Nov.; but already the Mediterranean was being denuded of landing craft in preparation for the invasion of Normandy; and the landing eventually made at Anzio on Jan. 22, 1944, was not strong enough to do more than just hold its ground against the

German forces in possession of the area.

In Jan., 1944, it was decided to increase the strength of the assault on Normandy from three divs. with a follow-up of two divs. to five divs. with a follow-up of two divs. This led to the postponement of the date of invasion from May 1 to the beginning of June, because it would probably have been impossible to provide sufficient assault craft by the earlier date. When the same problem of shortage of craft made it impossible to stage the northern and southern invasions of France simultaneously, Maitland Wilson on June 19 urged the abandonment of the southern invasion, and the substitution for it of an invasion of Trieste in Sept., with a concentration of all available forces in the Mediterranean area in the armies in Italy, under Alexander's command, so that an Allied advance could be made through the Ljubljana Gap to Vienna.

From Feb., 1944, onwards the Allied air assault on Europe steadily increased in weight. Bridges, marshalling yards, centres of research, of heavy industry, and of synthetic petrol manufacture, and factories making aircraft and other war materials were the objects of heavy raids by day and by night.

D-Day Invasion of Normandy

In spite of high winds and heavy seas, the invasion of Normandy, involving the movement across the Channel of more than 5,000 vessels, was successfully carried out on June 6, 1944. One among many considerations prompting Eisenhower's decision to strike in spite of the inclement weather was the knowledge in high Allied quarters of the existence of the flying bomb (first of which fell on England on June 13, one week after the invasion), and possibly other secret weapons, subjects of continual boasting by Hitler. Had the flying bomb been perfected a few weeks earlier, or the invasion postponed for the month that would have been necessary if Eisenhower had not taken his bold decision, the flying bomb might have proved a far more important factor in the war than it did.

Mulberry harbour was brought into being, and the lodgement area was steadily enlarged. For several days the Germans assumed the Normandy landing to be a diversionary operation, and continued to hold the bulk of their forces in the Pas de Calais, expecting the

main assault to occur at one of the Channel ports. They certainly never anticipated that the "military idiots," as Hitler had called the Allied service chiefs, would invent, bring with them, and successfully construct their own harbour. But as the days went on, and it became apparent that the Allies were pouring men and material into their Normandy bridgehead, the Germans at last sent strong reinforcements. W. The British, on the E. of the sector, encountered the full weight of German armour; the Americans, on the W. of the sector, broke out westward, then N. into the Cotentin peninsula to take Cherbourg on June 27; westward again into Brittany, and then in a north-easterly sweep towards Paris, with comparatively light opposition, though they had to fight hard against a determined German attempt near Mortain to cut off the troops in the Cotentin from those wheeling S.W. towards Brittany, and again, with the British, to liquidate the German 7th army encircled in the Falaise pocket.

Landing in S. France

Maitland Wilson's plan for a landing at the head of the Adriatic was not accepted, and the first decision to land in southern France was maintained. This landing was made on Aug. 15. It had to overcome relatively feeble resistance, for by that time most of the German forces in the S. had been withdrawn, and the mixed forces constituting the U.S. 7th army advanced up the valley of the Rhône to meet the Allied forces from the W. near Somborn on Sept. 11, four days later passing under Eisenhower's command.

Eisenhower, having liberated Paris on Aug. 24 and Brussels on Sept. 3, hoped to turn the Siegfried line and deprive the Germans of the Rhine as a line of defence by an air crossing of that river in the Netherlands. The carrying out of this plan on Sept. 17 involved three air drops, two S. of the Rhine, which were completely successful, and a third N. of it, at Arnheim, which, initially successful, failed for three reasons: (1) the aircraft available were insufficient to give adequate strength to more than two air drops, and as the two S. of the Rhine were essential to the success of the third N. of it, the first two had prior claim; (2) the fortuitous presence near Arnheim of German armour retreating from Fortress Holland in the expectation that the Allied move would

succeed; (3) the fanatical opposition encountered by the Allied ground forces which, advancing successfully to Grave and Nijmegen, could not extend their narrow corridor the required further 15 m. to reach Arnheim in time.

Effects of Arnheim Failure

Grave and Nijmegen were held, and the corridor was gradually widened; but the failure of the full attempt brought untold suffering to the people of the Netherlands, as well as, in all probability, prolonging the war for at least six months. The Germans, already withdrawing from the provinces of N. and S. Holland, where the people began immediately to celebrate, returned in force, determined to hold the base from which, on Sept. 8, they had begun to launch their rocket weapons at England. A rly. strike, started on Sept. 17 by the Dutch workers in response to a broadcast call from Queen Wilhelmina, and maintained to the end of the war, gave the Germans the occasion to refuse, as a reprisal, to bring in any more food or coal for the inhabitants, thousands of whom in the big towns died of starvation during the terrible winter of 1944-45.

The conquest of the Rhine by air having failed, Eisenhower recast his strategy, and determined to bring his forces up to the right bank of the great river at least from its mouth as far S. as Düsseldorf before again attempting to cross it.

Meanwhile, by the end of Sept., 1944, the Russians had cleared the Crimea (May 12); invaded Rumania (April 2), which country surrendered to the Allies (Aug. 23) and declared war on Germany (Aug. 25); invaded Estonia (July 19); forced Finland out of the war (Sept. 19); invaded Bulgaria, which, though a German satellite, was not at war with Russia, and compelled the govt. to declare war on Germany (Sept. 8). In Oct. Russian forces crossed the Hungarian frontier (6th); captured Riga, capital of Latvia (13th); took Petsamo in Finland from the Germans on the 15th, and Belgrade, capital of Yugoslavia, on the 20th; entered East Prussia on the 23rd and Norway on the 25th. Budapest the Red army encircled by Dec. 26. Owing however, to lack of suitable craft for crossing a major river very strongly held on the opposing bank the Russians had failed in Aug. to cross the Vistula from Praga, some 450 yds. broad at that point, and relieve the Polish underground army fighting in Warsaw under

Gen. Bor-Komorowski. In this second battle of Warsaw, which lasted from Aug. 1 to Oct. 3, most of the city was reduced to rubble, and the Polish underground army was virtually annihilated.

The shortage of landing and assault craft which had made impossible a landing in force in Italy to take Rome more quickly, and necessitated the postponement for more than two months of the landing in S. France, as well as the Allied decision to settle the European contest first, affected the conduct of the war in the Far East, where throughout 1943 the Allied advance, if sure, was slow. American reconquest of Guadalcanal took from Aug. 7, 1942, to Feb. 10, 1943. By then the Australians had pushed the Japanese out of Papua (Jan. 23, 1943). The Japanese were cleared from the Aleutians by Aug. 15; from New Georgia by Aug. 28. Americans landed at Nassau Bay in Australian-mandated New Guinea on June 30, Australians and Americans near Lae on Sept. 4 and 5.

Burma: Turn of the Tide

Mountbatten, on taking up his appointment to the new command in South East Asia in Aug., 1943, wanted to attack the Japanese in Burma by a combined operation on the coast; but no landing craft could be spared to him; and it was not until the spring of 1944 that he was able to begin to attack overland. The small area of India near Imphal invaded by the Japanese on March 17, 1944, was cleared by Aug. 25. Stilwell, who had started in Dec., 1942, on his great trek from Leda through the jungles of Japanese-held northern Burma to build a new road connecting with the old Burma road somewhere near the Burma-China frontier captured Myitkyna airfields on May 17, 1944, the town of Myitkyna itself on Aug. 4, and completed the conquest of a route, and the road itself, on Jan. 23, 1945.

The Australians, with American aid, had secured control of the whole of the island of New Guinea by May, 1944, though pockets of Japanese troops still remained in the mts. of the N. and in the S.W. area of the island; the Americans had gained control over the Gilbert (Nov., 1943) and the Marshall Islands (Feb., 1944) in the central Pacific, and of the Marianas in the W. Pacific (Aug., 1944), and between Oct. 20 and Dec. 25 reconquered Leyte, central island of the Philippines.

The failure of the plot against Hitler's life, which came to a shor-

tive fruition in July, 1944 (*see* July Plot), had cleared from Germany all those who might have attempted to come to terms with the Allies before their country was devastated; and in Dec., though against his own judgement, von Rundstedt staged the offensive in the Ardennes that not only failed, but left Germany with no reserves for fighting the final battle that followed it on German soil. During March, 1945, the Allies made a powerful crossing of the Rhine in force near Wesel on the 24th, and two unexpected but useful lesser crossings farther S. The stand made under F.-M. Model by the 650,000 Germans encircled in the Ruhr was overcome between April 1 and 18. All organized resistance to Montgomery, commanding in N.W. Germany, ceased on March 27.

From Rome to Rimini

In Italy, the Allied forces, held at Cassino from Feb. to May 18, 1944, by desperate German defence covering the only practicable road to Rome, raced forward to meet on May 25 the troops which had at last broken out from the Anzio beach-head, and on to take Rome, June 4, evacuated by the Germans although they threatened to hold it. Alexander was hopeful that in spite of the denuding of his forces to make the landing in S. France he could still drive the Germans out of Italy by the end of 1944; and as the Allied 5th and 8th armies—the first under American, the second under British command, but both very mixed, and composed of British, American (including Negro), French, S. African, New Zealand, Brazilian, Greek, Polish, and, in the later stages, Italian troops—fought on doggedly up the backbone of Italy, it seemed that his hope might be realized. But Rimini was not taken as had been planned at the beginning of Sept., and when it fell on Sept. 21, torrential autumn rains had begun to fall, and it was impossible to advance into the low-lying valley of the Po, criss-crossed as it is by watercourses. The Allies did succeed in crossing the Rubicon (going N.), but there they were stopped until the following April, when Italy, with the help of Italian partisans, was cleared of the Germans at a breakneck pace, all German forces in Italy and a large part of Austria surrendering to Alexander (supreme Allied commander, Mediterranean, from Nov., 1944) at Caserta on April 29, 1945.

The Russians liberated Warsaw on Jan. 17, 1945, and cleared Buda-

pest on Feb. 13, after six weeks' fighting in and around the city. They invaded Pomerania, Brandenburg, and W. Prussia on Jan. 29. Königsberg (Kaliningrad), the last centre of resistance in E. Prussia, fell to them on April 9.

The Allied forces in Germany were now rapidly approaching one another from E. and from W., and after encirclement of Model's two army groups in the Ruhr on April 1, to effect a junction with the Russians became a primary consideration for Eisenhower. He informed Stalin of his general plan to strike in the centre and then to link with the Russians somewhere in the Regensburg-Linz area, with the object of cutting off the mountainous S. from the N. of Germany, and so preventing the retreat to the "redoubt" in the Bavarian-Austrian highlands about which Hitler had talked. In his report to the combined chiefs of staff, Eisenhower states:

The decision to concentrate first upon a major thrust in the centre nevertheless gave rise to some misgivings. The desirability of bringing the U-boat war to an end, of opening up supply lines through the N. German ports, of acquiring the use of Swedish shipping, of relieving the Dutch, and of occupying Denmark and Norway, and the political and psychological effects of an early entry into Berlin were all advanced as reasons in favour of early operations in the 21st army group sector [*i.e.* Montgomery's sector in the N.].

We had not forgotten the important advantages to be gained by the conquest of N. Germany. It was merely a question of timing that was at issue. Our plan for an advance in the centre was itself intended to facilitate such a conquest which, I was convinced, could more easily be achieved once Germany was cut in two. It was vital that we should concentrate for each effort in turn rather than allow our power to be dispersed by attempting to undertake too many projects at once . . . Berlin, I was now certain, no longer represented a military objective of major importance.

Russian Capture of Berlin

The capture of Berlin was therefore left to the Russians, who entered the capital on April 23. Two days later Allied troops from East and from West met at Torgau on the Elbe. Berlin was conquered, a wrecked city, on May 2, and in the cellars of the chancellory, where Hitler and a few followers had remained to the last, Goebbels, his wife, and his family were found dead of poison. Evidence pointed to the earlier suicide of Hitler. All the German forces in Holland, Denmark, Slesvig-Hol-

stein, and the N.W. of Germany surrendered unconditionally to Montgomery on May 4, 1945, the surrender taking effect next day; a general surrender to all the Allies was signed at Eisenhower's h.q. at Reims at 2.41 a.m. on May 7, and ratified in Berlin on May 9.

Pacific: Final Phase

The progress of the war in the West made it possible, towards the end of 1944, for the British to send a substantial fleet to the Pacific. American operations in the Philippines extended to Mindoro (conquered Dec. 15–29, 1944) and to Luzon, where U.S. forces landed on Jan. 9, 1945. Manila was recaptured Feb. 4–6 (though desperate suicide groups of Japanese continued to resist in the old walled town of Intramuros until the 24th); Bataan and Corregidor were recaptured on Feb. 16. In the mts. and some of the smaller Philippine islands, Japanese remained until the general surrender; but the Philippines were again under American control.

British forces advancing overland in Burma captured Mandalay on March 20, 1945, while a combined operation from seaward secured Rangoon on May 3 and ended all effective Japanese resistance in that country. The Australians landed on Tarakan off Netherlands Borneo on May 1, in Sarawak on June 20, and at Balikpapan on July 1. Preparations were going forward for an invasion of Malaya from India. At great cost in lives, the Americans invaded and captured Iwojima, in the Japanese Bonin islands, Feb. 19–March 16, and Okinawa in the Ryukius, part of the Japanese homeland, April 1–June 21. On July 14 an intensive Allied naval and air bombardment of the coasts of Honshu, principal island of Japan, began—the big cities, *e.g.* Tokyo, Yokohama, Nagoya, Osaka, Kobe, had since June, 1944, been frequently and heavily bombed by U.S. aircraft based on Saipan in the Marianes, or on airfields in China.

On July 17, 1945, the U.K., the U.S.A., and Russia met at Potsdam, near Berlin, for a conference on the future of Germany, and thither the Russians (not then at war with Japan) brought a tentative peace offer from Japan. This was rejected by the U.K. and the U.S.A., and on July 26 an ultimatum was issued, with China's agreement, calling upon the Japanese govt. to surrender unconditionally. Next day warnings were dropped on eleven Japanese towns

CHRONOLOGY OF PRINCIPAL EVENTS IN THE SECOND GREAT WAR —

1939	1941				
Sept. 1 Germans invaded Poland.	Jan. 22 Australians captured Tobruk, Libya.	Dec. 7 Japan attacked Pearl Harbour; declared war on U.K. and U.S.A.; seized Shanghai; U.K. declared war on Finland, Hungary, and Rumania.	May 4-9 Battle of Coral Sea (naval)		
Sept. 3 U.K., France, Australia, N. Zealand declared war on Germany; Sept. 6 S. Africa; Sept. 10 Canada.	Feb.-March British occupied Ital. Somaliland, reoccupied Brit Somaliland.	Dec. 8 U.K., U.S.A., Canada, Netherlands, declared war on Japan; Japanese invaded Siam and Malaya, attacked Hong Kong.	May 15 British evacuated Burma.		
Sept. 17 Russian troops crossed Poland's E. frontier.	March 11 U.S. Congress passed Lease-Lend Act.	Dec. 10 Japanese landed in Philippines.	May 23 Russians evacuated Kerch peninsula.		
Sept. 27 Warsaw surrendered to Germans.	March 28 Battle of Cape Matapan, Mediterranean.	Dec. 11 Germany and Italy declared war on U.S.A.	May 26 Anglo-Russian treaty signed		
Sept. 28 Russo-German partition of Poland.	April British occupied Eritrea.	Dec. 13 U.K. declared war on Bulgaria.	June 17 British withdrew to Egyptian border.		
Nov. 30 Russia invaded Finland.	April 5 British captured Addis Ababa, cap. of Abyssinia.	Dec. 17 Japanese landed in N. Borneo.	June 21 Germans captured Tobruk.		
Dec. 13 Battle of River Plate, S. Atlantic.	April 11 Germans reached Soltum, Egypt.	Dec. 23 Japanese occupied Wake Island.	July 3 Russians evacuated Sevastopol; Germans in possession of Crimea.		
	April 11-Nov. 26 Axis forces' siege of Tobruk	Dec. 24 British captured Benghazi, Libya.	July 27 Russians evacuated Rostov.		
1940	April 13 Germans captured Belgrade, Yugoslavia; Russo-Japanese 5 year non-aggression pact signed.	Dec. 25 Japanese conquered Hong Kong.	Aug. 4 Germans invaded Caucasus.		
March 12 Finland surrendered to Russia.	April 17 Yugoslavia capitulated to Germans		Aug. 7 U.S. forces landed on Guadalcanal, Solomon.		
April 9 Germany invaded Denmark and Norway.	April 27 Germans occupied Athens.		Aug. 16 Russians evacuated Malokop, Caucasus.		
May 10 Germany invaded Netherlands, Belgium, Luxembourg; British troops landed in Iceland.	May 27 German battleship Bismarck sunk.		Aug. 19 British reconnaissance in force on Dieppe.		
May 11 Churchill formed all-party govt.	June 1 Germans conquered Crete.		Sept. 15 Japanese reached Iorabaiwa, Papua.		
May 14 Germany invaded France; Netherlands army surrendered.	June 22 Germans invaded Russia.		Sept. 16 Fighting on outskirts of Stalingrad.		
May 26-June 4 Evacuation of British and French troops from Dunkirk.	June 27 Finland and Hungary declared war on Russia.	1942	Sept. 30 Japanese withdrew from Iorabaiwa.		
May 28 Belgian army surrendered.	July 1 Germans captured Riga.	Jan. 1 Declaration of Washington (embodying Atlantic Charter) signed by 20 Allied nations.	Oct. 23 Battle of Alamein, Egypt.		
June 10 Italy declared war on France and U.K.	July 7 U.S. troops landed in Iceland.	Jan. 23 Japanese landed in Solomon Is.	Nov. 2 Russians evacuated Nalchik, Caucasus.		
June 22 France signed armistice with Germany; June 24 with Italy.	Aug. 13 Russians admitted evacuation of Smolensk.	Jan. 26 First U.S. troops arrived in N. Ireland.	Nov. 8 Allied landings in French N. Africa		
July 1 Germans occupied Channel Islands.	Aug. 14 Churchill and Roosevelt drew up Atlantic Charter	Jan. 29 Germans recaptured Benghazi.			
July 26 Japanese occupied French Indo-China.	Sept. 21 Germans captured Kiev.	Feb. 14 Japanese parachutists landed in Sumatra.	1943		
Aug. 4 Italians invaded Kenya, the Sudan, British Somaliland.	Oct. 12 Germans captured Briansk.	Feb. 15 Japanese conquered Singapore.	Jan. 14-24 Casablanca Conference (Churchill and Roosevelt).		
Aug. 8-Sept. 15 Battle of Britain, decisive period.	Oct. 14 Germans captured Rzhev.	Feb. 27-March 1 Battle of Java Sea (naval).	Jan. 18 Siege of Leningrad raised.		
Aug. 19 British evacuated British Somaliland.	Oct. 16 Germans captured Odessa.	Feb. 28 Japanese landed in Java.	Jan. 23 British captured Tripoli; Australians cleared Japanese from Papua.		
Sept 13 Italians invaded Egypt.	Oct. 20 Russian govt. moved to Kulbishev.	March 7 British evacuated Rangoon, Burma.	Jan. 27 Siege of Stalingrad raised.		
Oct. 28 Italians invaded Greece.	Oct. 24 Germans captured Kharkov.	March 8 Japanese landed in New Guinea.	Jan. 30 Russians recaptured Malokop, Caucasus		
Nov. 21 Italian retreat in Greece.	Nov. 18 British Imperial offensive opened in Libya.	March 9 Dutch surrendered in Java	Feb. 2 Last Germans at Stalingrad surrendered.		
Dec 15 British invaded Libya from Egypt.	Nov. 26 Imperial forces relieved To rui, Libya.	April 8 Bataan, Philippines, conquered by Japanese.	Feb. 10 Americans cleared Guadalcanal		
	Nov. 27 G nd , Abyssinia, surrendered to British.	April 18 Tokyo bombed by U.S. carrier-borne aircraft	March 3 Russians recaptured Rzhev.		
		May 1 British evacuated Mandalay, Burma.	May 12 Axis forces in Tunisia capitulated.		
			July 10-Aug. 17 Allied conquest of Sicily		

that they were to be destroyed from the air. Five of them were heavily attacked on Aug. 1. Further warnings were followed by further dire air assaults. And then on Aug. 6, 1945, a solitary U.S. aircraft dropped an atomic bomb over Hiroshima. Its effects horrified the whole world. Russia declared war on Japan and invaded Manchuria on Aug. 8. A second atomic bomb was dropped over Nagasaki on Aug. 9, and on Aug. 14, 1945, Japan surrendered unconditionally. Military operations in the Second Great War were at an end.

The Second Great War had cost the U.K. fewer lives than the First — 244,723 service plus 60,585 civilian deaths compared with 812,317; but it had left her immeasurably more impoverished. The greater part of her overseas

investments, interest on which had provided a large part of the invisible factors that had helped to balance her pre-war trading accounts, had been expended on paying for food and armaments during the 18 months before the U.S.A. introduced lease-lend: nearly a third of the buildings in England and Wales had been damaged, more or less seriously, by German air attack; and, after the introduction of lease-lend, the U.K. had turned her industry almost wholly to the production of war materials, making no attempt to maintain her normal trade.

France had suffered few battle casualties, but two millions of her young men had been prisoners of war for more than four years, with inevitable effect upon an already dwindling population, and thousands of citizens, men and women,

had died at the hands of the occupying power because of their part in resistance or as a result of forced labour; French industry had been disrupted and French machinery and stocks pillaged by the Germans, French roads, rivers, bridges, and seaports had been systematically destroyed by Allied air attack, resisters' sabotage, and German demolition.

Up to 1948 no accurate return of Russian deaths was published, but estimates placed total deaths of service men and civilians in the occupied areas as high as eight millions; the destruction of buildings, machinery, rivers, trees, and the land itself, particularly in the Ukraine, was beyond computation; Russia's oldest and most beautiful cities were pounded to dust.

For its size, the Netherlands suffered more severely than any

—FROM THE INVASION OF POLAND TO THE JAPANESE SURRENDER

July 25 Mussolini resigned.
 Aug. 25 S.E. Asia Command set up.
 Sept. 3 Unconditional surrender of Italy; Allies landed in Calabria, Italy.
 Sept. 9 Allies landed in Gulf of Salerno, Italy.
 Sept. 17 Russians recaptured Briansk.
 Sept. 25 Russians recaptured Smolensk.
 Oct. 1 Allies occupied Naples.
 Oct. 9 Russians cleared Germans from Caucasus.
 Oct. 12 Portugal granted Azores bases to U.K.
 Oct. 13 New Georgia islands in Allied hands; Italy declared war on Germany.
 Oct. 25 Russians recaptured Dnepropetrovsk.
 Nov. 25 U.S. forces in control of Gilbert Is.
 Nov. 28-Dec. 1 Teheran Conference (Churchill, Roosevelt, Stalin).

1944

Jan. 22 Allies landed at Anzio, Italy.
 Jan. 27 German blockade of Leningrad cleared.
 March 17 Japanese invaded Assam.
 March 26 Russians reached R. Prut.
 April 10 Russians liberated Odessa.
 May 9 Russians liberated Sevastopol.
 May 12 Russians cleared Germans from Crimea.
 May 17 Allies captured Myitkyina airfields, Burma.
 May 18 Cassino, Italy, captured by Allies.
 June 4 Allies occupied Rome.
 June 6 D-day: Allied landing in Normandy.
 June 10 Russian offensive in Karelian Isthmus.
 June 13 First flying bombs fell in England.
 June 27 Americans captured Cierbourg, France.
 June 30 U.S.A. severed relations with Finland.
 July 9 British captured Caen, Normandy.

July 20 Unsuccessful German attempt on Hitler's life.
 Aug. 4 Allies captured Myitkyina, Burma.
 Aug. 7 Americans secured control of Marianne Is.
 Aug. 12 Allies occupied Florence.
 Aug. 23 Rumania surrendered to Allies.
 Aug. 25 Paris liberated; Japanese cleared from Assam; Rumania declared war on Germany.
 Sept. 3 Brussels liberated.
 Sept. 4 Antwerp liberated.
 Sept. 5 Russia declared war on Bulgaria.
 Sept. 8 First rocket bomb fell in England; Bulgaria declared war on Germany.
 Sept. 11 Americans invaded Germany.
 Sept. 12 Armistice between Allies and Rumania.
 Sept. 17-25 Battle of Arnhem.
 Sept. 19 Armistice between Allies and Finland.
 Sept. 21 Allies captured Rimini, Italy.
 Oct. 20 Aachen (Aix-la-Chapelle) surrendered to Americans.
 Oct. 20-Dec. 25 Americans reconquered Leyte, Philippine Is.
 Oct. 23 Russians invaded E. Prussia.
 Oct. 25 Russians entered Norway, freed Kirkenes.
 Oct. 28 Armistice between Allies and Bulgaria.
 Nov. 1 British Home Guard stood down.
 Nov. 24 Tokyo raided by U.S. bombers based on Marianne Is.
 Dec. 16-Jan. 16, 1945 German counter-offensive in Ardennes.
 Dec. 26-Feb. 13, 1945 Russian siege and capture of Budapest, Hungary.

1945

Jan. 3 British recaptured Akyab, Burma.
 Jan. 9-Feb. 16 Americans reconquered Luzon, Philippine Is.

Jan. 17 Russians captured Warsaw.
 Jan. 23 Ledo Road, Burma, completed.
 Jan. 29 Russians invaded Pomerania, Brandenburg, and W. Prussia.
 Feb. 4-12 Yalta Conference, Crimea (Churchill, Roosevelt, Stalin).
 Feb. 19-March 16 Americans conquered Iwojima, Bonin Is.
 Feb. 22 Allies cleared Germans from Luxembourg.
 March 6 Americans captured Cologne.
 March 8 Americans captured Rhine bridge at Remagen.
 March 20 British recaptured Mandalay, Burma.
 March 24 Allies crossed Rhine in force.
 March 27 Organized resistance in N.W. Germany ceased.
 March 30 Russians captured Danzig; Americans captured Heidelberg and Frankfurt-on-Main.
 April 1-18 Americans conquered Ruhr basin.
 April 1-June 21 Americans conquered Okinawa, Rikyu Is.
 April 4 French captured Karlsruhe.
 April 9 Russians captured Königsberg (Kalliningrad).
 April 12 Death of President Roosevelt; Americans captured Weimar and overran Buchenwald camp.
 April 13 Russians captured Vienna.
 April 14 Arnhem, Netherlands, liberated by British.
 April 23-May 2 Russians captured Berlin.
 April 25-June 25 United Nations Conference, San Francisco.
 April 25 Allies from W. and E. met at Torgau on the Elbe.
 April 26 Bremen surrendered to British.
 April 27 Allies entered Genoa, Italy.
 April 28 Mussolini shot by Italian partisans.

April 29 Germans in Italy surrendered unconditionally.
 May 2 British reached Baltic at Wismar.
 May 3 British recaptured Rangoon, Burma; Allies entered Trieste; British occupied Hamburg.
 May 4 German forces in N.W. Germany surrendered unconditionally to British.
 May 4 Americans captured Berchtesgaden, Salzburg, and Innsbruck, and drove over Brenner Pass to Italy.
 May 6 Allied 5th army crossed from Italy into Austria.
 May 7 Germany surrendered unconditionally.
 May 8 "VE" day; Russians took Dresden.
 May 9 Germany's surrender ratified in Berlin; Channel Is. freed.
 May 10 Americans and Russians entered Prague, Czechoslovakia.
 May 23 Churchill's all-party govt. resigned.
 June 20 Australians landed in Sarawak, Borneo.
 July 5 General election in U.K.
 July 14 Naval and air bombardment of Honshu, Japan, began.
 July 17-Aug. 1 Potsdam Conference (U.K., U.S.A., U.S.S.R.).
 July 26 Allied ultimatum to Japan; Labour govt. in U.K.
 Aug. 6 Americans dropped atomic bomb over Hiroshima, Japan.
 Aug. 8 Russia declared war on Japan and invaded Manchuria.
 Aug. 9 Americans dropped atomic bomb over Nagasaki, Japan.
 Aug. 14 Japan surrendered unconditionally.
 Aug. 15 "VJ" day.
 Sept. 2 Japanese surrender signed in Tokyo Bay.
 Sept. 9 Surrender of Japanese in China signed at Nanking.

other country; not only was the empire in the Far East overrun, pillaged, and left in chaos, but in the homeland inundations—some due to military necessity, as in Walcheren, others deliberate and pointless destruction by the German occupier—drowned one-fifth of the agricultural land. Nearly a third of the people lost their homes; the ports of Amsterdam, Rotterdam, and Flushing were wrecked. Deaths of citizens from forced labour and other causes, including starvation, numbered more than 200,000. The worst-hit community was the industrious Jewish population of Amsterdam: 150,000 before the war, it numbered only 20,000 after it.

Loss of life in Italy was comparatively light, but, in a land of many rivers, scarcely a bridge remained standing, and the Germans

used special machinery to uproot the rly. lines as they retreated slowly up the peninsula, inflicting desperate poverty on a naturally poor country. As for Germany, many of her towns, large and small, were severely damaged; some, notably Berlin, Bremen, Hamburg, Cologne, Essen, and Dresden, were reduced to rubble by bombardment from the air, aggravated in some places by a fierce defence against advancing ground forces. Germany's known dead numbered 1,709,739, missing and prisoners another 1,782,929.

In the Far East, to the devastation of battle and deliberate destruction of installations, plantations, and buildings by both Allies and Japanese, were added the unrest and uncertainty created in untutored minds by Japan's incredibly rapid advance, followed

almost immediately by her decisive defeat and her scarcely less rapid retreat.

The U.S.A. suffered no devastation, and emerged from the war with greatly developed industrial potentialities; but 396,637 U.S. citizens died under arms, compared with 59,578 in the First Great War.

Peace-making was slow. Treaties were signed in 1947 with five of the lesser Axis states—Finland, Rumania, Hungary, Bulgaria, and Italy; but three years after the cessation of hostilities the conclusion of peace with Germany, with her unwilling partner Austria, and with Japan seemed no nearer than when those countries surrendered unconditionally, owing to the apparent impossibility of the Allies' arriving at a compromise mutually acceptable to

Russia on the one hand, the U.K., the U.S.A., and France on the other.

Bibliography. An important source of information on the Second Great War is the dispatches from British commanders published as supplements to the London Gazette; outstanding among these are Wavell's accounts of operations in the Middle East, Feb. 7 to July 15, 1941 (pub. 1946), covering the 1941 campaign in Greece, and of operations in E. Africa, Nov., 1940-July, 1941 (pub. 1946), covering the conquest of Italian E. Africa to the fall of Amba Alagi; Dowding's account of the battle of Britain (pub. 1946); Alexander's dispatch on the African Campaign from El Alamein to Tunis (pub. 1948), with Anderson's on N.W. Africa from Nov. 8, 1942, to May 13, 1943 (pub. 1946); and Montgomery's dispatch on operations in N.W. Europe (pub. 1946). The Report of the Supreme Commander to the Combined Chiefs of Staff on the operations in Europe of the Allied Expeditionary Force (pub. H.M.S.O. 1946) gives a complete account of all the operations, U.S., British, and Canadian, carried out under Eisenhower's command in N.W. Europe; the Report of the Supreme Allied Commander, Mediterranean, on operations in Southern France, Aug., 1944 (pub. H.M.S.O., 1946) supplements this with an account of the landings on the Riviera and the subsequent campaign of the 7th army until it became part of the A.E.F. The war in the Pacific is described from July 1, 1943, to June 30, 1945, in the Biennial Report of the Chief of Staff of the U.S. Army to the Secretary of War (pub. H.M.S.O. 1945).

No official account of the war in Russia was published; but those campaigns, as well as all other aspects of the Second Great War, are covered in *The Second Great War* (nine vols.) compiled from contemporary sources under the general editorship of Sir John Hammerton.

Cyril Falls published a short history of *The Second World War*, 1948. *Crusade in Europe* by Gen. D. D. Eisenhower, was published 1948. Montgomery gave his personal account of his campaigns in Normandy to the Baltic, 1946, and El Alamein to the River Sangro, 1948. Harry Hopkins in his memoirs, published posthumously in 1948, throws much light on the political history of the period; and Winston Churchill, who through his position as inspired and inspiring leader of the British people played a unique part in the conflict, issued in 1948 the first of the several vols. of his *War Memoirs*.

Second Lieutenant. Lowest rank of commissioned officer in the British army. He corresponds to a pilot-officer in the R.A.F., and to a sub-lieutenant in the navy. See Lieutenant; Officer.

Second Mrs. Tanqueray. THE Tragedy by Arthur Pinero. It was produced, May 27, 1893, at the St. James's Theatre, London, where it had a run of 225 performances. The heroine, Paula Ray, is a woman with a past, who, finding that the man engaged to her step-daughter, Ellean, is one of her old lovers, commits suicide. Mrs. Patrick Campbell made her name as Paula, Maude Millett played Ellean, H. V. Esmond appeared as Cayley Drummie, a friend of the family, and G. Alexander as Aubrey Tanqueray. The play has since been several times revived.

Second Republic. Name given to the period of French history between Feb. 24, 1848, when King Louis Philippe abdicated and a republic was proclaimed, and Dec. 2, 1852, when Louis Napoleon was proclaimed emperor as Napoleon III, thus creating the Second Empire. See France: History; Louis Philippe; Napoleon III.

Second Sight. Popular name for several kinds of spontaneous psychical phenomena, including clairvoyance, and premonitory and symbolic visions or hallucinations. It is especially applied to a gift alleged to be possessed by many persons in the Scottish Highlands. Natives of Skye and seventh sons of seventh sons are popularly credited with the power. The seers are generally healthy persons of good reputation for honesty and sobriety, and have included many educated men. The best known kind of second sight is the death-warning, which takes various forms, including "corpse candles" or spectral lights, or an apparition of the doomed person, known as the wraith or fetch. Also, when the object of the warning is pre-

sent, a symbolic shroud is seen wrapping the lower part of his figure, the height to which it extends being believed to indicate the nearness of death. A fatal accident may be seen on the spot before it happens, or at a distance at the time of its occurrence.

Another form of second sight, not specially sinister, is the phantasmal appearance of a person shortly before he actually arrives—perhaps a telepathic phenomenon. The evidence is abundant, but not easily substantiated, especially as in many parts of Scotland the power is supposed to be lost by relating the vision before the event. Closely allied beliefs prevail in other Celtic countries and in Scandinavia. Perhaps persons unusually sensitive to psychic influences are numerous in these regions, but apart from the local symbolism most of the phenomena can be paralleled in all parts of the world. Tales of second sight are well known in connexion with the tragic deaths of the Scottish kings Alexander III, James I, James IV, and Charles I, and Sir W. Scott and D. G. Rossetti have made effective literary use of these traditions. There is an example in Homer's *Odyssey*, Bk. 20. See Apparition; Clairvoyance; Psychical Research; Telepathy.

Second Wind. Term popularly applied to the process by which a runner regains stamina. It is described under Respiration.

Secretary at War. Title of former British government official. The office with this title has been traced to the time of Charles I. After 1670 its importance grew, and from being a secretary to the commander-in-chief, the secretary at war, originally independent of parliament, took charge of military affairs in the house of commons, 1704, and became responsible for army finance, 1783. In 1855 the office was merged with that of the secretary of state for war, and in 1863 it was abolished. See War Office.

Secretary Bird (*Sagittarius serpentarius*). African bird of prey, allied to the vultures, but differing greatly from them in appearance. The name is derived from the pendent crest of long feathers upon the head, which suggest quill pens thrust behind the ears. The bird has long legs, and stands over four feet high; and the tail is nearly two feet long. The plumage is grey and white, with black rump and black and white bars on the tail feathers. It is found throughout S. and E. Africa and in a few of the W.

Secretary Bird. Long-legged species of vulture inhabiting S. and E. Africa

districts. The birds feed mainly on small snakes, lizards, and insects. The nest is constructed of sticks and clay in a tall bush, and appears to be used for several years in succession. The eggs, as large as those of a goose, are laid in August; and the young do not leave the nest for five months. Secretary birds can fly strongly, but they spend most of their time on the ground.

Secretary of State. In the U.K., high officer of the crown, in charge of one of the chief depts. of govt. There are eight secretaries of state—home, foreign, colonial, Commonwealth relations, war, air, and Scotland. The home secretary ranks as the senior secretary.

The early English kings had clerks or secretaries to assist them with their business, and soon one of these became a principal secretary. In the 16th century there were two of them, both members of the privy council; the most notable of these early secretaries was William Cecil, Lord Burghley, and in Elizabeth's time they were first called secretaries of state, and became members of parliament. The two divided the business between them, and after 1688 one looked after northern and the other after southern affairs.

In 1782 their duties were divided on a more workable plan, one taking charge of home, the other of foreign, affairs. In 1794 a third secretary of state was appointed to manage certain military affairs, and in 1801 he took over the charge of colonial business. In 1854 these two functions were separated and a fourth secretary was appointed. The fifth secretary of state was appointed to manage the affairs of India after the dissolution of the East India co. in 1858, but this office ceased to exist 1947-48. From 1707 to 1746 there was a secretary of state for Scotland, and from 1768 to 1782 one for colonial affairs, this being terminated when the American colonies became independent. Since 1926 the secretary for Scotland has been again a secretary of state.

In the U.S.A. the secretary of state is the chief of the dept. of state, the most important of the executive depts. of the U.S. govt.; his functions roughly correspond with those of the British secretary of state for foreign affairs.

Secret Service. Department maintained by the govts. of most countries to make inquiries into political, criminal, or other matters and to obtain details of activities, domestic or foreign, likely to be prejudicial to state security. In

Great Britain, branches of the secret service operate as intelligence on behalf of the three fighting services, while the branch working for the Foreign office is called political intelligence. Funds are provided by parliament under a secret service vote; this was formerly a token estimate of £100, further expenditure being met from the vote of credit, but in 1946 parliament began to vote annually £2,500,000 for secret service. In the U.S.A. the secret service dept. has a wider sphere of activity and is the authority for detecting civil crime and fraud against the federal govt., and for enforcing federal, as distinct from state, laws. *See* Espionage. *Consult* Secret Service, G. Aston, 1930; Secret War, T. M. Johnson, 1930.

Secret Session. Meeting of the British parliament from which press and public were excluded, held under the authority of the Speaker in times of emergency, e.g. during both Great Wars. During the Second Great War some 30 secret sessions were held on matters of military and foreign policy. For the subject matter of these sessions *consult* Secret Session Speeches, W. S. Churchill, 1946.

Secret Society. Body of persons concealing from outsiders its membership, tenets, aims, or activities. Such societies are of the most various kinds, the motive of secrecy being to safeguard members against persecution, to pursue a common object respecting which publicity is undesirable, to maintain caste privilege, or merely to surround members with an air of mystery. Initiation rites are frequent, often including a symbolic death and resurrection, and passwords or other signs of recognition are used. The aims are religious, military, disciplinary, etc.

The societies connected with the mysteries of ancient Greece, Asia Minor, and Egypt, link primitive secret societies with later religious organizations. In medieval Europe, as in the East today, an element of secrecy belonged to most religious and political societies. Chinese secret societies appear to lack the religious and magical elements, and pursue revolutionary or anti-European aims. *See* Assassins; Carbonari; Cathari; Freemasonry; Illuminati; Initiation; Ku Klux Klan; Mafia; Mystery; Rosicrucians; Thugs; Totemism; Voodoo.

Secret Weapon. Term used by the Germans in the Second Great War to describe any new weapon of unorthodox design, the use of

which, it was claimed, would bring the conflict to a sudden and successful conclusion.

Hitler first claimed possession of a secret weapon in a speech suggesting that the Allies come to terms after the conquest of Poland. This was the magnetic mine used against British shipping a few months later. Other weapons claimed as secret were radio-controlled midget tanks, containing 1,000 lb. of explosives and used on the Russian front; self-propelled armoured torpedo boats unsuccessfully used against Allied shipping at the Normandy landings; rocket-propelled interceptor aircraft; the V1 flying bomb; and the V2 rocket.

Flying bomb and rocket did constitute a serious threat, and the Allied air forces engaged in prolonged operations to hinder their development and production. Knowledge of their existence undoubtedly swayed Eisenhower's decision to invade the Continent in spite of the unpropitious weather in June, 1944. Germany's diversion of industry and research to the production of such weapons was at the expense of the Luftwaffe in particular; it proved detrimental to her military situation and shortened her resistance.

Section (Lat. *secare*, to cut). Literally, something cut off, and therefore a portion. The word is used for the surface formed when a solid is cut by a plane. In architecture a sectional drawing shows the plan or elevation of a building as cut by a plane to expose the proportions and details of the structure. In military language a section is a division of a larger unit, e.g. a section of an infantry platoon.

Sector. In geometry, a portion of a circle enclosed between the arc of a circle and the two radii to its extremities from the centre. Its area is half the product of the radius of the circle and the length of the arc. (*See* Circle.)

In its military sense, the term sector describes a small section of an operational area, generally defined by topographical features. In the civil defence system of the U.K. during the Second Great War, areas of towns and cities were divided into sectors, each in charge of a warden.

Secular (late Lat. *saeculum*, the world). Term used at one time to denote all things outside the Church. It was later applied to clergy who worked among the people and were not bound by monastic vows or rules. Hence the phrase secular clergy, or secu-

lar priesthood. The word is also used in a geological sense to mean occurring once in, or lasting for, a long period of time.

Secular Games (Lat. *Ludi Saeculares*). Festival of ancient Rome, lasting three days, celebrated at intervals of 100 to 110 years. Horace's well-known ode, the *Carmen Saeculare*, was written on the occasion of the celebration of the games in the time of the emperor Augustus. See *Ludi*.

Secularism (Lat. *saeculum*, age, generation; late Latin, world). Philosophical system which limits the destiny of man to the present life. It was founded in England by G. J. Holyoake (*q.v.*). The avowed object of its members was to live and die for the world and to work for the welfare of man. Dogmatically, its position was negative; it denied the arguments for the existence of a God, a divine government of the world, or a future life. If there were a future life, those who had done their best to assist their fellows in this world would find their reward; if there were not, it would be foolish not to enjoy oneself while one could. At the same time, secularists denied that they were atheists and called themselves non-theists, as being unconcerned about the question of God. They may thus be called utilitarians and agnostics, the name which later secularists preferred.

While Holyoake was the chief spirit of the movement, its character on the whole was unaggressive; but under Charles Bradlaugh (*q.v.*) it was distinguished by excessive radicalism and a bitter hostility to religion in any form. During the present century secularism has been little heard of as a distinct sect, its activities having been apparently merged in some of the numerous ethical societies. The institution of a kind of religious ceremonial in accordance with a set of rules called the Holyoake Ritual and other points of resemblance to the philosophical system of Comte caused it to be said that secularism was nothing but a translation of French positivism. See *Agnosticism*; *Freethought*; *Positivism*; *Rationalism*.

Secular Variation. Term in statistics to denote the persistency of a variate to increase or decrease with time. Before this becomes apparent it may be necessary to subject the data to a smoothing treatment to remove the masking effect of variation over shorter periods. An example is the general upward trend of winter temperatures over N.W. Europe

which began about 1900; but the occurrence of a series of cold winters during 1940-42 and in 1947 indicates that it is not certain this trend will continue.

Secunderabad OR **SIKANDARABAD**. Former British military cantonment of Hyderabad, which was administratively part of the capital city 6 m. to the S.W. One of the largest British military stations in India, it had an immense parade ground on which 7,000 troops could be manoeuvred with ease. British troops were withdrawn in 1947 when the administration of the town was handed over to the nizam of Hyderabad, who maintained it as a garrison during the brief invasion by India's forces in Sept., 1948. See *Hyderabad*.

Security (Lat. *securitas*, freedom from anxiety). Originally having the meaning of the Latin word, security came to have the derived sense of something deposited as a guarantee that a debt will be paid; hence, a document, e.g. bond or stock certificate giving evidence of debt or of property. Securities of this kind are frequently accepted by banks, etc., from customers who desire an overdraft. The word is contracted as *surety* (*q.v.*). See *Guarantee*; *Social Security*.

Security. Term for an organization that has as its object the protection of a nation's interests, particularly in wartime. In the Second Great War, all belligerents enforced stringent security measures; in Great Britain these were mainly the responsibility of the military intelligence department, M.I.5. Besides their work in counter-espionage and the suppression of fifth-column activities, the security authorities ran a campaign against careless talk about defence measures. Censorship of civilian and service correspondence was an essential security measure, and at some airfields and military establishments it was a practice to forbid outward postal, telephone, or telegraph traffic, except of official nature, for some time before major operations.

Extra security measures imposed upon the threat of German invasion included the removal of signposts, the closing of certain coastal areas, and restrictions on the use of vehicles. Precautions during the concentration and transport of troops destined for French N. Africa enabled landings to be carried out with the maximum element of surprise. The Allied invasion of Europe on June

6, 1944, took place without the enemy's having certain knowledge of the point of attack.

Security police accompanied the armies in the field to counter the activities of enemy agents. Lack of them in the campaign in France in 1940 allowed enemy tactics to confuse the Allied retreat. When the Allies entered Germany in 1945, field security police examined German police and officials before permitting them to continue duty.

After the war, the development of atomic research for pacific application was seriously hampered and much of it duplicated because security restrictions prevented the free interchange of knowledge. In 1948 the British govt. announced that members of the Communist or fascist parties in the employment of the state would be removed from work vital to national security. In the U.S.A. federal security authorities began investigation into the activities of Communists alleged to be dangerous to national security. See *Espionage*; *Intelligence*, *Military*; *Secret Service*.

Security Council. One of the five chief sections of the United Nations organization. It consists of eleven member nations, of which Great Britain, the U.S.A., France, China, and the U.S.S.R. are permanent members, while the six non-permanent nations are elected each for a two-year term. The council is responsible primarily for the maintenance of international peace and security. Decisions on questions of procedure are by affirmative vote of seven members, but on all other questions must carry the votes of all permanent members. The council is assisted by an advisory military staff committee. See *Veto*.

Sedaine, MICHEL JEAN (1719-97). French dramatist. Born in Paris, July 4, 1719, and early left fatherless, he worked as a mason's labourer before being befriended by an architect who received him as a pupil. Developing his literary gift, he wrote the libretti of several light operas. Like his friend Diderot, he believed it possible to import the emotional interest of tragedy into the realistic framework of comedy, and his *Philosophe Sans le Savoir* is the best 18th century contribution to serious comedy. An academician from 1786, Sedaine died May 17, 1797.

Sedalia. City of Missouri, U.S.A., the co. seat of Pettis co. It is 82 m. E. by S. of Kansas City, with which it has rly. connexion. Sedalia newspapers, which reflect

the traditions of the Mark Twain era, have proved a training ground for successful journalists. Sedalia, which has rly. workshops and large packing houses, was incorporated as a town in 1864, and chartered as a city in 1889. Pop. 20,428.

Sedan. Town of France. It is on the right bank of the Meuse, 164 m. N.E. of Paris, in the dept. of Ardennes, and is chiefly famed as a fortress. It has woollen and cloth factories, metal and dye works. It was a Protestant centre after the Reformation, and owed its prosperity to the Huguenots. At its theological seminary, Andrew Melville, Scottish theologian, was a teacher. Here also was born Turenne. The battle of 1870 is described below. Occupied by the Germans throughout the First Great War, Sedan was captured by French and American troops just before the armistice of 1918. It fell again to the Germans on May 15, 1940, several bridges over the Meuse near the town having been left intact by the defenders. On Aug. 31, 1944, units of the U.S. 1st army entered the town unopposed. Pop. 13,514.

Sedan, CAMPAIGN OF. German success over France in 1870. The campaign began when MacMahon assembled an army of 150,000 men at Châlons. He wished to move it on Paris, but his judgement was overruled, and he was ordered to join up with Bazaine, still at Metz. Napoleon III accompanied the army, which began its march Aug. 21. The German plans were to prevent Bazaine breaking out of Metz, while continuing the march on Paris in sufficient force to meet the Châlons army. By Aug. 30 the French had been caught up at Beaumont, while still on the left bank of the Meuse. Although unprepared, the rearguard fought well and was withdrawn with skill, but 3,000 prisoners and 51 guns were captured. The French spent the night of the 30th and up to mid-day on the 31st in a confused concentration round Sedan. On the night of the 30th both the pursuing German armies were directed to continue northward.

The 3rd German army moved directly on Sedan from the S., its left wing crossing the Meuse at Donchery, while connexion with the army of the Meuse was maintained by the Bavarians. On Sept. 1, Moltke, expecting that the

French would continue the retreat, gave orders for the attack to be pressed at day-break, by the Meuse army from the E. and the Bavarians from the S., while the left wing of the 3rd army pushed N. to prevent a retreat on Belgium. MacMahon was wounded in the early morning, and handed over the command to Ducrot, who at 7 a.m. ordered a retreat. Scarcely had the retirement begun when Wimpffen produced an order from Paris, directing him to succeed MacMahon, and he stopped the retreat.

Meanwhile the German right was closing round the Châlons army. Long lines of artillery were coming into action on each side, and the huddled Frenchmen in the centre were being slaughtered wholesale. The Guard, now in touch with the 3rd army, at 5 p.m. carried the Bois de la Garenne, and the battle was practically over. Fugitives from all sides were crowding into Sedan. German guns

Sedan Chair. Type used in the period of Louis XVI

vented, it was introduced into England by the duke of Buckingham in the reign of James I. A patent was granted in 1634 for the right to hire out covered chairs in London, and they soon became generally popular, and their use lingered on till early in the 19th century. Usually the door was in front, between the poles; often the roof lifted to enable ladies with high headdresses to enter without danger of disarranging them.

Sedative (Lat. *sedare*, to settle, allay). Drug used to calm restlessness or excitement, or to produce sleep. Any degree of effect from slight soothing to deep coma can be obtained with the barbiturate drugs. Bromides and chloral hydrate are also important sedatives.

Sedbergh. Market town of the W. Riding of Yorks, England. It is situated 9 m. E. of Kendal, and is on the Rawthey, with a station on a branch rly. between Ingleton and Tobay. The chief

building is the ancient church of S. Andrew. There are some manufactures, and cattle fairs are held. Around are the moors and hills which culminate in Wharfedale. Market day, Wed. Pop. 2,250.

Sedbergh School. English public school. It was founded in 1525 by Roger Lupton, provost of Eton, and was

Sedbergh, Yorkshire. Parish church of S. Andrew

were starting conflagrations there, and the Bavarians were starting an assault on the Torcy gate, when the flag of surrender was hoisted by the emperor's orders. The victory cost the Germans 9,000 casualties and the French 17,000, but Napoleon III and 104,000 officers and men became prisoners of war. See Franco-Prussian War; Moltke; Napoleon III.

Sedan Chair. Enclosed armchair carried by bearers by means of poles passed through rings or supports in the side of the vehicle. So called from Sedan in France, where it was said to have been in-

vented, it was introduced into England by the duke of Buckingham in the reign of James I. A patent was granted in 1634 for the right to hire out covered chairs in London, and they soon became generally popular, and their use lingered on till early in the 19th century. Usually the door was in front, between the poles; often the roof lifted to enable ladies with high headdresses to enter without danger of disarranging them.

Seddon, FREDERICK HENRY (d. 1912). British poisoner. In July, 1910, a Miss Barrow went to lodge

with Seddon, an insurance agent, at Tollington Park, London. Gradually he obtained possession of all her property, more than £4,000 in shares and cash, giving her in exchange an annuity. On Sept. 14, 1911, she died and was hurriedly buried in a public grave, Seddon representing that her remaining possessions were worth only £15. Her relatives had not been informed of her death, and, becoming suspicious, they got permission for her body to be exhumed, when Miss Barrow was found to have died from arsenic poisoning. Seddon was proved to have purchased six fly-papers, each containing more than enough arsenic to kill an adult person. Immediately after the death he made payments of £150 in gold which could not be accounted for by his bank book. Seddon was found guilty of murder and hanged in Pentonville, April 18, 1912.

Seddon, RICHARD JOHN (1845-1906). British-born New Zealand statesman. Born at St. Helens, Lancashire, June 22, 1845, the son of a schoolmaster, he became an engineering apprentice, but in 1863 went out to the Australian gold-fields, and for some time lived a roving life. Prosperity began when he opened a store in New Zealand. In 1874 he transferred this to Kumara, where he became prominent in local affairs, and in 1881 was elected to the New Zealand legislature. Joining the Liberals, he was for nine years an active private member. In 1890 he was made a minister, and in 1893 he succeeded John Ballance as premier. He held that position until his death, and was also the head of several of the most important departments of state: finance, defence, labour, mines, public works, and trade at one time or another, generally three or four together. He introduced old-age pensions, women's suffrage, local option, and land taxes, and nationalised mines and the fire insurance business. He was also a strong imperialist, gave practical support to the imperial navy, and favoured tariff reform based on colonial preference. He died June 10, 1906.

Sedentary Deposits. In geology, sedimentary deposits which have been formed and left in their place of formation without having been transported. Many soils are typical sedentary deposits, and other products of weathering such as bauxite and laterite are included under the term.

Sed Festival. Ritual custom observed periodically in ancient

Egypt, perhaps of astrological origin. According to another view the prehistoric Egyptians ceremonially slew their kings, actually or symbolically, after a certain number of years, as some Nilotic tribes still do. Hence arose the practice of identifying the king with Osiris, and sometimes of investing the crown prince with a *sed*, or tail, to establish his status. In the XXIInd dynasty Osorkon II, c. 858 B.C., reconstructed at Bubastis a stately edifice called the Hall of the Sed Festival, whose portal was sculptured with scenic representations of the attendant ceremonies.

Sedge (*Carex*). Extensive genus of perennial tufted herbs of the family Cyperaceae. They are

Sedge. Grass-like leaves and flower spikelets of *C. pseudo-cyperus*

The male and female flowers are separate, but both kinds are usually included in the same spikelet. The fruit is a minute leathery nut. The tissues are used in paper-making. The underground stems are sometimes used for food; those of the European *C. arenaria* have been used for sarsaparilla.

Sedgefield. Market town of Durham, England. It is 9 m. N.N.W. of Stockton-on-Tees, with which it is connected by rly. The buildings include the parish church, an Early English building of the 11th century. Near by is the only racecourse in the county. Cattle markets are held. Pop. est. 4,200.

Sedgemoor, BATTLE OF. Fought July 6, 1685, between the troops of James II and those of the duke of Monmouth. On June 11, 1685, the duke landed at Lyme Regis and, gathering recruits as he marched, was greeted with extraordinary warmth at Taunton. Thrice he marched towards Bristol, but soon turned, and by a circuitous route made his way to Bridgwater, having thus given the king's generals time to assemble a force.

On Sunday, July 5, 1685, the royal troops, 2,500 regulars, and about 1,500 militia, were on the plain of Sedgemoor, just outside Bridgwater. The earl of Feversham was in command, while under him was John Churchill. Monmouth decided on a night attack. He himself led the foot, and in the darkness they set out along a route taking them to the moor. All went well until they reached an unexpected ditch, where a pistol went off, giving the alarm.

Many of Monmouth's horsemen fled at once from the field; but his foot, though mainly peasants badly armed, offered a stout resistance. At length their ammunition was exhausted, while, after a delay, horses were found to drag the royalist cannon to the scene. Their fire decided the issue, and before the morning Monmouth's routed army was pouring back into Bridgwater. Their leader had already fled, and a terrible revenge was taken by the victors. The rebels, perhaps 5,000 strong, had 1,000 killed; the royalists about 300. Consult S. and the Bloody Assize, C. D. Curtis, 1930.

Sedgley. Urban dist. of Staffs, England. It is 3 m. S. of Wolverhampton and has a rly. station. The industries are those of the Black Country, collieries, fire-clay fields, limestone quarries, and ironworks, and the making of hardware. Pop. est. 19,000.

Sedgwick, ADAM (1785-1873). British geologist. Born March 22, 1785, at Dent, Yorkshire, and educated at Sedburgh and Trinity College, Cambridge, he became a fellow, 1810. He was elected to the Woodwardian professorship of geology, 1818, though

Adam Sedgwick, British geologist

ignorant of the subject, but he studied it with such energy that he was able to begin a course of lectures in 1819, which rapidly became famous. President of the Geological Society 1831, he was awarded the Wollaston medal, 1851.

Sedgwick travelled extensively in Great Britain making geological studies, and several times on the Continent with Murchison (*q.v.*). He became an authority on Palaeozoic rocks. Died Jan. 27, 1873.

Sedilia (Lat. *sedile*, scat). In church architecture, term applied to recessed and decorated seats with canopies, reserved for the

officiating clergy. Three in number, they are near the altar.

Sedimentary Rocks. In geology, rocks deposited one above the other in strata. They include sandstone, shale, limestone, coal, and salt deposits. They are commonly laid down in the sea; but some, such as ancient desert sands or river deposits, were deposited on land, being said to have a continental origin.

Mechanically formed sediments are those derived from broken or ground-up fragments or minerals of earlier rocks, being termed terrigenous. Rocks containing fragments above 2 mm. diam. are termed breccias if the fragments are angular, or conglomerates if rounded, e.g. pebble-beds, and pudding-stone. Coarse angular sands form grit, or gritstone, fine sands form sandstones. Fine muds on consolidation yield first clay, then as they harden mudstone, or, if the rock is laminated, shale.

Organically formed sediments are those derived from the accumulation of animal or vegetable remains, or from mineral matter secreted by animals. Thus coal, peat, and lignite, are accumulations of vegetable matter which owing to conditions at the time of their formation have not decayed, but have been preserved. Limestones composed of shell fragments, old coral reefs, etc., are also considered as being of organic origin.

Chemically formed sediments result from the precipitation of material from solution. Many limestones, particularly oolitic limestones, are formed this way. Calcium carbonate from hot or cold springs—travertine or tufa respectively—are the direct results of such precipitation. Salt, gypsum, magnesium, and potassium salts are produced by the evaporation of salt water, and are the best examples of chemically formed sediments.

The original components of sedimentary rocks are loose and unconsolidated, as can be seen on any seashore. With time and burial beneath later sediments the material becomes compressed, water squeezed out, and other minerals are deposited, forming a cement in the interstices between the grains. The degree of consolidation varies greatly, and is not wholly dependant on age.

The age of many sediments can be determined by their fossil content (see Fossils); and from the character of the fossils and the nature of the rock it is possible to

deduce whether the sediments were laid down on land, near shore, or in deep water. Comparison with rocks of the same age in other areas thus permits the delineation of ancient seashores, land areas, or zones of deep water. This is a branch of geology known as palaeogeography.

Sediments are of great economic importance. Many sandstones and limestones are extensively used as building stones. Most slates are derived from shales or mudstones. Limestones or chalk together with clays are used for cement, and bricks are made from clay. Some sedimentary beds are important sources of water, and artesian wells are supplied from them. Much iron ore, all coal, and petroleum are direct products of sedimentation. See Geology; Rock. Consult Principles of Physical Geology, A. Holmes, 1944; The Petrology of the Sedimentary Rocks, F. H. Hatch, R. H. Rastall, and M. Black, 1938.

Gilbert Wilson, Ph.D

Sedition (Lat. *seditio*, civil discord). In the British Empire, an offence against the crown and government, differing from treason in that it is not capital. It includes any attempt to bring into contempt or hatred the person of the reigning monarch, or the government and constitution of the U.K. as by law established, or either house of parliament; or to incite his majesty's subjects to attempt the alteration of any matter in church or state otherwise than by lawful means. It is also sedition to raise discontent or disaffection amongst his majesty's subjects, or to promote hostility and ill-will between different classes.

Prosecutions for sedition and more particularly for sedition by words—i.e. seditious libel—were frequent in the 18th and early 19th centuries, it being held at that time that any criticism of the govt. was sedition. This principle was carried to extreme lengths, and in 1758 one John Shebbeare was sent to prison for criticising William III and George I, then long since dead. The law of seditious libel was thus a serious obstacle to the freedom of the press. It is, however, now established that it is permissible to point out errors in the govt. or the constitution with a view to their reformation. There had been no prosecutions for seditious libel for nearly 100 years before 1947, when a newspaper editor was charged on the ground that an article written by him was anti-Semitic and intended to promote violence by

stirring up hostility between different classes of his majesty's subjects. He was acquitted.

Sedley, Sir Charles (c. 1639–1701). English dramatist and wit. Born at Aylesford, Kent, and educated at Wad-

Sir Charles Sedley,
English dramatist

ham College, Oxford, he earned a great reputation as a wit when he entered London society and one equally great for profligacy. He

wrote two tragedies and three comedies, of which the comedy *Bellamira*, 1687, founded on the *Eunuchus* of Terence, is the best. His poetry has little merit, though his lyric *Phyllis is My Only Joy* is still remembered. Sedley died Aug. 20, 1701.

Sedley, Amelia. Heroine of *Vanity Fair*, by W. M. Thackeray. The daughter of worthy, middle-class parents, she acts as a foil to the designing Becky Sharp whom at first she befriends, and whom she introduces to her family. She marries George Osborne only to discover after his death that Becky has been his mistress. She eventually marries the benevolent and faithful Major Dobbin. Her brother Joseph, familiarly known as Jos, is represented as a good-natured but valetudinarian servant of the East India co. on whom Becky fastens when all else fails.

Seduction (Lat. *seducere*, to lead astray). The act of inducing a girl or woman to part with her virtue. In English law the parent of a person seduced may be entitled to claim damages from the seducer. The cause of action arises, however, not from any injury to the parent's feelings, but from the financial loss it is presumed he has incurred through being deprived of his daughter's services by a confinement following seduction. This is part of the larger principle under which a master is entitled to claim damages from a person depriving him of the services of a servant. A father can therefore claim damages only if he can show that his daughter rendered him services; but in practice very slight evidence of service will suffice, e.g. making the parent a cup of tea. The damages are not limited to the value of these services.

Sedum or **STONECROP.** Genus of succulent herbs of the family Crassulaceae. There are 150 known species, chiefly of the Old World. Eleven are natives of Great

Britain, including rose-root (*S. rhodiola*), orpine (*S. telephium*), and the common stonecrop (*S. acre*). The flowers of the last are starlike, and brilliant yellow; it grows on roofs and walls, or by the seashore. See Rock Plants.

See. Word meaning literally a seat. It came to be used especially for the throne, or seat, of a bishop, and therefore for the cathedral city. A later extension made it a synonym for diocese (*q.v.*).

Seed. In botany, a fertilised and ripened ovule containing an embryo plant. Seeds develop in many different forms. Some, as nuts, are contained in a case of almost stony hardness; others, as the milkweeds, are covered with silky hair; others again, *e.g.* those of the date, apple, or yew tree, are enclosed in fruity pulp. In all the covering is such as will best tend towards the dispersion or survival of its contents.

In the leguminous plants the pods, when dry, twist and scatter the seeds. The fleshy fruits, as the strawberry, are eaten by birds or mammals, and the seeds passing uninjured through the digestive organs are widely distributed. The so-called "burr" seeds are provided with hooked spines, which catch in the coats of passing animals, and in this way are carried to a distance. Many seeds are distributed by the wind. Some trees, as the elm and ash, have winged seeds which drift a long way from the parent tree.

Seeds vary enormously in rapidity of germination. Some germinate within a few days of sowing; others, such as the hard-shelled seeds of ash, hazel, hawthorn, or holly, do not sprout until 18 months after ripening. Again, some seeds can be kept for years without losing their power of germination, while others are dead within 12 months or less. Seed-testing stations have been established in almost every civilized country, where seedsmen can have samples of seeds tested and receive guarantees of purity and germination. In Great Britain the examination of samples is undertaken by the ministry of Agriculture, county agricultural organizers, most agricultural colleges, and the agricultural departments of universities.

On the sale of most agricultural and garden seeds the seller must deliver to the purchaser a written statement containing particulars as to variety, purity, and germination. The particulars as to germination must be based on a

test which must have been made at a testing station licensed by the ministry of Agriculture. See Botany; Fruit; Plant.

Seeding. Device used in making the draw for a knock-out competition in athletics. Those regarded as the best competitors have their names placed in various sections of the draw so that, should they come through their earlier matches, they will not meet one another until a late round of the event. Wimbledon lawn tennis provides the best-known example of this practice.

Seeds, SIR WILLIAM (b. 1882). British diplomatist. Born June 27, 1882, he went to Rugby and entered the diplomatic service in 1904. Having been high commissioner in the neutralised Rhineland, 1928-30, he was for the next five years ambassador to Brazil, but is chiefly remembered as ambassador to the U.S.S.R. in 1939-40 before Sir S. Cripps. Seeds was made K.C.M.G. in 1930.

Seeley, SIR JOHN ROBERT (1834-95). British historian. Born in London, Sept. 10, 1834, the son of a publisher and author, he was educated at the City of London school and at Christ's College, Cambridge, where he became fellow and lecturer. He was professor of

Sir J. R. Seeley,
British historian

Latin at University College, London, 1863, and regius professor of modern history at Cambridge from 1869 until his death, Jan. 13, 1895. He was made K.C.M.G., 1894.

Seeley regarded history as the science of the state, as a study of the inception and development of policies and tendencies rather than of the deeds of individuals. It was a somewhat narrow view, but Seeley was its greatest exponent, and his work shows him as a deep and accurate thinker. His *Expansion of England*, 1883, and *Growth of British Policy*, 1895, are written on these lines. His first book, however, was of a different kind; in 1865 he wrote anonymously *Ecce Homo*, a study of Jesus Christ as a man of astonishing influence but not a divine being. Seeley also produced *The Life and Times of Stein*, 1879, and a short *Life of Napoleon*, 1886. His suggestive lectures, *Introduction to Political Science*, appeared after his death.

Seeley, JOHN EDWARD BERNARD. This British politician, who was secretary for war 1912-14, is noticed under Mottistone, the name he assumed on being raised to the peerage.

Seferis, GEORGE (b. 1900). Greek poet. Born at Smyrna (Izmir), and educated in Athens, he studied law in Paris, then entered the Greek diplomatic service, acting as vice-consul in London, 1931-34, and consul in Albania 1936-38. During the Second Great War he was press liaison officer for the Greek govt. in Cairo, and first secretary at the Greek embassy in Pretoria. In 1945-46 he was *chef de cabinet* to the regent Damaskinos. He established a reputation with the publication, 1932, of a collection of poems, *The Turning Point*. This was followed by *Mythistorama* (*Myth of Our History*), 1934; *Gymnopedias* (*Book of Exercises*), 1936. In its affection for tradition, blended with modernist style, his work has been likened to that of T. S. Eliot; and the sympathy between the two is evident, for Seferis translated into Greek many of Eliot's poems. A representative selection of his works was translated into English by B. Spencer, N. Valaoritis, and L. Durrell, under the title *The King of Asine*, 1948.

Sefton, EARL OF. Irish title held by the Molyneux family since 1771. Representative of an ancient family of Lancashire, Sir Richard Molyneux was made Viscount Molyneux in 1628. His son Richard, 2nd viscount, a royalist who fought for Charles I at Worcester, died childless, and was succeeded by his brother Caryl. The succession passed in due course to William, who was created earl of Sefton in 1771. His son Philip (1772-1838), 2nd earl, was in 1831 made Baron Sefton, by which title the earls sit in the house of lords. Hugh (b. 1898), 7th earl, succeeded his father in 1930. He was lord-in-waiting to the king in 1936-37 and lord mayor of Liverpool 1944-45. His chief seat is Croxteth Hall, Liverpool.

Sefton Park. Suburb of S.E. Liverpool, England. It has a rly. station. The park itself is one of the finest open spaces in the city, covers 269 acres, and contains a lake, a palm house, and an aviary. See Liverpool.

Seger Cones. Standard materials used in determining the softening temperatures of refractory materials (*q.v.*).

Segesta OR **EGESTA**. Ancient Greek city in N.W. Sicily. It was situated on Mt. Varvaro, 2 m. N. of the site of the modern Calatafimi. Segesta was allied with Athens, 454 B.C., became subject to Syracuse in 307 B.C., and was allied with Rome after the First Punic War. The place is now entirely deserted. There are remains of city walls, an incomplete Doric temple, and a rock-cut theatre.

Segni. Town of Central Italy, in the prov. of Rome. The ancient Signia, it is situated 33 m. S.E. of Rome on a spur of Monti Lepini, 2,190 ft. Several gateways in portions of the ancient cyclopean walls are well preserved. The modern town occupies the lower portion of the old site. Pop. 7,000.

Sego OR **SEGOZERO**. Lake in the Karelo-Finnish S.S.R., 30 m. N.W. of Lake Onega. It is 25 m. long and 20 wide, and abounds in fish.

Segou OR **SEGU**. French town on the river Niger. In French Sudan, it is 400 m. S.W. of Timbuktu. Pop. 22,150.

Segovia, **WANKS**, OR **COCO**. River of Central America. It rises in the W. of Nicaragua, and along its lower course forms the boundary between that state and Honduras, entering the Caribbean Sea near Cape Gracias á Dios. Small vessels penetrate 150 m. from the delta.

Segovia. Province of Central Spain. It slopes to the N.W. from the forested Sierra de Guadarrama, and is mainly an arid plateau drained by the tributaries of the Douro. Cattle, sheep, swine, and mules are reared; wheat, hemp, and flax are cultivated with the help of extensive irrigation schemes. Marble and granite are quarried. Its area is 2,682 sq. m. Pop. 199,649.

Segovia. A city of Central Spain, in the prov. of Segovia. It is 63 m. by rly. N.N.W. of Madrid. The old town is a decayed city, surrounded by a well preserved wall with 86 towers and set upon a hill crowned with a castle, the Alcázar, and a 16th century Gothic cathedral. A Roman aqueduct, 2,700 ft. long, built in the time of Trajan, is still used to convey water; its central portion consists of a double tier of arches, and is the largest and best preserved structure of its kind in Spain. Many ancient churches, palaces, and houses maintain a venerable aspect. In medieval times Segovia was the residence of the court of Castile; in 1474 Isa-

Segovia, Spain. Keep of the Alcázar

bella of Castile was crowned in the Alcázar. Museums, picture galleries, and libraries house many collections of archives. There are mills and factories. Pop. 16,500.

Segovia, **ANDRÉS** (b. 1894). Spanish guitarist. Born at Jaén, Feb. 18, 1894, he was chiefly self-taught, and after giving recitals in Spain, played in the chief cities of Europe and N. and S. America, achieving an international reputation from the 1920s by masterly interpretation and technique.

Segrave, **SIR HENRY O'NEAL DEHANE** (1896-1930). British racing motorist. Born at Baltimore, Md., U.S.A., Dec. 22, 1896, of Irish parents, he went to Eton and Sandhurst, served in France in the First Great War, and went on an aviation mission to Washington in 1918. He took up motor racing and made many attempts at speed records; he exceeded 200 m.p.h. at Daytona, Fla., in 1926, and raised this to 231-362 in his car Golden Arrow in 1929, being knighted on that achievement. On Lake Windermere, June 13, 1930, he was killed in his motor boat Miss England II after it had broken the world speed record for that craft. His *Life*, by J. W. Day, was written in 1930.

Segrave Trophy. A British trophy awarded annually for outstanding achievements in sea, air, and land transport. Established in 1930 as a memorial to Sir Henry Segrave (*v.s.*), it is made to the British subject who, in the opinion of a committee, accomplishes the outstanding demonstration of initiative, courage, and skill in furthering the development

of transport. Consideration is also given to the extent to which the vehicle is a product of the British Empire. The trophy was first given in 1930 to Kingsford-Smith for his England-Australia flight; in 1939 it went to Sir Malcolm Campbell for setting up a world speed record on water. Award was suspended during the Second Great War.

Segregation (from Lat. *segregare*, to set apart from a flock). Act of separating men or animals from others of the same kind. It is used sometimes when, as in the case of the Chinese introduced into the Transvaal in 1903, it is necessary to keep one part of the community apart from another.

In metallurgy and geology the term is applied to a particular form of separation in which metals or minerals separate from the mass in which they have been held and collect together. Thus when a steel ingot cools, carbon, phosphorus, and sulphur, and perhaps manganese and silicon, separate from the mass and tend to collect in that part of the ingot which cools last.

Seguidilla. A Spanish dance, the music being in triple time, and often in the minor mode. It is performed by two persons, and is accompanied by the guitar, to which may be added castanets, and the accompanists also sing couplets (*coplas*) at certain places. The Seguidilla is of three kinds: *Manchega*, lively; *Bolera*, more sedate; and *Gitana*, very slow. Nothing is known of its origin.

Séjur, **LOUIS PHILIPPE, COMTE DE** (1753-1830). French diplomatist and author. Born in Paris, Dec. 10, 1753, he served with Rochambeau's army in the American War of Independence and was afterwards French ambassador in St. Petersburg and Berlin. Though under the Restoration he became a peer, he retained his early liberal ideas to the end of his life. His works, which are written with spirit and grace of style, include *Histoire de Frédéric-Guillaume II*, *Histoire Universelle*, *Galérie Morale et Politique*, and *Mémoires*. Séjur died Aug. 27, 1830.

Segura. River of S.E. Spain. The ancient Tader, it rises in the Sierra de Segura in the prov. of Jaén, flows E. and S.E. past the city of Murcia, and enters the Mediterranean Sea 19 m. S.W. of Alicante after a course of 150 m. It traverses the provs. of Albacete, Murcia, and Alicante, and is unnavigable but useful as a source of irrigation water for the *huertas* or cultivated gardens.

Seiche (Fr. *sèche*, dry). Name given to the oscillations in the level of the surface of lakes or land-locked areas of the sea, explained by G. H. Darwin as long waves in relatively shallow water. Winds, local earthquakes, and probably atmospheric oscillations, recorded as waves by microbarographs, produce the phenomena. These apparent tides were first observed in Lake Geneva, where it was found that the rise and fall of the water ranged from a fraction of an inch to several ft., the periods varying between 20 and 40 mins. Some Scottish lochs exhibit another type of seiche; here waves have been observed in a layer below the surface in which there was a sudden change in temp. *Pron.* saysh.

Seidlitz Powder. Mixture of potassium and sodium tartrate and sodium bicarbonate wrapped in blue paper, and tartaric acid wrapped in white paper. The powder in the blue paper is dissolved in half a tumbler of warm water, and the powder in the white paper is then added, the mixture being taken while effervescing. It is a classical remedy for disorder of the liver or for the ill-effects of too much alcoholic liquor, and is best taken about half an hour before breakfast. The name is taken from the mineral spring of Seidlitz, in Bohemia, though the composition does not correspond to that of those waters.

Seigne, COL DE LA. Alpine pass on the border between France and Italy, S.S.W. of Mont Blanc. A bridge path connecting Chamonix and Courmayeur, it reaches an altitude of 8,245 ft. at the summit, where a shelter hut and a cross mark the frontier.

Seigniorage (old French). Something claimed by sovereign prerogative. Specifically, it means a royalty or prerogative of the crown by which a deduction is claimed from gold and silver bullion brought to the Mint in exchange for coined money. In modern times the proceeds of seigniorage go into the exchequer.

Seignobos, CHARLES (1854-1942). French historian. Born at Lamastre, Ardèche, Sept. 10, 1854, he was educated at the lycée of Tournon, and the École Normale, and studied in Germany, 1877-79. In 1879 he became professor at Dijon and joined the staff of the Sorbonne in 1883, later becoming professor of modern history. His historical works, most of which have been translated into English, include his *Histoire de la Civilisation*, 1884-86; *Scènes et Episodes*

de l'Histoire Nationale, 1890; *Histoire Politique de l'Europe Contemporaine*, 1897; *Histoire Comparée des Peuples de l'Europe*, 1938. His death was announced May 2, 1942. *Pron.* Sane-yo-bo.

Seine. River of France. It rises in the dept. of Côte d'Or, and flows generally N.N.W. for 482 m. to the English Channel. Between Nancy in the N.E. and Nevers in the S.W. stretches an upland area, known in the E. as the Plateau of Langres; the steep scarp slope faces S.E. to the Saône valley, and is known as the Côte d'Or S.W. of Dijon. Down the gentle slope N.W. to the Paris basin flow three large streams, the Marne, the Seine, and the Yonne, which have carved their way across the different strata of the basin to converge on Paris.

The Seine rises N.W. of Dijon, and flows N.W. from the plateau, past Troyes, to its junction with the Aube, a smaller stream, which flows similarly N.W.; thence the combined stream flows S.W. to the confluence with the Yonne above Fontainebleau. The Yonne has meanwhile received a right-bank tributary, the Armançon, which like the Aube drains the plateau. The Marne, farther E., has a similar tributary, the Ornain, which flows past Bar-le-Duc. Just before the Seine reaches Fontainebleau, it is joined on the left by the Loing, and from the confluence the Seine flows N.W. to receive the Marne just before it reaches Paris. The Marne flows in a curve past Châlons, Épernay, and Meaux, and is fed by the Grand Morin from the left. N. of Bar-le-Duc rises the Aisne, which follows a course roughly parallel to that of the Marne, and passes Soissons almost to Compiègne, having received from the left the Vesle, on which stands Reims. Above Compiègne the Aisne joins the Oise, which flows S.W. from just within the Belgian frontier, to reach the Seine below Paris. From the Oise confluence the Seine flows N.W. past Rouen to the estuary at Havre, receiving short tributaries from both sides, the longest being the Eure, on which stands Chartres. Below Paris the Seine has a strikingly tortuous course.

This concentration of waterways on Paris has become the basis of a great system of canals. From Havre by the Seine itself; from Dunkirk and the industrial towns of N.E. France and Belgium; by the St. Quentin canal and the canalised Oise; from Liège by the Sambre and Oise; from Strasbourg on the Rhine and the Saar

basin *via* Nancy, and canalised reaches of the Marne, Aisne, and Oise; from Alsace by the Doubs and *via* Dijon; from the Rhône-Saône valley by canal to the Loire, and thence by canal past Nemours, barges find their way to Paris. Havre is a great port; small ships reach Rouen, and barges reach Paris by the Seine.

During the campaign of 1940 in France German forces crossed the Seine near Vernon on June 12, and on June 14 occupied Paris. During Aug., 1944, when German columns were retreating E. before the advancing Allies, the Allied air force maintained a non-stop attack on the Seine crossings. The U.S. 3rd army had established a bridgehead across the river by Aug. 19, between Mantes-Gassicourt and Vernon, and on Aug. 24 liberated Paris. By Aug. 27 Allied forces were lining the Seine along almost its whole length and had crossed in strength at four places, the remnants of the German 7th army being hemmed in near Elbeuf. On Aug. 30, the British 2nd army swept forward from the line of the Seine nearly to the Somme, while the Canadian 1st army, after liberating Rouen, Aug. 29, struck N. to the Channel.

Seine. Dept. of France, formerly part of the prov. of Île de France. Entirely surrounded by the dept. of Seine-et-Oise, it consists of the twenty arrondissements of Paris, together with the surrounding dists. It is traversed by the Seine valley, the Marne joining the Seine within the dept. Intensive agriculture, market gardening, etc., are important. Its administration is closely connected with that of Paris. Its area is 185 sq. m. Pop. 4,775,711.

Seine-et-Marne. Dept. of France, formerly part of the prov. of Île de France. It lies contiguous with the depts. of Seine-et-Oise, Oise, Aisne, Marne, Aube, Yonne, and Loiret, and is traversed by the Seine in the S. and the Marne to the N., other rivers including the Yonne, Loing, Yèze, Aubetin, Grand-Morin, Petit-Morin, and Oureq; the three last named were strategically of great importance in the battle of the Marne, 1914. Mainly agricultural, the dept. produces grain, beet, and vines, and dairy farming, with many famous brands of cheese, is important. Industries include preserving food-stuffs, sugar refining, distilling, brewing, tanning, and paper, printing, brick, and tile works. Melun is the capital, other towns being Coulommiers, Fontainebleau,

Provins, Mortant, and Monttereau. Its area is 2,275 sq. m. Pop. 407,137.

Seine-et-Oise.

Dept. of France, formerly part of the prov. of Île de France. It lies adjacent to the depts. of Seine-et-Marne, Loiret, Eure-et-Loire, Eure, and Oise, and surrounds the enclave of the dept. of Seine. It consists of three main plateaux, those of Beauce, Brie, and Vexin, with tracts of hilly country between. The dept. includes the valley of the Seine from near Corbeil to a point near Vernon, and tributaries of the Seine within it are the Oise, Essonne, Marne, Yères, Juinne, Orge, Yvette, Bièvre, Avre, Maudre, etc. The Beauce and Brie are rich grain-growing tracts; beetroot growing and market-gardening are important. Porcelain, paper, and brewing are among the industries. The capital is Versailles, other towns including Pontoise, Mantes, Rambouillet, Étampes, and Corbeil. Its area is 2,184 sq. m. Pop. 1,414,910.

Seine-Inférieure. Dept. of France, formerly part of the prov. of Normandy. Bounded on the N. by the English Channel, it is adjacent to the depts. of Somme, Eure, and Oise. The chalky plateau of Caux forms a great part of its surface, and distinctive features of the country are the steep wooded valleys and high chalk cliffs of the coast. Rivers include the lower reaches of the Seine, and the Béthune, Varenne, Scie, and Epte. Forests include those of Eu, Bray, Hellet, Rouvray, and Roumare. Agricultural products include cereals, beet, and cider apples. There are fishing fleets at Le Tréport, Dieppe, Fécamp, etc., and industries centre on Rouen and Havre (*q.v.*). Among the many popular small watering-places on the coast are Le Tréport, Pourville, Varengeville, Fécamp, and Étretat. Rouen is the capital, other towns being Havre, Neufchâtel, and Yvetot. Its area is 2,448 sq. m. Pop. 846,131.

Seine Net (Fr. from Lat. *sagena*, Gr. *sagēnē*, drag-net). Fishing net kept outstretched by means of corks at the top, and leads at the bottom edge, and used to encircle fish, and draw them to the shore

Seine Net used in salmon-fishing on the Tweed

or into a boat. In sea fishing the seine net is used principally for the capture of herring, pilchards, sprats, mackerel, bass, or grey mullet. If caught in deep water, the fish are emptied from the net into boats. If caught in shallow water they are drawn on to the beach. Numerous legal restrictions govern the use of the seine net for salmon-fishing. Thus a seine net may not be used for more than one-third of the year, nor may it be worked right across a stream, or within a certain distance of another net of the same kind.

Seir. Name in the O.T. for the mountainous dists. of Edom (*q.v.*).

Seisin or **SEIZIN.** (Old Fr. *seisine* from *seisir*, to seize). Word of French origin, used in feudal times for taking possession of land. A man was seised of an estate when he took possession thereof. After a time it was applied to freehold land only, but it is now almost obsolete. Primer seisin was the name given to the right possessed by sovereigns of taking the revenue of an estate held by a tenant-in-chief for a

certain time, generally a year, whenever the holder thereof died. This custom was abolished in England in 1660. The Scottish equivalent of the word seisin is sasine. See Feudalism.

Seismograph (Gr. *seismos*, earthquake; *graphein*, to write). Instrument for recording automatically the tremors of the earth. It consists of a simple pendulum placed on a concrete pillar, embedded in the ground. The framework to which the pendulum is attached moves in sympathy with earth movements due to a distant earthquake, the bob of the pendulum tending to remain stationary. The sensitivity of such an arrangement, however, is low and modern seismographs are therefore fitted with special types of pendulums. An oscillatory system once disturbed will oscillate with its natural period, irrespective of the period of any vibrations superimposed upon it. Hence to obtain a record of the latter the free motion of the pendulum must be damped down, *e.g.* by mechanical or magnetic means. The degree of damping must not be so great as to render the pendulum sluggish, but generally it must be sufficient to suppress the free motion in the shortest possible time, that is, it must produce a "dead-beat" action.

Vibrations caused by distant earthquakes are small, and the relative motion between the inertia mass and its support must be

Seismograph. Top, revolving drum with the pens which record the earth tremors. Below, earthquake record, showing the amplitude of movement along two directions at right angles to each other

magnified. The pendulum of a mechanical seismograph is connected by a long arm or system of levers to a stylus, pressing lightly on a sheet of paper on which soot is deposited. This chart is wrapped round a clockwork or electrically driven cylindrical drum which makes one revolution in an hour; a traversing mechanism is embodied for economy of paper.

The daily record therefore takes the form of 24 equally-spaced lines running lengthwise along the sheet. Earth movements displace the stylus perpendicular to the direction of the undisturbed trace,

and provision is made for time-marking the record at minute intervals. The most popular seismograph which is based upon this principle is the Wiechert, where the mass of the pendulum varies from 80 to 200 kilograms; it affords a magnification of about 100 times.

Although there is the advantage of the trace being available for inspection at the time of occurrence, such entirely mechanical seismographs have been largely superseded by other types employing optical or electro-magnetic methods of registration by which friction is eliminated. In the direct optical pattern a beam of light is reflected from a small mirror, mounted on the pendulum, and focused as a sharply-defined spot on a sheet of photographic bromide paper. Examples are the well-known Milne-Shaw for general recording and the short period, high magnification (1,500 times) Wood-Anderson. In most horizontal seismographs gravity is the restoring force, but the Wood-Anderson type makes use of the torsional reaction of a stretched vertical wire carrying the bob, which weighs about 1 gm. Electro-magnetic seismographs depend upon the principle that the movement across a magnetic field of a coil of wire, mounted on the pendulum, sets up electric currents in the coils, the strength of current being proportional to the angular velocity of the pendulum. The coil is connected to a mirror galvanometer and the deflections of the mirror are recorded photographically (e.g. Galitzin pattern).

An earthquake causes a disturbance communicated to other parts of the earth in the form of waves, and, in general, any ground movement may be regarded as composed of the component displacements along three directions at right angles to each other, N-S, E-W, and vertical (Z) being adopted by convention. To investigate the origin and magnitude of earthquakes it is therefore necessary for the station to be equipped with seismographs capable of recording all three components. Vertical instruments are much more troublesome to maintain than horizontal ones for the reason that the coiled spring chiefly used to control the motion of the pendulum is very sensitive to temperature changes. To facilitate the interpretation of the traces, seismographs are constructed to record both horizontal components, and sometimes the vertical, too, side by side on the same sheet

of paper. In regions where violent shocks are frequently experienced less sensitive seismographs are employed. An important economic application of the seismograph is in prospecting for oilfields, etc., information on the nature of the subsoil being provided by seismic records of the ground waves from artificial explosions. See Earthquake; Pendulum

Seistan. Region of Afghanistan and Persia. Lying around the immense swamp called Lake Hamun, and anciently known as Sacastane, its boundaries are somewhat indefinite, but its area is put at about 7,000 sq. m., most of it belonging to Afghanistan, with its chief town, Nusretabad or Nasirabad, on the E. side of the lake. Though subject to inundations, much of the country is good agriculturally. The W. side of Lake Hamun is mountain-

Selaginella. Moss-like, flowerless plant, growing upon stones

ous, the E. side flat. During the summer months a strong N. wind, known as the "seistan," blows sometimes with gale force. The frontier between Persian and Afghan Seistan was delimited in 1872 by a commission appointed by the government of India at the request of the shah of Persia.

Sejanus, LUCIUS AELIUS (d. A.D. 31). Commander of the praetorian guard under the Roman emperor Tiberius. His influence with the emperor was very great, and he used his power in the most tyrannical manner. Ambitious of securing the imperial throne for himself, he persuaded Tiberius to retire to Capri, and set himself to put out of the way every member of the house of Germanicus that stood between him and the throne. Agrippina and her sons Nero and Drusus were banished. Tiberius at last began to suspect the designs of Sejanus, and through the agency of a trusted officer named Macro, whom he sent to Rome, the senate was encouraged to take action against the fallen favourite. His death was

decreed, and he was executed forthwith. The name of Sejanus is given to a tragedy by Ben Jonson, 1603.

Sekhet or **SEKHMET**. Egyptian goddess. Typifying, like Pakht of Beni Hasan, the destructive solar heat, she is represented as lioness-headed, with sun-disk and uraeus. She is the sister-wife of Ptah, and aided Ra in the mythical destruction of mankind. Of her many statues from Thebes, 30 are in the British Museum. See Bast; Egypt.

Sekondi or **SECONDEE**. Port of the Gold Coast Colony, Africa. Between Dixcove and Cape Coast Castle, it is the principal port of the colony, and is connected by rly. with Takoradi junction on the main line from Accra to Kumasi. Pop. 21,614.

Selachians. Name sometimes given to the sub-class of fishes also known as Elasmobranchs (*q.v.*).

Selaginella. Extensive genus of moss-like evergreen flowerless plants of the family Selaginellaceae. They are natives of all warm and temperate regions. The plants much resemble the club-mosses (*Lycopodium*), differing chiefly in the production of two forms of spores (macrospores and microspores) and spore-capsules. The macrospores are female, giving rise to prothallia, bearing archegonia, which are fertilised by the products of the microspores. The small leaves overlap and cover the stems. The best known species is *S. kraussiana*, a S. African species, commonly grown in greenhouses, which has trailing and rooting stems about a foot long.

Selaginellaceae. A family of flowerless plants of the class Pteridophyta. It includes the genera *Selaginella* and *Isoetes*. See Quillwort.

Selah. Term, probably of Hebrew origin, often used in the Psalms and occasionally in the book of Habakkuk. It is supposed to be a direction to readers or chanters to lift up their voices at the end of a strophe.

Selangor. One of the nine states of the Federation of Malaya. It lies between Perak and Negri Sembilan and between Pahang and the coast on the Strait of Malacca. From 1867, when the East India co. ceased to administer the Straits Settlements, continued piracy from Selangor troubled the British authorities, with the result that a British resident was appointed in 1874. The state is drained chiefly by the Klang river, on which is Kuala Lumpur, capital of the Federation of Malaya and,

since 1896, capital of Selangor, a Chinese town since 1872, and one of the greatest towns that have ever existed in Malaya. Tapioca plantations, tin-mining, and timber-cutting cleared away the jungle from this district, and, when these industries declined, rubber and coffee plantations took their place. Coffee planting ceased to be profitable, but rubber planting developed, especially along the Klang river to its mouth and at Kuala Langat.

The main western rly. of Malaya passes Kuala Kubu, Kuala Lumpur, Kajang, and many tin-mining towns; a branch goes N.W. from Kuang through the coalfield; the chief branch goes from Kuala Lumpur through Klang to Port Swettenham, the chief rubber port in Malaya. Excellent roads serve the exploited areas. Klang is the seat of the sultan. The area of Selangor is 3,160 sq. m. Pop. 701,552. See Malaya.

Selbie, WILLIAM BOOTHBY (1862-1944). A British divine. Born at Chesterfield, Dec. 24, 1862, he was educated at Manchester Grammar School and Brasenose College, Oxford. After lecturing on theology at Mansfield College, he was from 1890 until 1909 a Congregational minister at Highgate and Cambridge. He edited *The Examiner*, 1899-1909. Selbie was principal of Mansfield College, 1909-1932, and president of the Free Church Council, 1917. His chief book was *The Life and Teaching of Jesus Christ*. He died April 28, 1944.

Selborne. Village of Hants, England. It is 5 m. S.S.E. of Alton and 52 m. S.W. of London,

1232, and the place was once a market town. See White, Gilbert.

Selborne, ROUNDELL PALMER, 1ST EARL OF (1812-95). British lawyer. Born at Mixbury, Oxon,

1st Earl of Selborne, British lawyer

Nov. 27, 1812, he was educated at Rugby, Winchester, and Trinity College, Oxford, where he had a brilliant career, and was called to the bar at Lincoln's Inn, 1837. In 1847 he entered the house of commons, to remain, with short intervals, a Liberal M.P. until 1892, being solicitor-general, then attorney-general, in the Whig ministry of 1859-66. He was also a leader of the Chancery bar. In 1872 he was appointed lord chancellor and created a baron. He was responsible for the Judicature Act of 1873 which set up the English supreme and high courts in their present form and provided for the fusion of law and equity. Selborne left the woolsack in 1874 on the fall of the Liberal government and returned in 1880. Created an earl in 1882, he left office in 1885, and broke away from Gladstone in 1886 over the Home Rule question. To the end prominent as a churchman, he died May 4, 1895.

Selborne, WILLIAM WALDEGRAVE PALMER, 2ND EARL OF (1859-1942). British politician. Born Oct. 17, 1859, the son of the 1st earl, he was educated at Winchester and University College, Oxford. As Lord Wolmer, he

as high commissioner of S. Africa in 1905, and remained there while the details of the new federal constitution were worked out. In 1910 he returned home, and in 1915 joined the coalition government as president of the board of agriculture, resigning in 1916 owing to his disagreement with policy. He died Feb. 26, 1942.

He was succeeded in the title by his eldest son, Roundell Cecil Palmer (b. April 15, 1887), who as Viscount Wolmer became parl. secretary, board of trade, 1922-24, and was minister of Economic Warfare, 1942-45.

Selborne Society. Society originally formed in 1885 under the name of the Selborne League for the preservation of birds, plants, and pleasant places. In 1886 it was joined by the Plumage League, and carried on propaganda work against the wholesale destruction of wild birds for their plumage. The society also supports efforts to secure safe nesting-places for birds, especially in the neighbourhood of large towns, and generally to promote nature-study.

Named after Gilbert White, it met at Selborne in 1893 to celebrate the centenary of his death. The society organizes country and town rambles in connexion with antiquarian and historical study. Its offices are at The Hermitage, Hanwell, London, W.7.

Selby. Urban district and market town of Yorkshire (W.R.), England. It stands on the Ouse, 14 m. S. of York by rly. A canal connects it with the Aire and Calder navigation. The town is famous for its parish church, a magnificent cruciform building, restored after a fire in 1906. This belonged to a Benedictine abbey founded by William the Conqueror in 1069. It is 360 ft. long, and its features include some beautiful Norman and Decorated work, although the fire did irreparable damage. In 1690 the central

2nd Earl of Selborne, British politician

Selborne, Hampshire. Garden front of The Wakes, the home of Gilbert White, who lived in the older portion seen on the right

with a rly. station. The village is known as the birthplace of Gilbert White, author of *The Natural History of Selborne*. His house is shown, and he is buried in the churchyard. S. Mary's church dates back to Edward the Confessor's day, and has a fine 14th century window. An Augustinian priory was founded here in

entered parliament as Liberal M.P. for E. Hants in 1885, retaining the seat after he had become a Liberal Unionist. M.P. for W. Edinburgh, 1892-95, he succeeded to the earldom in the latter year, in which he was made under-secretary for the colonies. Having been first lord of the admiralty, 1900-03, Selborne succeeded Milner

Selby. Urban district arms

tower fell and destroyed the south transept, which was rebuilt in 1912. The town is the traditional birthplace of Henry I. Selby has boat building

Selby, Yorkshire. The Abbey church from the south-west

and oil works, and there is a considerable agricultural trade. The Ouse is navigable here for vessels of 200 tons. Market day, Mon. Pop. est. 10,000.

Selby, WILLIAM COURT GULLY, 1st Viscount (1835-1909). British politician. Born Aug. 29, 1835, the son of a doctor of medicine, he was educated at Trinity College, Cambridge. He became a barrister and in a quiet way enjoyed a good practice. In 1886, having hitherto failed

1st Viscount Selby,
British politician
Elliott & Fry

to secure election, he was chosen Liberal M.P. for Carlisle. In 1895 Gully was put forward by the Liberals as a candidate for the office of Speaker, and was elected. He held the post until 1905, when he was created Viscount Selby. He died Nov. 6, 1909. In 1923 the title passed to his grandson, Thomas Sutton Evelyn Gully (b. Feb. 16, 1911), who thus became 3rd viscount.

Selden, JOHN (1584-1654). English jurist and antiquary. Born at Salvington, near Worthing, Sussex, Dec. 16, 1584, he was educated at Chichester and at Hart Hall, afterwards Hertford College, Oxford. Settling in London, 1602, he became a student at Clifford's Inn, in 1612 was admitted to the bar at the Inner Temple, formed friendships with some of the most learned men of the time, Camden and Ben Jonson among the number, and

J. Selden
After Lely

keeper of records at the Tower. He signed the Solemn League and Covenant. A great scholar, whose legal writings are still quoted with authority, his *History of Tythes*, 1617, while admitting their legal, denied their divine, right, and was suppressed. His other works include *Titles of Honour*, 1614; *De Diis Syriis*, 1617, on the gods of Syria; and *Privileges of Baronage*, 1642; but he is best remembered for the volume usually called *Selden's Table Talk*, 1689, compiled by his amanuensis, Richard Milward. He died Nov. 30, 1654. A complete edition of his works, ed. D. Wilkins, was published in 1726. See Temple.

Selected Areas. In astronomy, regions of the sky subjected to fuller investigation than is possible for the whole heavens. In 1906 Kapteyn put forward a plan by which 206 such areas distributed uniformly over the sky should be exhaustively studied. Assuming that this represents a fair sample of the sky, the results can be regarded as typical of the whole universe.

Selection. Biological term used in several different senses, all having reference to the process of evolution or the production of types of individuals. Natural selection is a term often used to express the central idea of the Darwinian theory of evolution, according to which the individuals of a species least fit to survive are eliminated.

Artificial selection is the process which is used by breeders of animals in the endeavour to produce certain special types or qualities, as in horses and cattle, the progenitors of the race being picked out by man for reasons of his own. Germinal selection denotes the theoretical selection which possibly occurs amongst germ-cells in a vertebrate body.

appears to have been one of the company frequenting the Mermaid Tavern (*q.v.*). He sat in the Long Parliament for Oxford university, was a lay member of the Westminster Assembly (*q.v.*), and was several times in prison on account of his opinions. Among other offices he held that of

Reversed selection takes place when the selection affects not the increase of an organ but its decrease. Sexual selection is that part of the process of natural selection where sex comes into operation. The whole process of selection, whether natural or artificial, tends to the elimination of harmful or useless types or qualities and the improvement of species. See Biology; Darwinism; Natural Selection; Sex.

Selective Service. A system of military conscription adopted by the U.S.A. during each of the two Great Wars. The first Selective Service Act was signed by Wilson, May 18, 1917, and the second by F. D. Roosevelt, Sept. 16, 1940. The principle of the system was set forth as follows by the secretary of war in 1917: "It selects only those who by reason of their age and physical capacity are best fitted to receive the training and withstand the actual hardship of campaign, and who happily can be taken with least disturbance of normal economic and industrial conditions." According to these Acts, male citizens and alien residents within certain age limits were required to register on a specified date. Local civilian boards were appointed to administer the Acts with power, subject to appeal, to decide upon claims of exemption or deferment according to specific classifications of men available or non-available for military service. The order of calling-up was determined by means of a lottery at Washington. Thus on Oct. 29, 1940, H. L. Stimson, secretary of war, inaugurated the service by drawing, blind-folded, from a glass bowl, the number 158 as the first of the 16,313,240 cards of men registered.

Selēnē. In Greek mythology, goddess of the moon. She was the daughter of Hyperion and a sister of Helios, the sun-god, and Eōs, goddess of the dawn. She made her journey across the heavens in a chariot drawn by two white horses. Just as in later times Helios, the sun-god, became identified with Apollo, so Selēnē became identified with Apollo's sister Artemis. There was a legend that Selēnē became enamoured of the beautiful youth Endymion, and used to visit him nightly. *Prom. Selenece.*

Selenga or **SELENGA.** River of Mongolia and the Mongol-Buryat A.S.S.R. Rising in the Khangai Mts., it traverses Chinese territory, and, after uniting with the Orkhon, flows into Lake Baikal. Its length is about 750 m.

Selenite. Transparent crystalline variety of gypsum, commonly found in large crystals in clay formations. Twinned crystals possess a characteristic arrow-head form. *See* Gypsum.

Selenium. Chemical element, symbol Se; at. no. 34; at. wt. 78.96, discovered by Berzelius in 1817. Like sulphur it exists in several allotropic forms. Red selenium forms two different kinds of crystal known as α and β ; density 4.5 gm per c.c.; melting point (on rapid heating) about 180° C. An amorphous or vitreous red selenium can also be obtained by chemical means. If this is heated slowly to about 175° C. it changes to crystalline grey selenium A, which on standing changes again to the more stable B form. Crystalline grey selenium B is also obtained by slowly heating crystalline red selenium to about 200° C. It forms hexagonal crystals with metallic properties, density 4.8 gm per c.c., melting point 220° C. Liquid selenium has a density of 4.27 gm per c.c.; b. p., 684.8° C.

Selenium colours glass pink, and is used therefore to neutralise the green tint in glass produced by iron, and so to decolorise the glass. In larger quantities it produces red glass for signal lamps.

Crystalline grey selenium B exhibits the phenomenon known as photo-conductivity. In thin films, its electrical conductivity may be as much as ten times as great in strong light as it is in the dark, and it is particularly sensitive to the red end of the spectrum. Selenium cells are therefore used to operate burglar alarms, open doors, etc., by the interruption of infra-red beams; and to turn on and off marine and street lighting with the failure and return of daylight.

The term selenium cell is sometimes also applied to a photo-voltaic cell made of a thin film of iron selenide on iron, which gives a small current on illumination and is used in photographic exposure meters. *See* Photo-cell.

Seleucia. Ancient city of Asia. It was situated on the Tigris, on the frontiers of Assyria and Babylonia. Built by Seleucus I, king of Syria, between 312–302 B.C., it became a great and splendid city, reputed in the reign of the Roman emperor Titus to have 600,000 inhabitants; but eventually it was eclipsed by Ctesiphon as the chief city of W. Asia. After its capture by Severus, A.D. 198, its importance dwindled.

Seleucia Pieria. Ancient city of Syria. It was built by Seleucus I, king of Syria, in 300 B.C., and

was about 12 m. W. of Antioch, of which it was the port. Seleucia was a natural fortress, heavily reinforced. Prosperous and flourishing for many centuries, it eventually fell into decay, and was almost in ruins by the 6th century.

Seleucidae. Name of the Macedonian dynasty which ruled in Syria and other parts of W. Asia from 312 B.C. until the Roman annexation by Pompey in 65 B.C. Nearly all the monarchs of the dynasty bore the name either of Seleucus or of Antiochus. It was founded by Seleucus, called Nicator, or the conqueror, one of Alexander's generals, who in the partition of Alexander's empire acquired possession of Syria, Mesopotamia, and the regions east of the Euphrates.

Seleucus was succeeded by his son Antiochus I (280–262) called Soter, or the saviour, from his victory over the Gauls who invaded Asia Minor in 278. Seleucus II (246–226) was attacked by Ptolemy III of Egypt, who overran all Syria and Babylonia, and by Arsaces of Parthia, who wrested the countries beyond the Euphrates from him, while the king of Pergamum conquered most of Asia Minor. Antiochus III the Great (223–187) waged successful wars against Parthia and Bactria, but was unable to subjugate them effectively. On the other hand, he recovered the lost territories in Asia Minor and also Palestine.

Antiochus, the greatest of the eastern potentates, challenged the rising power of Rome, disastrously for himself. He met the Romans on European soil, but was defeated at Thermopylae, 191, and then still more decisively at Magnesia, in Asia Minor, 190. As a result of the treaty of 188, cessions of territory, indemnities, and other humiliating terms were imposed on him, which practically destroyed the prospect of further serious resistance to Rome on Syria's part. Antiochus died in 187 B.C. The ablest of his successors was his son Antiochus IV, called Epiphanes, 175–164. Attacked by Egypt, 170, he invaded and occupied that country, but in 168 was compelled by the Romans to withdraw. For another century after his death, c. 164 B.C., Antiochus followed Antiochus, varied by an occasional Seleucus or Demetrius, but none demands special notice except the last of the line, Antiochus XIII, who was finally deposed by Pompey in 65 B.C., when Syria was annexed as a province of the Roman republic. *See* Daniel; Syria.

Self-Consciousness. In philosophical language, a state of consciousness in which the idea of self or some aspect of self is present, the condition of being aware of oneself. It consists in introspective attention to some mental process which belongs to oneself and not to another, which forms part of one's own and no one else's experience. A person knows that he thinks and acts, and also that his thoughts and acts are his own.

The first idea of self, of its sphere and content, is to be looked for in the consideration of the human body, by which the consciousness of the existence of two distinct worlds, an external and an internal, first becomes possible. By reflection the nature of the body is established as external, and the Ego as an internal, mental substance. Practical factors in the formation of the idea of self are the marking off of our fellows by distinctive names, references to mind and minds, and more or less constant intercourse with others, all of which go to establish personal individuality. In popular language, self-consciousness is the idea that one is the subject of observation, good natured or ill-natured, by others. Undue anxiety as to what others think of one leads to inattention and neglect of one's occupation. According as one is agreeably or disagreeably affected, self-consciousness takes the form of vanity or shyness. *See* Introvert; Metaphysics; Psychology.

Self-Denying Ordinance. Law or order passed by the English parliament, April, 1645, requesting all members of parliament to resign their military and naval commands within forty days. The Civil War was raging, and the failure to crush Charles I at the second battle of Newbury brought the discontent of the parliamentarians to a head. Cromwell and Vane thought that Lord Essex, Manchester, and other leaders were not anxious to humiliate the king too much, and they decided upon the expedient of a self-denying ordinance. The first was thrown out by the lords, but they passed a second, and Cromwell was one of those who resigned. This second ordinance, however, unlike the first, allowed M.P.s to be reappointed, and Cromwell was soon chosen to command the cavalry. *See* Civil War.

Self-Determination. Term used in philosophy to describe a person's ability to determine his own course of conduct. During the First Great War it came to be applied in Allied propaganda to the

right to autonomy, claimed in 1918 for all peoples by Wilson in his Fourteen Points (*q.v.*) and subsequently elaborated in various speeches, the key phrase of which was, "What we seek is the reign of law, based upon the consent of the governed and sustained by the organized opinion of mankind." It was used in particular of the peoples who had formed the empire of Austria-Hungary. The peace treaties which concluded the First Great War sought to settle national boundaries in Europe in accordance with the principle of self-determination.

Self-Heal (*Prunella vulgaris*). Perennial herb of the family Labiatae. A native of Europe, N.

Self-Heal. Flower-heads and leaves

Africa, Asia, America, and Australia, it has a creeping root-stock, and short branching stems, with oblong or lance-shaped leaves. The purple, two-lipped flowers are produced in whorls, which are but slightly apart, the intervening bracts having purple margins. It was formerly used for wounds, and hence called carpenter's herb and sickle-wort.

Self-Help. Work by Dr. Samuel Smiles. Published in 1859, it was designed to show what can be accomplished by determination and the will to succeed, and is copiously illustrated by examples from the lives of men who attained eminence despite adverse circumstances. The book had an extraordinary success.

Self-Induction. In electricity, electrical inertia. It plays a similar part in an electrical system to a heavy fly-wheel in a mechanical one. The starting and stopping of an electric current occupies a small fraction of time. This is of little consequence with a direct current which flows continuously in one direction, but with an alternating current, where the direction is rapidly and constantly reversed, the effort of rapidly changing direction produces a counter electromotive force, which reduces the effective electro-motive force. See Current; Electricity.

Selfridge (HARRY) GORDON (1857-1947). An Anglo-American business man. Born of New Eng-

land stock at Ripon, Wis., U.S.A., in 1857, he left school at 14. After working as a clerk he entered the

Gordon Selfridge, Anglo-American business man
Russell

mail order business of Field, Lester, and co. in Chicago in 1879. Through his organizing ability and fund of ideas he advanced quickly, and in 1904 retired from a partnership in the Marshall Field co., with a fortune of £300,000. In 1909 he opened his store in Oxford Street, London, then one of the largest stores in Europe. Selfridge became a naturalised British subject in 1937. He wrote *The Romance of Commerce*, 1918. He died at the age of 90, May 8, 1947.

Self-Toning Paper. Formerly a popular photographic printing-out paper incorporating sufficient gold compound to tone the picture during fixation, thus eliminating the separate toning bath.

Selim I (1465-1521). Sultan of Turkey. Son of Bayazid II, he de-throned and killed his father, together with his brothers and nephews, in 1512, and two years later carried a war into Persia. Conquering Mesopotamia, Kurdistan, and Armenia, he led his triumphant army against the Mamelukes, whom he utterly defeated in 1516, annexing Egypt and wresting the title of caliph from the last of the Abbasides. Thus the sultan of Turkey became head of the Mahomedan world. Selim died Sept. 22, 1521.

Selim II (1524-74). Sultan of Turkey. Son of Sulciman the Magnificent, he ascended the throne in 1566, and though slothful and cowardly himself was fortunate in his grand vizier, Mahomed Sokkoli, who made advantageous treaties

Selim II, Sultan of Turkey

with the emperor Maximilian II and Ivan the Terrible, whilst his generals waged successful wars in the Hejaz and Cyprus, though the defeat of

Lepanto (*q.v.*) followed. Selim, whose habits had earned him the nickname of The Drunkard, died Dec. 12, 1574.

Selim III (1762-1807). Sultan of Turkey. Son of Mustafa III, he came to the throne in 1789, while his country was at war with Austria and Russia. Peace was concluded with these powers in 1791 and 1792 respectively, but in 1798 Napoleon's invasion of Egypt involved Turkey in a four years' war with France. Cultured and enlightened, Selim attempted to introduce reforms and raise Turkey to the western level of civilization, but the opposition, headed by the Janissaries, was too great, and riots broke out in Constantinople and Adrianople. In 1807 Selim abdicated in favour of his nephew Mustafa, who had him strangled.

Selincourt, ERNEST DE (1870-1943). English scholar and critic. Born Sept. 24, 1870, he was educated at Dulwich and University College, Oxford. An authority on the English romantic poets, he edited the standard editions of Wordsworth's poetry and letters and the introduction to his edition of Spencer was much praised.

During 1908-35 he Selincourt was professor of English at Birmingham university and vice-principal (1931-35). He was also professor of poetry at Oxford, 1928-33. His works include editions of Keats and Landor, Oxford Lectures on Poetry, and English Poets and the National Ideal. He died May 22, 1943. His brother, Hugh de Selincourt (b. 1878), was a critic and novelist. His works included *The Iligh Adventure*, 1908, Oxford from Within, 1910, *The Cricket Match*, 1924, and *Studies from Life*, 1934. Another brother, Basil, was a literary critic on *The Observer*.

Selinus. Ancient Greek city of Sicily. Situated on the S.W. coast, and originally a Dorian colony, it became one of the chief cities in Sicily. In 409 B.C. it was taken by the Carthaginians and almost destroyed, many of its inhabitants being sold into slavery. During the first Punic War it was again destroyed, and its inhabitants transferred to Lilybaeum.

Seljuks. Turkish family which ruled Western Asia in the 11th and 12th centuries. Its founder was

Selim III, Sultan of Turkey

Seljuk, who about A.D. 1000 led a band of Ghuz Turks from the N. to the region of Bokhara. His grandsons, after conquering Khorassan in 1039, gradually extended their sway over Persia, Toghrol (d. 1063) taking Bagdad, 1055, and becoming protector of the powerless Abbaside Caliphs. The Seljuks thus became the champions of Mahomedan orthodoxy, and prevented the disintegration of Islam at the hands of Persian sectaries. In the 11th century Syria and Asia Minor were conquered.

The Seljuk empire then extended from Kashgar to the Dardanelles, and from the Caucasus to S. Arabia. On Malik Shah's death the W. part broke up into independent states, of which the most illustrious was the Seljuk sultanate of Rum, the capital Iconium being the seat of a brilliant civilization, which lasted until the rise of the Ottoman Turks, about 1300. The W. Seljuks struggled against the first two Crusades, but were driven from Syria by Saladin (q.v.). The main line reigned at Hamadan until 1194. See Persia; Turkey.

Selkirk. Royal and mun. burgh of Selkirkshire, Scotland, also the county town. It stands on Ettrick

Selkirk, THOMAS DOUGLAS, 5TH EARL OF (1771-1820). British philanthropist. Born at St. Mary's Isle, Kirkcudbrightshire, June 20, 1771, youngest son of the 4th earl, he was educated at Edinburgh university, where he became a close friend of

Walter Scott, and succeeded to the earldom, 1799. He took keen interest in the economic condition of the Highlands of Scotland, and personally established settlements of Scottish emigrants in America. One, on Prince Edward's Island, founded 1803, was extremely prosperous. Other parties sent to the Red River Valley, now Manitoba, in the Hudson's Bay company's territories, met with many vicissitudes. He died at Pau, April 8, 1820. See Red River Settlement.

Selkirk, ALEXANDER (1676-1721). British sailor. The son of a shoemaker of Largo, Fifeshire, he had some experience of the sea during a turbulent young marhood, and in 1703 joined Dampier's expedition to the South Seas as navigator of the vessel Cinque Ports. In 1704, when off Juan Fernandez, he asked to be set ashore in consequence of a quarrel with his captain. He remained on the island 52 months, was then picked up by Captain Woodes Rogers, and eventually became mate of H.M.S. Weymouth, on which vessel he died. Rogers's Cruising Voyage Round the World, 1712, may have given to Defoe the idea of Robinson Crusoe (q.v.), and Selkirk's life suggested the well-known poem by Cowper.

Selkirk Mts. Mountain range in the S.E. of British Columbia. It extends N. from the U.S.A. boundary to the great loop of the Columbia river, and is a range of Alpine altitude, with magnificent forests and glaciers. Sir Donald (10,800 ft.), Dawson (11,100 ft.), and Bonney (10,200 ft.) are the highest peaks of the range. The

main pass is Roger's pass, crossed by the C.P.R. between Golden and Revelstoke.

Selkirkshire. Inland county of Scotland. In the south-east of the country, its area is 267 sq. m. The surface generally presents a succession of hills, the whole forming part of the forest of Ettrick. The highest points are Broad Law (2,754 ft.), Locheraig Head (2,625 ft.), and Dun Rig (2,432 ft.). The Tweed crosses the county; other rivers are its tributaries, Ettrick and Yarrow. St. Mary's Loch is the chief of several small lakes. Ettrickdale and the vales of the Tweed and the Yarrow, often visited by Wordsworth, are noted for their beauty. The chief industry is the rearing of sheep. Selkirk is the county town, but

Selkirkshire arms

Galashiels is the most populous. The county unites with Roxburghshire to send a member to parliament. Selkirkshire has some British and Roman remains, and at Torwoodlee is a round tower. Its history is that of the borders, of which Ettrick Forest once formed one of the wildest parts. Pop. 22,100.

LITERARY ASSOCIATIONS. As a border county and the home of the Scott clan, Selkirkshire has a great ballad literature. James Hogg was born at Ettrick, and William Laidlaw at Blackhouse. At Foulshiels Mungo Park was born;

Alexander Selkirk. Statue of Robinson Crusoe at Largo, Fifeshire

Selkirk, Scotland. Mercat Cross and Town Hall, in front of which is a statue of Sir Walter Scott

Water, 40 m. by rly. S.W. of Edinburgh. The chief buildings are the town hall, free library, and grammar school. The town was long famous for its manufacture of shoes, an industry now superseded by that of woollen goods. Selkirk figured considerably in border warfare between Scotland and England. Market day, Wed. Pop. 5,667.

Selkirk. Town of Manitoba, Canada, 22 m. W. of Winnipeg, on the Red River. Served by the C.P.R., it is at the head of Lake Winnipeg navigation, and centre of its fishing industry (7,000,000 lb.). Other industries include a steel foundry, rolling mills, and lumbering. Pop. 5,408.

Selkirkshire. Map of the lowland county of Scotland

there is a statue of him in the town of Selkirk.

The county is second only to Roxburghshire in its association with Sir Walter Scott and his work. At Ashiesteel he lived for seven years, and there wrote *Marmion*, *The Lady of the Lake*, and *The Lay of the Last Minstrel*. In the last of these is described Deloraine, on the Ettrick, and Newark Castle. Consult *History of Selkirkshire*, T. Craig Brown, 1886; *Border Raids and Reivers*, R. Borland, 1910; *Highways and Byways in the Border*, A. and J. Lang, 1913.

Selle. River of France. Rising S. of Le Cateau, it flows in a N. direction, joining the Schelde at Denain. It figured prominently in the closing stages of the First Great War, when the British 4th army and 1st French army, together with specially equipped tanks, attacked the German 2nd and 18th armies holding positions on the river, on Oct. 17, 1918. They captured Le Cateau, crossed the Selle, and pushed patrols to the little river Harpies farther E. In no Allied victory of the war were such large captures of guns made; 475 were taken, in addition to 20,000 prisoners. See *Le Cateau*.

Sellenger's Round. Tune and dance, probably in connexion with Maypole festivities, that became enormously popular in England during the 16th and 17th centuries. The composer is unknown. There are many variants of the tune. See *Folk Song*.

Selly Oak. Suburb of Birmingham. It lies to the S.W. of the city proper, with a rly. station. It is largely a manufacturing area. The chief church is S. Mary's.

is a principal product. Selma was founded 1817, incorporated 1820, and chartered 1852. Pop. 19,834.

Selous, FREDERICK COURTENAY (1851-1917). British traveller and hunter. Born in London, Dec. 31,

F. C. Selous, British traveller Swaine

1851, he was educated at Rugby and in Germany. From 1872 to 1890 he explored and hunted in Matabeleland and the country between the Transvaal and the Congo, becoming friendly with Lobengula, who granted him many privileges. Afterwards Selous acted as guide to the British South Africa co. in an expedition to Mashonaland. He fought in the Matabele war of 1893, when he was wounded, and took part in quelling the Matabele rising in 1896.

On the outbreak of the First Great War Selous joined the forces in East Africa. He received his captaincy the following August, and was awarded the D.S.O. in Sept., 1916. He was killed in E. Africa, Jan. 4, 1917. His publications included *A Hunter's Wanderings in Africa*, 1881; *Sport and Travel*, East and West, 1900; *Recent Hunting Trips in British North America*, 1907; and *African Nature Notes and Reminiscences*, 1908. Selous was the original of Rider Haggard's hero Allan Quatermain. Consult *Life*, J. G. Millais, 1918. *Pron.* Seloo.

Selsdon, WILLIAM MITCHELL-THOMPSON, 1st BARON (1877-

Selma. City of Alabama, U.S.A., the co. seat of Dallas co. It stands on the Alabama river, 51 m. W. of Montgomery, and is served by the Southern and other rlys. It has a university for coloured students. With the decline of the cotton market early in the 20th century, the Selma region turned to diversified agriculture, especially stock and dairy farming. Cotton-seed oil

1938). British politician. Born at Edinburgh in April, 1877, he was educated at Winchester, and Balliol, Oxford. After some years in legal practice, he was Conservative M.P. for N.W. Lanark, 1906-10, for N. Down, 1910-18, and for Maryhill, 1918-22. During 1923-32 he was returned for S. Croydon. Occupying various junior government posts during 1919-22, he was postmaster-general 1924-29. Having been knighted in 1918, Sir William was raised to the peerage as Baron Selsdon in 1932. On Dec. 24, 1938, he died, and was succeeded by his son, Patrick (b. May 28, 1913).

Selsey or SELSEA. Watering-place of Sussex, England. It is 8 m. S. of Chichester, with which it was once connected by light rly. Here, in the 7th cent., S. Wilfrid founded a monastery and Selsey became the seat of the bishop of the South Saxons. In 1075 the see was removed to Chichester. The site of the cathedral and part of the old town were submerged by the sea. Fishing is the chief occupation, and in the 19th century it began to attract visitors. At the end of the peninsula is the headland Selsey Bill. The name means seals' island. Pop. cst. 2,500.

Selston. Village of Notts, England. It is 9 m. by rly. from Mansfield. In the neighbourhood are coal mines and ironworks. S. Helen's church is mainly Early English, S. Michael's is modern. Pop. 9,000.

Seltzer Water. Mineral water originally obtained from Selters, near Limburg, in Nassau, Germany, and strictly speaking the water should be called Selters water. Most of the so-called seltzer waters now obtainable in Great Britain and America are artificial preparations with a similar composition to that of the natural water. The latter is a highly aerated alkaline water containing bicarbonates of sodium, calcium, magnesium, sulphate of potassium, etc. It is helpful in cases of chronic indigestion and respiratory disorders.

Selvagee. Coil formed by winding rope yarn. The yarn may be wound round two posts spaced a certain distance apart, and a uniform tension should be applied. After winding, the coil is tightly bound together

Selvagee. Diagram illustrating how a selvagee is made

continuously by another length of yarn before removal from the posts. The strength of the selvagee depends upon the number of turns in the coil. Selvagees are used as temporary or improvised slings, and for other purposes in connexion with hoisting apparatus, especially in military engineering.

Selvas (Sp., forests). Almost impenetrable equatorial forests in the basin of the Amazon river. The selvas contain giant trees, below which there is an undergrowth of trees of ordinary forest dimensions, while the whole is interlaced with creepers. The trees which give rubber are of great economic value, and the selvas also contain vast wealth in valuable hardwoods and dyewoods as mahogany, ebony, sandalwood, logwood, etc. The name has been extended to other regions where similar climatic conditions produce similar forests. The chief of these are the Guinea Coast and the Congo Basin in Africa, and the E. Indies.

Selwyn, GEORGE AUGUSTUS (1719-91). British wit. He was born Aug. 11. 1719, and educated

George Selwyn,
British wit
After Reynolds

at Eton and Hertford College (then Hart Hall), Oxford, which he was compelled to leave in 1745, owing to a freak which was described as blasphemous. Before this event he had been appointed to sinecures which rendered him independent, and had made the grand tour. He became M.P. for the pocket borough of Ludgershall in 1747; succeeded his father in the family estate of Matson in 1751, and was member for Gloucester, 1754-80. Selwyn was chiefly known as a convivial man about town, possessed of a lively wit, and as the hero of numerous anecdotes. He died in London, Jan. 25, 1791.

Selwyn, GEORGE AUGUSTUS (1809-78). British divine. Born at Hampstead, April 5, 1809, he was educated at Eton and St. John's College, Cambridge, where he won distinction as an oarsman and a scholar. In 1833 he was ordained, and in 1841 went to New

G. A. Selwyn,
British divine
After Richmond

Zealand as a missionary bishop, doing good work in developing the church in the young colony, where he was during the Maori War. Returning to England in 1867, he was consecrated bishop of Lichfield in 1868, and he was there when he died, April 11, 1878. Selwyn College, Cambridge, perpetuates his memory. *Consult* Lives, H. W. Tucker, 1879; G. H. Curteis, 1889.

Selwyn's son, John Richardson Selwyn (1844-98), was bishop of Melanesia, 1877-89, and master of Selwyn College, 1890-98.

Selwyn College, Cambridge. Chapel and master's lodge

Selwyn College. One of the colleges of Cambridge university. Founded in memory of George

Augustus Selwyn, bishop of New Zealand, it was incorporated by royal charter in 1882, and is an approved foundation of the university. The chapel was consecrated 1895; the hall built in 1908-09, and the library in 1929. The society consists of the master, 11 fellows, and 12 scholars.

Selymbria or **SELIVRIA**. Ancient Greek city of Thrace. Situated on the N. coast of the Sea of Marmara, 37 m. W. of Istanbul, it was founded about 670 B.C. by colonists from Megara. The modern Silivri is a small town of European Turkey.

Selznick, DAVID OLIVER (b. 1902). American film producer, born at Pittsburgh, May 10, 1902. In 1936 he was awarded the League of Nations medal, and in 1939 received the Thalberg memorial award for the most consistent high level of film production. He won academy awards for *Gone With the Wind*, 1939, and *Rebecca*, 1940. Other Selznick films were *The Four Feathers*; *King Kong*; *David Copperfield*; *A Star is Born*; *Duel in the Sun*.

Selwyn College arms

Semang. Primitive people in the Malay peninsula, mostly in Patani, Kedah, central Perak, and N. Pahang. On the E. coast they are called Pangan. They use bows, wear sackcloth or leaf girdles, and inhabit rock-shelters or palm-leaf structures. Each tribe is ruled by a chief medicine-man.

Semantics (Gr. *sēma*, sign). Study of the meaning of words, with the aims especially of giving a more exact significance to general terms and of making language a more precise instrument

of communication. The term was invented by Michel Bréal, French philologist. The study involves the application of philology, etymology, logic, and psychology to discover the true meaning of a word, and to remove prejudices and misunderstandings that interfere with the

communication of ideas. Semantists strive to give to such terms as "liberty," "individualism," "truth," the exactitude and freedom from misinterpretation of simple labels like "foot," "dog," "pencil." Basic English was an outcome of the semantic studies of C. K. Ogden. *Consult* Science and Sanity, A. Korzybski, 1933; *The Meaning of Meaning*, C. K. Ogden and I. A. Richards, rev. ed. 1936; *Tyranny of Words*, S. Chase, 1937.

Semaphore (Gr. *sēma*, sign; *phora*, a carrying). Instrument used for visual signalling, chiefly between ships at sea, and from ship to shore or vice versa. For use on

land it necessitated a series of stations built on eminences and having movable disks or shutters mounted in a frame and operated by cords and pulleys. It was invented in England in 1767, and put to practical use in 1794 to maintain contact between Paris and the French frontiers. In 1795 Lord George Murray

Semaphore on
British warship

introduced the semaphore into Great Britain to maintain communication between the Admiralty and Portsmouth dockyard. Instruments were placed on church towers, hills, etc., at an average distance of 8 m. apart, each station having in view the one in

Semarang. Town of central Java, capital of the former residency of the same name. It is situated 250 m E.S.E. of Jakarta, on the N. coast, at the mouth of the Semarang river, and has rly. connexion with Surabaya and Surakarta. It is an important commercial centre,

courses roughly N.W.; the Devoli turns S. and joins the Osum to form the Semen, which enters the Adriatic Sea.

Semeru. Volcano in E. Java. It rises to a height of over 12,000 ft., and is the culminating point of the island. It erupted violently in 1895.

Semibreve. Musical note written thus ♩ . It is the note of greatest value now used, and as such is the basis of the whole time system, including time signatures; but, as its name (nota semibrevis, the half-short note) imports, it was at first of little value, only the minim (*q.v.*) being of less.

Semicolon. Punctuation mark (;) in printing and writing. It is used to indicate a pause longer than that shown by a comma, and shorter than that by a full stop. Many literary stylists consider its use a sign of weakness, as indicating an indeterminate compromise. See Punctuation.

Seminole. (Creek, seceder). North American Indian tribe of Muskogian stock. An offshoot of the Creeks (see Muskogees), after the extinction of the Apalachees in 1704, they seceded in order to settle in Florida, using pile-dwellings in the shallows. The Seminole War, 1835-42, cost them their homes, and, removing to Oklahoma as one of the Five Civilized Tribes, their separate nationhood ceased in 1906. They number some 3,000; in Florida, 250. See American Indians.

Semipalatinsk. Town of Kazakh S.S.R., capital of the region of the same name. It stands on the river Irtysh, 600 m. S.W. of Omsk, and was formerly a small agricultural centre. Under the Five Year plans, however, it developed rapidly, and important flour mills and meat-packing plants were built. It is on the Turksib rly. Pop. 109,779.

Semiquaver. In music, a small note, equal in time value to half a quaver (*q.v.*). In form it is similar to a quaver, with two black strokes on the stem ♪ .

Semiramis. Fabulous queen and co-founder of the ancient Assyrian empire which centred in Nineveh. Daughter of a Syrian youth and the Syrian fish-goddess, Derceto, she married Onnes, one of the generals of Ninus, and, having heroically taken part in the siege of Bactra, won the king's attention. Her husband then destroyed himself, and Semiramis married Ninus, whom she succeeded. She ruled for forty-two years, conquering many nations

Semaphore. The semaphore alphabet; when preceded by numeral sign, the letters A to I represent the figures 1 to 9

front and the one behind. A short message could be transmitted over the 72 m. between London and Portsmouth and an answer received in 15 mins. In 1816 Popham replaced the framework and shutters by an upright post with two arms which could be swung into different positions. With the coming of the electric telegraph, land semaphores were superseded, but the post-and-arm type continued to be used at sea. Telegraph Hill, near Guildford, received its name from the installation on it of the old Admiralty device.

Semaphore flag signalling is by the waving of two flags to make signals corresponding to those transmitted by semaphore arms. The flags are half blue, half white, and two feet square. With a single flag messages can be transmitted in Morse (*q.v.*). See Signalling.

Semaphore. Watering-place in S. Australia. On the Gulf of St. Vincent, it is a suburb of Adelaide, the capital.

and has shipyards. The town was originally connected with the sea by the river; later, a canal was made, and both river and canal require continual dredging. Petroleum and copper are found in the neighbourhood. The temporary surrender of Java in 1811 to the British was made here. Pop. est. 100,000.

Semele. In Greek mythology, daughter of Cadmus, king of Thebes, beloved by Zeus. Hera, prompted by jealousy, persuaded her to ask of Zeus that he should appear before her in all his glory. Zeus unwillingly consented, and in the lightning, which was the symbol of his majesty, Semele was consumed, after giving birth to a son by Zeus, the god Bacchus or Dionysus. Semele is the name of a secular oratorio by Handel, containing the tenor aria, Where'er you walk. See Bacchus. Pron. Semeele.

Semeni. River of Albania. The Osum and Devoli rise in the eastern mts. and flow at first in parallel

and founding Babylon, and then resigned the crown to her son, and disappeared to heaven in the form of a dove. Her memory is generally associated with opulent luxury and voluptuousness, and she is probably identical with the Syrian Venus Astarte. *See Assyria. Pron. Se-mirramis.*

Semite. Name denoting a group of peoples, past and present, mostly in W. Asia and E. Africa. Based on the fact that some of them are described in Gen. 10 as descendants of Shem, the name is applied primarily to peoples speaking closely related languages of the Semitic family.

The cradleland of the main Semitic-speaking peoples is not yet determined. Some characteristics of their speech and early culture bear such fundamental relationships to those of the Hamitic peoples, that a prehistoric period is assumed when Hamite and Semite were an undivided African or Afro-Asian branch of the white race. The typical Semite is essentially long-headed, tawny white, of medium stature, with black curly hair, strong beard, fine oval face, and straight or aquiline nose. The Jewish people, who are of mixed descent, and not typical Semites, acquired a distinctive form of nose, apparently by contact with an Alpine stock from Asia Minor.

The classification of these peoples, linguistic rather than racial, is broadly into N. and S. The S. Semites include the Arabians, both the pastoral nomads or Beduins of N. Arabia and the settled communities in the S. known in history as Minaean, Sabaeen, and Himyar, with their migrant offshoots in Abyssinia. The N. Semites penetrated to outlying regions in successive waves of migration under the pressure of the food quest when desert supplies failed. Archaeology and written history record their early appearance in ancient Mesopotamia, where they mingled with the riverside dwellers and founded Semitic dynasties in Babylonia and Assyria. Another wave, apparently later, accounts for the Aramaeans of the upper rivers, who may have given rise later still to the Canaanite peoples. These in their turn absorbed the Hebrew influx after its long contact with Egyptian civilization. The Phoenicians may be a part of the Aramaean stream which moved across from the Persian Gulf, mingling with and dominating the seafaring population of the E. Mediterranean.

The place of the Semite in human culture varies as much as his habitat. The desert-loving Beduin is to be distinguished from the Punic mariner, the agricultural Jew of E. Europe from the slave-trading Arab of equatorial Africa. None of man's primary inventions in technology and the useful arts is attributable to him. In his own environment, such art as the Semite practises is imitative rather than creative.

Semitic languages differ profoundly from Indo-European in vocabulary and grammatical structure. A dominant feature is the formation of roots containing three consonants, words being derived from them by vowel-changes, prefixes, and suffixes. Thus from the Arabic root *kṭp* are formed *kātib* *kataba* *kitāb*, a writer wrote a book. The verbal tenses denote completed or uncompleted action, and are formed by suffixes and prefixes respectively. There is no construction of compound words, such as bookbinding, bookishness. The only Semitic dialect spoken exclusively by Christians is Maltese.

The service rendered by the Semite to the intellectual life of mankind by sharing in the formation and dissemination of alphabetic writing was very great. Apart from religious poetry and idealism, where it reigns supreme, Semitic literature is of secondary rank. *See Anti-Semitism; Jews.*

Semitone. Smallest interval recognized in European music. It may be described as the distance on the pianoforte from any given note to its immediate neighbour, and thus it will always be represented by two notes of different colours, except when between E and F, and B and C. Semitones are of two kinds: diatonic, having different letter names, and chromatic, having the same letter name for the two notes, *e.g.*

The chromatic semitone is smaller than the diatonic; in other words, D flat is sharper than C sharp, but equal temperament (*q.v.*) having divided the octave into twelve mean semitones, the difference between the two has become one merely of grammatical writing. String players commonly display a tendency to accentuate the sharpness of the sharp and the flatness of the flat, thereby making their chromatic semitone larger than their diatonic.

Senliki. River of Central Africa. It flows N.E. from the Edward Nyanza to the Albert

Semmering, Austria. Entrance to the railway tunnel through the Eastern Alpine mountain pass

Nyanza, partly through Belgian and partly through British territory. It runs W. of the mountain mass of which Ruwenzori is the principal peak, and forms one of the headwaters of the Nile. Except when closed on account of sleeping sickness, it is navigated in canoes. Length 150 m.

Semmering. Pass in the Eastern Alps, Austria. It is 3,300 ft. above sea level and extends for 33 m. by rly. from Gloggnitz in Lower Austria to Mürzzuschlag in Styria. It is on the historic route to Vienna from the S.W., and was opened as a bridge path in the 13th century. A road was completed in 1728. The rly., opened in 1854, avoids the summit by a tunnel a mile long and 282 ft. below the pass. Within the pass are 15 tunnels and 16 viaducts.

Semneh. Ruined fortress in the Sudan. On the left bank of the Nile, 37 m. S. of Halfa, it was founded, with Kummeh, on the right bank, to guard the new S. frontier of Egypt, by Senusert III who set up a remarkable inscription there urging resistance to Nubian attacks, and built a temple in the fortress, rededicated by Thothmes III to Khnum and the Nubian god Didun (Tithōnus). It is the ancient Samnin or Sammina. *See Egypt.*

Semnones. Ancient German tribe. In the 1st century A.D. they inhabited the region E. of the Elbe between that river and the Oder and Havel. They claimed to be the leading tribe of the Suevic confederation, whose religious centre was in their territory. Having submitted to Maroboduus, king of the Marcomanni (*q.v.*), they revolted with their northern neighbours the Langobardi, and helped Arminius to defeat him, about A.D. 18.

Semolina (It. *semolino*, grits). Middlings or coarse particles of the grain produced during the process of grinding wheat. Semolina is largely used in the manufacture of macaroni and is a principal ingredient of many well-known cereal foods, in addition to forming the base of nutritious puddings.

Sempach. Town of Switzerland, in the canton of Lucerne. It stands on the E. shore of Lake Lucerne, 1½ m. by road from its station, 9 m. by rly. from Lucerne. Pop. est. 1,500.

The battle of Sempach was fought July 9, 1386, between the troops of Leopold, duke of Austria, and the Swiss. For an act of defiance Leopold decided to punish the inhabitants of Sempach. The men of Lucerne called those of other cantons to their aid, and outside Sempach 1,500 of them met the Austrians. The nature of the country compelled the knights of the latter to dismount, and a stubborn fight ensued. At length the Swiss attacks prevailed, and soon their victory was complete, Leopold and many of his men being killed. It was in this battle that Arnold von Winkelried (*q.v.*) is said to have performed his feat of breaking the hostile line by drawing to his breast a group of spears.

Sempervivum. Perennial succulent herb, a familiar example being generally known under its English name of house-leek (*q.v.*).

Sempill, BARON. Scottish title held by the family of Sempill since about 1489. The founder of the family, Sir John, was killed at Flodden, 1513. The succession passed through his son William (d. 1550) to Robert, 4th baron, who was Scottish ambassador to Spain in 1596. From him the title descended to Francis, 8th baron, on whose death without issue in 1684 the title passed to his sister Anne, wife of Robert Abercromby. Their eldest son, Francis, became 10th baron in 1695. From Hugh, the 12th baron, the title descended to Selkirk, 15th baron, on whose death in 1835 it fell to his sister, Maria Janet. On her death in 1884 the title passed to Sir William Forbes, grandson of the 12th baron's daughter, Sarah. He was the 17th baron and was succeeded in 1905 by his son, John Forbes-Sempill, as 18th baron, and in 1934 William Francis Forbes-Sempill (b. Sept. 24, 1893), who was well-known as an airman, became the 19th baron. Lord Sempill's heir is known as the Master of Sempill.

Sempronia. Name of a Roman plebeian gens or clan, the most

distinguished family of which was that of the Gracchi. Sempronia was the name of the sister of the Gracchi and the wife of Scipio Aemilianus. She was suspected, but without reason, of having poisoned her husband. Sempronia is the name of a learned woman in Ben Jonson's drama *Catiline*.

Sen. Japanese bronze coin, the one-hundredth part of a yen (*q.v.*). Its nominal value is one farthing.

Sen. Both faces of the Japanese bronze coin. The actual diameter is 1½ ins.

Sena. Township and dist. in Mozambique. The town is on the Zambezi, where the rly. from Beira to Lake Nyasa crosses it, and was once an important centre of trade. The dist., which contains many cattle, extends inland S. of the Zambezi from its mouth to the district of Tete.

Senanayake, DON STEPHEN (b. 1884). First prime minister of the dominion of Ceylon. See N.V.

Sénancour, ÉTIENNE PIVERT DE (1770–1846). French author. Born in Paris, he studied philosophy,

Étienne de Sénancour, French author

and ran away to Switzerland to escape the training for the Church intended by his father. Returning to Paris about 1800, he lived in obscurity and wrote a number of works, of which the best known is the sentimental, introspective romance *Obermann*, 1804, familiar to English readers through the two elegiac poems of Matthew Arnold, who praised its "austere sincerity" and "delicate feeling for nature." Sénancour died Jan. 10, 1846.

Senate (Lat. *senatus*, council of elders). In ancient Rome, originally a council of *patres* or

Senate. Second Chamber of the U.S.A. legislature. It is in the Capitol at Washington

heads-of clans or families, chosen by the king, and meeting to advise upon public matters. With the establishment of a republic the senate became the most powerful factor in the new constitution under which Rome was developed from a city state into a world empire. There were two classes of senators, those nominated by the consuls or at a later date by the censors to fill vacancies, and, after 351 B.C., certain ex-magistrates who sat in virtue of having held office. The censor had also the power to deprive unworthy members of their seats. Whether plebeians were admitted to the senate in early times is uncertain, but the patricians long reserved the dignity for themselves, until the disabilities of the plebeians were removed. The number of senators varied from 300 in the early times to 1,000 in the time of Julius Caesar. Augustus fixed the number at 600.

Notwithstanding its theoretical limitations, the senate had large administrative and legislative powers. The former included the care of the national religion, public morals, the control of public finance, the conduct of war (apart from actual operations in the field), negotiations with foreign powers, and the government of the provinces. In the legislative sphere it originally confirmed or annulled the laws voted by the comitia or popular assembly, but in course of time its approval came to be given or withheld before the measure was introduced to the comitia. In times of emergency the senate had the power to confer special authority on magistrates, to suspend certain laws, to call citizens to arms, and to take other measures.

Under the empire the senate became definitely a law-making body, and was also the supreme judicial authority. It elected the magistrates, but only from among

candidates chosen by the emperor. In theory, at least, it conferred the imperial dignity on the emperor. With the growth of absolutism the power and importance of the senate gradually diminished, until by the time of Diocletian and Constantine it became merely the municipal council of the city of Rome.

The word senate has passed into the constitutions of modern states, being sometimes applied to the second chamber of a legislature of two houses. Canada, Australia, S. Africa, Italy, and the U.S.A. call their second chamber by this name. In Canada the senate consists of a varying number of representatives from each of the provinces of the dominion; the total number must not be more than 104. Senators are nominated for life. In Australia it consists of six representatives from each of the states (chosen for six years), and a similar principle prevails in the union of S. Africa, where the senate consists of 40 members, eight being nominated by the governor-general, and 32 elected, eight from each province. In S. Africa senators must be British subjects of European descent, at least 30 years of age. The Act of 1920 set up senates in both the parliaments of Ireland.

The senate of Italy is elected on a regional basis for six-year terms. Each region has six members. The U.S. senate is composed of 96 members, two being elected by direct popular vote from each state for a term of six years. The periods of office are so arranged that one-third of the senators retire at the end of every second year. Each senator at the time of his election must be at least 30 years of age, must have been a U.S. citizen for nine years, and must be an inhabitant of the state for which he is chosen. No senator may be a member of the cabinet or hold any other civilian office under the U.S.A. The senate is presided over by the vice-president. It has the sole power to try all impeachments. The president must obtain its "advice and consent" before he can make treaties (requiring the concurrence of two-thirds of the senators present) or appoint ambassadors, consuls, judges of the supreme court, and certain other public officers. In certain universities the governing body is called the senate or senatus. *See Cicero; Second Chamber.*

Sendai. Town of Japan. The capital of the prefecture of Miyagi, it stands near the E. coast of

Honshu, and is connected by rly. with Tokyo, 225 m. S. by W. It is the chief trade entrepot of the N. part of Japan, salt and fish being largely dealt in. It has large warehouses and stores, and in the 20th century has considerably extended as a manufacturing centre. Pop. 262,803.

Seneca. Lake in New York, U.S.A. The largest of a group of long, narrow lakes of glacial origin in the W. central portion of the state, it is 37 m. long, from 1 m. to 3 m. broad, and reaches a depth of 631 ft. The Seneca river drains it to Lake Cayuga. It is used by steamers, and has canal connexions with the Erie canal.

Seneca, LUCIUS ANNAEUS (c. 54 B.C.-c. A.D. 38). Roman rhetorician, called Seneca the Elder.

Born at Corduba (Córdoba) Spain, father of the philosopher, Seneca the Younger, and grandfather of Lucan, the poet, he was possessed of an amazing power of memory which enabled him to repeat verbatim speeches which he had heard delivered many years before. Most of his writings have been lost, but ten books of *Controversiae*, disputations on imaginary issues, and a fragmentary book of *Suasoriae* (exhortations) are extant.

Seneca, LUCIUS ANNAEUS (c. 4 B.C.-A.D. 65). Roman philosopher, dramatist, and statesman, known as Seneca the Younger. Son of the elder Seneca, he was born at Corduba (Córdoba), in Spain. Adopting a public career in Rome, he was appointed

Seneca the Younger,
Roman philosopher

Seneca the Elder,
Roman rhetorician
From a bust

as tutor to the young Nero, and after his accession continued in the closest association with him. His great influence over Nero was undoubtedly for good, for the first years of his reign, when Seneca virtually ruled the empire, were years of good government. Later, he fell into disfavour, and in A.D. 65 was accused of being privy to the conspiracy of Piso, and was compelled to commit suicide.

Seneca's character is not altogether without reproach; he had

some of the worst vices of the courtier, pandering shamefully to the whims of his imperial master, and he found it not inconsistent with the Stoic philosophy, of which he was a distinguished exponent, to amass a fortune equal to £3,000,000. Many of his works have been lost, but many have come down to us, including works on philosophy, morals, and science, the latter being of no scientific value. Nine tragedies have also been preserved, which, though quite lacking in dramatic instinct, had great influence upon the drama of the 16th century, being the only extant Latin models of this class of literature. Seneca is at his best in his writings on morals, which abound in passages of great eloquence. *Consult Seneca, F. Holland, 1920.*

Seneca Falls. Village of New York, U.S.A., in Seneca co. It stands on Seneca river, 41 m. W. by S. of Syracuse, and is served by the Lehigh Valley and New York Central rlys., and the New York state barge canal. It has manufactures of pumps, foundry and machine-shop products, boxes, hydraulic machinery, and gas engines. Settled in 1791, Seneca Falls, named after the waterfall (55 ft.) in the river, was incorporated in 1831. In 1848 Elizabeth Stanton, whose father had disinherited her, organized here the first convention for women's suffrage. Pop. 6,449. Cayuga Lake Park, a noted summer resort, is 2 m. away.

Senefelder, ALOIS (1771-1834). Austrian-born inventor of lithography. Born at Prague, then in Austria, Nov. 6, 1771, he tried authorship, privately printing his own books. While experimenting with copper and other materials of engraving to illustrate

Alois Senefelder,
German inventor

one of his works, he accidentally discovered a method of printing from a slab of Kelheim stone, and having slowly perfected this process, established it as a commercial undertaking. An account of it by him, published in 1818, made it universally known. He died at Munich, Feb. 26, 1834. *See Lithography.*

Seneferu or **SENEFERU**. Egyptian king. Although actually the last of the IIIrd dynasty, he is often ranked with the IVth dynasty be-

cause, as the predecessor of Cheops, he inaugurated the art and policy of the pyramid age. Reigning 29 years, he introduced the practice of extensive foreign campaigns. He seized the Sinai turquoise mines, established permanent garrisons there, and sculptured in the Wadi Maghara a rock-stela portraying himself in the act of slaughtering a Beduin. His conquest of the Sudan was accomplished with Nile craft 170 ft. long. Besides his Dahshur pyramid he built another at Medum, opened by Maspero in 1881, and re-examined by Petrie in 1891 and 1910. Now in three stages, 115 ft. high, it formerly comprised seven stages. Seneferu was an object of worship down to Ptolemaic times.

Seneffe. Village of Belgium. In the prov. of Hainault, it is 16 m. from Mons. Here, in Aug., 1674, the Dutch and their allies under William of Orange fought a stubborn but indecisive battle with the French under Condé. Here, too, on July 2, 1794, the Austrians were defeated by the French.

Senega (*Polygala senega*). A perennial herb of the family Polygalaceae. A native of N. America, it has a hard creeping rootstock with a ridge along one side, from which several stems arise. The lance-shaped leaves have rough edges, and the white flowers form a single spike. The rootstock, powdered or infused, or a tincture prepared from it, affords a stimulant and expectorant medicine. In an overdose it may act as an emetic and cathartic. It has been used in America as a remedy for snake bites. The active principles are probably glucosides.

Senegal. River of W. Africa. It has two main sources, the Bafing and the Bakoy, which rise to the W. of the watershed of the Niger and unite to form one river at Bafoulabé, 700 m. from the coast. Its general course is W. and N.W., and it falls into the Atlantic near the city of St. Louis. The Senegal is navigable in the rainy season as far as Kayes (*q.v.*).

Senegal. French colony and protectorate of W. Africa, the oldest colonial possession of France in Africa. Since the French first established themselves on this coast early in the 17th century the borders of the Senegal colony were gradually extended towards the E., but later, owing to administrative changes, the boundaries have been reduced by the establishment of other separate territories. The colony, which lies to

the S. of the Senegal river, consists of the four municipal communes of St. Louis (the capital), Dakar, Rufisque, and the island of Goree; and various territories under the direct administration of the governor, assisted by a general council. In the four communes the natives exercise the franchise, and with the Europeans elect two deputies to the national assembly. In the council Senegal is represented by three members. The climate is hot and unhealthy.

The colony is stated to be rich in minerals, but little has been done to make them commercially available. The chief agricultural products are ground-nuts, gum, millet, maize, and castor beans. The colony is traversed by two rlys., from St. Louis to Dakar, and from Thiés, a station on the first rly., to Kayes and Bamako in the French Sudan. There are two submarine cables, Brest-Dakar, and Brest-Casablanca-Dakar. Area, 77,730 sq. m. Pop. 1,720,000. *Consult* Le Sénégal, Sabatié, 1926.

Seneschal (Old Fr. from Teutonic, literally old servant). Medieval term for the steward or major-domo of a royal or noble household. Originally a superior domestic, the office grew in dignity, especially at the court of France, where in the beginning of the 11th century the grand seneschal became the person next in importance to the king. Head of the royal household and commander of the king's army, he also exercised judicial functions. The importance of the office in France ceased in 1191, but the greater feudal lords had their own seneschals, who eventually acted as bailiffs or agents. In England the equivalent office was steward, and the grand seneschal of France had his counterpart in the lord high steward of England. *See* Steward.

Senigallia OR SINIGAGLIA (anc. *Sena Gallica*). Coast city of N.E. Italy, in the prov. of Ancona. It is 15 m. by rly. W.N.W. of Ancona city. The harbour is small, but the place is a favourite summer sea-bathing resort. A settlement of the Gallic tribe of Senones, the Roman colony, founded c. 280 B.C., was destroyed by Pompey in 82 B.C. The bishopric dates from the 4th century. The rebuilt town suffered severely during the conflict between Guelphs and Ghibellines. It escaped with only slight damage in the Second Great War. Pop. est. 10,000.

Senility (Latin *senex*, old man). Changes which occur in the body and mind as a result of old age.

Physically, the most important changes are some hardening and thickening of the smaller arteries, this in turn leading to more obvious changes in the vital organs. The arteries become brittle, and rupture of an artery may cause apoplexy. The lungs gradually suffer from the continuous inhalation of atmospheric impurities, and the lessened mobility of the chest walls diminishes the breathing capacity. The teeth decay, or become loose and fall out, the tissues of the stomach and intestines undergo some degree of atrophy, and digestion is impaired. Muscles decrease in size, leading to wrinkling of the skin. Hair becomes grey and falls out. Bones become thinner, brittle, and more liable to fracture. The lessened blood supply to the grey cells of the brain results in lessened elasticity of intellectual power, lessened power to form new impressions, and impairment of recent memory, though early memories are well retained. A type of early senility showing all these signs is associated with atrophy of part of the pituitary gland.

Senior Training Corps. This pre-military organization of the British army is described under Training Corps.

Senlac. Ancient name of the place in Sussex where the battle of Hastings was fought in 1066. *See* Hastings, Battle of.

Senlis. Town of France. It stands on the Nonette, in the dept. of Oise, 32 m. N.N.E. of Paris. The chief building is the former cathedral dating from the 12th to the 16th centuries. Other churches are S. Pierre and S. Vincent, the latter once part of an abbey. The town walls still stand, as do 16 watch towers, and there are remains of the castle. Cotton goods and other textiles are manufactured. A Roman settlement, Senlis became early the seat of a bishop. The see was suppressed in 1801. The town was greatly damaged in the First Great War. Foch had his headquarters here on Nov. 8, 1918, when the Germans applied for an armistice. Pop. est. 7,000.

Senna (*Cassia*). Large genus of shrubs and herbs of the family Leguminosae. Mostly natives of tropical and warm climates, they have leaves broken up into two rows of leaflets, and the flowers are yellow. The dried leaflets of several species constitute the drug senna, of which the best kind (*Alexandrian senna*) is afforded by *C. acutifolia*, a native of the Nile region. It is obtained from wild

plants, and its chief active principle is cathartic acid. East Indian or Tinnively senna is the leaflets of cultivated *C. angustifolia*. It contains a lower percentage of cathartic acid. Senna is used as a purgative. See Cassia.

Sennacherib. King of Assyria, 705-681 B.C. Son of Sargon II, he undertook campaigns against Elam, Cilicia, Phoenicia, and Palestine. Although his siege of Hezekiah in Jerusalem was raised (2 Chron. 32), he despoiled and depopulated Judah, rebuilt Cilician Tarsus, 698, and destroyed Babylon, 689. To his improvements Nineveh owed its renown.

Sennar Dam. Dam on the Blue Nile. It is about 200 m. S.E. of Khartum, and was opened in 1926. It is 3,330 yards long. The flood waters of the Blue Nile, which come down from Abyssinia from May to Sept., are impounded in sufficient quantity to irrigate 3,000,000 acres of fertile soil.

Sens. City of France. It stands on the Yonne, in the dept. of that name, 70 m. S.E. from Paris. The chief building is the cathedral of S. Étienne, begun in the 10th century and finished only in the 16th. Features are fine sculpture, stained glass, and old bells. Other buildings include the churches of S. Savinien, of Roman origin, and S. Pierre, parts of the castle restored by Viollet-le-Duc, and the old palace of the archbishops. There are manufactures of cutlery and chemicals.

Sens was the capital of the Senones, hence its name, and an important place under the Romans. Its archbishop was primate of Gaul

Sennacherib, King of Assyria. From a bas-relief
British Museum

and for long Paris was in his diocese. Remains of many fine Roman buildings have been unearthed, and many Roman relics are in the museums. Pop. 17,329.

Sensation (late Lat. *sensatus*, perceived by the senses). Feeling or mental state resulting from the action of external stimulation due to some bodily organ connected by nerve fibres with the brain. It is an elementary process, incapable of analysis; unlike perception, it takes no account of any external object, being simply feeling. Sensations possess quality, intensity, and duration. They may be broadly divided into affective (pleasure, pain), and representative (taste, touch, smell, heat). See Nerve.

Sensationalism, SENSATIONISM OR SENSUALISM. In philosophy, the theory that sensation (*v.s.*) is the source of all knowledge. It is asserted that all our ideas are at bottom referable to sensation, but reflection is allowed to play a part as a necessary complement (Locke, Leibniz). Ideas are nothing but a rehash of old sensations, and even our reasoning powers are transformed sensations, habits produced by the association of these same sensations (Condillac, Hume, James Mill, Spencer).

Sense and Sensibility. Novel by Jane Austen, written 1797-98, and published anonymously in 1811. Well received

from the first, the story made its author's reputation, though her name was not publicly associated with it until after her death. Its title indicates the contrasting qualities of two sisters, who are finely individualised with that direct power of portraiture which was one of the author's chief gifts.

Sensitive Plant (*Mimosa pudica*). Prickly perennial herb of the family Leguminosae. A native of tropical America, it has much-

Sensitive Plant. The Brazilian *Mimosa pudica*. Below, with leaves expanded; top, closed

divided leaves, and minute red flowers crowded in globose heads. The leaves are divided into two pairs of primary leaflets, and these again into a large number of secondary leaflets. At the slightest touch each secondary leaflet folds up from the sides, the primary leaflet droops, then the main leaf-stalk hangs down. Leaves above the one touched then successively pass through the same movements. The shock is conveyed cell by cell to the swollen base, and the cells on its lower side contract by allowing their fluids to pass into the upper side, with a consequent collapse of the stalk. Similar sensitiveness, though in a less degree, is possessed by *M. sensitiva* and other species.

Sensitometry. Term in photography. Originally meaning the measurement of photographic sensitivity, it has been extended to cover all general investigation of the reactions of photographic emulsions to light. Such work involves setting up special apparatus and a laboratory technique capable of maintaining set standards as to the exposing light, the exposing machine or sensitometer, the processing and evaluation of the developed densities.

Senta. Alternative spelling for the Yugoslav town Zenta (*q.v.*).

Sentence. In law, the judgement pronounced by a court or a judge on a criminal. It is distinct

Sens, France. West front of the cathedral; the north tower (left) was destroyed 1845; the south tower dates from 1535

from punishment, for it is only a statement of the punishment which the court thinks proper, and may be altered by a higher court.

Sentence (Lat. *sententia*, way of thinking, opinion). In grammar, an assemblage of words, the sense of which is complete. It usually contains a subject and a predicate, but a single word, such as an exclamation or command, can express a complete sentence. Sentences may be simple, containing only one subject or predicate; compound, containing more than one subject or predicate; complex, containing one or more subordinate clauses.

Sentimental Journey, A. Work by Laurence Sterne. It was published Feb. 27, 1768, twenty days before its author's death, in two volumes, with the full title of *A Sentimental Journey through France and Italy*. The easy, witty, discursive narrative is by many critics regarded as Sterne's masterpiece. It was designed to be completed by a further two volumes.

Sentis or **SANTS**. Alpine peak in Switzerland, the highest mt. in the canton of Appenzell. It rises to a height of 8,215 ft., 6 m. S. of the town of Appenzell. The view from the summit, where there is a meteorological station, embraces Lake Constance and the Bernese Alps.

Sentry (perhaps med. Lat. *semitarius*, belonging to a path). Soldier posted at any special point to watch and guard. Sentries at camps and barracks ascertain that all persons seeking admission are duly authorised. On active service they may be posted in pairs to increase their confidence, and a sentry post consists of three or six men, so that some are resting whilst the rest are on duty. Each man is relieved every two hours. A sentry guarding a permanent point marches a fixed beat, but on active service in the field his duties are carried out by combat patrol.

Senusert. Name of three Egyptian kings of the XIIth dynasty. The word is also spelled *Senwosri* and *Usert(sen)*. Senusert I refounded Heliopolis, where an obelisk of his still stands; his pyramid is at Lisht. Senusert II, Manetho's Sesostris, built the Illahun pyramid, with a magnificent granite sarcophagus. Senusert III fortified Semneh for protecting the Sudanese trade, and built a pyramid at Dahshur. See Egypt; Karnak; Pyramids.

Senussi. Mahomedan order. Founded in 1835 by an Algerian, Sidi Mahomed ben Ali es Senussi, its headquarters were originally at

Alexandria. In 1843 the founder established near Benghazi the Zawia Baida or White Monastery. Removing in 1855 to Jarabub in the Siwa oasis, he died there in 1859. His son and successor, Senussi el Mahdi, removed in 1894 to Jof in the Kufra oasis; on his death in 1902 his nephew, Sidi or Sayed Ahmed, succeeded, after whose flight in 1916 el Mahdi's son Sidi Idris became head of the order.

Influenced by Wahhabite puritanism, Senussism sought to recapture the simplicity of early Islam as taught by the Koran. It prohibited music, dancing, tobacco, and coffee, and attracted to the desert oases between the W. frontier of Egypt and the Italian sphere of influence in Tripoli many who found Turkish rule oppressive and Christian toleration irksome. From 1896 onwards European influences were brought to bear and during 1902-13 French hostilities were prosecuted against the community, which exercised sovereignty over much of the central Sudan, and was powerful throughout the whole of N. Africa. The British in the First Great War conducted a campaign against the Senussi (v.s.). During the Italian regime in N. Africa, the tendency was for the Senussi to agitate for an independent state, and during the Second Great War many of them acted with the British 8th Army Long Range Desert Group, as scouts and guides. In 1949 a Senussi state was set up, with British authority, the emir enacting a constitution. See Cyrenaica; Kufra. *Consult* Mahdism and the Egyptian Sudan, F. R. Wingate, 1891; The Sanusi of Cyrenaica, E. E. Evans-Pritchard, 1949.

Senussi, CAMPAIGN AGAINST THE. British operation during the First Great War. Urged on by Turko-German intrigue, the Senussi invaded Egypt in Nov., 1915, under their chief, Sidi Ahmed, known as the Grand Senussi. They had an organized force of their own, which was supplemented by Arabs, Berbers, and Turks, the whole comprising upwards of 30,000 men, and including a number of Turkish officers, one of whom, Gaafer Pasha, directed their operations in the field.

Sir John Maxwell, the British commander-in-chief, withdrew the Anglo-Egyptian posts from Sollum and Sidi Barrani, and concentrated at Mersa Matruh a force of 3,000 men. On Dec. 11 and 13, 1915, Gen. Wallace drove back the Senussi S. and W. of the town, inflicting considerable losses on them

at the Wadi Shaifa. On Dec. 25 he defeated them in a battle at Gebel Medwa, a few miles from Matruh, and stormed their main position at Wadi Majid, whereupon they broke and fled to Halazin, 25 m. S.W. Reinforced by part of the South African brigade, Wallace attacked the Senussi at Halazin on Jan. 23, 1916, and completely routed them.

On Feb. 25, 1916, Gaafer attacked the British near Agagia, but next day Lukin utterly defeated Gaafer and took him prisoner. The British advanced to Sidi Barrani, and thence on to Sollum, reoccupying it on March 14, 1916. Meanwhile, the Grand Senussi had gone to the Siwa oasis, and in Feb. his troops, accompanied by himself, seized the Baharia, Farafra, and Dakhla oases, well to the S. of the Libyan desert, and comparatively close to the Nile.

In March, 1916, Sir Archibald Murray replaced Sir John Maxwell and took such energetic measures that the Senussi were driven out of Baharia and the S. oases, while the Grand Senussi took refuge in Siwa again. During May, 1916, the Italians cooperated with the British by depriving the Senussi of Barda and Mersa Moraisa, two ports on the Mediterranean.

Seoni. District and town of the Madhya union, India, in the Jubbulpore division. The dist. comprises rugged tree-clad hills in the Satpuras with narrow fertile valleys between bare stony ridges. Rice, wheat, hemp, and pulses are the chief crops. The town is on the great road N. from Nagpur, and has rly. connexions with Nagpur, Chindwara, and Jubbulpore. Area, 3,206 sq. m.

Seoul. Capital of S. Korea. It is 25 m. from its port Chemulpo, with which it is connected by rly. The city was founded in 1394 and once had a wall 11 m. in circumference; some of the city gates still stand. Seoul is noted for its bell tower, with a bell dating from 1468. Under U.S. occupation 1945-1948, it then became capital of the republic of S. Korea. Pop. (1940) 756,890. See Korea in N.V.

Sepal (Lat. *separ* separate). One of the outer protecting whorls of floral leaves. The sepals collectively are known as the calyx, and if united by their edges the calyx is said to be gamosepalous. As a rule, sepals are green, but in the absence of petals they have to function as the attractive portion of the flower, and are brightly coloured. See Flower.

Separation. In English law, term generally used in relation to matrimony. It describes (1) the state of things that exists when a husband and wife cannot agree to live together, and enter into an arrangement for living apart; (2) a separation order by a magistrate; or (3) judicial separation.

No particular form of agreement is necessary for a separation by mutual consent. The agreement usually provides that husband and wife shall live apart and not molest one another, and that the husband shall pay a sum for the maintenance of the wife and children, if these are to be in the wife's custody. Some provision for varying the amounts payable by the agreement in the event of a change in the husband's income is usually included. The husband will be entitled to deduct income tax from payments made under the agreement unless this provides that he shall pay "such a sum as will after deduction of tax amount to £x per annum." Such a provision is burdensome on the husband. When husband and wife have thus separated, neither can later charge the other with desertion while the agreement remains in force.

Seoul, S. Korea. Independence Gate, commemorating Korea's independence from China in 1895

A separation order is made in the magistrate's court on the application of either wife or husband. A wife may obtain one when her husband has been convicted summarily of an aggravated assault on her, or convicted on indictment of an assault on her and fined more than £5 or imprisoned for more than two months; or has deserted her, or has been persistently cruel to her or her children, or has wilfully neglected to maintain her or her infant children, or is an habitual drunkard, or has com-

mitted adultery, or has insisted while suffering from venereal disease on having sexual intercourse with her, or has compelled her to submit herself to prostitution. A husband may obtain an order against his wife if she is an habitual drunkard, or has been persistently cruel to his children, or has been guilty of adultery. So long as a separation order is in force it prevents either party from contending that the other party is guilty of desertion. For this reason separation orders are now rarely made, the court usually making a maintenance order, i.e. an order that the husband shall pay a sum for the maintenance of the wife.

A judicial separation may be ordered by a judge of the divorce division of the high court on any grounds in which a divorce might have been obtained, or on failure to comply with a decree for restitution of conjugal rights.

Separation Allowance. Monetary payment made to the wife or other dependants of a man serving in the British navy, army, or air force. The amount varies according to the cost of living; in 1914 it was for the lowest ranks 12s. 6d. a week for a wife and 2s. 6d. for each child, and in 1948 had increased to 42s. for a wife and 9s. for each child. The rate rises with promotion to non-commissioned rank. In both Great Wars, a man who had lived with a woman out of wedlock for a stated period could claim a married man's separation allowance together with the appropriate sums for any children of the union.

In peace, men under 21 are not entitled to separation allowances if they are married before enlisting or wed without the permission of their commanding officer. To qualify for this allowance, the man must allot a fixed sum from his daily rate of pay. Dependants of married soldiers and airmen living in married quarters do not receive the allowance, which is consolidated as part of pay.

Officers over 25 are granted a flat rate marriage allowance taking account only of rank. In 1948 this was fixed at a maximum of £337 a year for a lieutenant in the navy and army and a flying officer in the R.A.F., falling on promotion to a maximum of £319. Officers make no qualifying allotment, and the allowance is added to basic pay.

Sephardim. Name given to the families and descendants of Jews driven out of Spain and Portugal. While their theology is

virtually identical with that of their German-Polish co-religionists, or Ashkenazim, they differ in their pronunciation of Hebrew, and their customs. See Ashkenaz.

Sepharvaim. Ancient city of Syria. It has been identified with Sibraim (Ezek. 47, v. 16), which was situated between Damascus and Hamath. The name occurs in 2 Kings 17, v. 24, and 18, v. 34. Some authorities claim that it is identical with Sippara, a place near the Euphrates in Babylonia.

Sepia (Gr., cuttle-fish). Name of a genus of the order Cephalopoda of the phylum Mollusca. See Cephalopoda; Cuttle.

Sepia. Transparent brown pigment originally derived from the cuttle-fish, but now generally made from the juice of walnuts. It is much used in artists' drawings when it is desired to show the gradation of tones of one colour, and is often combined with pen-and-ink work and other means of heightening an effect. See Ink: Monochrome.

Sepiolite. This is the mineralogist's name for meerschaum (*q.v.*).

Sepoy (Persian *sipahi*, army). Anglo-Indian term for the native soldier in an Indian regiment, of the former British army in India, and cognate with the French *spahi*, an irregular horseman. The word is still applied in India and Pakistan to the infantry soldier as distinguished from the *sowar* or trooper. Sepoys were first raised in trained bands as factory guards by the East India Company in the middle of the 18th century, and formed the nucleus of the company's army in their struggle with the French. The first overseas expedition in which Indian troops

Sepoy. Bengal sepoys in the army of the East India Company

were engaged was the war with Spain in 1762, in which sepyo companies took part in the capture of Manila. During the next 150 years they were employed in various campaigns in Asia and Africa, but it was not until 1914 that they fought in Europe. In the Second Great War they fought in all theatres of war, distinguishing themselves particularly in N. and E. Africa, Malaya, and Burma; in Europe they took part in campaigns in France, Italy, and Greece.

Religious differences always provided problems for the white commanders of sepyo troops; notable in this connexion were the orders precipitating the Indian Mutiny (*q.v.*). See Indian Army.

Sepsis (Gr., putrefaction). The process of poisoning by products of bacterial activity. It is more fully mentioned under Blood Poisoning. See also Antiseptic.

Sept (O.F. *septe*, variant of *secte*, sect). Group of related persons claiming descent from a common ancestor and paying fealty to one chief. The term was common in ancient Ireland, where the sept was a division of the tribe or tuath, of which it was an offshoot or colony. Freemen of the sept were theoretically related by blood, and bore the clan name with the prefix Ua, grandson, written O' in English. The sept owned common land, and the nobles had their estates, on which lived slaves and dependants.

In Scotland the sept was a branch of the clan; persons who were members of the clan, but outside blood relationship to the chief, had sept names, which were generally of two kinds, according to whether persons were related to the chief by marriage or bound to the clan by bond or manrent. A few septs took their name from territory; others from occupation. Thus a man's clan might be MacDonald, but his sept name Gow (Smith). After the proscription of 1745, many clansmen adopted sept names to conceal their identity, and many existing so-called clan names in Scotland were originally occupational sept names.

September (Lat. *septem*, seven). Seventh month of the old Roman and ninth of the Christian calendar. Like October, it was temporarily known by other names in honour of Roman emperors, e.g. Germanicus, from the surname assumed by Domitian to commemorate his defeat of the Chatti, a German tribe; Antoninus, in honour of Antoninus Pius; and Hercules,

from the surname taken by Commodus in allusion to his enormous strength. September massacres is the name given to the wholesale butchery in the prisons of Paris, Sept. 2-7, 1792, when some 1,400

Septic Tank. Small tank shown in plan and section

aristocrats and royalists were put to death; and the members of the revolutionary commune responsible for the massacre were called the Septembrists.

Septennial Act. Act passed in 1716 fixing seven years as the extreme limit for the duration of a British parliament. In early times there was no such limit, parliaments being dissolved when the king wished or when he died. In 1694 the Triennial Act declared that no parliament should sit longer than three years. In 1716, however, the Jacobite rising had caused great unrest in the country, and to avoid the danger of a general election at such a time the Septennial Act was passed. It remained in force until 1911, when the Parliament Act (*q.v.*) limited the duration of a parliament to five years. In both Great Wars the sitting parliament passed annual Acts prolonging its life by a year at a time. See Parliament.

Septet or **SEPTUOR** (Lat. *septem*, seven). Musical term for a composition for seven soloists, whether vocal or instrumental.

Septicemia (Gr. *septikos*, putrefying; *haima*, blood). Form of blood poisoning in which microorganisms are present in the blood stream. See Blood Poisoning.

Septic Tank. Tank through which sewage passes sufficiently slowly for the solids brought in suspension to separate out. Solids heavy enough to sink settle in the bottom as "sludge"; those light enough to float rise to the top as "scum." As fresh sewage enters, "effluent" passes out. During its passage through the tank the

liquid sewage, also the sludge and scum, undergo chemical and biological changes, these varying with the different shapes, sizes, and mode of operation of the tanks. No septic tank can achieve

purification of sewage. The effluent always contains highly unstable and usually putrefactive compounds, which are liable to become offensive until oxidation is carried to the point of stability either in the soil by the native organisms, or in biological filters. The aim of the designers of septic tanks must always be to produce

an effluent amenable to harmless and inoffensive stabilisation in the soil or on a filter. See Sewage.

Septimer Pass. Alpine pass in Switzerland. It connects Bivio with Chiavenna, in canton Grisons, and was in Roman times and during the Middle Ages the chief pass in this section of the Alps. Now it has no longer a carriage road, and has been superseded by the St. Gotthard pass and tunnel. Its summit is 7,582 ft. alt.

Septuagesima (Lat., seventieth). Sunday nine weeks before Easter in the Christian calendar. This is actually the 63rd and not the 70th day before Easter, but the name arose because Quinquagesima is the 50th day before Easter, and Sexagesima and Septuagesima were applied to the Sundays respectively a week and a fortnight earlier. Septuagesima occurs as early as Jan. 18 and as late as Feb. 22. See Calendar.

Septuagint, **THE**. Greek version, commonly designated LXX, of the O.T. It is so called from the Lat. word *septuaginta*, seventy, because, according to a tradition, preserved by Philo, Josephus, and in the so-called Letter of Aristas to Philocrates, the translation of the Law (Pentateuch) was made by seventy or seventy-two translators. Tradition states also, no doubt with truth, that the translation was made at the instigation of Ptolemy Philadelphus (285-246 B.C.), the founder of a library at the Serapeum. On the whole the work of Alexandrian Jews, the version was made gradually and was not completed until nearly the beginning of the Christian era;

the style of different books varies greatly. In some, e.g. the Pentateuch, and Chronicles, it follows the Hebrew text closely, in others it is paraphrastic, and again in others, e.g. the Book of Job, it is full of obscurity. The Septuagint includes the O.T. Apocrypha, and it is noteworthy that these are not grouped separately, but interspersed among our canonical books. *See Bible; Hexapla.*

Sepulchre (Lat. *sepelire*, to bury). Tomb or other place of burial. The Holy Sepulchre is the name given to the tomb of Jesus Christ in Jerusalem. It is within the present wall of the city, and this has been held as a fatal objection to its genuineness, for burials never took place within the walls; but recent excavations go to show that it is outside the wall that existed at the time of Christ. The site was identified by Constantine, who built a church there, the successor to which now covers the supposed site of Calvary, as well as that of the tomb. The Holy Sepulchre, in the middle of the church, is now converted into a chapel and so encased with marble and ornamentation that it is difficult to realize that it is cut out of the solid rock. Around it are a series of chapels devoted to the purposes of the Latin, Greek, Armenian, and other churches. *See Holy Places; Jerusalem.*

Sequani. Tribe of ancient Gaul. Their canton lay chiefly between the Rhône and Saône, nearly corresponding to the French departments of Doubs, Haute Saône, and Jura, with part of W. Switzerland. Their capital was Vesontio, the modern Besançon. About 71 B.C. they called in a German army under Ariovistus (*q.v.*), against their rivals the Aedui. He gave them the nominal hegemony of central Gaul, exacting a third of their territory as the price, but on his defeat by Julius Caesar in 58 B.C. they became subject to Rome.

Sequence (Latin *sequi*, to follow). In music, the repetition or imitation on a higher or lower degree of the scale of a melody or harmonic progression. Sequences are of two kinds—tonal, in which the imitation is general, and the key is not quitted; and real, in which the imitation is exact, with the result that modulation ensues. In the repetitions certain licences

are allowed, e.g. the doubled leading note in the fourth chord of the first illustration.

Sequence is one of the most valuable devices available for the composer, but, as it tends to become mechanical, it is seldom that more than two repetitions are employed. Passages which follow the general idea without conforming to precise imitation are sequential.

Sequestration (Lat. *sequestrare*, to lay aside). Act of depriving one of something. It is used in Scots law for the act of taking possession of a bankrupt's property in order to deal with it for the benefit of his creditors. In England, during the Commonwealth, when estates were taken from Royalists, they were said to be sequestered.

In ecclesiastical law a writ of sequestration is a writ of execution against the holder of a living in the Church of England. When a benefited clerical defendant owes a debt for which judgement has been obtained, the plaintiff can procure this writ. It is directed to the bishop of the diocese, and orders him to enter into possession of the rectory and parish church, receive all income, and out of the receipts pay the judgement debt. In order that the services of the church may be carried on, the bishop is to appoint a curate, and assign him a stipend, which must be paid before the creditor gets anything.

Sequestrum. Piece of dead bone which has separated in the course of necrosis following an injury to a bone.

Sequin (Fr. from Ital. *zecchino*). Name of an Italian gold coin minted at Venice in the 13th century and used until the fall of the republic. Its nominal value was about 9s. 4d. Sequins were minted at Genoa, Bologna, and Rome till 1834, and in Austria till 1822. The name is now applied to small metallic disks or spangles used in ornamenting clothing. *See Ducat.*

Sequoia. Genus of evergreen trees of the large family Coniferae. Natives of California, they have a close-grained red timber, and grow to a gigantic size. *S. gigantea*, or mammoth tree, has been known to attain a height of over 300 ft. and a girth of 90 ft. *S. sempervirens*, or redwood, is a valuable timber tree. *See Wellingtonia.*

Sequoia (c. 1760–1843). Cherokee Indian scholar. A half-breed, also known as George Guess, he

Sequoia, the Cherokee scholar, from a statue Capitol, Washington

lived as a youth near Tuskegee, Alabama. He early appreciated the value of reading and writing, and between 1809 and 1821 invented a system by which every sound in the Cherokee language could be represented. The success of his system induced him to carry the new learning to the western tribes in Arkansas, 1823.

Serabit OR **SERABIT-EL-KHADEM** (Arab., the servant's pillars). Ancient turquoise mining settlement near the W. Sinai coast, also spelled Sarabit and Sarbut. In 1905 Petrie explored its IIIrd dynasty cave-shrine, with a Middle Kingdom forecourt added by Amenemhat III, and records of Hatshepsut and Rameses II. It was dedicated to Hathor, worshipped as lady of turquoise with Semitic rites.

Seraglio (Turk. *serai*, palace). Former residence of the sultan in Constantinople. It crowns the most easterly of the city's seven hills, and is surrounded by a wall, 2 m. round. Mohammed II commenced the buildings in 1468 and Suleiman II made considerable additions 1520–66; since 1839 it has not been in use and has fallen into decay. It contained the sultan's harem, and from this has come the use of the word for a place where women are kept for licentious pleasure. *Pron* Seral-yo.

Seraing. Town of Belgium, in the prov. of Liège. It lies on the right bank of the Meuse, 5½ m. by rly. W.S.W. of Liège, and is the centre of a busy industrial area, which includes such neighbouring towns as Jemeppe, Lize, Ougrée, Val-St. Lambert, and Flémalle. It is the seat of the famous iron-working and engineering firm, the Société Anonyme John Cockerill. Pop 43,000. *See* Cockerill's.

Serajevo. City of Yugoslavia, the chief town of Bosnia. It stands on the Miljacka, 122 m. S.W. of Belgrade, with which it has rly. connexion. Several fine stone bridges span the river. Ruins of a 13th century Hungarian castle

Sarajevo, Yugoslavia. General view of the city, showing the Town Hall in the left foreground

crown a hill above the town. Notable buildings are the R.C. cathedral (1889), the 16th century mosque of Husref Bey, the Konak, now the residence of the governor, and the town hall. Potteries, a brewery, and tobacco, silk-weaving, and dyeing factories are the chief industries. The assassination here of the archduke, Francis Ferdinand of Austria, on June 28, 1914, precipitated the First Great War. In the Second Great War German forces captured Sarajevo from the Yugoslav army, April 16, 1941, organized resistance by the Yugoslavs ceasing on the following day. The town was liberated by Yugoslav troops, April 6, 1945. Pop. 78,173. *Pron. Serrayayvo.*

Serampore. Town of West Bengal, India, in Hooghli dist. It is situated on the right bank of the Hooghli above Calcutta. There are large jute mills. The Car festival at the temple of Juggernaut (*q.v.*) is second only to that of Puri.

A Danish factory was established at Serampore in the middle of the 17th century and the settlement was called Frederiksnagore. It was transferred by treaty to the East India co. with the rest of Denmark's Indian possessions for £125,000 in 1845. Serampore became in 1800 the headquarters of Baptist missionaries, among whom was William Carey (*q.v.*). The house in which he lived and died is now in the precincts of the Serampore College established by the missionaries in 1818. The college has faculties in theology and confers its own degrees. The library contains first editions of Carey and Marshman's 40 translations of the Bible. The Danish church of S. Olaf's was built 1805 and the R.C. church 1776. The tomb of Carey is in the Baptist cemetery. Pop. 55,339.

Serang. Alternative name for the island in Indonesia better known as Ceram (*q.v.*).

Serapeum. Temple of Serapis. The most famous was at Alexandria, founded about 300 B.C., and converted into a Christian church, A.D. 389. The ruined Serapeum at Sakkara has bestowed its name inaccurately upon the anterior rock-cut Apis-tombs beneath. Ptolemaic and Roman Egypt had 40 Serapeums elsewhere, notably at Canopus and Oxyrhynchus. The market hall of Puteoli (Pozzuoli) is commonly called a Serapeum from a Serapis statue found there. *See* Pozzuoli.

Seraphim (Heb., Seraphs). Supernatural beings attendant upon Jehovah and guardians of His sanctuary. In the O.T. they are mentioned only in one passage (Isa. 6, v. 2). Elsewhere the same word, *sārāph*, means serpent (Num. 21, v. 6; Isa. 14, v. 29, 30 *v. 6*). This

Seraphim, as depicted by Raphael in his painting *The Vision of Ezekiel*
Pitti Palace, Florence

suggests, that the Seraphim attendant upon the deity were conceived originally as serpent-deities. The term is familiar from the Prayer Book canticle *Te Deum Laudamus*.

Seraphine. Name given to an instrument made in England, in imitation of the German Physsharmonica. It had free reeds and bellows. The tone was somewhat harsh, but the chief factor in preventing any instrument of this kind from being accepted was the invention of the harmonium (*q.v.*).

Serapion (*fl. c.* 350). Father of the Church. A zealous antagonist of the Arian heresy and an adherent of Athanasius, he was bishop of Thmuis, in Africa. His fame rests on his prayer-book for the use of bishops, the MS. of which, discovered on Mt. Athos in 1894, appeared in English in 1899.

Serapis or **SARAPIS.** Greco-Egyptian deity. Ptolemy I Soter introduced to Alexandria a Greek Hades-image; this was Serapis, and for its worship he erected the Serapeum. Deemed to represent an Egyptian Osiris-Apis, the new cult, in association with Isis, gained prompt recognition in Egypt, and spread thence through the Greco-Roman world.

Serbia. Former kingdom of Europe, since 1918 a federative unit of Yugoslavia, of which country it forms the large E. portion. As such it covers approx. 34,000 sq. m., with a pop. of 5,795,724. The area corresponds roughly to the medieval kingdom of Rashka. At various times during the Middle Ages parts of Bosnia and Herzegovina were under the Serbs.

The Serbs are a branch of the Slavs who invaded the Balkan peninsula in the 6th and 7th centuries. The Serb speech is identical with the Croat, the only difference being that the Serbs use the Cyrillic alphabet, and the Croats the Latin. The typical Serb is a tall, broad-headed man, with grey or blue eyes, and light or brown hair, resembling very much the original Slav invaders. These were loosely organized in government. The Serbs settled in the Montenegrin area (Zeta), and in the Novi Pazar area (Rashka). Here they were protected by strong barriers of forest and mountain against foreign invaders, and nurtured their strength. The Byzantine em-

Serbia arms

perors and the Bulgarian kings fought for the possession of Macedonia and Serbia, while two small, strong peoples grew up in Zeta and Rashka. The first important event in Serbian history was their conversion to Christianity by the Slavonic Apostles Cyril and Methodius, in the middle of the 9th century. Zeta and Rashka thus became, and have remained, Greek Orthodox in religion.

Medieval Serbia

Zeta developed a political organization, and in the mid-11th century became a fairly strong and stable kingdom. In 1186 Stephen Nemanya united Zeta and Rashka, and founded the Nemanyid dynasty. His son, Stephen I, was crowned king of the united Serbian kingdoms. From this time forward medieval Serbia was a powerful and important state, the more powerful and important because both the Bulgarian kingdom and the Byzantine empire were declining. Her true period of greatness came under Stephen Dushan (1331-55), a really notable medieval king and warrior. While still a sub-king, under his father Stephen Urosh III, he had led the charge which defeated a great Bulgarian host at Kustendil, 1330. In a series of campaigns he annexed all Macedonia—except Salonica—as well as Albania, Thessaly, and Greece as far as Arta and Volo. He finished his work by having himself crowned as emperor of Serbs and Romans (i.e. Greeks) in 1346. Shortly afterwards Dushan issued the Zakonik, an important code of Serbo-Byzantine law. His last years were occupied with making preparations for the conquest of Constantinople. These were unfinished when Dushan died. A critical moment in the history of the East thus passed by, for a Serbian conquest of Constantinople might have had very momentous results.

Stephen Dushan's reign established in the eyes both of contemporaries and of posterity the tradition of Serbia's predominance in the Balkans. Without Dushan's military capacity and political ability, the claim could not have been made good. The limits of Stephen Dushan's empire became the ideal of the Serbs, but his empire did not include the Croats, Dalmatians, or Slovenes of the West. Hence his influence tended on the whole to drive the Serbs away from the ideal of uniting the brethren of one language under one

dominion, and to bring them in contact with their remote kinsmen in Macedonia, and their bitter enemies in Albania.

Even in Dushan's lifetime the Turks had begun to press into Europe and had established themselves on the European side of the Dardanelles in 1354. Immediately after Dushan's death his great empire fell to pieces. The Serbs were first defeated by the Turks in a battle at Tchernom on the Maritza, 1371, and finally on June 15, 1389, in the famous battle of Kossovo, where the Serbian king Lazar was killed. The defeat

Serbia. Gata dress as worn by peasants of the old kingdom of Serbia

of Kossovo is remarkable as having become the source of all the historic legends and memories of the Serbs. Though a defeat, it is as renowned as if it were a victory, and it is the celebration of this defeat which has welded together the Serbian people in days of disaster. It is equally remarkable that the favourite Serbian hero Marko Kraljevitch, whose deeds are told in every Serbian family today, was really a vassal prince of the Turks, and probably helped them to crush his fellow-countrymen at Kossovo.

The medieval Serbian empire was not finally crushed at Kossovo. The last fortresses were not wrested from Serbian hands until 1459. The Serbian state fell rather from its own weaknesses than from Turkish attacks, and the inability of the Serb princes to combine against the Turk is an illustration of their fatal lack of political unity. One small fragment of the Serbian race continued, even to the 20th cent., to assert a precarious independence on the heights of Montenegro.

The Turkish conquest of Serbia did not at first weigh heavily on the population. It was not until 1593 that any serious rebellion took place, though in point of fact wholesale immigrations of Serbs into S. Hungary had taken place ever since the 15th century. In 1690 the Austrian armies had occupied Serbia and, when they were compelled to retreat, the Serbian patriarch of Ipek followed them with a very large number of Serb families. The actual Turkish occupation became seriously oppressive towards the end of the 18th century.

Unrest began in 1793-94, and revolt broke out in 1804 under the leadership of Kara George, the national hero of Serbia and the ancestor of the last ruling house. He gradually organized a government. He was finally defeated and compelled to fly the country in 1813. But in 1815 the revolt burst out again under Kara George's rival, Milosh Obrenovitch, who defeated the Turks and maintained his position by great diplomatic skill. Finally he got the Turks to acknowledge him as a vassal prince, and his position of virtual independence was confirmed in 1829. The position was, however, highly anomalous, and it was not until 1867 that Turkish garrisons were finally expelled from Serbia, and not until 1878 that Serbia's complete independence was acknowledged by Turkey.

Murder of King Alexander

Under King Milan Obrenovitch (1868-89) and his son Alexander (1889-1903), Serbia followed in the train of Austria-Hungary. Alexander, the last Obrenovitch, was murdered by some of his officers in 1903 in circumstances of atrocious cruelty. The crown was then offered to and accepted by Peter Karageorgevitch, the grandson of the original Kara George. His reign marked a new era, a relatively constitutional regime and a pronounced pro-Russian policy. In 1912, in cooperation with Greece, Bulgaria, and Montenegro, Peter went to war with Turkey and acquired the new territories of Macedonia and Novi Pazar, and more than one million new subjects. In 1914 Austria declared war on Serbia, and ultimately King Peter acquired eight million new subjects and the new territories of Montenegro, Dalmatia, Croatia, Symia, Voivodina, and Slovenia. Since 1914 the old king had handed over the active power to his son Alexander, who became king of Yugoslavia in 1921.

FIRST GREAT WAR. The First Great War began with Austria's declaration of war on Serbia, July 28, 1914, and next day the Austrians began to bombard Belgrade, and on Aug. 12 crossed the Drina into Serbia.

This was the first of three unsuccessful invasions by Austria between Aug. and Nov., of which the most successful was the third, when Belgrade was occupied. But the Serbs counter-attacked on Dec. 2, and by Dec. 14 had driven the invaders back. The next day King Peter in Belgrade cathedral gave thanks for victory.

But in repelling these invasions Serbia incurred losses which she could not make good, and during the ensuing winter and spring the ravages of pestilence weakened her still more. When in Oct., 1915, she was called on to withstand a fourth invasion, this time by German troops in combination with Austrians, under the German Mackensen, her strength was much reduced. She might, however, have held her ground had it not been for Bulgaria, who attacked her on the E., where her frontier was about 300 m. long, outflanked her on the S.E., and made victory for her a strategical impossibility. By the Salonica expedition the Allies tried to assist her, but failed. Serbia put into the field every man who could hold a rifle, but their total number was under 300,000, as against 600,000 Germans, Austrians, and Bulgarians, and in the face of far more powerful artillery. Her allies advised a defensive retirement, and promised help, but it came too late, and was inadequate.

The attack opened Oct. 6. Belgrade was evacuated Oct. 8. Within a month the larger part of Serbia, with most of the important rly. to Constantinople, possession of which had been Germany's real preoccupation, was in the hands of the invaders.

By the end of the month the Serbian N. forces had retreated into the mountains of Montenegro and Albania. The S. Serbian troops retreated into Albania, Monastir being evacuated on Dec. 2. Serbia was overrun and conquered by Dec. 7, but as her army was not utterly destroyed, the chief design of her conquerors was frustrated. Despite dreadful sufferings in the retreat to the coast, more than 100,000 men ultimately reached Corfu, where they were rested and refitted by the Allies, and again became a magnificent fighting force

During Sept., Oct., and Nov., 1916, the reconstituted Serbian army, transported from Corfu to Salonica and thence to the Macedonian front, played a great part in the operations that led to the recapture of Monastir (*q.v.*), and it was prominent in the fighting that took place in March and in May, 1917, in the Cherna Bend and Dobropolye sectors respectively. But, apart from trench warfare, it did not engage in any movement of importance from that time to the opening of the great Allied offensive under d'Espérey which began on Sept. 15, 1918. The Serbs occupied the mountain line, and French and Italian divisions continued the Allied front to the Adriatic. In all the Allied strength was about 400,000 men. W. of the Vardar the enemy front was held by the 1st Bulgarian army, and E. of it by the 2nd Bulgarian army, both being supported by the 11th German army, then quartered in Serbia. In Albania a considerable Austrian army opposed the Allies. The total strength of the enemy was equal to that of d'Espérey, who, however, had the disadvantage in positions. By nightfall on Sept. 15, the Serbians, with the French in union, had taken Sokol, Dobropolye and Vetrenik, and broken the Bulgar front. Next day they stormed Golobilo, and took Kozjak, the centre of the second Bulgarian line, making a gap ten m. in width and five m. in depth. On Sept. 17 the Allies gained some further ground, and next day the Serbs were

across the Cherna and were marching on Prilep. See Salonica.

On Oct. 22 the Serbs were in Krajevo, and on Oct. 25 in Kragujevatz. They reached the Danube between Semendria and Belgrade on Oct. 30, and were again in Belgrade on Nov. 1, 45 days after the beginning of d'Espérey's offensive. By Nov. 3 Serbia was entirely liberated, and her troops were crossing over into Bosnia, while at the same time the Yugo-Slavs in Austria were taking steps towards the union of all the Slavs of the S. into one great kingdom under the leadership of Serbia.

Serein. Term applied to fine rain falling from an apparently cloudless sky. It is a very rare atmospheric phenomenon, and probably only occurs when the air is temporarily supersaturated with moisture. It was observed in the S. Atlantic by Sir James Clark Ross in 1839, at Geneva in 1837 and 1838, and has occurred at Istanbul and on Mauritius. Snow fell at several places in England from a cloudless sky in 1895.

Serenade. (1) Primarily, a song sung at night, conventionally by a lover beneath his mistress's window. The singer accompanies himself on a guitar or similar instrument, and the accompaniment is accordingly characteristic. (2) As an instrumental composition of similar style, a serenade generally comprises a number of short movements. Mozart's Haffner Serenade, Beethoven's Trios Op. 8 and Op. 41, and Brahms's Op. 11 and Op. 16 may be mentioned as examples.

Serenata (Ital.). A term which, though etymologically the same as serenade, means musically something different. (1) It was a form of cantata: Handel called his *Acis and Galatea* a serenata. (2) In the 18th century it also meant a kind of suite intended for private performance, and scored for varying combinations of instruments. The *bourrée* and the *gavotte* were omitted from it, but the march and the minuet were almost invariably included.

Sereno. Spanish name for a watchman who makes the round of the streets by night. These men a kind of night police, generally sing out with characteristic cries the hour of the clock and the state of the weather.

Serer. Negroid people in Senegal, French W. Africa. Mostly between Cape Verde and the Salum-Gambia watershed, they are a large-chested and weaklimbed people, averaging 5 ft 8 ins in height, but often much taller.

Serer. Women workers and (top) man of the negroid tribe

and are less black and thinner lipped than the neighbouring Wolof. Their ruling families display strong Mandingo traits. Many are nominally Mahomedans, but nature-worship is prevalent. They are inclined to intemperance.

Seres, **SERRES**, OR **SIRIOS**. Town of Greece, the ancient Seris or Sirae. In E. Macedonia, 45 m. N.E. of Salonica, it is the capital of a dept. of the same name, with a cotton industry, and a trade in grain, rice, tobacco, wool, hides, and silk cocoons. It is the seat of a Greek archbishop. Seres was occupied by the Bulgars in 1916 by collusion with the Greek government, and evacuated by them in Oct., 1918, after the armistice granted to Bulgaria by the Allies. Pop. (1938) 29,640. The department had a pop. of 216,569 in 1938.

Seret (Rum. Siretul). River of Rumania. It rises in the Bukovina, and flows S. across Moldavia in a steep-sided narrow valley to join the Danube 5 m. above Galatz. The Little Seret, Suczawa, Moldava, and Bitritz are its chief affluents. Its length is 291 m.

The river gives its name to a battle of the First Great War, fought between Russians and Austro-Germans, Sept., 1915. The Russians attacked from a line on the Seret, Sept. 7, and fierce fighting raged for the rest of the month. The Austrians fell back, on a $5\frac{1}{2}$ m. front, towards the Dniester. The Russians took 100,000 prisoners.

Serf (Lat. *servus*, slave). In feudal usage, a member of the class of peasants bound to the land of their master, which they cultivated. The serf could not own land himself, nor could he leave the land without the lord's consent; he paid a rent in money or kind, rendered other dues in personal labour (e.g. the typical French *corvée*), and could pass on his tenure to his heir only on a fixed payment by the latter to the lord; the lord had full right of disposing of the serf with the land he occupied, but could not transfer the serf to another master except with the land as well.

Historically, serfdom may be regarded as a form of the earlier slavery, modified in certain respects by the example of the late

Roman colonies, where systems of protection in return for services rendered were in operation, and to some extent by the humanising influence of the Christian church, e.g. in that the serf had the right of contracting marriage. The influence of the German village community has been disputed by modern scholars. The early

Seres, Greece. The ancient Greek fortress, situated on a hill which dominates the old town

medieval forms of serfdom were gradually modified by such means as the granting to certain towns of rights of refuge to serfs who had deserted their masters, and by rights of emancipation on certain conditions, e.g. by purchase, or, as was common during the Crusades, by giving military service.

The origins of English serfdom and its exact relationship with the Saxon ceorl's status are obscure. At the time of Domesday the bulk of the population were villeins, but these cannot properly be described as serfs, although economically they were a dependent class. Below them, however, were others, who can fairly be described as such. The condition of the villeins seems to have deteriorated during the centuries after 1066, and there are cases on record of individuals being sold by their lords. The break-up of the manorial system, the economic changes brought about by the Black Death, and the growth of the towns put an end to the serfdom of many, and by the end of the 16th century the custom was extinct.

In Scotland, however, colliers and salters remained serfs until late in the 18th century, when they were emancipated by statutes 15 and 39 Geo. III. In France the institution survived in many districts in a modified form until the Revolution, when it was abolished with feudal obligations and other relics of medieval law and custom. The liberal emperor, Joseph II, decreed the abolition of serfdom

in his Austrian and Bohemian dominions, 1781-82, but the system was not entirely ended in the empire until 1848.

In Prussia serfdom was deeply rooted and widespread, especially on the great estates in the East, where it had grown up through the conquest of the native Slav population, and was enforced through the adoption of Roman law. Its asperities were gradually mitigated in the 18th century, and in 1807 the minister, H. F. von Stein, effected the emancipation, by decree, of the Prussian serfs, and secured for all citizens the free choice of occupation. Other German states followed, but in Upper Lusatia the serfs were not freed until 1832.

In Russia the peasants fell into a condition of serfdom early in the 17th century, and the only result of their violent insurrections was that the system was legally enforced in 1648, and made more severe by Peter the Great. The partition of Poland, where legislation in the 16th century had turned masses of peasantry into serfs, swelled the servile population of the empire. The virtual enslavement of millions of peasants to the land-owning class was a constant source of unrest.

As a result of the Crimean War, the tsar Alexander II began the emancipation of the Russian serfs by liberating those on the imperial domains in 1858, and completed it by the Act of Feb. 19, 1861, which came into full effect in 1863. In all about 23,000,000 serfs were set free. The landowners were compensated, and the peasants, who received allotments, paid for their emancipation by yearly instalments. See Feudalism; Manor; Slavery; consult also Villainage in England, P. Vinogradoff, 1892.

Serge (Lat. *sericum*, Seric, i.e. Chinese stuff; silk). Twilled cloth of worsted or of worsted warp and woollen weft, used chiefly for clothing and usually dyed dark blue or black. "Silk serge" is a twilled silk serge-like fabric used for coat linings. On account of its durability serge has long been a popular clothing material. It was formerly used chiefly for curtains and coverlets; Samuel Pepys recorded in his Diary in 1660 that his dining-room was furnished with green serge hanging.

Serge (1857-1905). Russian grand duke. Born May 11, 1857, the fourth son of Alexander II, he became gov.-general of Moscow, and incurred the displeasure of Nicholas II when during the coro-

nation ceremonies of 1896 2,000 people were crushed to death. Regarded as the leader of the reactionary party in Russia, he was killed by a bomb while driving in Moscow, Feb. 17, 1905.

Sergeant (Lat. *serviens*, serving). Non-commissioned rank in the British army, Royal Marines, and R.A.F., also in most foreign armies. The rank is above that of corporal and below that of staff-sergeant. In the R.A.F., sergeant is the lowest rank granted to aircrew personnel. The duties of a sergeant are to maintain discipline, to instruct, and to command one or two sections in the field. A sergeant of artillery has charge of a gun crew. Insignia of rank are three inverted chevrons worn above the elbow, except on the Royal Marine greatcoat, where they are carried on the cuff. Corporal of horse in the Household Cavalry is the equivalent of sergeant.

Sergeant-Major. A warrant officer in the British army. He is the senior warrant officer (Class I) of a regimental unit and has under him four company, battery, or squadron sergeant-majors (warrant officers Class II), according to the arm of the service. Infantry sergeant-majors generally command a platoon in the field. Insignia of rank are the royal arms for regimental sergeant-majors and a crown for company, battery, or squadron sergeant-majors. When not in battle-dress, sergeant-majors wear officers' service dress with Sam Browne belt.

Sergipe. State of Brazil, S. America. It is the smallest state of the republic, having an area of only 15,089 sq. m. It lies N.E. of Bahia, being separated from Alagoas by the São Francisco. The coastlands are low and flat, the interior has fertile areas, grass land on which there are large herds of cattle, and forests. Sugar, rice, cotton, coffee, maize, cocoa, tobacco, flax, and rubber are produced. The chief town is Aracaju. Pop. 542,000.

Sergius. Saint and martyr. Little or nothing is known of him, but he is believed to have been a soldier who suffered for the faith in the early days of Christianity. His festival is kept on Oct. 7.

Sergius. Name of four popes. Sergius I was pope during 687-701, and Sergius II, 844-847. Sergius III, pope 898-911, only obtained the papal throne after putting two rivals to death. Sergius IV was pope 1009-12. See Papacy.

Seri. American Indian tribe on Tiburon Island, Gulf of California, and the adjacent coast. Occupying

primitive huts, they use cane rafts and bows and arrows. Their animal food is mostly raw, their only domestic animal the dog, and they cultivate nothing. Mother-right is strict. They number some 300.

Series. In mathematics a series is distinguished from a sequence by writing plus (or minus) signs between the terms; a sequence is a set of numbers arranged in a given order. Interest attaches chiefly to those sequences in which successive terms are derived according to a fixed rule. For example, in an arithmetical progression each term is formed by adding a fixed quantity to the preceding term; if a is the first term and d the common difference, the sequence is $a, a+d, a+2d, \dots$, and the n^{th} (or general) term is $a+(n-1)d$. In a geometrical progression each term is formed by multiplying the preceding term by a fixed quantity: if a is the first term and r the common ratio, the sequence is a, ar, ar^2, \dots , the n^{th} term is ar^{n-1} , and the sum of n terms is $a(1-r^n)/(1-r)$. (See Progression.)

If the number of terms in a series is limited the series is said to be finite and can be written: $a_1+a_2+a_3+\dots+a_n=\Sigma a_n$.

If the number of terms is unlimited, the series is said to be infinite. The sum (or value) of an infinite series, however, is not necessarily infinity. Consider the series of n terms

$$S_n = a + ar + ar^2 + \dots + ar^{n-1} \\ = a(1-r^n)/(1-r).$$

If $r > 1$, then as n is increased indefinitely, r^n will increase indefinitely, and hence S_n will increase indefinitely. The series is then said to diverge to infinity, or the series is divergent. It is also divergent for $r=1$, and (to $-\infty$) for $r < -1$. Where $r=-1$ the series reduces to $1-1+1-1+\dots$; if n is even $S_n=0$, if n is odd $S_n=1$; in this case the series is said to oscillate. Where, however, $-1 < r < 1$, r^n will tend to 0 as n increases indefinitely. Also S_n will tend to a limiting finite value which can be found from the summation formula:

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \frac{a(1-r^n)}{1-r} = \frac{a}{1-r}.$$

The series is then said to converge to $a/(1-r)$. For a series to be convergent it is necessary that the n^{th} term should tend to 0 as $n \rightarrow \infty$; but this is not sufficient. The harmonic series $1+1/2+1/3+1/4+\dots$ can be shown to be divergent. Many tests have been devised to discover if

Seringapatam, India. Mausoleum of Tipu and Haider Ali

particular series are, or are not, convergent, but no completely general process is available.

A series of the form $b_0+b_1x+b_2x^2+\dots+b_nx^n+\dots$, or more generally $b_0+b_1(x-a)+b_2(x-a)^2+\dots$, where a is a constant and the coefficients b_0, b_1, b_2, \dots are independent of x , is known as a power series. Many transcendental functions can be expressed as power series, which when convergent enable values for the functions to be computed to any required degree of accuracy. Thus $\sin \theta = \theta - \theta^3/3! + \theta^5/5! - \theta^7/7! + \dots$; $e^x = 1 + x + x^2/2! + x^3/3! + \dots$; or in general (Maclaurin's series) $f(x) = f(0) + f'(0)x/1! + f''(0)x^2/2! + \dots$. The binomial series:

$$1 + kx + \frac{k(k-1)}{2!}x^2 + \dots$$

gives the value of $(1+x)^k$ for any real k .

Consult A Course of Pure Mathematics, G. H. Hardy, 1941.

Series-connexion. A method of connecting the components in an electric circuit. With resist-

Series-connexion. See text

ances, one current flows through all and the combined resistance is equal to the sum of the separate resistances, i.e.

$$R = r_1 + r_2 + r_3 + \dots$$

With condensers, the reciprocal of the combined capacitance is equal to the sum of the reciprocals of the separate capacitances, i.e.

$$1/C = 1/c_1 + 1/c_2 + 1/c_3 + \dots$$

Serif. Term in typography and printing, denoting the minute projecting turns or portions at the

extremities of a letter. Derived from the characteristic flourish of the broad-pointed pen, they were stylised by the Romans in their classic carved inscriptions on monuments, etc., and have been generally adopted by typographers using the Roman alphabet. *See Sans-serif.*

Seringapatam. Town of Mysore, India. Situated on an island in the Cauvery river, 9 m. N.E. of Mysore, it was the old capital of the state in the days of Tippoo and Haider Ali, and contains their tombs, Tippoo's mosque, and the ruins of his palace. Tippoo was mortally wounded in 1799 when the fort was stormed by British and Indian troops. Pop. 10,000.

Seringapatam. *SIEGE OF.* Incident in the campaign against Tippoo Sahib, 1799. On the entry of the British into Mysore in 1790, Tippoo invaded the country and established himself in Seringapatam, which he fortified strongly. In 1791 Cornwallis made a demonstration before the town, and gained a decisive victory the next year, which deprived Tippoo of much of his territory. The latter retained Seringapatam, however, and held it until General Harris arrived before it, April, 1799. After besieging the fortress a month Harris made a breach in the S. wall, which faced the Cauvery river, May 4, 1799. The city was bravely defended, and Tippoo Sahib lost his life fighting in the breach. *See* Cornwallis; Tippoo Sahib.

Serious Call. A. Religious treatise by William Law, published in 1728, with the full title: *A Serious Call to a Devout and Holy Life, adapted to the State and Condition of All Orders of Christians.* Clear and vivid in its literary style, and embodying descriptions of typical characters often rendered with pungent satire and irony, the book won praise from Johnson and Gibbon, and is the best remembered of its author's works. *See* Law, W.

Serjeant. An alternative and older spelling of the non-commissioned rank in the British army, etc., usually spelt sergeant and so entered in this work.

Serjeant-at-Arms. Title of certain officers of the British royal household. One is the lord chancellor's mace-bearer and attendant in the house of lords, and another performs similar functions for the Speaker in the house of commons. The Speaker's serjeant-at-arms also enforces order and expels and arrests members. The other serjeants-at-arms have ceremonial

duties of various kinds in the royal household (*q.v.*).

Serjeant-at-Law. In England, a legal order, now extinct. Serjeants existed in the 13th century or earlier, and before Q.C.s were appointed by Elizabeth the rank was the highest open to barristers.

Until 1845 serjeants-at-law had a monopoly in the court of common pleas in term time, but not in vacation. They sat within the bar, and until 1873 no one was appointed a common law judge unless he was a serjeant. Their mark of office was a coif or skull cap; after the introduction of wigs a serjeant's wig was made with a hole in the top so that the coif showed through. They had their own inn, Serjeants' Inn (*q.v.*), and enjoyed state precedence. After 1873 appointments ceased. The word comes from the Latin *serviens ad legem*, serving the law. *See* Barrister; Coif.

Serjeantry or **SERJEANTY.** In the feudal system, a system of land tenure by which the tenant rendered to the crown a definite personal service. Two classes of serjeantry were generally found in practice: grand and petty (or petit) serjeantry. In grand serjeantry the service required as condition of tenure was directly personal. In petty serjeantry a yearly tribute had to be made by the tenant of some article or articles pertaining to war, *e.g.* a bow or a sword. Relics of this custom have survived in England, *e.g.*

the estates of the dukes of Wellington are still held by an annual offering to the king of a flag. *See* Feudalism; Tenure.

Serjeants Inn. Name of two former inns in London, belonging to the serjeants-at-law (*q.v.*). One, destroyed by bombing in 1940, was a quadrilateral enclosure on the S. side of

Serjeants' Inn. Hall of the old inn, formerly at the southern end of Chancery Lane, London
From a drawing by T. H. Shepherd

Fleet Street, E.C. The other was near the corner of Chancery Lane and Fleet Street. The two societies combined in 1758, and occupied the northern inn until 1877, when the order of the coif was dissolved. *See* Inns of Court.

Sermon (Lat., discourse). Address on some religious topic, usually founded on a passage of Scripture, called the text, and given in church for the doctrinal instruction and spiritual comfort of the congregation. *See* Homily; Preaching.

Sermon on the Mount. THE. Name given to the collection of sayings by Jesus Christ comprised in Matt. 5-7. In these chapters the sayings are given as one long discourse addressed to the disciples after Christ "went up into a mountain." His descent from which is recorded in Matt. 8, v. 1. The sermon opens with the Beatitudes, and includes the Lord's Prayer (Matt. 6, vv. 9-13), as well as the essence of Christ's ethical teaching, *e.g.* Love your enemies (Matt. 5, v. 44). Another version of the Beatitudes and some of the ethical instructions are given in Luke 6, and of the Lord's Prayer in Luke 11. It is assumed that the contents of what Matthew presents as one sermon were in fact uttered on various occasions during Christ's ministry.

Serous Membrane. Membrane consisting of two layers, one covering the free surface of an organ and reflected back at the attachment of the organ to form the second layer, which lines the cavity containing the organ. Examples of serous membranes are the pleura, which covers the lung and the inner surface of the pleural cavity containing the lung, and the pericardium, which forms a sac enclosing the heart. The function of the serous membrane is to form a fluid called lymph, which

Serjeant-at-Arms.
The Speaker's mace-bearer

occupies the space between the two layers and facilitates gliding movements of the organ within its cavity, such as occur between the lung and the pleural cavity during respiration. Pleurisy is inflammation of this membrane so that the surfaces grate instead of sliding.

Serpa Pinto, ALEXANDRE ALBERTO DE LA ROCHA (1846-1900). Portuguese explorer. Born April 10, 1846, he entered the army and, sent with an expedition to Angola, crossed Africa, W. to E., 1877-79, recording his experiences in *How I Crossed Africa*, 2 vols., 1881. He made further journeys between Mozambique and Lake Nyasa, 1884-86, was in 1889 made governor of Mozambique, and became, as the result of an expedition he organized in the Zambezi region, a central figure in the trouble between Great Britain and Portugal which led first to the convention of 1890 and later to the *modus vivendi* of 1891, defining the spheres of the two countries. He died at Lisbon, Dec. 28, 1900.

Serpens. In astronomy, one of the ancient constellations, the serpent which Ophiuchus strangles. The head of the serpent is marked out by five stars in the shape of an X immediately below the semicircle of the Northern Crown. The tail comes to an end in a channel of the Milky Way. The constellation contains the globular cluster Messier 5. The chief star is Cor Serpentis, a star of about the third magnitude.

Serpent (Lat. *serpere*, to creep). Alternative name for the legless reptiles or snakes. The distinction is purely philological, serpent being introduced to the English language by the Romans, and snake by the Anglo-Saxons. In modern use serpent is applied to the larger species. See Ophidia; Reptile; Snake.

Serpent. Obsolete wind instrument of the cornet (*q.v.*) type. Invented by Canon Guillaume of Auxerre, it was generally made of wood in several pieces, joined together and covered with leather, but having a metal crook terminating in the mouthpiece. The conical tube was about 8 ft. in length, bent for convenience in handling into snake-like convolutions, this giving rise to the name. The normal compass was three octaves from C to c", and owing to the mechanical imperfections of the instrument, the scale was uncertain and the tone variable. Its soft, woody quality, however, made it a great favourite for church use. In France it sustained the plainsong, and in

Serpent, an obsolete musical instrument of the cornet type

England it was a common member of village church orchestras. Mendelssohn, Verdi, Wagner, and other composers employed the serpent, but the instrument has now been superseded, in performing their scores, by the ophicleide. The ancient Lysardon was probably a serpent.

Serpentine. In geology, a mineral, a member of the chlorite family. An hydrated silicate of magnesium $[Mg_3Si_4O_{10}(OH)_2]$, serpentine is commonly the product of decomposition of olivine which has been attacked by hot water or steam and carbon-dioxide. It is a soft, greenish coloured mineral, and when it develops in long hair-like or fibrous crystals it forms asbestos. Many large rock-masses are essentially of serpentine, and the same name is applied to the rock as well as to the mineral. Serpentine rock is usually the product of alteration of some ultra-basic igneous rock (*q.v.*), such as peridotite, which is rich in olivine. Serpentine occurs at the Lizard, Cornwall, in Scotland, and in the Shetland Isles, in the U.K. At Prato, Tuscany, a variety called *Verde di Prato*, and resembling bronze, is used for sculpture. Chromite and platinum deposits are often associated with serpentines derived from ultra-basic rocks. Altered impure magnesian limestones may also develop serpentine, in which case the white calcitic mass of the rocks is streaked or mottled with green, so forming an attractive ornamental stone termed serpentine marble or opicalcite, e.g. Connemara marble. Though soft, serpentine is durable, and its varying colours, and the fact that it will take a high polish, make it in great demand as an ornamental stone for vases, ash-trays, or interior decoration.

Serpentine, THE. Artificial lake in Hyde Park and Kensington Gardens, London. Caroline, queen of George II, during 1730-33 threw several ponds into one, and the sheet of water thus formed (41 acres) was fed by the Westbourne until 1834 when water was supplied from the river Thames. The

part in Kensington Gardens is called the Long Water. Boating and bathing in the Serpentine have long been popular pastimes. After leaving the park at Albert Gate the Serpentine becomes part of the London main drainage system. See Hyde Park; Kensington Gardens; Lido.

Serpent Worship. Religious cult of individual snakes, of snakes in general, or of deities or heroes regarded as assuming such forms. Of extraordinary variety, and almost universal range, serpent worship or ophiolatry has been the subject of much wild and often mystical speculation, generally unwarranted. The mysterious attributes of snakes aroused a sense of awe and veneration independently in many regions. Their renewal of youth by sloughing the skin suggested resurrection and immortality; their mode of progression, swiftly working poison, power of fascinating their victims, habit of haunting houses, tombs, and ruins, and emergence from subterranean holes, originated other ideas. Though snakes are commonly connected with the underworld, they are only occasionally regarded as evil powers. Ancestor-worship (*q.v.*) is often the basis of these religious cults.

In Genesis, as to the Babylonians and Aztecs, the serpent is a spirit of wisdom, and was worshipped as such by the semi-Christian sect of Ophites. A widespread connexion with healing is found in the brazen serpent of Israel, worshipped in Hezekiah's time, in the Greek cult of Aesculapius, and in W. African belief. Serpents are often worshipped as water spirits, and as such were propitiated by human sacrifices. They were also associated with the sun, as in ancient Egypt, or with lightning, as in N. America. As deities of fertility, they are attended by priestesses, as in the elaborate python cult of Whydah, W. Africa. See Dragon; Ophites; Uraeus; Voodoo.

Serpho, SERIPHOS, SERFANTO, or SERFO. Greek island in the Aegean Sea. It is one of the Cyclades, 24 m. W. of Syra, and has an area of 30 sq. m. Wine is produced. Livathi, at the head of a deep inlet, is the chief town and harbour. Pop. 4,000.

Serpukov. A town of the R.S.F.S.R. It is 60 m. S.W. of Moscow, on the Nara, near its junction with the Oka, and the Moscow-Kursk rly. It is mainly industrial, with factories for leather, linen, cotton, and cloth goods.

The cathedral dates from 1380, and was remodelled in 1710. Pop. 90,766.

Serpula. Genus of polychaete (many-bristled) marine worms, belonging to the phylum Annelida.

They construct the chalky tubes so often seen on the shells of scallops and other molluscs. The head bears beautifully coloured plumes, which appear to be sensitive to light and shadow, and thus warn the animal of the approach of danger. They have bright green blood, owing to the presence of a pigment, chlorocruorin, which has an affinity for oxygen like that of haemoglobin.

Serrano Suárez, RAMON (b. 1901). Spanish politician. Educated at Madrid and Bologna universities, he became a lawyer. He entered political life in the 1930s, and was deputy for Saragossa during 1933-36. Minister of the interior under Gen. Franco, his later appointments included those of foreign minister during the crucial period of Spanish neutrality in the Second Great War, 1940-42. Member of the Falange national council from 1942, he was president of the political junta.

Serrano y Domínguez, FRANCISCO, DUKE DE LA TORRE (1810-85). Spanish soldier and statesman. Born at Arjonilla, Sept. 10, 1810, he entered the army, and became a general of division at the age of thirty. After the revolution of September, 1868, and the fall of Queen

Francisco Serrano y Domínguez, Spanish soldier

Isabella, Serrano was nominated commander-in-chief of the revolutionary army, and regent. When the Cortes decided in favour of a constitutional monarchy, Serrano became regent, and though he resigned these functions on the accession of Amadeus I of Savoy, he remained a minister. After the abdication of Amadeus in Feb., 1873, he was head of the provisional military government, and on the accession of Alphonso XII in 1874 left the country, but re-

turned in 1881. He died at Madrid, Nov. 26, 1885.

Sert, JOSÉ-MARIA (1876-1945). Spanish artist. Son of a celebrated textile designer, he was born in Barcelona, and studied in his father's workshops. He later went to Paris, where he became well known as a mural painter. Essentially a decorator, he executed wall paintings for Sir Philip Sassoon, and his work became fashionable in London during the 1920s. In Spain his most famous paintings consisted of seven large panels for Vich cathedral. This work occupied 20 years, and was destroyed in the Spanish Civil War. He later designed another set of huge groups of figures to adorn the restored cathedral. His style was derived from the Spanish Baroque and Rococo sculptors. Other murals included those for the conference room at League of Nations palace, Geneva, and for the Rockefeller Centre, New York. He died Nov. 27, 1945.

Sertorius, QUINTUS (d. 72 B.C.). Roman soldier. Born at Nursia in Sabine territory, he practised as a lawyer, and then entered the army. Having distinguished himself under Marius against the Cimbri, and in the Social war, he joined the democratic party of Marius and Cinna. After their death he removed to Spain and got together an army to oppose Sulla. By skillfully playing upon the superstitious feelings of the people, and by other measures, he made himself immensely popular. He made himself master of the greater part of the country, but, after fighting with varying success against Pompey and Caccilius Metellus, he was forced to abandon part of his conquests and to limit himself to maintain guerrilla warfare. He gradually lost the confidence of the natives, and, betrayed by his

Serval. Wild cat found in the forests and undergrowth throughout Africa

ally Perperna, was treacherously murdered at Osca (Huesca).

Sertularia. Genus of hydrozoan polyps. They occur in colonies fixed to marine shells and

Sertularia. Cells and portion of the stem of *S. perculata*, highly magnified

stones. They form horny, branched structures, often called sea firs.

Serum (Lat., whey). Pale yellow, watery, albuminous fluid left after removal of the clot formed in blood which has been allowed to stand. It contains thrombin (q.v.). See Blood.

Serum Therapy. Prevention or treatment of disease by an antitoxic serum. When a dose of bacteria or the toxins produced by bacteria is injected into an animal, the serum of the blood of that animal develops certain substances known as antitoxins, which neutralise the effect of the poisonous injection. After a succession of gradually increasing doses has been injected the animal is killed, and the serum prepared from its blood may be used for injection into a human being suffering from the disease, or may be given as a preventive dose. This method has been of great value in the treatment of diphtheria, tetanus, and many other diseases. See Antitoxin.

Serval (*Felis serval*). Species of wild cat. Occurring throughout Africa, it is about 4 ft. 6 ins. in total length; and the fur is a rich brownish yellow with black spots. The tail is banded and is a little over a foot long.

Servant (Lat. *servire*, to serve). In general, a person employed in working for another, whose orders he is bound to obey, provided that certain obligations, explicit or implicit, are observed by the master. The term is usually applied to those engaged in domestic service. The phrase, His Majesty's Servants, is commonly used of actors, from the fact that certain companies of players, especially in the 17th

century, were granted the right of describing themselves as "servants" of the king or queen. Members of the civil service are known generally as civil servants. The term servant is also commonly used in correspondence with a superior in rank, e.g. "Your humble servant." See Civil Service; Domestic Servant; Master.

Servetus, MICHAEL (1511-53). Spanish theologian. Born at Tudela, in 1531 he published a work

Michael Servetus,
Spanish theologian

on Errors Concerning the Trinity, which brought him into prominent notice. He then studied medicine at Lyons, and became physician to the archbishop of Vienne. Another work, published anonymously in 1553, led to his imprisonment at the instigation of Calvin; and on his escape to Geneva the same influence caused him to be rearrested and burnt, Oct. 27, 1553.

Service, ROBERT WILLIAM (b. 1874). Canadian poet and novelist. Born at Preston, Lancashire, Jan. 16, 1874, he led a varied and active life in Canada, and his poems, written much under the influence of Kipling, reflect the sterner aspects of life in the wild northwest. His

Robert W. Service,
Canadian poet

Songs of a Sourdough and Ballads of a Cheechako enjoyed a vogue; also his Rhymes of a Red Cross Man, prompted by his experiences in the Canadian Army Medical Corps during the First Great War. The Trail of '98 is a novel containing vivid pictures of life at Klondike. Later works include Ballads of a Bohemian, The Rough-Neck, Bar-room Ballads, Harper of Heaven, and his autobiography, Ploughman of the Moon, 1946.

Services, THE. Term used to define collectively the three British fighting forces, the Royal Navy, the Army, and the Royal Air Force (given here in order of seniority, the navy being often spoken of as the Senior Service). Servicemen are members of any of these services.

Service Tree (*Pyrus sorbus*). A tree of the family Rosaceae.

Service Tree. Leaves and clusters of greenish-brown berries

A native of Europe and temperate Asia, it is very similar to mountain ash, but the bark is rough, the leaflets broader and downy on both surfaces, the flowers larger, and the oval fruits four times the size of mountain-ash berries. The colour of the fruits also is different, being greenish brown with dots of rusty red. They are harsh to the taste until touched by frost.

Servile Wars. In ancient Roman history, name given to three slave revolts. The first Servile War, 135-132 B.C., began with a rising at Enna, in Sicily, led by Eunus, a Syrian wonder-worker, who defeated two consular armies, and overran the island. The capture of Enna and Tauromenium by Publius Rupilius ended the war.

A second revolt in Sicily, 103-99 B.C., ran a similar course. The leaders, or "kings," were a Syrian, Tryphon, and a Cilician, Athenio. After several years' hard fighting, the insurrection was suppressed by Manius Aquilius.

The third Servile War, also called the Gladiatorial War, 73-71 B.C., was a much greater danger than the others to the Roman power. Under Spartacus (*q.v.*), a vast horde of escaped gladiators and slaves ravaged Italy from the Alps to the Straits of Messina. In 72 they defeated both consuls, but the Celtic and German band, which seceded under Crixus, was destroyed at Mt. Garganus. The main body was blockaded in the Brutian peninsula, and, crossing into Lucania, was overthrown there by M. Licinius Crassus (*q.v.*).

Servites. Popular name of the R.C. mendicant order of the Religious Servants of the Holy Virgin. It was founded in 1233. The dress includes a black habit, leather

girdle, scapular, and cape. In 1487 Innocent VIII conferred upon the order privileges akin to those bestowed upon the Franciscans, Dominicans, Augustinian Hermits, and Carmolites.

Servitude (Lat. *servire*, to serve). State of slavery (*q.v.*) or slavish dependence. In Scots law, servitude is a burden affecting land and other heritable property. By it the owner is either restrained in the full use of his property, or is obliged to allow someone else to do certain acts upon it. Instances are the right of using a footpath, salmon fishing, and erecting something against a wall. The term is borrowed from Roman law. The English legal equivalent is easement (*q.v.*).

Servius Tullius. Sixth legendary king of ancient Rome, 578-534 B.C. The son of a slave of the royal household, he attracted the attention of Lucius Tarquinius Priscus, after whose murder he became king. He is the reputed founder of the so-called Servian constitution. Essentially military in character, this formed the basis of a new assembly, *comitia centuriata*, in which the power of wealth predominated. Servius also made an alliance with the Latins, brought the seven hills within the city limits, and surrounded the whole with a ditch and rampart, still known as the Servian Wall. See Comitia.

Sesame, GINGELLY, OILY GRAIN, OR GINGELI OIL-PLANT (*Sesamum indicum*). Annual herb of the family Pedaliaceae. A native of the Indian sub-continent, it has opposite, oval leaves, and white two-lipped flowers spotted with yellow, red, or purple. The small oily seeds are contained in oblong two-celled capsules. On pressure they yield a tasteless oil, which

Sesame. Leaves and flowers of the Indian plant

is used for the adulteration of oil of almonds. *Pron. sessa-me.*

Sesame and Lilies. Two lectures, Of Kings' Treasuries, and Of Queens' Gardens, by Ruskin, first published in 1865. They were addressed principally to young men and women, and dealt with the purposes of education; the Treasuries of the first lecture being true books and the Gardens of the second being the spheres of women's service.

Sesamoid Bone (Gr. *sēsamē*, sesame; *eidōs*, form). Small bone formed in the tendon of a muscle

which moves over a bony surface. The largest sesamoid bone in the body is the patella or kneecap.

Sesostris. Legendary Egyptian king. In Herodotus, Diodorus, and other Greek writers he is an heroic figure, whose empire extended from Libya to India, and from Nubia to Thrace. The deeds attributed to him are reminiscent of the achievements of Thothmes III, Seti I, and Rameses II.

Sessa Aurunca. City of Italy. It is in the prov. of Naples, 27 m. by rly. N.W. of Caserta. The cathedral dates from 1103. There are Roman remains in the city. Monte Massico, 2,660 ft., is a neighbouring limestone hill, anciently celebrated for its wines. Pop. 6,000.

Session (Lat. *sedere*, to sit). Word meaning a sitting and used in two main senses, political and legal. In the British parliament, and in those that have modelled their procedure thereon, e.g. the Canadian, a session is a continuous sitting of parliament, and usually takes up the greater part of a year. Each parliament consists of a certain number of sessions, each of which is opened by the king or someone representing him. A session is ended by a prorogation, but a parliament by a dissolution. A pause of a few days or weeks in the midst of a session is termed an adjournment. In law, the word is used for quarter and petty sessions. Each is a sitting of judges or magistrates. In the Presbyterian Church session is the name given to the meeting of the minister and elders. See **Parliament**; **Sessions**.

Session, COURT OF. In Scotland, the supreme civil tribunal, known also as the college of justice. In its present form, the court of session consists of thirteen judges, or senators of the college of justice; the inner house is divided into the first and second divisions, the former presided over by the lord president, the latter by the lord justice clerk, and each containing four judges; the outer house consists of five judges, lords ordinary, with coordinate powers of jurisdiction. The functions of the inner house are, with certain exceptions, those of an appeal court. Actions in the first instance come before judges of the outer house, and there are special courts, such as those of valuations and registration appeal. The court of session has no jurisdiction in criminal causes. It sits in Parliament House, Edinburgh. See **Scotland**.

Sessions. In law, term used for the sittings of justices in court upon commission. In England,

sessions of the peace is the general term for those sessions held by justices of the peace, which comprise petty sessions, where two or more justices sit to give summary trial for certain minor offences; special sessions, where justices transact such business as granting of licences, etc., for the county division, or borough which they represent; quarter sessions; and general sessions, where the justices meet to act judicially for the region covered by their commission.

In the U.S.A. courts of sessions, general sessions, and special sessions are local criminal courts for trial chiefly of minor offences. See **Brewster Sessions**; **Justice of the Peace**; **Quarter Sessions**.

Sesterce (Lat. *sestertius*, from *semis tertius*, two and a half). Ancient Roman coin at first equal to 2½ asses and subsequently to 4

Sesterce. Coin of Vespasian commemorating, on the reverse, the conquest of Judea. Diameter 1½ ins.

asses, or something over twopence in English money. Originally a small silver coin, it became a copper one under the Empire. Its symbol was IIS or HS. The *sestertium*, 1,000 *sestertii*, was the unit for reckoning large sums of money.

Sestina. Verse form invented by the French troubadour Arnaut Daniel, and used by the French troubadours of the 12th to the 14th centuries. It originally consisted of six stanzas of six unrhymed lines each—the same terminal words being used in each stanza, but in a different order—and a triplet. The form was frequently used by Dante and Petrarch. When English poets were experimenting with the old French verse forms in the latter part of the 19th century a number of them wrote rhymed sestinas. There are examples in A. C. Swinburne's *Poems and Ballads* (2nd series) and E. Gosse's *On Viol and Flute*.

Sestos. Chief town of the Thracian Chersonese, in ancient Greece. Situated on the Hellespont, opposite Abydos, it was in early times of considerable importance as affording a convenient passage from Europe to Asia. It is chiefly remembered as the place whence Xerxes (480 B.C.) transported his army to Europe over a

bridge of boats, and as the scene of the story of Hero and Leander. It was destroyed by the Athenian Chares in 353 B.C.

Sestri Levante. Town of Italy. It is on the coast of the Riviera di Levante, in the prov., and 28 m. by rly. E.S.E., of Genoa. It is both a winter and summer resort, and is beautifully situated. Pop. 3,600.

Sestri Ponente. Town of Italy. It is on the coast of the Riviera di Ponente, in the prov., and 4 m. by rly. W., of Genoa. It has ship-building yards, ironworks, tanneries, and saw-mills, and manufactures matches and macaroni. There are alabaster quarries in the neighbourhood. Pop. 26,000.

Set or Seth. Egyptian deity. Originally a predynastic tribal god at Kom Ombo, his traditional defeat by Horus may denote the victory of metal-using hawk-worshippers. Portrayed as a grotesque animal, perhaps the okapi, he came to represent the powers of darkness. He was rehabilitated in the XIXth dynasty, whose two monarchs Seti bore his name, and was ultimately identified with the Greek Tryphon.

Sète. French form of the Mediterranean town entered in this work under Cette.

Sete Quedas OR GUAYRA FALLS. Waterfall of S. America, situated on the river Paraná, in Brazil, just below its confluence with the Piquiry.

Seti. Name of two Egyptian kings of the XIXth dynasty. It is also spelled Sety, and in Greek Sethos. Seti I (c. 1300 B.C.) recorded at Karnak his Syrian, Hittite, and Libyan campaigns. His great Abydos temple and Theban tomb are supreme exam-

Seti I, the warrior king of the XIXth dynasty, as depicted in a relief in his temple at Abydos

ples of Egyptian art. Of his reign is a papyrus plan of Nubian gold mines, the oldest map known. His mummy is at Cairo. See Egypt; Sarcophagus.

Set-off. In English law, any debt due from the plaintiff to the defendant, which the defendant has a right to set off against the debt sued for. The Statute of Set-off (2 Geo. II, c. 22), which gave the defendant this right, confined it to a case of mutual debts of a definite sum. But now, in any action, the defendant may set up by way of set-off or counterclaim any claim that he has against the plaintiff.

Seton, ERNEST THOMPSON (1860-1946). Canadian author and artist. Born at South Shields, England, Aug. 14, 1860, descendant of the last earl of Winton, he was taken as a child to Canada. He lived in the Canadian backwoods, 1866-70, and was educated at Toronto; then returned to England to study in the R.A. school, London, 1879-81. Under the name of Ernest Seton-Thompson he established a reputation as a writer and illustrator of stories and books about wild nature, and received an official appointment as naturalist to the Manitoba government. His first book, *Wild Animals I*

E. Thompson Seton,
Canadian author

Have Known, 1898, was the first of many popular books of the same kind, e.g. *Wild Animals at Home*, 1913; *Wild Animals' Ways*, 1916. He was equally popular as a lecturer on these themes, and his *Art Anatomy of Animals* became a standard work. But he is chiefly remembered for his foundation of the Woodcraft League, a pioneer U.S. movement which in some ways anticipated the boy scouts. Seton died at Santa Fé, New Mexico, Oct. 23, 1946.

Settee. Long seat with a back and arms. It is a variant of the settle, and was first associated with the Directoire and Chippendale styles. A settee and two matching arm chairs form the standard three-piece suite. The word is also used for a sailing vessel with a long sharp prow and a single deck.

Settembrini, LUIGI (1813-77). Italian author and patriot. He was born at Naples, April 17, 1813, and became professor at Catanzaro at the age of 22. His liberal and patriotic views brought him into con-

flict with the authorities, and from 1839 he was either in prison or in exile until 1860, when he returned to Italy and was appointed professor of literature at Naples university. He died Nov. 3, 1877. His *Lezioni della Letteratura Italiana*, of which there have been many editions, is on the whole the best Italian literary history.

Setter. Large breed of dogs of the spaniel group. They are game dogs and are trained to crouch

Setter. A champion of the English breed

down when marking game, instead of standing like the pointer.

Five breeds of setter are recognized, though only three of them are generally met with. The English breed, which contains a good deal of pointer blood, is a handsome animal with a wavy silky coat, while the tail carries a fringe of long, straight hair, and the toes have hair on the inner sides.

The Scottish or Gordon setter is the heaviest breed, and has been crossed with the bloodhound. It is black and tan in colour, has coarse hair and a rather short tail. The Irish setter is a smaller and much lighter breed, has red hair, and is an untiring companion for the sportsman. The Russian setter has an extraordinarily woolly coat, densely matted together, which almost conceals its form.

Setters require careful training, as they are apt to run wild in their excitement; but well-bred dogs are usually broken to game without much difficulty. See Dogs colour plate; Pointer.

Setterwort (*Helleborus foetidus*). Perennial herb of the family Ranunculaceae. It is a native of W. Europe, and, as a rare wild plant, of the S. and E. of England in chalky soil. It varies in height from a foot to 2 ft., with large, leathery leaves 6 ins. across.

The large flowers, which open about Feb., are conspicuous from their pale greenish-yellow sepals,

the petals being converted into little green tubes containing nectar. After the flower has been slightly open for a few days, a line of dull crimson develops on the margins of the sepals. The seed-vessels are large follicles, of which two or three are produced by each flower, and contain about twelve large black wrinkled seeds. It has a strong fetid odour. Formerly, it was much used in domestic medicine, the dried leaves being powdered and administered as a vermifuge. Another name for the flower is stinking hellebore. See Hellebore.

Settle. Market town and rural district of Yorkshire (W.R.), England. It stands on the left bank of the river Ribbles, 16 m. from Skipton, and is served by rly. The buildings include the parish church

and town hall. Folly Hall is a 17th-century building, and there are cotton mills and tan yards. The town is a good centre for tourists to the neighbouring Pennine Hills with their caves. Across the Ribbles is Giggleswick (g.v.) School. Market day, Tues. Pop. 2,455.

Settled Land Acts. Acts of the British parliament by which land can be freely dealt with even though it is settled on various persons in succession none of whom would, but for the Acts, be entitled to dispose of the land. The Settled Land Act, 1925, vests the legal estate in the land in the person entitled to its present enjoyment, i.e. the tenant for life. He holds this legal estate on trust to give effect to his own interest and to the interests of those who will be entitled to the possession of the land after him. He has therefore large powers of selling and otherwise dealing with the land. Before he can exercise these powers two trustees must be appointed whose duty it is to receive any money paid, e.g. in sale, and retain it as capital, investing it in trustee securities. The income will be paid to the tenant for life and the capital will pass under the settlement in the same way as the land that has been sold.

Settlement. Act of settling or placing a person or thing. Apart from its special legal senses (v.i.), the word is used for the planting of

a colony, for the establishment of anyone in a fixed place or position, and for the payment of a debt.

In another sense settlement is the gradual sinking of a building or some part of it. It may be of no consequence, or it may be so serious as to lead to collapse, unless immediately remedied. There are three kinds of settlement: (1) settlement of mortar joints in brickwork and masonry, which occurs as courses are added before the mortar in the bed joints below has set; this is of no consequence provided the walls are not built too quickly, and that settlement is equalised by building at an even rate all round the walls; (2) equal settlement due to even compression of the foundation subsoil under the weight of the building; this varies, but is normally a small fraction of an in., and is of no consequence unless excessive; (3) unequal settlement, usually due to local weakness of subsoil, or inadequate foundations under points where heavy loads are concentrated, as under beams and columns.

Unequal settlement causes walls to crack vertically, may lead to bulging, leaning, or even collapse of walls which may affect floors and roofs depending upon the walls for support. In framed buildings unequal settlement causes distortion, though collapse is not so likely. The remedy is to underpin the walls and columns and to strengthen the foundations, either by taking them to stronger subsoil at a greater depth or by increasing the bearing area of the foundation by widening it. For all but small buildings this work is costly. Where unequal settlement is slight and does not increase it is sufficient to repair the cracks.

Settlement. In English law, the tying up of property with the object of providing for members of the settlor's family, and also of preserving a property intact. Such a settlement can be made either by deed or by will. Suppose that A, a man of wealth, is about to marry. He will make a settlement, making himself tenant for life, which will give him full enjoyment of the property and also enable him to dispose of the property under the Settled Land Acts (*v.s.*). Next will follow: (1) a provision for an income for his proposed wife during her widowhood; (2) a provision for the enjoyment of the property to pass on A's death to the eldest of the sons born of the marriage.

The law was opposed to the tying up of property for a very long

period, and settlements are of no effect if they attempt to tie up the property for longer than the life of persons living when the settlement is made and 21 years thereafter. Thus a settlement is usually valid only until the eldest son of the marriage becomes 21. The eldest son, when he becomes 21, usually joins with his father in resettling the property.

Settlement, ACT OF. Measure passed by the parliament of England in June, 1701. It settled the crown of the country, and with it those of Scotland and Ireland, on the electress Sophia of Hanover and her heirs. There was little prospect of the reigning king, William III, or his heir presumptive, Anne, leaving a child who could succeed to the throne, and the dominant party in the land was determined that the Stuarts should not return. Sophia, widow of the elector of Hanover, was a granddaughter of James I, and, most important of all, she was a Protestant. The Act therefore said that, failing issue to William or Anne, the crown should pass to Sophia and the heirs of her body being Protestants. It bound Ireland, and Scotland accepted it by the Act of Union which came into force in 1707.

The Act contained eight clauses apart from those settling the succession. One declared that all future sovereigns must belong to the Church of England, and another that the country should not be compelled to engage in war for the defence of lands not belonging to the crown of England unless with the consent of parliament: this was a censure on William's wars in defence of the United Provinces. It provided that judges should not be removed from their offices, except at the request of both houses of parliament, and it prevented the sovereign from putting a stop to an impeachment. Other clauses, afterwards repealed, forbade the sovereign to leave England, Scotland, or Ireland without the consent of parliament; ordered all resolutions of the privy council to be signed by the members assenting thereto. The full text of the Act is printed at the end of Stubbs's *Select Charters*. Passed by a majority of one vote in the house of commons, it received the royal assent, June 12, 1701. By His Majesty's Declaration of Abdicacion Act, 1836, under which Edward VIII abdicated the throne, it was provided that the Act of Settlement should be construed so as to exclude from the

succession the issue, and descendants of the issue, of Edward VIII. The right of George VI and his heirs to the British throne arises from the Act of Settlement, 1701, and the Abdicacion Act, 1936.

Settlement. In English poor law, the legal right, acquired by residence or otherwise, of a pauper to maintenance in a particular union or parish. The duty laid on every parish by the 43rd Elizabeth to maintain its own poor was followed in 1662 by a statute enacting that settlement could be acquired by 40 days' undisturbed residence in a parish, but providing that any new inhabitant within 40 days of his arrival might be removed to the parish where he was last legally settled by birth, residence, or apprenticeship, unless he either rented a tenement of £10 a year, or could give adequate security. This led to certain abuses, and subsequent legislation made it almost impossible for the poor to acquire settlement, and thus avoid removal. In 1795, however, some redress of their grievances was given by the declaration that henceforth no poor persons should be liable to removal until they actually became chargeable to the parish. Settlement ceased to be relevant with the passing of the National Assistance Act, 1948. See *Pauperism*; *Poor Law*.

Settlement, SOCIAL. Name applied to various societies of social workers established in the poor quarters of great cities. Their aim is to study the problems affecting the life of the labouring classes on the spot, by daily intercourse with them, and thereby to promote their education, culture, and in many cases their religious life. The movement originated in the second half of the 19th century, especially in connexion with the work carried on in Whitechapel by S. A. Barnett and A. Toynbee, continued after the latter's death at Toynbee Hall (*q.v.*). Most social settlements organize social clubs, classes, lectures, concerts, etc., and afford temporary quarters for persons who wish to study and help in the work. University settlements, like Oxford House (*q.v.*) and Toynbee Hall, form one class; others are conducted by colleges and public schools, like the one maintained by Caius College, Cambridge, at Battersea, and Eton College Mission at Hackney Wick; and by religious bodies, like the Woodbrooke Settlement, Birmingham, and the Robert Browning Settlement, Walworth Road, London.

Setúbal. Dist. and town of Portugal. The district has an area of 1,970 sq. m. and a pop. of 268,884. The town lies on the Bay of Setúbal, on the river Sado, 20 m. S.E. of Lisbon, and is served by rly. An important seaport and an important centre of the sardine fishery, its exports include salt, of which there are rich deposits, sardines, fruit, local white wines, cork; its imports coal and tin. Christ Church is a notable 15th century foundation, and the harbour has two main forts. On the other side of the bay are situated the ancient remains known as Troia, possibly the Roman Cetobriga. St. Yves is the French, St. Ubes the English name for the town. Pop. 47,000.

Setúbal, BAY OF. A wide opening on the coast of Portugal, it lies S. of Lisbon between Capes Espichel and de Sines. It receives the river Sado and at its head is the port of Setúbal.

Seurat, GEORGES PIERRE (1859-91). French painter. Born in Paris, Dec. 2, 1859, he studied under Henri Lehmann. His painting, *La Baignade*, refused by the Salon in 1884, was exhibited the same year at the Salon des Indépendants, which he helped to found; it was later acquired by the Tate Gallery. He joined the Impressionists and painted his later pictures in the style called pointillism (*q.v.*), of which he was a pioneer. Two of his best known

Sevastopol, Crimea. The Middle Harbour of this historic port

as Goktcha (*q.v.*). There is also an island of Sevang on which is an Armenian monastery.

Sevastopol. Town and fortress of the R.S.F.S.R., in Crimea region. It stands on the S.W. coast of the Crimea, and is a rly. terminus. The harbour, the ancient Ktenus Portus, is one of the best in Russia, capable of accommodating ships of very large tonnage. The town, including the port and the naval dockyard, was virtually destroyed in the Second Great War (*v.i.*). Its chief industries were shipbuilding and the making of wine. Sevastopol, near the site of the old Greek colony Kheronesus-Heraclaea (Kheroneses Pt.)

SECOND GREAT WAR. Sevastopol was first bombed by the Germans on June 22, 1941, the day they invaded Russian-held territory. By the beginning of Nov. the Germans were in the Crimea, and by Nov. 11 had invested the town. The Russians repelled repeated German attempts to storm Sevastopol, and made counter-attacks supported by aircraft and the guns of the Black Sea fleet, submarines of which kept the town supplied with food and ammunition during the ensuing siege. On June 5, 1942, the Germans opened a new violent attack with infantry, massed artillery, tanks, and waves of dive-bombers. By June 24 most of the civilian population, which had remained in the town through the siege, had been evacuated by sea, and the garrison had withdrawn within the inner defences. The Germans broke into the town on July 2, its evacuation being admitted by the Russians on July 3.

By their recapture of Melitopol on Oct. 23, 1943, the Russians isolated Axis forces in the Crimea, attacking them early in the following April. As one point after another in the Crimea fell to the Russians, the Germans and Rumanians retired behind three lines of prepared defences into Sevastopol, their attempts to escape from which by sea were frustrated by the Russian air force and the Black Sea fleet. Shelling with long-range Russian artillery began on April 15, 1944; bitter local engagements culminated in a three days' assault at the end of which, on May 9, the 4th Ukrainian army took the town by storm, the elaborate German defences having been shattered by artillery and aerial bombardment.

Georges Seurat. *La Baignade*, his first exhibited picture, now in the Tate Gallery, London

works are *Un Dimanche à la Grande Jatte*, 1886, now in the U.S.A., and *La Cirque*, 1891, in the Luxembourg. He died in Paris, March 29, 1891.

Sevang. Alternative name for the lake of Armenia better known

as Goktcha (*q.v.*). There is also an island of Sevang on which is an Armenian monastery. The siege of 1854-55 is described in a separate entry (*v.i.*). The Bolsheviks captured Sevastopol in Nov., 1920. Pop. (1939) 111,946.

Sevastopol, SIEGE OF. Principal incident in the Crimean War, 1854-55. The Allies' main attack on Russia was made in the Black Sea and centred on the capture of the fortress of Sevastopol, which commanded the harbour where lay the principal forces of the Russian fleet. After Alma, Sept. 20, 1854, the Allied armies were able to entrench themselves within a mile of Sevastopol, and on Oct. 17 began to bombard it.

Meanwhile the harbour had been successfully blocked by sunken vessels and booms. Little change took place so far as Sevastopol was concerned until June 7, 1855, although in the interval had occurred the battles of Balaklava and Inkerman. On June 7 the French carried the Mamelon fortress which protected the Malakoff works, Sevastopol's chief defence. The British attempt on the Redan, ten days later, failed. A furious bombardment was opened by the Allies early in Aug., and the French victory of the Tchernaya, Aug. 16, was the finishing stroke to the Russians. After a final assault, Sept. 5, Sevastopol was evacuated and the Russians retreated, leaving their wounded behind them. *See* Alma; Crimean War; Redan.

Seven (Skt. *saptan*; Gr. *hepta*; Lat. *septem*). Sacred number among many nations of the East. Called sometimes the number of perfection, it and its multiples are of frequent occurrence in the Bible. For examples, on the 7th day God ended His work (Gen. 2); clean beasts were taken into the ark by sevens (Gen. 7); the feasts of the Passover, Weeks, and Tabernacles lasted 7 days (Ex. 12; 34; Deut. 16); Pentecost was 7 weeks after the Passover (Lev. 23); each 7th year was a sabbatical year (Lev. 25); the jubilee year was the year after 7 times 7 years (Lev. 25); the Day of Atonement fell in the 7th month (Lev. 26). In the N.T. are notable the 7 words from the Cross, the choosing of 7 deacons by the church (Acts 6), the whole imagery of the Book of Revelation, and the enumeration of the 7 Churches of Asia (*q.v.*). In both O.T. and N.T., however, the number, the application of which in ecclesiastical art is noteworthy, was used sometimes simply to express a sufficiency or the equivalent of a large number, as it was by Shakespeare, who also referred to the seven ages of man.

Buddhist philosophy refers to man as representing the 7-stringed world-lyre; Chinese philosophy gives man 7 material souls; Japan

has its 7 gods of happiness or luck. The 7 senses are animation, feeling, speech, taste, sight, hearing, and smelling. The 7 virtues are faith, hope, charity, prudence, justice, fortitude, and temperance; or humility, chastity, love, patience, bounty, abstinence, and vigilance. The 7 deadly sins are pride, wrath, envy, lust, gluttony, avarice, and sloth.

Seven Bishops. Those who in 1688 petitioned James II against his order commanding the clergy to read on two successive Sundays his second Declaration of Indulgence. The seven were William Sancroft, archbishop of Canterbury; Thomas Ken, bishop of Bath and Wells; Sir Jonathan Trelawny, Bart., bishop of Bristol; Lloyd of St. Asaph; Lake of Chichester; White of Peterborough; and Turner of Ely. In temperate language they declared that the Declaration was illegal, and asked to be excused from reading it. The petition was printed, and the king had the bishops arrested for seditious libel. Tried before three judges, they were found not guilty by the jury.

Seven Champions of Christendom. Name given in medieval legend to the patron saints of seven countries. Their deeds were celebrated in prose and verse, the best prose version being that of Richard Johnson (1573-1659), entitled *Famous Historie of the Seaven Champions of Christendom*, 1596-1610. The champions were: S. George of England, S. Denis of France, S. Anthony of Italy, S. James of Spain, S. Andrew of Scotland, S. Patrick of Ireland, and S. David of Wales.

Seven Churches of Asia. Name given to the seven principal churches in Asia Minor which were presided over by bishops in apostolic days. They are enumerated in the opening chapters of the Book of Revelation, where special messages and warnings are sent to them. They were Ephesus, Smyrna, Pergamos, Thyatira, Sardis, Philadelphia, and Laodicea. *See* Revelation, Book of.

Seven Days' Battle. Series of engagements in the American Civil War, June 26-July 2, 1862. After their repulse by the Federal army at the battle

of Fair Oaks (*q.v.*), the Confederates made a vigorous attack. The first engagement, June 26, failed.

The next day Lee attacked again, and forced the Federals across the river, losing heavily, but taking over 5,000 prisoners. During the 28th McClellan retreated south, and on the following day Lee sent six divisions under Jackson and Longstreet in pursuit. Indecisive fighting took place until July 1, when the two main armies engaged at Malvern Hill on the N. bank of the James river. The battle gave no definite advantage to either side, but the Federal campaign of invasion was definitely balked, and the moral advantage lay with the Confederates. *See* American Civil War.

Seven Dials. Area in London where seven narrow streets meet. It is between St. Martin's Lane and New Oxford Street, W.C. A column bearing a sundial, which stood in the centre of the open space, was removed in 1773 during a quest for a supposed buried treasure, and was set up on Weybridge Green, Surrey, 1822. Once noted for its broadsheet ballad printers and ballad-mongers, Seven Dials later became a centre for dealers in domestic pets.

Seven Islands. Bay of Quebec, Canada. An opening on the N. side of the Gulf of St. Lawrence, it is about nine by six miles in extent, and is protected by seven islands, which have been celebrated in a ballad by Whittier. It is an excellent harbour, with three distinct channels for navigation.

Sevenoaks. Urban dist. and market town of Kent, England, 22 m. by rly. S.E. of London. It gives its name to a co. constituency. Picturesquely situated on the Darent, it allegedly derives its name from seven oaks standing on the Tonbridge road. The chief building is the church of S. Nicholas, dating in part from the 13th

Sevenoaks, Kent. Parish church of S. Nicholas
F. 114

Sevenoaks arms
ground in England. Adjoining the town to the S. are Knole (*q.v.*) house and park. Market day, Mon. Pop. 14,550.

Seven Pillars of Wisdom, THE. Book by T. E. Lawrence (*q.v.*). Of immense length, it is primarily an account of Lawrence's campaign undertaken in the First Great War to rouse the Arab tribesmen in the Middle East against their Turkish rulers; against this background it is a brilliant exhibition of erudition, philosophy, and human drama. The book was first printed on the author's private press in 1923, when about 90 copies were issued, at a price variously stated at 23, 25, and 90 guineas. Lawrence intended the book to be published only after his death, but in the autumn of 1927 an abridged edition, *Revolt in the Desert*, was enthusiastically welcomed by the public. Lawrence's death in 1935 released the ban on the original version, which was published that year, and sold 200,000 copies. The work takes its name from a poem of dedication "to S.A." in which Lawrence writes:

... to earn you freedom,
The seven-pillared worthy house ...

Seven Sisters, THE. Name given to a line of chalk sea cliffs, forming the edge of a spur of the South Downs, stretching S.E. from Cuckmere Haven, Sussex, to Birling Gap, near Beachy Head. The

The Seven Sisters. A striking line of chalk cliffs forming part of the Sussex coast, near Seaford

undulations of the cliff top form the white face of the cliff into seven peaks. Most of the downland here was vested in the National Trust in 1930-31.

Seven Sleepers. Seven Christians of Ephesus who, according to the Eastern European legend, took refuge in a cave during the persecution of the Roman Emperor Decius.

249-251, and being walled into the cave by their pursuers, fell into a trance which lasted 200 years. On awaking in the reign of Theodosius II (408-450), they convinced him of a life after death, and then fell into another trance destined to last till the Resurrection.

Seventh. Musical interval one degree smaller than an octave. It is of three kinds:

A chord of the seventh consists of a 7th from the root added to a triad. There are three categories: (a) fundamental, *e.g.* the dominant seventh; (b) secondary, *i.e.* other than (a) but diatonic; and (c) diminished, which always includes one or more chromatic notes. This is really the first inversion of a minor ninth chord, and, owing to the possibility of enharmonically changing the notation of any of its notes, with a consequent fresh resolution, it affords an easy method of effecting any modulation, no matter how extraneous. The normal resolution is upon a chord the root of which is a fourth higher, thus:

Provided, however, that the dissonant note, the 7th, either falls a degree, or rises a semitone, or remains to be a note in the next chord, any other resolution is possible.

Seventh Day Baptists. Protestant sect which originated with the Traskites or Sabbatarians of

the 17th century. They profess the usual principles of Baptists, but observe the Jewish Sabbath. They were established in the U.S.A. about 1681. See Adventists.

Seven Weeks' War. Name given to the war between Prussia and the allied powers of Austria and certain German states, 1866. The long-standing enmity between

Austria and Prussia had caused the latter power to reorganize her army and place herself on a powerful footing. When Austria referred the Schleswig-Holstein question to the Germanic diet, Bismarck outlined the Prussian scheme of hegemony, purposely irritating Austria to the extent of making her demand the exclusion of Prussia from the diet. With Austria stood Bavaria, Württemberg, Baden, Saxony, Hesse-Cassel, Hanover, and Nassau. Strengthened by the secret alliance of Italy, April 8, Prussia declared war, June 14, and invaded Saxony and Bohemia.

The Austrians, who had anticipated an attack from Silesia, had concentrated their forces near the Riesengebirge, and the Prussians met with little opposition. After several minor successes the Prussians, under William I, encountered the main Austrian army at Königgrätz or Sadowa (*q.v.*) and defeated them decisively on July 3. The Austrians asked for a truce, but the Prussians pushed on to Vienna, which they would have taken had not the truce of Nikolsburg been declared, July 26. Meanwhile the Italians, who had entered the war for the purpose of recovering Venetia, had advanced across the Mincio, but were defeated at Custoza, June 24.

This catastrophe did not affect the success of Italy's purpose, for after Sadowa the Austrians ceded Venetia to Napoleon III, who handed it over to Italy. Italy's part in the war was not limited to her defeat at Custoza, for on July 20 her fleet, under Persano, was utterly routed by Tegethoff at the battle of Lissa (*q.v.*). The part played by the allied German states was insignificant; the Hanoverians were defeated at Langensalza, June 28, by Prussia, who successfully quashed the offensives of all the smaller states. The armistice of Nikolsburg was succeeded by the peace of Prague, signed Aug. 23. By this Austria withdrew from the Bund, ceded Venetia, and renounced her claims in Schleswig-Holstein, which, with Hanover, Hesse-Cassel, Nassau, and Frankfurt-on-Main, were soon annexed by Prussia.

Seven Wise Masters, THE. Old collection of Oriental stories, of which Hebrew, Persian, Syriac, and Latin versions have been recorded. The stories are connected with the fate of a king's son, whose life is in danger if he does not refrain from speaking for seven days. His fate is kept continually in the balance, for his stepmother

tells a fresh tale each day to justify his instant execution, while the seven wise masters, or viziers, successively win a day's respite for him by another tale, until the seven days are past and the lad can speak and reveal the truth about his wicked stepmother. The oldest English version, printed in the mid-16th century, is included in *Early English Metrical Romances*. G. Ellis, 1805.

Seven Wise Men. These were Solon of Athens, Thales of Miletus, Bias of Priēne, Chilon of Sparta, Pittacus of Mitylēnē, Periander of Corinth, and Cleobolus of Lindus. Many wise sayings were attributed to them, the most notable being Solon's "Do nothing in excess" and Chilon's "Know thyself."

Seven Wonders of the World. In ancient times, the Hanging Gardens of Babylon, the Pyramids of Egypt, the temple of Diana at Ephesus, the statue of Jupiter by Pheidias at Athens, the Colossus of Rhodes, the mausoleum erected by Artemisia at Halicarnassus, and the Pharos or lighthouse of Alexandria. An extant description of these wonders is attributed to the mechanician Philo of Byzantium (c. 145 B.C.).

Seven Years' War, THE (1756-63). Struggle between, on one side, Great Britain, Prussia, and Hanover, and on the other, France, Austria, Russia, Sweden, Saxony, and finally Spain. It had two main aspects. In one it was a duel between France and Great Britain for the overseas empire in America and in India; in the other it was the struggle of Prussia against foes encircling her on every side.

The first blow was struck with the attack upon Minorca, its capture by the French in 1756 initiating the naval contest. The other powers remained at peace. But in the autumn Frederick, satisfied that Austria was waiting only to complete her preparations before launching against him her own armies and those of her allies, struck before his enemies were ready, and attacked Saxony. That state, however, offered a sufficiently firm resistance to compel him to postpone the invasion of Bohemia which was his objective.

The war in India had two phases, the conquest of Bengal, which was only indirectly connected with the French quarrel, and the destruction of the French power in the S. of India consequent upon the inability of France to dispatch adequate military or naval assistance. The decisive incidents were the battle of Plassey (*q.v.*), June

23, 1757, and the overthrow of the French at Wandewash, Jan. 22, 1760. In America partially successful campaigns in 1753 were followed by the siege and capture of Quebec by General Wolfe (*q.v.*) in 1759, whereby the complete conquest of Canada in the next year was ensured. The British fleet, after initial mismanagement, soon asserted an ascendancy which generally paralysed the French and was converted into an overwhelming supremacy by the virtual annihilation of the French fighting fleet in Hawke's (*q.v.*) great victory at Quiberon, Nov. 20, 1759. After that the British fleet could go where it would. The French colonial possessions lay at its mercy, and those of the Spaniards also when they entered the war in 1761.

In the actual war on the Continent Great Britain, under the guidance of the elder Pitt, played only a secondary part, *i.e.* she supplied Frederick with troops which were efficient but few, and money, without which it would have been impossible for him to maintain the struggle. Also, by engaging France in the colonial war, and by the perpetual threat and the occasional practice of descents upon the French coast, she diverted French energies from concentrating in full force upon the war against Frederick—just as that war prevented France from concentrating her energies on what was, to her, of infinitely more importance, the duel with Great Britain.

Thus the Prussian kingdom had to fight for its life almost single-handed. On the N.W. it was guarded by the forces of its N. German and British allies, under the command first of the duke of Cumberland, and then of Ferdinand of Brunswick, a most efficient general. In 1757 Frederick invaded Bohemia, won the battle of Prague, and was driven out again by his defeat at Kolin (*q.v.*). Later he was always on the defensive, threatened by the French on the S.W., the Austrians on the S., and the Russians on the E., each having an army larger than any force he could muster. Yet he broke up the French army at Rossbach, Nov. 5, and an Austrian army at Leuthen, Dec. 5.

In 1758 he drove off the Russians by a victory at Zorndorf, but suffered defeat from the Austrians at Hochkirch. In 1759 Ferdinand won a brilliant victory over the French at Minden, but Frederick suffered a crushing defeat from the Russians at Kunersdorf. In 1760 he twice defeated the Aus-

trians, at Liegnitz and Torgau. But his victories were no longer crushing blows; his exhaustion was too great. He was in fact saved by the incapacity of the Austrians, and the disinclination of the Russians to follow up any victory. In 1761 the French were practically out of action, and Russia withdrew from the war; so that in what remained of the duel with Austria Frederick was still just able to hold his own. The war was brought to an end at the beginning of 1763, by the treaties of Paris and Hubertusburg, which gave Canada to Great Britain, left the French without an effective foothold in India, and preserved to Frederick his territories intact as they were before the war. See Chatham, 1st Earl of; Clive, Lord; Frederick the Great; Wolfe.

Severn. River of England and Wales. It rises in Wales, on the E. side of Plynlimmon, in the S.W. of Montgomeryshire, and flows in a great curve to its estuary, an inland continuation of the Bristol Channel. The estuary, the lower course of the river itself as far as Tewkesbury, and the Stratford or Warwickshire Avon, the chief left-bank tributary of the Severn, form a valley containing three lowland sections, the Vale of Berkeley, the Vale of Gloucester, and the Vale of Evesham, and receives no streams of any size from the S.E. scarp of the Cotswolds. The Bristol Avon flows in a gorge round the S.W. end.

In a striking contrast the rivers which flow into this valley from the N.W. are numerous and long, and drain the major portion of the Cambrian uplands. The Taff, Usk, Wye, and Leadon are right-bank affluents of the Severn. In its middle course the Severn receives the Teme from Kerry Hill, Montgomeryshire, and the Stour from the N. end of the Lickey Hills. On its banks are Shrewsbury, Welshpool, Newtown, and Llanidloes.

The Severn is a rapid river. Below Gloucester, especially near Newnham, the tide, coming up with great velocity, may, owing to the configuration of the estuary, reverse the flow as high up the river as Towkesbury lock, 13½ m. above Gloucester. Twice a year, in early March and early Sept., this produces a wave or bore, locally called hygro, which is sometimes 5 or 6 ft. high and strong enough to overwhelm lighters using the river. Severn is of little use for navigation except in the deeper reaches. In the upper course the Shropshire Union canal is parallel with the

river for many miles. At Stourport it connects with the Staffordshire and Worcester canals, and at Worcester with the Worcester and Birmingham canal. The Avon connects with the Stratford-on-Avon canal at Stratford. By the Bristol Avon there is canal connexion with the Thames.

At Sharpness the Severn bridge, 4,162 ft. in length, carries the rly. across the estuary by 22 spans, and by a swing bridge, 200 ft. long, over the Gloucester and Berkeley ship canal. In 1947 the ministry of Transport authorised the construction of a road bridge between Beachley and Aust, to be the longest suspension bridge in Europe, with a centre span of 3,000 ft., two side spans of 1,000 ft. each, and a total length, including the approach roads on both sides of the estuary, of 8 m. Near New Passage a tunnel, 4½ m. long, shortens the rly. journey from Bristol to Cardiff.

SEVERN BARRAGE. A committee presided over by Lord Brabazon proposed in 1933 the construction of a barrage at the English Stones reef, between Glos and Mon, for the production of hydro-electric power from the tide in the Severn. Ten years later a panel of engineers was set up by the ministry of Fuel and Power and reported in March, 1945, that from an engineering point of view the scheme was practicable; the barrage would take eight years to build and would cost £47 m.; the average annual output of energy would be 2,190 m. kWh.; and the saving in coal during the first 15 years would be 985,000 tons.

Severn, JOSEPH (1793-1879). British painter. Born at Hoxton, Dec. 7, 1793, he studied at the R.A. schools, and won the gold medal in 1818. An intimate friend of Keats (*q.v.*), whose portrait he several times painted, he accompanied the poet to Italy in 1820, and was present at his death in 1821. Severn lived principally in Rome, where he painted historical subjects. He acted as consul at Rome during 1860-72, and died there, Aug. 3, 1879, being buried beside Keats. *Consult* Against Oblivion, Lady Birkenhead, 1943.

Severus, ALEXANDER. Roman emperor. from A.D. 222 to 235. *See* Alexander Severus.

Severus, LUCIUS SEPTIMIUS (146-211). Roman emperor, 193-211. Born near Leptis Magna, Africa, he was in command of the legions in Pannonia when the emperor Pertinax was murdered,

and was by them proclaimed emperor. Didius (*q.v.*) was murdered just before Severus entered Rome, and Pescennius

Septimius Severus,
Roman emperor
From a bust

Niger, proclaimed emperor by the Eastern armies, was disposed of after two battles in 194. Yet another claimant, Clodius Albinus, was defeated by Severus near Lyons in 197. Disquieting news from the East now caused Severus to turn his attention to the Parthians, and in the course of an expedition against them he took Babylon, Seleucia, and Ctesiphon, the Parthian capital. His eastern victories are celebrated on the well-known arch at Rome which bears his name. The closing years of his reign were occupied with campaigns in Britain from 208. He is said to have rebuilt the wall between the Forth and the Clyde which bears his name. Severus died at York, Feb. 4, 211. *See* Rome.

Sévigé, MARIE, MARQUISE DE (1626-96). French writer. Born in Paris, Feb. 5, 1626, Marie de Rabutin-Chantal lost both parents at an early age, and was well educated by her uncle the Abbé de Coulanges. In 1644 she married the marquis Henri de Sévigé, who was mortally wounded in a duel in 1651. She then settled in Paris, where she educated her children, and died at Corignan, Feb. 17, 1696. A woman of great charm and brilliant gifts, she retained her goodness of heart and character unsullied by the corrupt society in which she was a conspicuous figure. In spite of her intellect Mme. de Sévigé did not, like so many *précieuses*, seek literary fame; but the letters which for some 25 years she wrote to her daughter, the comtesse de Grignan, and her many friends, who included Turpin and Conti, are an enduring monument to the genius of one whom the French regard as unsurpassed in the epistolary art.

Seville. Inland prov. of S.W. Spain, in Andalusia. It lies between the Sierra Morena and the Sierra de Ronda, and is a lowland drained by the Guadalquivir, the Genil, and smaller streams. Coal, iron, copper, and marble are the chief minerals. Seville has been celebrated for its wool, silk, wine, and oil since Phoenician times. Its area is 5,428 sq. m. Pop. 1,081,000.

Seville. Fourth city of Spain, in Andalusia. It stands on the left bank of the Guadalquivir, 54 m. from the Atlantic and 12 m. below the end of the tidal reach of the river, which has been canalised and dredged as far as the city. Much of the city lies below high-water level, and is liable to floods; the river front is a wide open embankment, and three bridges make connexion with the suburb of Triana on the right bank.

Seville arms

More characteristically Moorish in its architecture than any other Spanish city, the older portions are of surpassing interest. On the Plaza del Triunfo stand the cathedral, the Alcázar, and the exchange; on the Plaza de San Fernando, the city hall. The minster, 1403-1519, one of the finest Gothic edifices in the world, occupies part of the site of a Moorish mosque, the Court of Oranges being another portion. The Giralda, or bell tower, part of the old mosque, is probably the finest structure in the city, and is surmounted by a 13 ft. bronze figure of Faith which is a weather-vane (*giraldita*). The Alcázar was in turn the palace of Moorish and Spanish kings. Pilate's House, the isolated Torre del Oro on the river bank, the palace of the duke of Medinaceli, the Maria Luisa park, and the tobacco factory are features of interest.

The museum houses a rich collection of the works of Murillo and Velázquez, both natives of Seville. The exchange or Casa Lonja contains the Indian archives, documents relating to the discoveries on the Spanish Main; and the Columbian library collected by Fernando Colon, the son of the great Christopher Columbus, is in the cathedral. The university,

After Vanteuil

1. Principal gate of the Sintelnio Palace, completed in 1734. 2. South-east corner of the Casa del Ayuntamiento or Town Hall, a Renaissance building of 1526-64, restored in 1891. 3. Cathedral from the south-east,

showing the lofty Giralda tower 4. The city from the Triana suburb, with the Isabel II bridge. On the river bank, right, is the Torre del Oro, a relic of the Moorish Alcázar; in the distance, left, the cathedral

SEVILLE: NOTABLE BUILDINGS IN THE ANCIENT CAPITAL OF ANDALUSIA

deriving from a school founded by Alphonso X in 1256, dates from 1502. Tobacco, chocolate, soap, perfumes, silks, glazed tiles (*azulejos*), and musical instruments are manufactured, and there are iron foundries and machine shops. Pottery is made at Triana.

Since the earliest times a great port, Seville exports wine, fruits, oil, cork, and metallic ores. An important city known to the Phoenicians as Hispal and to the Romans as Hispalis, it was the capital of S. Spain in the dominions of the Vandals. The Moors conquered it in the 8th century, and corrupted the name to Ishbilliah, and from 1026 for more than two centuries it was the capital of a Moorish kingdom; 400,000 Moors are said to have left the city after its capture in 1248 by Ferdinand III of Castile, of which it was for a time the capital. Seville was the richest and most populous city in Spain during the 16th cent., when it had the monopoly of the trade with Spanish America. Pop. 382,000. See Alcázar illus. p. 266; Door illus.

Sèvres. Town of France. It stands on the Seine, between Paris and Versailles, and is famous for its porcelain factory. The chief building is the state factory, and the museum and technical school attached thereto. Pop. 15,242.

Sèvres. Type of porcelain made at Sèvres. In 1756 a factory for making the ware, up to then associated with St. Cloud, was established here, and in 1759 it became state property. The first porcelain produced was of the soft paste type, the product of a complicated mixture, but in 1768 hard paste, a mixture of kaolin and feldspar, began to be used, and ultimately it superseded the soft paste.

Sèvres porcelain comprises handsome vases and large decorative pieces, dinner services, and biscuit figures and groups. The potter's wheel is not used, all pieces being moulded and modelled. The forms chosen are classic in style. In the middle of the 19th century the use of layers of various coloured clays was introduced. See China-ware colour plate; Pottery.

Sèvres, TREATY OF. Peace treaty signed on August 10, 1920, between the Allies and Turkey. It was, however, never ratified by Turkey and was superseded in 1923 by the treaty of Lausanne (*q.v.*). The treaty of Sèvres, had it been ratified, would have limited Turkey's sovereignty in Europe to Constantinople (Istanbul); given

part of Thrace to Greece; placed the rest of Thrace, the Dardanelles strait, the sea of Marmara, the Bosphorus with adjacent islands, and Smyrna (Izmir) under international control; and made Armenia independent, besides limiting the Turkish army and controlling Turkish finance and economy.

Sewage. Waste liquids discharged from houses, waste waters from industrial processes dis-

charged to enter the sewers, by the volume of water used for bathing, and by the volume and nature of the industrial wastes discharged. In some districts the proportion of industrial liquors is so high as to necessitate special methods of treatment; for example at Bradford—a town with a large wool industry—the sewage contains an unusually large proportion of wool fat, which is recovered at the sewage-disposal works.

At many towns on the sea coast, or on large estuaries, the sewage is discharged into the sea or the estuary without treatment. Sometimes, to prevent such nuisance as fouling of bathing beaches, it may be treated by macerating the larger floating and suspended solids, or suspended matter may be removed by sedimentation before the sewage is discharged. Inland, however, where the sewage has to be discharged to fresh-water streams, much more extensive treatment is necessary. Irrigation on land called sewage farms is successful, but requires a very large area of land, and in Great Britain is no longer much used. Instead, sewage is treated in works occupying a much smaller area, where the liquid is passed through screens to remove large solids, through detritus tanks, where grit is removed by

Sewage. Diagram illustrating its disposal by sewers. Fig. 1. Junction box receiving sewage from small drains, a, and discharging by the large earthenware drain, b; c is a cemented spigot and faucet joint, d, the ventilating shaft, and e, the manhole. Fig. 2. A, sewer; B, footpath; C, sill over which the flood sewage flows into sewer, D, which leads to river or sea, or to intercepting sewer, E.

charged to municipal sewers, and any rain water which enters the sewers by direct discharge or by infiltration. In the U.K. the average volume in dry weather is some 35 galls. per day per head of those connected to the main drainage, but may be much greater in wet weather. Sewage contains coarse material in suspension—including grit, vegetable matter, and particles of faeces—and also contains colloidal and dissolved substances. Its composition varies considerably from place to place and is influenced particularly by the proportion of rain water al-

sedimentation, and through much larger sedimentation tanks to remove as much as possible of the finer suspended particles as a watery sludge (primary sludge). After the sludge has been removed the sewage is still a very polluting liquid, and at inland towns is usually further treated by biological filtration (*see Filtration*: Sewage) or by the activated-sludge process. In the activated-sludge process the settled sewage is passed through tanks in which it is aerated, either by bubbles of air passed into it through diffusers at the bottom of the tanks or by

mechanical means. Several types of mechanical plant are available; they are designed to stir the liquid in various ways so as to accelerate the solution of oxygen from the air. Flocs of activated sludge are formed, consisting for the most part of masses of bacteria, which are the chief agents for the purification of the polluting matter. From the aeration tanks the liquid, containing the activated sludge in suspension, is passed through separating tanks to remove the sludge, part of which is returned to the aeration tanks to maintain the concentration of the flocs at an optimum value. From this process effluents of good quality can be obtained; the final liquid is generally similar in composition to the final effluent from a works using biological filtration.

From a few towns situated on estuaries sludge is taken out to sea in special sludge vessels and is there dumped. At a few inland towns the liquid sludge is supplied by pipe line to agricultural land and is allowed to flow over the surface or is run into prepared trenches. Usually, however, sludge is treated at the sewage works to remove as much moisture as possible so that it can be more easily handled. The simplest process is to allow it to drain on specially constructed under-drained sludge-drying beds. When it is dry enough to be lifted with a spade or by mechanical equipment it is removed, to be used on the land in place of farmyard manure. It contains available nitrogen, though often in relatively small amounts, together with some available phosphate, but little potash. At larger works the sludge is often digested under anaerobic conditions before being run on to the drying beds. During digestion a mixture of gases—mostly methane and carbon dioxide—is evolved, and is often used for heating and for driving gas engines to provide electric power. A relatively small quantity is compressed and used to drive motor vehicles; it also has possibilities as a raw material in the chemical industry.

B. A. Southgate

Seward. Town of Alaska, the ocean terminus of the Alaska rly., which runs to Fairbanks 470 m. N. At the head of Resurrection Bay, 60° N., 149° 30' W., Seward is a trading centre for the scattered pop. of the Cook inlet dist. and the Alaskan peninsula and for the Aleutian Is. Pop. 700.

Seward, ANNA (1747-1809). British poet, called the Swan of Lichfield. Born at Eyam, Derby-

shire, she was brought up in Lichfield, where her father became a canon. Encouraged by Dr. Erasmus Darwin, she began to write poetry, but she is remembered today rather by her friendship and correspondence with Hayley, Mrs. Piozzi, and Sir Walter Scott, for the last named of whom she had the warmest admiration. She died March 25, 1809. Of her own works, *Louisa*, 1782, and her *Sonnets*, 1799, are the best known. She also left six volumes of letters. *Consult* A Swan and her Friends. E. V. Lucas, 1907; *The Swan of Lichfield: selected correspondence of Anna Seward*, H. Pearson, 1936.

Seward, WILLIAM HENRY (1801-72). American statesman. Born in New York State, May 16,

William H. Seward

1801, and educated at Union College, he became a lawyer in 1822. Activity in the politics of the state led to membership of the senate of the New York legislature and to the governorship of that state (1838-42), and brought him into association with the anti-slavery movement. In national politics he was a Whig, and was one of those who held that a fugitive slave was free as soon as he got on to free soil.

In 1849 Seward became a member of the senate, where he strongly denounced slavery, and was one of the founders and leaders of the Republican party. He was not, however, put forward as a candidate for the presidency either in 1856 or in 1860; instead, he became Lincoln's secretary of state, and remained in office until 1869. His work throughout a most difficult period was for the most part successful: it included the management of the Trent and Alabama difficulties, the French interference in Mexico, and the purchase of Alaska from Russia, as well as the reconstruction measures that followed the Civil War. In April, 1865, he was

wounded at Washington, on the day of Lincoln's murder, his wife's death being one result of this outrage. He died Oct. 10, 1872. *See* Lincoln; Republican; United States. *Consult* Lives, T. K. Lothrop, 1899; F. Bancroft, 1899; E. E. Hale, 1910.

Sewell, ANNA (1820-1878). British author. She was born at Yarmouth, March 30, 1820, the daughter of Mary Sewell (*v.i.*). In early childhood she injured both ankles and was a lifelong invalid in consequence. She attained fame as a result of the publication in 1877 of *Black Beauty*, a book purporting to be the autobiography of a horse. This attained enormous popularity, over 100,000 copies being sold in 15 years. French, German, and Italian translations were almost equally successful. Anna Sewell died in April, 1878.

Sewell, MARY (1797-1884). British author. Born April 6, 1797, the daughter of John Wright, a Norfolk farmer, she was educated at home, married in 1819, and settled in the S. of England. Her children's books and poems attained an extraordinary popularity, over 1,000,000 copies of her *ballad Mother's Last Words* being sold in 1860. Her last years were spent near Norwich, where she died, June 10, 1884.

Sewing Machine. Machine for performing the operation of stitching by mechanical means. Thomas Saint patented a machine in 1790, chiefly for sewing leather. It possessed an automatic feed, continuous thread, an awl that punched a hole for the needle, which moved with a vertical reciprocating movement. The needle was forked and pressed the thread through the hole, a reciprocating hook beneath the material passing thread through to form a chain stitch.

Barthélemy Thimonnier, in France in 1830, invented a machine in which a hooked needle passed backwards and forwards through the material to form the stitch. The machine was worked by a treadle. Very successful and much copied, it brought no reward to its inventor. Newton and Archbold, in 1841, made an important advance with their patent of the eye-pointed needle, and in 1846 Elias Howe patented the first lock-stitch machine, though its essential features had been anticipated by another American inventor Hunt.

In Howe's machine, basis of most contemporary sewing machines,

the needle was curved, had a reciprocating horizontal instead of a vertical motion, and was eye-pointed. A shuttle on the underside of the cloth working in conjunction with the needle produced a lock-stitch. A. B. Wilson's later invention of a four-motion feed and I. M. Singer's fixed overhanging arm are both widely used.

Sewing machines produce lock-stitch, and simple or double chain-stitches. The majority of household sewing machines are of the lock-stitch type, but the principle of machine sewing is the same for all types of stitch produced. There is a reciprocating eye-pointed needle, which moves through the material being stitched. The material rests on a steel plate, and is automatically moved forward with each stitch by a small toothed bar or feed dog. In making the chain-stitch the needle passes through the material, and a small loop is formed on the underside of the material. Through this loop a hook passes and holds it while the needle ascends. At that moment the material is moved forward, and on the next return of the needle the latter passes through the held loop and forms a fresh loop within the first. The first loop is automatically released and the second held, the first being drawn up tightly against the underside of the material to form the stitch, and the series of operations is repeated. The reciprocating hook which seizes each loop in turn is called the looper. The disadvantage of the chain-stitch is that the line of stitching unravels if broken at any point.

In the lock-stitch a loop is

formed when the needle passes through the fabric, and through this loop a second thread is passed by means of a vibrating shuttle or by a hook with a rotating movement. This second thread interlocks with the first thread in the centre of the material. The cotton or thread is kept at a suitable tension to ensure a tight stitch by means of steel plates held together by an adjustable spring.

SEX: EVOLUTION AND TRANSMISSION

Paul G. 'Espinasse, Professor of Zoology, Hull

This article explains the process by which sex is transmitted and developed from generation to generation. With it should be studied the articles on Chromosomes; Endocrinology; Gene; Gonad; Hormone; Meiosis; Oestrous Cycle; Pituitary Body; Prostate Gland; Protozoa; Reproduction

Sex (Lat. *secare*, to cut) is the term used with reference to the differences between the male and the female of a species. Before the fusion of the sexual elements, egg and sperm, there are two organisms; after its completion there is one. The division of the individuals of so many species of animals and some plants into two groups in each of which the members produce one kind of gamete, or sexual cell, does not, in itself, promote reproduction directly. Indeed, the separation of the individuals into groups of this kind adds a very great hazard to reproduction: the elements whose fusion must precede development

ments' of the two kinds required for fusion, are the rule. In such cases the sperms and the eggs from one individual may fuse with each other, or two individuals may still be needed since the sperms of one will fertilise the eggs of the other only; but the total output of offspring will be great, since so large a part of the energies of the animals is devoted to the production of enormous numbers of both eggs and sperms. Since sexual reproduction is widespread, and since natural selection seems to put a premium on efficiency, it would seem that there must be some compensating advantage in the process.

The explanation of sex lies in the nature of the process of living. Life has been well defined as the mode of existence of certain proteins. These substances replicate themselves, and, in association, form hierarchies. These hierarchies may be very complex indeed, and can only with the greatest difficulty be analysed sufficiently to be usefully understood. They are hierarchies of function: different elements do different things in the functioning whole, and these different things may be of different degrees of consequence. The cooperation of the elements of this hierarchical association is the life of the organism that can be seen, the molecular aggregate that can be touched. There are far more molecules and atoms in an adult organism than there are in the egg and the sperm from which it commonly, though not universally, originates. These have been captured by the key molecules in the egg and sperm, and used and built-in in their replication and in their further organizing of their immediate surroundings. It is in this replication by capture and

may never meet. In some forms, for instance in many internal animal parasites which have reduced chances of getting about and meeting each other, this risk becomes so great that the primary separation of individuals in this way is overborne, and hermaphrodites, capable of producing ele-

organizing that both growth and reproduction consist. In particular the heart of the process of reproduction lies in the replication of the key molecules called genes and the parting of the replicas from the originals so that the replicas may initiate new organisms by their replication and organizing.

Effect of Changed Genes

Now, the structure of genes is liable to change. Changes are very rare indeed, but they do occur. They probably happen by the arrival of energy in the form of radiation, and they probably happen through an imperfection of replication. An imperfect replica, or a gene changed by radiation, if it is still viable, will replicate itself in the new form. It is of the very essence of an organism to be a cooperative effort, so that a change in any cooperating element is likely to lead to consequential changes in the cooperative product. These differences in the end product may increase or decrease the efficiency of the organism in the circumstances obtaining; but these circumstances obtaining are themselves subject to change, and while an alteration of the end product might be bad for it on one occasion it might be good on another. Further, since the end product is the result of a cooperative effort, any particular change in any co-operating element may have one effect among one set of cooperative colleagues and another in different company. It is for these reasons that any system which would allow a changed gene to have more than one chance of showing its worth would be of great value. Changes in genes are rare, and if a changed gene can be tried round in all sorts of company and in all sorts of circumstances it may fit somewhere most profitably. There is a system which will give this chance: *viz.* the issuing of key molecules or genes in pairs, of which one member can be regarded as the great conductor and the other as his imperfect replication or understudy. The great conductor, or dominant gene, directs operations, and his understudy does at least little harm in the guise of a recessive gene. It will be seen at once that if conductors and understudies are allowed to change orchestras and to recombine in pairs, so that sometimes two conductors and sometimes two understudies might find themselves face to face with any orchestra, as well as a conductor and any understudy, then the

chance of an understudy making good and finding an orchestra he could conduct, in circumstances where they would do as he told them, would be very greatly increased. It is just such a series of possibilities that sexual reproduction lays before a changed or mutated gene. It is here that the enormous advantages of the sexual process really lie.

The fusion of egg and sperm mediates the addition (not the fusion) of genes, for genes are discrete entities. It is obvious that if such additions of genes went on from generation to generation gametes would soon be carrying vast numbers of them. This is avoided by the process of meiosis, by which the genes are reduced to half their number in the gametes. The whole number, or double set, is restored at the moment of fertilisation. The single set issued to a gamete by the organism making it, that is by an animal making sperms or making eggs, consists of a set which is whole, but of which any member may be derived from the animal's father or the animal's mother. While the fertilised egg, or zygote, must get all its ordinary genes in a double set, one set from each parent, any particular ordinary gene may have come to it from any of its four grandparents, and any pair of ordinary genes from any two, and from only two, of its grandparents. It is this recombining generation after generation that provides the very large possibility of change in genetic company for genes and permits useless or harmful genes to persist as recessives in the company of their valuable dominant partners.

Survival of the Good Genes

The effect of a recessive gene shows when it is present twice. If this effect, thus permitted to show, is bad, the organism dies or does not reproduce in its turn; if it is good it survives and perhaps wins in competition with its more old-fashioned relatives. But what may be bad today in one company of colleagues may be good tomorrow in another, and in a different place and in different circumstances. It is the system of reproduction called sexual that gives this huge advantage. In nature animals are directed by genes that have thus become dominant; they also carry recessives waiting for time and chance to set out in their turn on the road to dominance.

In many forms, *e.g.* in many protozoa, where fusion of two

individuals, or of parts of two individuals, does not seem to occur, most complex arrangements are found which procure some degree of recombination of genetic elements.

Recombination of Genes

A myriad details of structure and behaviour have come to subserve recombination of genes. Mechanisms have evolved which primarily determine the sex of each individual at fertilisation. By far the most common system here is the location of certain key sex-determining genes on the members of one particular pair of chromosomes. In man, for instance, there is a pair of chromosomes called the X chromosomes which, when present complete, determine the development of the primary female organ or ovary. If only one member of this pair is present in a fertilised egg and the place of the other is taken by a somewhat defective chromosome called the Y, then what develops will not be an ovary at all, but a testis; that is to say, sperms (which are made by a process of meiosis at which the X and the Y are separated, and one, but not both, goes to each sperm) are of two kinds, X and Y, whereas eggs, made by an organism with two similar Xs, are all alike X. It is for this reason that in each generation about half the offspring are male and half female, because half the X eggs will gain another X and be female by construction while half of them will gain the Y and be male by construction. Actually, in many forms, man among them, the Y sperms seem to be more efficient and to fertilise eggs more often than do X ones. There are therefore far more male conceptions than female. But more male than female organisms die young, because the X chromosome has many recessive, sex-linked genes on it, some harmful. These are likely to do no harm if they are masked by a beneficent dominant on the other X, but prove fatal in the male where the Y is too reduced to do much effective masking.

In insects and some other forms the genes, distributed to each cell as the embryo develops, control directly the multitudinous qualities distinguishing the sexes. In mammals and birds, as well as in many other forms, their control is not so direct; their function is chiefly to determine the gonads so that these are differentiated as either ovaries or testes. As the gonads are differentiated, they lead

the organism to produce hormones of the male- or of the female-determining kind. To these hormones and similar substances the developing organism is remarkably accurately attuned in its various parts. It is this precision of response, rather than the complication of the hormone, that is important. The elements of both the male and the female reproductive systems are present in the embryo, but if there is an ovary only the female system of oviducts, uterus, and vagina flourishes. If there are testes present, determined by the XY genetic make-up of the embryo, the female system is reduced to a few small vestiges some of which get built into the prostate gland at the base of the bladder against the front wall of the lower rectum.

Influence of the Endocrines

These vestiges retain their sensitivity to female hormones, and if in later life they become subject to their action through any derangement of the system which leads to the production of female hormone instead of male, or through the breakdown of male into female hormone, they may enlarge and play some part in prostatitis. In the mammals the milk glands are present in both sexes and enlarge in the female in response to progesterin and associated substances produced by her metabolism. The whole endocrine system cooperates to produce and to preserve one sex or the other according to whether an ovary or a testis has developed as a result of the embryo's having chromosomes of the male (XY) or female (XX) kind. Any disturbance of any member of the endocrine set can result in a disturbance of the differentiation. The adrenals, for instance, if they become deranged, may affect the growth and distribution of the hair and the disposition of the individual. The master-gland, the pituitary at the base of the brain, controls the functioning of the gonads of both sexes, but in profoundly different ways. The behaviour, the desires, and the structure of the two sexes are geared through the pituitary to ensure that eggs and sperms shall meet at the right time and in the right place. Nest-building, parental care, male aggressiveness, all subserve the purpose of reproduction by this difficult and elaborate means, and all are organized in the different forms of the oestrous cycle through the endocrine systems of the sexes which complement each other.

In some worms the differentiation of sex seems to depend directly on circumstances—a developing egg goes male if it falls near a female and female if it is allowed to develop without that influence. In some forms sex changes as time goes on, and each individual passes through a stage in which it is of one sex and proceeds to another stage in which it is of the other. In some forms polygamy is the rule, in some polyandry, and in some monogamy. There seems, indeed, scarcely a limit to the ways in which the meeting of sperm and egg can be organized.

Sexagesima (Lat., sixtieth). In the Christian calendar, the Sunday which falls eight weeks before Easter; hence its earliest date is Jan. 25 and latest Feb. 29. It is not exactly the sixtieth day before Easter, but its name arises by extension from Quinquagesima, the following Sunday, which is the fiftieth day before Easter. *See* Calendar.

Sex-Determination. Method by which nature arranges the proportion to one another of the sexes in any species. The advantages to be reaped from the recombination of the genetic units made possible by sexual reproduction can be enjoyed only if the species concerned has developed an efficient means of ensuring the continued production of eggs and sperms. These may be produced by the same individual, called an hermaphrodite (*q.v.*), but more often, in the higher animals, the dimorphism of the gametes occurs through a dimorphism of individuals in the species—a dimorphism of structure and behaviour recognized universally and called the division into the two sexes, the members of one of which produce one kind of gamete, sperms, and members of the other kind eggs. But sexual dimorphism is by no means the only kind of dimorphism known. There are also many examples of polymorphism, in which a number of forms coexist to make up a species fertile within itself.

These dimorphisms or polymorphisms are for the most part nicely controlled by a genetic mechanism. To take a simple instance, there are two forms of guillemot, one with, and one without, a ring round the eye and a streak passing backward. The form having this is called the bridled form and it is spreading in Great Britain. So far as can be observed, there is no advantage

to the species in having in it any particular proportion of bridled and unbridled forms; but it is far otherwise with a dimorphism subserving the production and meeting of eggs and sperms. According to the organization of the sexual lives of the animals in the species—polygamy, polygyny, monogamy, polyandry—the proportions of males and females are important. The genetic mechanism of sex-determination provides a means of arranging these proportions extremely neatly.

A genetic mechanism gives a division of individuals in terms of genes, while the adult is an expression of an interaction, more or less prolonged, between the genes among themselves and between the genes and the rest of the environment. Simple and absolute as the division of genetic types into male and female may be, the division of resulting adults into males and females is not absolute or qualitative, but partial and quantitative. It is customary to call the chromosome carrying the important key-genes of sex-determination the X chromosome. Its opposite number may be reduced, when it is called Y, or absent, when the missing member is represented by O. The rest of the chromosomes are called collectively autosomes. Each egg and each sperm receives an X in the homogametic sex (that having two Xs), only half the eggs and sperms receive an X in the heterogametic sex (that having one X and a Y or O).

Differentiation of the Sexes

The organism resulting from the union of egg and sperm must then be either homogametic or heterogametic, and in different groups one or the other will produce an adult of either sex. Thus in the mammals two X chromosomes will ensure in their cooperation with the autosomes the development normally of an ovary, and one X the development of testes; but in birds, and in moths, one X gives an ovary and two a testis. In some minnows the key genes are very few, and close together. Here it is possible for them to cross over all together on to their opposite chromosome the Y, and indeed some species of minnows are male with two Xs, and some female. Where there are many key-genes, crossing-over seems to be suppressed. Because normal development depends on the cooperation of a sexual set of genes and autosomes, if crossing-over broke a set of key genes

disaster would follow, and it is probable that as evolution has proceeded different groups have settled down with different but safe arrangements for preventing this.

In hermaphrodites there would not seem to be any sexual differentiation at all, so that no such genetic mechanism need be supposed to exist. In some forms (e.g. *Bonellia*, a worm) there is a very sharp sexual differentiation, but there does not appear to be any genetic mechanism. Here the egg develops into a female if it falls on the sea-floor by itself, and into a male if it falls near an adult female. In the insects the genetic mechanism seems to control each step in sexual development. The same race may establish different gene-complexes in members that have evolved far apart from each other geographically so that they have not crossed and mingled genes for a great number of generations. Goldschmidt crossed two such individuals of the gipsy moth (*Lymentria dispar*), and produced a large series of graded intersexes (see Intersex).

Changes of Sex

In a number of forms as the life of the individual proceeds a change of sexual function normally occurs. In some molluscs, for instance, the youngest are male, the next older hermaphrodite, the oldest female. In barnacles, too, a similar series of stages is normally passed through. In birds there seems to be a series of waves of proliferation of reproductive tissue during the normal development of the embryo, and the genetic constitution (XX or XY) settles which wave shall succeed in establishing a gonad, and thus, since the waves are not all productive of the same kind of tissue, whether the gonad established shall be an ovary or a testis. Once established, the gonad, by mediating the production of sexual hormones and active substances, imposes the development of oviduct or sperm duct, and all the other secondary sexual characters.

It occasionally happens that tuberculosis or some other disease may destroy the ovary in a hen. If the bird survives a gonad will regenerate, but the tissue will, so to speak, belong to the next wave of proliferation, and will give a testis. This will impose the development of male qualities, and here is the explanation of the authenticated cases of sex reversal in fowls. In the mammals the same sort of dependance of the

secondary sexual characters is found, and if anything happens to interfere with the production of the proper substances by the gonad, harmonic intersexes will result in which the clitoris, for instance, in the female may tend towards a structure of a penis, and the prostate gland of a male may tend to proliferate what should be a uterus. In this group the elements of the female system (the Mullerian system) and the elements of the male system (the Wolffian system) coexist in the embryo, and the substances produced by the gonad encourage one and discourage the other. Intersexes of this group are quite different in kind from those found in the *Lymentria* moth, when the disturbance is in hormones but in genes. The difference between

Sextant. Left, micrometer model used in navigation. Right, diagram explaining the principles upon which it is worked. See text

hormonic and genetic sex-determination is quantitative. In insects, genes determine cell by cell the character by which the sex of an individual can be distinguished through this control of metabolism at the site of the development of the structure. In mammals and birds, genes determine the characters by which the sex of an individual can be distinguished through their control of the development of the gonad into a testis or an ovary. In mammals and birds, therefore, the circulating and seeping hormones provide an extra chance that something may go wrong as a result of errors in the production of their substances. Natural selection sees to it, however, that sex-determination is good enough in all groups to ensure the production and the meeting of gametes, and hence the continuance of the race.

Paul G. Espinasse

Sextant. Instrument used for measuring angles between distant objects. It forms part of the equipment of the navigator, who uses it daily to measure the sun's altitude at noon, in order to determine the latitude of the ship. It consists essentially of a segment of a circle, on which is a scale or arc divided to about 130 degrees, a telescopic eyepiece, an index mirror placed at the centre of the circle, but fixed to a movable arm, at the end of which is a tangent screw to record the angle, and a fixed second half-silvered horizon mirror. In the illustration (which shows a micrometer model), A is the half-silvered horizon mirror, B the central index mirror, C two of the coloured shades for use in solar observations, D the scale or arc, E the telescope, F the micrometer head for reading minutes and seconds, and G the end of the movable arm.

The observer sights one distant object (P) through the telescope and through the unsilvered half of

mirror (A), and moves the index arm (G) until he can see the second object (S) in the silvered half of the mirror (A) immediately below the object (P). The angle between S and P can now be read on the graduated scale or arc (D). When the index arm is at zero on the scale, the mirrors must be parallel; adjusting screws are provided to secure this condition, and to make them perpendicular to the plane of the instrument. The actual divisions on the scale are marked in degrees, although each scale degree is actually only half an angular degree in size. This is due to the principle of the instrument, for the angle through which the index arm (G) is moved is only half the actual angle to be measured. In the diagram, a is the angle through which the index arm is moved; KA and KB are perpendiculars to the mirrors, and the angle b between them is equal to

a. The angles c and c' between the incident and reflected rays at A and AK are equal. The angle x between SM, the direction of S, and PT, the direction of P, is the angle to be measured. The angles d and d' between the incident and reflected rays at B and BK are each equal to d'' . $x+c'=d''+b$, and $d'=b+c$, hence $x=2b=2a$. See Compass; Navigation.

Sextet or **SESTET**. Composition for six solo voices or instruments. Owing to the difficulty of writing in six real parts, specimens are comparatively rare, but Spohr, Raff, Dvorak, and Brahms have essayed this form of composition for strings only. Beethoven wrote two: one for wind instruments, and one for two horns in addition to strings. The term has also come to be used for the players concerned, as with quartet (*q.v.*).

Sexton (contracted from sacristan). In the Church of England, a parish official appointed, jointly by the incumbent and the church council, as keeper of the various things used in divine worship. Among his duties are the cleansing, lighting, and heating of the church, the filling-up, and sometimes the digging, of graves, tolling the bell, etc. In town churches these duties are usually performed by the vergers, except the cemetery duty, which is fulfilled by cemetery employees.

Sexton, **SIR JAMES** (1856–1938). British politician. He was born, of Irish parentage, at Newcastle, and went to sea when 13. Later he occupied various positions in the trade union world, being general secretary of the National Union of Dock Labourers, 1890,

Sir James Sexton,
British politician

and president of the T.U.C., 1905. From 1918 to 1931 he was Labour M.P. for St. Helens, being knighted in the latter year. He also wrote much for the Labour press, and in 1936 published a book of reminiscences, *James Sexton, Agitator*. He died Dec. 27, 1938.

Sextus Empiricus. Greek philosopher and physician, called Empiricus as belonging to the empirical medical school. He flourished about A.D. 200. In two extant works, *Outlines of Pyrrhonic Philosophy*, and *Against the Mathematicians*, he clearly sets forth the principles of the extrem-

ist Greek sceptics. No proof of any truth, no knowledge, is possible. The existence of bodies cannot be proved, and cause has only a relative meaning. See Scepticism.

Sexual Selection. One of the modes of Natural Selection (*q.v.*). In many animals striking characteristics distinguish one sex or the other, more commonly the male. These may be of appearance and structure or of behaviour or of both. It was at first thought that the existence of such peculiarities as the peacock's display meant that through the evolution of that species peahens had tended to select as their mates the most gifted exhibitionists among their suitors. Later it came to be considered that the display was not so much concerned with the selection of a mate as with the stimulation of the female so that, already paired off, she should permit copulation with her mate at suitable times. It is the pair that achieves simultaneously a desire for sexual intercourse that produces young and rears them. In this sense the pair may be said to be selected as parents.

Seychelles. British possession in the Indian Ocean. With its dependencies, the Seychelles group of islands comprises 92 islets and islands, with a total area of 156½ sq. m. Mahé, the chief island, accounts for a third of the area. Islets in the main group are Praslin, Silhouette, La Digue, Curieuse, Félicité; the dependent islets include the Amirante islands, Cosmoledo group, Assumption, the Farquhar islands, and the Aldabra islands. Incorporated as a dependency of Mauritius in 1810, the Seychelles was made into a separate colony in 1897.

Cotton, rice, and tobacco are cultivated. The exports include copra, guano, cinnamon, vanilla, and coconut oil. Phosphate deposits are also worked. Victoria on Mahé has a good harbour, and is an Admiralty coaling station. Reported to have been discovered in 1505 by the Portuguese Mascaregnas, the Seychelles were later a haunt of pirates; about 1750 they became French and have been held by Britain from 1794. Pop. 33,621.

Seyhan. Vilayet of Turkey. Its capital is Adana (*q.v.*), which is sometimes also called Seyhan. Agriculture is the chief occupation of the vilayet; wool, grain, cotton,

wine, and fruit are exported. The river Seyhan, flooding of which caused the loss of 2,000 lives in 1947, flows through it.

Seyler, **ARTIENE** (b. 1889). British actress. Born May 1, 1889, she was educated at Bedford

Athene Seyler,
British actress

College and the R.A.D.A., making a successful first stage appearance at the Kingsway Theatre, London, in *The Truants*, 1909.

With great vitality and exceptional technique, she excelled in Restoration comedy, *e.g.* *The Way of the World*, *Love for Love*, and *The Country Wife*. She joined the Old Vic company in 1933, and played in Shakespeare, Chekhov, and Wilde. Other memorable performances were in *The Dover Road*, 1922; *The Mask and the Face*, 1924; *The Circle* (revival), 1931; *Watch on the Rhine*, 1942. She appeared also in many films. She collaborated with Stephen Haggard in writing *The Craft of Comedy*, 1944. She became president of the R.A.D.A., 1949.

Seymour. Town in Anglesey co., Victoria, Australia. It is on the Goulburn river, 61 m. by rly. N. of Melbourne, and is an important road and rly. junction, the centre of an agricultural and pastoral area, and the site of a military camp and an officers' training school. Pop. 3,000.

Seymour. Name of a famous English family, now represented by the duke of Somerset and the marquess of Hertford. It is a variant of St. Maur. One of that family long settled in Monmouthshire married about 1360 an heiress of the family of Beauchamp. Their son, Sir William St. Maur, had estates in the west of England, and his descendant, Sir John, who called himself Seymour, was the father of Edward Seymour (*c.* 1506–52), made duke of Somerset and lord protector. Edward's sister was Jane Seymour, third queen of Henry VIII. Many Seymours served the state in various ways, and Francis Seymour Conway was made marquess of Hertford in 1793. See Hertford, Marquess of; Somerset, Duke of.

Seymour of **SUDELEY**, **THOMAS** SEYMOUR, **BARON** (*c.* 1508–49). English admiral. He was son of Sir John Seymour of Wiltshire, and brother of Jane Seymour. Employed by Henry VIII on various

Seychelles arms

diplomatic missions, he was appointed ambassador to the Netherlands and marshal of the English forces there during the Spanish war, 1543. He served as master of ordnance and admiral of the fleet in the French campaign, 1544. After Henry's death he was made lord

Baron Seymour of Sudley,
English admiral
After Holbein

high admiral and secretly married the king's widow, Catherine Parr. Seymour then commenced against his brother the duke of Somerset, a series of intrigues which resulted in his arrest for treason and his execution on Tower Hill, March 20, 1549.

Seymour, JANE. For details of the third queen of Henry VIII, see Jane Seymour.

Seymour, ROBERT (c. 1800-36). British artist. Born in London, of poor parents, he received a scanty education, and was apprenticed to a pattern-drawer. He spent his leisure in sketching and painting miniatures, and when his apprenticeship was over be-

Robert Seymour,
British artist

came a professional artist. During 1833-36 appeared his *Humorous Sketches*, frequently reprinted, and from 1831 to his death he illustrated *Figaro* in London. An invitation to Dickens to provide letterpress for a series of Cockney sporting pictures by Seymour led to the publication of *The Pickwick Papers* in 1836. But Seymour, whose increasing moroseness had been exacerbated by a quarrel with the editor of *Figaro* in London, shot himself, April 20, 1836, before the second part of *Pickwick* was published. See *Pickwick Papers* and *illus.*

Seyne-sur-Mer OR LA SEYNE. Seaport of France, virtually a suburb of Toulon. In the dept. of Var, it stands on an opening of the Mediterranean, just opposite Toulon. Connected by rly. and steamer with Toulon, it has ship-building yards. Pop. est. 27,000.

Seyss-Inquart, ARTUR (1892-1946). Austrian politician. He was born in the Sudeten area July 22, 1892, and educated at Vienna

university. In 1928 he joined the Austrian Nazi party, and as one of its leaders prepared the way for Hitler's occupation of Austria in 1938. After the Anschluss he became governor of the country; following the German invasion of Poland in 1939 he was deputy governor-general of that country until in May, 1940, he became high commissioner of the German-occupied Netherlands, where he was responsible for the deaths of many Dutch Jews and resistance workers. Captured in Germany, May 8, 1945, he was charged with war crimes before the Nuremberg tribunal, sentenced to death, and hanged on Oct. 16, 1946. *Pron.* Sice-ink-vart.

Artur Seyss-Inquart,
Austrian politician

Sezze. City of Italy, the ancient Setia. It is in the prov. of Littoria, 52 m. by rly. S.E. of Rome, and stands on a hill overlooking the wide unpopulated waste of the Pontine marshes. The Gothic cathedral dates from the 4th century. Ruins of the ancient city walls built of massive stone blocks and of a similarly built temple exist. Sezze became a Roman colony in 382 B.C. Pop. 7,000.

Sfax. Seaport of Tunisia. It stands on the N. shore of the Gulf of Gabes, about 150 m. S. of Tunis, to which there is a rly. line. There is trade in fruit, nuts, olive oil, sponges, phosphates, and esparto grass. In the Second Great War Sfax was entered April 10, 1943, by the British 8th army pursuing the Axis forces after the battle of the Mareth Line (*q.v.*). Pop. 43,333.

Sforza. Name of Italian family that succeeded the Visconti as dukes of Milan, holding the throne

Francesco
Alessandro Sforza,
Duke of Milan

from 1450 to 1535. The name Sforza (strong) was first given to Muzio Attendolo (1369-1424). He was of peasant stock, and became a soldier of fortune, fighting, among other allegiances, for Florence, 1401, Pisa, 1405, Pope John XXIII, and Naples, of which he became constable. His son, Francesco Alessandro Sforza (1401-66), entered the service of the Visconti, 1426, but his allegi-

ance changed, and he fought against Visconti for Florence, 1437-39. After capturing Milan, 1450, he made himself duke. Though a reckless and profligate man, he was a patron of refugee scholars from Constantinople.

The duke's son, Galeazzo Maria (1444-76), served under Louis XI of France, and, earning the bitter hatred of his subjects, was assassinated. His daughter was Caterina Sforza (1463-1509), famous for her great courage and resource when besieged in Forlì by Cesare Borgia and his French auxiliaries, 1499. When forced to surrender Forlì, she was for a time imprisoned in Rome, and died in Florence. Galeazzo

Galeazzo Maria
Sforza, Duke of
Milan

zo's sons were Gian Galeazzo Maria (1468-94) and Ludovico il Moro, or the Moor (1451-1508), who imprisoned and probably poisoned the former, seizing power in 1489. He was the patron of Leonardo da Vinci, opposed Charles VIII, and lost Milan to Louis XII in 1499, dying a prisoner at Loches in Touraine. The last duke of the line was Francesco Maria (1492-1535), who lived obscurely and died without heir. See Milan.

Sforza, CARLO, COUNT (b. 1873). Italian statesman. He was born, Sept. 25, 1873, at Montignoso di Lunigiana.

After graduating from the university of Pisa, he entered the diplomatic service, being minister to China, 1911-15, minister to Serbia, 1915-18, Italian high commissioner in Turkey, 1918-19, ambassador to France, Feb.-Nov. 1922, when he resigned on Mussolini's seizure of power. He had been foreign minister 1920-21. He was a vigorous opponent of fascism from its beginning, and led the democratic opposition from 1922 until political parties were suppressed in 1926, leaving Italy for France in 1928. On the German invasion of France in 1940, he went to the U.S.A., where he was active in anti-fascist propaganda. At the Montevideo conference of free Italians (1942), he was proclaimed leader of the free Italian

Count Carlo Sforza,
Italian statesman

movement. After the Allied armistice with Italy, 1943, he returned to his country where he associated himself with the Action party, which wanted to abolish the monarchy. This led the British to view him with disfavour, and it was not until after the king's abdication that he became minister without portfolio in 1944. He became president of the consultative assembly, 1945-46, and minister of foreign affairs, 1947.

Sganarelle. Character in several of Molière's plays, notably *Le Médecin Malgré Lui* (q.v.) and *L'École des Maris* (q.v.). It is also the title of one of his less well-known plays, of which a translation in broken English forms the second act of Sir W. Davenant's *The Playhouse* to be Let. Sganarelle was also translated by Sir John Vanbrugh.

Sgraffito (Ital. *sgraffiare*, to scratch). Term applied to certain methods of mural decoration and pottery work. In the former, a layer of white plaster is laid over one of black, and the top layer is excised so as to expose the black underneath in the required pattern. The effect thus produced resembles, at a distance, that of a coloured bas-relief design. In pottery, the term is applied to the process by which a clay of one colour is superimposed upon one of a different, and a design produced by cutting away the outer coating. This method of decorating earthenware is probably of Italian origin; examples of 15-17th century *sgraffiti* are to be seen in the British and Victoria and Albert Museums.

Shabatz OR SABAC. Town of Yugoslavia, in Serbia. It is situated on the Save, 38 m. W. of Belgrade, and was a prosperous town before the First Great War. On the edge of the fertile plain known as the Matchva, lying in the angle between the Save and the Drina, it had a considerable trade in grain and cattle. Its strategic importance led the Romans and the Turks to fortify it. During the First Great War it was occupied by the Austrians, Aug. 12, 1914, and evacuated by them twelve days later. Shabatz was occupied by them for a short time again in 1914, but they lost it in Dec., after the battle of the Kolubara. It passed to them once more in Sept., 1915, and remained in their hands till the beginning of Nov., 1918.

Shabatz, BATTLE OF. Called also the battle of the Jadar, this was fought in Aug., 1914, between the Austrians and the Serbians. By Aug. 15, 1914, the Austrians,

in their first invasion of Serbia, occupied the N.W. corner of the country from Shabatz on the N. to Liubovia on the S. The Serbian armies were under Marshal Putnik.

Putnik's first care was to cut off the Austrians in Shabatz from those farther S., and on Aug. 16, the former were routed at Belikamen. On the same day, however, the Serbians on the Tzer range, as well as on the Iverak hills, had been forced back by the Austrians.

On Aug. 17 Putnik took up a new line. On his extreme right he was feeling his way towards Shabatz, but found the position there too strong at the moment. Developing a combined movement against Tzer and Iverak with the left and centre of the 2nd army, he took the heights of Trojan and Parlog, victories which were somewhat offset by an Austrian advance on Iverak, and the continued pushing forward of the Kuprani force, in conjunction with a force from Liubovia, which threatened his left. On Aug. 18 the Austrians from Shabatz were defeated when trying to join up with their Tzer forces, who, that day, were driven from Kosanigrad, while their Iverak forces were held and then beaten at Yugovitchi and Velika Glava. Farther south the Serbians counter-attacked with success the Kuprani and Liubovia detachments. The Serbian victories on Tzer and Iverak were decisive on Aug. 19, when the Austrians retreated across the Drina. Putnik thereafter turned his attention to Shabatz, where the Austrians showed fight, but were defeated on Aug. 23, and evacuated the town next day. See Serbia.

Shackleton, SIR DAVID JAMES (1863-1938). A British Labour leader and administrator. Born at Nelson, Lancashire, he was educated at an elementary school at Haslingden, and began work in a cotton factory as a boy. In 1893 secretary of the weavers' association at Ramsbottom, in the next year he was transferred to Darwen. M.P. for Clitheroe in 1902, he was elected president of the Labour party 1905, and chairman of the T.U.C. 1908 and 1909. In 1910 Shackleton left parliament to

become senior labour adviser to the home office. In 1912 he was made an insurance commissioner. During 1916-21 he was permanent secretary to the ministry of Labour, being knighted in 1917, and having been its chief labour adviser, 1921-25, he retired in 1925. He died Aug. 1, 1938.

Shackleton, SIR ERNEST HENRY (1874-1922). British explorer. Born at Kilkeel, Ireland, Feb. 15, 1874,

Sir E. H. Shackleton, British explorer of the Antarctic

he was educated at Dulwich College, and entered the mercantile marine. In 1901 he was in the Antarctic Expedition under R. F. Scott (q.v.), and was secretary to the Royal Scottish Geographical

Society during 1903-06. He commanded the British Antarctic Expedition of 1907-09, which ascended Mt. Erebus, reached the south magnetic pole for the first time, and attained a point 97 m. from the South Pole itself. He also commanded the Antarctic Expedition of 1914-17, and in 1921 sailed from London at the head of the Shackleton-Rowett Antarctic Expedition in the Quest. Shackleton died of heart-failure, following influenza, on board the Quest at about 3.30 a.m. on Jan. 5, 1922, while his ship was at South Georgia (q.v.). His body was taken to Montevideo with the intention of bringing it to England, but on Feb. 3 it was announced it would be taken back to South Georgia and interred on that island. The expedition continued under Commander Frank Wild. Shackleton was knighted and appointed C.V.O. in 1909. He wrote *The Heart of the Antarctic*, 1909, and *South*, describing the 1914-17 expedition, 1919. There is a memorial to him on the Royal Geographical Society's building, Exhibition Road, London, S.W.7. See *Antarctic Exploration*; *Erebus*; *Quest*. Consult *Lives*, H. Bogle, 1922, H. R. Mill, 1923, F. Worsley, 1931.

Shad. Species of fish of the herring family. The *Allis shad* (*Alosa alosa*) is common about the coasts of Europe and often found in the lower reaches of rivers. It varies in length from one to two feet, and in appearance much resembles a large herring with a few black spots on the sides. The *twait* shad (*A. finla*) is more often found in southern waters.

Shad. Common European variety, *Alosa alosa* or *Allis shad*

Shaddock (*Citrus decumana*). The older name for the green tree of the family Rutaceae, now better known as grape fruit (*q.v.*).

Shadoof. Water-raising device common in Egypt. Chiefly for distributing water from the Nile into irrigation channels, it consists of two wooden posts supporting a cross-bar, the latter carrying a beam with a weight at one end and at the other a bucket suspended from a length of palm stick. The water can thus be raised to a height of 8 ft., but in some parts of Upper Egypt as many as five shadoofs are required to raise the water in relay from low-lying rivers.

Shadow. In optics, phenomenon due to the cutting off of light by an opaque object. Shadows, by their formation, afford the simplest proof of the propagation of light in straight lines, for it is found that the edge of a shadow formed by a point of light, *e.g.* a pin hole in a dark shutter, is in a straight line with the edge of the object and the source of light. In order to find the form of a shadow cast by a point of light it is only necessary to draw lines from the source to the screen so that they touch the edge of the object.

When, however, the source is not a point but a large body, there is no longer a simple black shadow with sharp outline. In the figure the light from a point A on the luminous source would throw the shadow of the object on to the screen at H K. Similarly the shadow cast by B would be G J. All intermediate points on the source would cast shadows between G and K. It will thus be seen that H J will be the only part of the screen completely

Shadow. Diagram explaining cause of the optical phenomenon. See text

in shadow, or completely cut off from the whole of the source of light. This part of the shadow is called the umbra. The rest of the shadow, the penumbra, is not completely dark, but gets darker from the outside to the edge of the umbra. The umbra and penumbra of shadows are important during eclipse of the sun by the moon. Observers in the umbra see a total eclipse or annular eclipse, and in the penumbra a partial eclipse.

If the shadow cast by an opaque object in the path of a beam of

Shadoof. An Egyptian contrivance for raising water from the Nile for irrigation purposes

light is examined microscopically the edge will be seen to be not absolutely sharp, and a series of light and dark bands will be observed near the edge. The corpuscular theory of light could not explain this so-called diffraction effect, which was one of the strongest points in favour of Fresnel's wave-theory.

Shadows exist in most forms of radiant energy, in the sense that they are spaces from which the energy has been cut off by interposition of some body. See Light.

Shadow Cabinet. Political term in Great Britain to describe a committee formed by the opposition party in the house of commons. It consists of the ministers who held office when their party was last in power, and, under the chairmanship of the ex-prime minister, acts as advisory committee to formulate party policy. The term was first used when the Liberal party went into opposition in 1923. The official title of the Conservative shadow cabinet is consultative committee.

Shadow Factory. Term introduced during the British rearmament programme in 1936 to describe munition plants which, although not in full production, could begin work at short notice. The term was used chiefly in relation to the aircraft industry, but makers of motor vehicles also built shadow factories for the production

of aero engines and armoured vehicles.

Shadwell. Dist. of E. London. Part of the parish and met. bor. of Stepney (*q.v.*), it is in the parl. div. of Whitechapel and St. George's. Its church of S. Paul, 1670-71, was rebuilt in 1820-21. Shadwell contains the East London hospital for children, 1868. A tunnel connecting Shadwell with Rotherhithe (usually called the Rotherhithe tunnel) was opened in 1908. Shadwell Basin forms part of the London docks.

Shadwell, ARTHUR (1854-1936). British scientist and writer. Born Sept. 21, 1854, he was educated at Uppingham and Keble College, Oxford, studied medicine at S. Bartholomew's Hospital, and practised at Brighton, 1883-87. Special correspondent to The Times in Russia and Germany during the cholera epidemic, 1892, he was cholera superintendent to the metropolitan asylums board, 1893. Later he devoted attention to social, economic, and industrial subjects, and wrote The London Water Supply, 1899; Drink, Temperance, and Legislation, 1902; Industrial Efficiency, 1906. In The Socialist Movement, 1925, and Typhoeus, or The Future of Socialism, 1929, he criticised Socialist ideas. He died March 21, 1936.

Shadwell, THOMAS (c. 1642-92). English dramatist. Born at Weeting, Norfolk, he studied at Caius College, Cambridge, and the Middle Temple. He wrote about 17 plays which, though inferior as drama, show an intimate knowledge of the London underworld of his day, and were remarkable for their censures of contemporary morals. Dryden, whom he had attacked, immortalised Shadwell in Mac-Flecknoe, or a satire on the True Blue Protestant Poet, T. S., 1682, and satirised him again as Og in Absalom and Achitophel. Shadwell, however, succeeded Dryden as poet laureate, and died Nov. 19, 1692. His works were edited by G. Saintsbury, 1925.

SHAEP. Abbrev. for Supreme Headquarters Allied Expeditionary Force. This was formed on Feb. 15, 1944, to direct Allied military operations before, during, and after the invasion of Europe, and remained in existence until July 13, 1945, when the Allied military govt. assumed control of defeated Germany. See Allied Expeditionary Force; D-day; Second Great War.

Shaft. In mechanics, a unit of a power transmission system, usually consisting of a round bar

of iron or steel, revolving in bearings. The revolving shaft may drive direct by means of belting, or have wheels or pulleys attached to it for the same purpose. Such shafts receive names according to their specialised work, e.g. propeller shaft. A countershaft is an intermediate between a main shaft from which it is driven and a machine to which it transmits motion. *See* Belt and Rope Drive; Crank; Motor Vehicle; *see also* Shaft-sinking.

Shaftesbury or SHASTON. Mun. borough and market town of Dorset, England. It is 28 m. N.W. of Dorchester and 103 S.W. of London, its nearest rly. station being Semley. The chief building is the church of S. Peter, a Perpendicular edifice; those of Holy Trinity and S. James are old foundations rebuilt. Shaftesbury is said to have been founded by King Alfred, and there was a Benedictine abbey here at an early date, in which Canute died in 1035. It became a borough, and from 1294 to 1885 was separately represented in parliament. In the Middle Ages Shaftesbury was a place of pilgrimage; today it is a centre of agricultural trade. Market day, Sat. (alternate). Pop. est. 3,400.

Shaftesbury, ANTHONY ASHLEY COOPER, 1ST EARL OF (1621-83). English statesman. He was born

1st Earl of Shaftesbury, English statesman
After Lely

July 22, 1621, at Wimborne St. Giles, Dorset, and educated at Exeter College, Oxford. In the Civil War Cooper, after serving in the royal army, joined the parliamentary forces, 1644. He sat in Barebone's and other Commonwealth parliaments, after 1655 in opposition. At the Restoration he was placed on the privy council, made Baron Ashley, and chancellor of the exchequer, 1661. He showed great diligence and ability, and was a member of the Cabal (*q.v.*).

In 1672 he was made earl of Shaftesbury and lord chancellor,

but espousing the popular cause of Protestantism, was dismissed, 1673, and joined the opposition. His violence led to his committal with Buckingham to the Tower, 1676, where he was confined two years until he submitted. Shaftesbury made use of the Popish Plot of 1678-80 to secure, among others, the judicial murder of his personal enemy Lord Stafford (*q.v.*). On the fall of Danby he became lord president, 1679, and carried the Habeas Corpus Act, but a proposal to exclude James from the succession in favour of Monmouth gave Charles the opportunity for his

Shaftesbury, Dorset. Gold Hill with the old wall on right

final dismissal. Attempts to foment rebellion brought him to the Tower again, 1681, and, being acquitted of treason by a Whig jury, Shaftesbury fled to Holland, 1682, and died at Amsterdam, Jan. 22, 1683. A man of great capacity and versatility, Shaftesbury was true only to his own interests. Dryden's Absalom and Achitophel describes his character. *Consult* Lives, W. D. Christie, 2 vols., 1871; H. D. Traill, 1886; L. F. Brown, 1934.

Shaftesbury, ANTHONY ASHLEY COOPER, 3RD EARL OF (1671-1713). English philosopher. Born in London, Feb. 26,

1671, son of the second earl, he was educated privately under the care of John Locke, at Winchester, and abroad, soon showing intellectual gifts of a high order, and giving much time to study. During 1695-98 he was M.P. for Poole, but his incursions into political life were intermittent. In 1699 he succeeded his father in the earldom, and he died at Naples, Feb. 15, 1713. His only son, Anthony, became the 4th earl.

3rd Earl of Shaftesbury, English philosopher

Shaftesbury's system of philosophy attracted the attention of Voltaire, Diderot, Leibniz, and other European thinkers. His ideas were set forward in various writings, especially his *Characteristics of Men, Manners, Opinions, Times*, 1711. This was republished, ed. J. M. Robertson, 1900.

Shaftesbury, ANTHONY ASHLEY COOPER, 7TH EARL OF (1801-85). English philanthropist. Son of the 6th earl, he was born April 28, 1801, and educated at Harrow and at Christ Church, Oxford. M.P. for Woodstock, 1826, Dorchester, 1830-31, and Dorset, 1831-46, he was made a lord of the Admiralty in 1834 and in 1851 succeeded to the earldom.

In 1828 he agitated for various reforms in the treatment of lunatics; in 1833 he turned his attention to mill-workers, and after many years obtained legislation introducing a ten-hour day and affording protection to children in the factories. In 1842 he succeeded in getting through a bill preventing women and children from working underground in mines. In 1846 he turned his attention to the Ragged Schools instituted for poor children, and was the chief instrument in extending their influence throughout the kingdom. Many kindred institutions also owe their existence to Shaftesbury. He died Oct. 1, 1885. *Consult* Life, by J. L. and B. Hammond, 1923; Noble Lord, B. Blackburn, 1949. In 1886 his grandson, also Anthony Ashley Cooper (b. Aug. 31, 1869), succeeded to the title as 9th earl. *See* Eros.

7th Earl of Shaftesbury, English philanthropist

Shaftesbury Society AND RAGGED SCHOOL UNION. Name taken in 1914 by the Ragged School (*q.v.*) Union of which the 7th earl of Shaftesbury (*v.s.*) was first president.

Shaft-sinking. Construction of deep wells for water supply and of vortical openings to give access to and ventilate mines and rly. tunnels. If the ground is firm and free from water they are usually of square section; but circular if they will be exposed to external pressure. Masonry and iron are commonly used for the lining. Where the ground is fairly dry the shaft is excavated and lined a section at a time. In waterlogged ground sinking may be done on the pneu-

matic caisson principle, and a segmental lining like that of a tube tunnel be used.

The Kind-Chaudron process of sinking through watery ground is as follows: A pilot shaft, 4 or 5 ft. in diameter, is drilled to firm ground with a large boring tool, and the shaft is then enlarged to full size with a similar tool of greater diameter guided by the pilot. The lining of segmental cast-iron rings is lowered from the top when the boring is complete, rings being added in succession. The bottom is closed by a diaphragm, through which a pipe is carried to the surface, and outside the lowest rings are an upper fixed and a lower sliding collar, with moss or oakum between them. The lining is thus converted into a huge plunger, sunk by allowing water to escape gradually through the tube. When the lining reaches bottom, the lower collar of the "moss-box" is forced upwards by the weight, squeezing the moss against the fixed collar and the ground outside the lining. The action is much the same as that of a patent pickle-bottle stopper or drain-plug. The space between lining and ground is filled in with hydraulic cement, and the water pumped from the interior. Shafts several hundred feet deep have been lined in this manner.

Quicksands are solidified by freezing the ground to be excavated with brine circulated in pipes sunk at intervals round the side of the shaft. Each pipe has a plug at the bottom, and contains an open-ended interior pipe. The brine is forced down through the small pipe and returned to the surface between it and the larger pipe. In the course of a few months the ground is frozen hard, and is kept in that condition while the shaft is excavated and lined. To thaw the ground, warm brine is circulated through the pipes.

The Joosten process is also used for the solidification of loose ground, such as ballast, gravel, and sands, by the injection of two chemical solutions, one after the other. This has the effect of forming a silica gel, and the free silicic acid generated during the process combines with the loose quartz particles, and binds the whole into a solid permanent mass, insoluble in water. Petrification is almost instantaneous. Several escalator shafts and tunnels of the London underground railway system have been constructed with the aid of chemical solidification. Compressed air has been successfully used.

Shag OR **GREEN CORMORANT** (*Phalacrocorax aristotelis*). British bird, common about the coasts. It

Shag or Green Cormorant. Small diving bird which frequents the British coasts
W. S. Berridge, F.Z.S.

is distinguished from the common cormorant by its smaller size and greenish plumage; and it spends less time on the rocks, besides being less numerous. It preys upon fish, which it catches by diving.

Shaggy Ridge. Name given by men of the Australian 7th div. to a spur of the Finisterre range, New Guinea. It lies c. 30 m. S. of Madang; 5,600 ft. high, it terminates in a conical peak named by the Australians the Pimple, which is 100 ft. higher. It dominates the upper Ramu valley through which the Australians were advancing against the Japanese in 1943 and, strongly fortified by the Japanese, had to be taken by frontal attack. After several days' bombardment of the ridge from the air the Australians stormed the Pimple, Dec. 27 (mid-summer), in torrential rains. Only near the crest of the ridge, so narrow in places that two men could not stand side by side, did they encounter resistance; but there savage hand-to-hand fighting continued until Jan. 21, 1944, before the Japanese were driven from Shaggy Ridge.

Shagreen. Untanned leather with a granular surface. The word is said to be derived from Turkish and Persian *saghri*, the back of a beast of burden, shagreen being made from the skin of the horse, ass, camel, and other animals. The characteristic surface is produced by pressing into the wet skin small seeds, which are removed when the skin is dry. Shagreen is also made from shark-skin. It is used for polishing wood and, usually dyed green, for sword and dagger-handles, horse trappings, small cases and boxes, etc. In the late

18th century it was a favourite material for covering watch cases. Many old Persian manuscripts are covered in shagreen. *Chagrin* is the French form of the word, used to denote vexation or mortification, from the grating nature of the material.

Shah. Title of the rulers of Persia. It is an abbrev. of *padshah*, lord king. The Turkish form is *padishah* (q.v.).

Shahabad. District of Bihar, India, in the Patna division. It is situated between the river Son and the Uttar union and S. of the Ganges. Rice, other cereals, and pulses are the chief crops. A third of the cultivated area is irrigated. Total area, 4,408 sq. m. Pop. 2,328,581.

Shahabad. Town of the Uttar union, India, in Hardoi district. It is situated on the N. border of the dist., 75 m. N.W. of Lucknow, on the rly. between Hardoi and Shahjahanpur. Pop. est. 24,000.

Shahabad. Town of Hyderabad, India. Situated about 300 m. S.E. of Bombay, it is noted for limestone quarries, the stone and cement from which are exported. It stands on a tributary of the Bhima and on the rly. between Raichur and Sholapur.

Shahapur. Town of India, in the former state of Sangli, Bombay state. It is the chief trading centre in the state, and dyeing silk is the principal industry. Pop. 13,000.

Shahjahanpur. District and town of the Uttar union, India, in the Ronilkhand division. The dist. stretches from the Ganges almost to the boundary of Nepal. Annual rainfall is 37 ins., and wheat, barley, and millet are the chief crops. Area, 1,770 sq. m. The town is a centre from which five rly. lines radiate, and has sugar factories and a rum distillery. Pop., dist., 983,385; town, 110,163.

Shah Jehan (d. 1666). Mogul emperor. Son of Jahangir, he fought bravely against the Rajputs

Shah Jehan,
Indian ruler

in 1614, but rebelled against his father in 1622. He was defeated in 1624 and pardoned, ascending the throne on Jahangir's death, 1627. His reign was one of constant warfare, but was signalised by an excellence of architecture unknown in India before or since. At Agra the Taj Mahal (q.v.) and the Pearl

Mosque were built by Shah Jehan, while the city of Delhi was founded by him. He made the Peacock throne, valued at £8,000,000, and captured by Nadir Shah, 1759. From 1658 Shah Jehan was imprisoned by his son Aurungzebe (*q.v.*) at Agra.

Sha-ho, BATTLE OF. Engagement of the Russo-Japanese War. Fought Oct. 7-17, 1904, it resulted from a Russian attempt to relieve Port Arthur (*q.v.*). The Russians opposed about 250,000 men to the 150,000 of the Japanese. Their plan was to move down the rly. from Mukden and endeavour to turn the Japanese right, and cut Japanese communications.

The advance began Oct. 4. On the night of Oct. 10 the opposing forces faced each other on a front of 40 m. from the Hun-ho on the W. to Pen-hsi-hu on the E. On Oct. 11 the Russian commander, Kuropatkin, strove to maintain his position on the Sha-ho river, while his left attempted the turning movement; but his troops were forced back on the right and centre. Next day the left was recalled and the Russians fell back toward the Sha-ho. On the 13th, pursuing Japanese drove them to the river, and by the 17th had forced them across to the left bank. Both sides then went into winter quarters on opposite banks of the Sha-ho, the Russians awaiting reinforcements, the Japanese awaiting the fall of Port Arthur before risking further attack. In this engagement the Russians lost over 40,000 men, the Japanese less than 20,000. See Russo-Japanese War.

Shahpur. District and town of Punjab, Pakistan, in the Rawalpindi division. The dist. lies W. of the Chenab, and is crossed by the Jhelum. The chief crops are wheat, millet, and cotton. Salt is obtained from the Salt Range at Warcha. The town lies E. of the Jhelum. Area, 4,770 sq. m. Pop., dist., 998,921; town, 10,400.

Shahpura. Town and former state of India, since 1948 part of Rajasthan. The state lay S. of Ajmer state on the E. side of the Aravalli Hills. Its area was 405 sq. m. Pop. 61,173. The town is 60 m. S.E. of Ajmer town. Pop. 9,600. The state was one of the first to decide to accede to the dominion of India in 1947.

Shahraban. Town of Iraq. Situated on the Diala river, where it breaks through the Hamrin Hills to the plain, it is about 50 m. N.E. of Bagdad, with which it is connected

by rly. During the First Great War it figured in the Mesopotamian campaign, and was occupied by the British in March, 1917. Here in Aug., 1920, six Englishmen and a handful of natives heroically defended the barracks during an Arab rising. Five were killed, including E. L. Buchanan, assistant irrigation officer. His widow was captured by the Arabs. She described the defence and her experiences in a book, *In the Hands of the Arabs*, published in 1921.

Shaikh OR **SHEIKH** (Arab., chief). Division of the Mahomedan community in India and Pakistan. The term now has little significance, as it has been so widely adopted by Muslims of all classes, and no special enumeration is made in the census. The title, properly denoting the spiritual leaders of the Sufi sect, should be confined to strict Muslims of Arab descent. The word is also used for a chief among the Arabs, but usually spelled sheik (*q.v.*).

Shairp, JOHN CAMPBELL (1819-85). Scottish scholar, critic, and poet. Born at Houstoun, West

Lothian, July 30, 1819, and educated at Edinburgh Academy, Glasgow university, and Balliol College, Oxford, he was professor of Latin at, and eventually principal of, St. Andrews university.

In 1877 he became professor of poetry at Oxford. Among his works are *Kilmahoe*, 1864, notable for its beautiful lyric, *The Bush abune Traquair*, *Studies in Poetry and Philosophy*, 1868, *Culture and Religion*, 1870, *Burns*, 1879, and *Glen Dessaray*, 1888, another volume of poems. He died Sept. 18, 1885.

Shake OR **TRILL**. Musical ornament consisting of the rapid alternation of a note with that next above it in the scale. It is usually indicated by *tr.* (*tr. trillo*) and as a rule ends with a turn, which may or may not be written out.

The early practice was to commence the shake on the upper note, but for the last century it has

been customary to begin on the principal note, as above, and now when the older effect is desired the composer indicates it thus:

The performance of the shake in the 18th century was governed by very exact rules according to the nature of the passage.

Shakers. American religious society, founded about 1776 by Ann Lee (*q.v.*). An offshoot of the Society of Friends, they call themselves the Millennial Church or the United Society of Believers. Their religious worship originally included dancing and contortions of the body. They reject the use of the Sacraments, discourage marriage, and claim that true Christianity was never taught between the days of the Apostles and the rise of Mother Ann. Their buildings are bare and their dress plain. Their numbers are steadily decreasing, and only four small settlements remain. Their headquarters are at New Lebanon, N.Y., where they founded their settlement in 1787. An English sect of Shakers was founded in the New Forest in 1864 by Anno Girling (d. 1866), who claimed to be the incarnation of Christ.

Shakespeare, SIR GEOFFREY HITHERSAY (b. 1893). British politician. Educated at Highgate, and Emmanuel College, Cambridge, where he was president of the union, he entered politics in 1921, becoming secretary to Lloyd George. Called to the bar in 1922, he was National Liberal M.P. for Wellingborough 1922-23. After a spell in journalism he became, in 1929, Liberal M.P. for Norwich, continuing to sit as a Liberal National from 1931 to 1945. He was parliamentary under-secretary for the dominions, 1940-42. Created a baronet in 1942, he became a privy councillor in 1945.

Shakespeare, JOHN HOWARD (1857-1928). British divine. Born at Malton, he was educated at University College, London, and for the Baptist ministry at Regent's Park College. In 1883 he became a Baptist minister at Norwich, where he remained until 1888, when he was chosen secretary of the Baptist Union. He retired in 1924. Editor of *The Baptist Times*, Shakespeare was a prominent Nonconformist, being president of the Free Church Council in 1916. His books include *The Churches at the Cross-Roads*, 1918. He died March 12, 1928.

WILLIAM SHAKESPEARE

Sir Sidney Lee, D.Litt., Author of *A Life of William Shakespeare*

For details of Shakespeare's plays and characters see the articles under their respective titles, e.g. Hamlet; Macbeth; Falstaff; Juliet, etc. See Bacon-Shakespeare Controversy; Bankside; Blackfriars; Pytton; Globe Theatre; Leicester Square; Sholtery; Stratford-on-Avon; also Drama; English Literature

William Shakespeare was baptized in the parish church of Stratford-on-Avon, Warwickshire, April 26, 1564. He died April 23, 1616. His father, John Shakespeare, son of a farmer of Snitterfield, settled in Stratford about 1551, as a dealer in agricultural produce; he soon took an active part in municipal affairs, holding the office of bailiff, or mayor, in 1568-69; his wife, Mary Arden, was daughter of a substantial farmer of Wilmcote.

The dramatist was the third, but eldest surviving, child of the marriage. Of five younger children, three sons, Gilbert, Richard, and Edmund, and a daughter, Joan, reached maturity. William was educated at the grammar school of the town, and was soundly trained there in Latin literature. The dramatist left school in his 14th year. He is traditionally reported to have been "apprenticed to a butcher." At the end of 1582, when in his 19th year, he married Ann, daughter of Richard Hathaway, a farmer of Sholtery. Richard Hathaway's home is still preserved, and is known as Ann Hathaway's Cottage. Ann was Shakespeare's senior by eight years. A daughter, Susanna, was born within six months of the marriage, and twins—a son, Hamnet; and a daughter, Judith—early in 1585. The son died in his 12th year; the two daughters survived their father.

An Actor in London

In 1586 Shakespeare left his native town. Seventeenth-century tradition assigns the immediate cause to a threat of prosecution for poaching in the neighbouring Charlecote Park, belonging to Sir Thomas Lucy, whom Shakespeare ridiculed later as Justice Shallow. After a short experience as a country schoolmaster, Shakespeare reached London early in 1587. There he found humble employment in Shoreditch, at The Theatre, the only playhouse then existing. He was quickly admitted member of a company of actors, to which he remained faithful during the rest of his career. The successive patrons who gave their names in turn to Shakespeare's company were Queen Elizabeth's favourite, the earl of Leicester; the 4th earl of Derby; the 1st and 2nd Lords Hunsdon (both of whom held the office of lord chamberlain); and finally, after the death of Queen

Elizabeth, James I. King James, on May 19, 1603, issued letters-patent to Shakespeare and his colleagues, licensing them "freely to use and exercise the arte and facultie of playing." Thenceforth Shakespeare's company was commonly styled "The King's Servants," and took foremost rank.

With Kemp and Burbage

Throughout the winter and spring of each year, notably at Christmastime, the acting companies were summoned to perform at the royal palaces. As early in Shakespeare's career as Christmastide, 1594, he joined two eminent colleagues, William Kemp, the chief comedian of the day, and Richard Burbage, the chief tragedian, in rendering at Greenwich Palace "two several comedies or interludes" on St. Stephen's Day, Dec. 26, and Innocents' Day, Dec. 28, respectively. There is no evidence that Shakespeare went abroad, but there is reason to believe that he accompanied his colleagues on their tours at home.

Shakespeare played parts in Ben Jonson's earliest comedy, *Every Man in His Humour*, 1598, and in the same writer's tragedy *Sejanus*, 1603. In his own plays tradition reckons among his impersonations the Ghost in *Hamlet*, and Adam in *As You Like It*.

In London, Shakespeare first lodged in the parish of St. Helen's, Bishopsgate, but in 1596 he migrated to Southwark, which was soon the chief centre of theatrical activity. There he seems to have resided during the greater part of his subsequent London life, but in 1604 he "laye in the house" of Christopher Montjoy, a Huguenot refugee, who carried on the business of a "tire-maker" (i.e. maker of ladies' head-dresses) in Silver Street, Chapside.

Well before the opening of the 17th century, Shakespeare had gained an influential position in theatrical affairs. In 1598 he and three other fellow actors joined Richard Burbage and his brother Cuthbert in a speculation of great historic interest. The Burbages had, on the death, in 1597, of their father, the original founder, become owners of The Theatre in Shoreditch. In 1598 they, with the financial cooperation of Shakespeare and the other actors, leased a plot of ground near the Bank side

at Southwark, and transferred the fabric of The Theatre to the newly acquired site.

The re-erected playhouse was named The Globe, and with The Globe, which became the leading theatre of the period, Shakespeare was long identified. He acquired a tenth share in the property, which yielded handsome returns. Richard Burbage also inherited on his father's death the Blackfriars playhouse, but that theatre was leased by Burbage to others till 1608, when he presented Shakespeare with a seventh share. From Jan., 1610, onwards, the Blackfriars theatre was occupied by Shakespeare's company during the winter season, the rest of the year being spent by them at The Globe.

While faithful through life to the profession of actor, Shakespeare, like other players of his day, turned playwright early in his stage career, and rapidly gave proofs of a dramatic genius of unique quality. His powers of characterisation, his mastery of dramatic speech in both verse and prose, his philosophical temper, steadily grew more potent with his years, but from the outset he interpreted with poetic and dramatic insight the romantic no less than the comic and tragic phases of life.

Shakespeare's dramatic work was produced in the course of some twenty years, 1591-1611. Thirty-seven plays were assigned to his pen in his lifetime, but in the case of the three parts of Henry VI, Titus Andronicus, Taming of the Shrew, Timon of Athens, Pericles, and Henry VIII, he collaborated with others. Unprincipled publishers attributed to him in his lifetime six pieces with which he had no concern, and critics of acumen, solely on internal evidence, have since detected his hand in parts of Arden of Feversham, Sir Thomas More, and Edward III; while *The Two Noble Kinsmen* was originally published in 1634 as by Shakespeare and John Fletcher.

Early Work as Dramatist

Shakespeare's earliest dramatic efforts, produced in 1591-92, were three experimental comedies of varying types, *Love's Labour's Lost*, a social satire; *Two Gentlemen of Verona*, a romance qualified by drollery; and the farcical *Comedy of Errors*. He soon proved the breadth of his comic range in *The Merchant of Venice*, 1594, where comedy hovers on the brink of tragedy; in *A Midsummer Night's Dream*, 1594, where ethereal fancy mingles with romance and broad humour; in *All's Well That Ends Well*, 1596-97,

a pathetic romance rather unpleasantly developed; in *The Taming of the Shrew*, 1595-96, a farcical romance; and in *The Merry Wives of Windsor*, 1598, a domestic comedy.

In 1599-1600 he showed his matured hand as a writer of comedy in the romantic trilogy, *Much Ado About Nothing*, *As You Like It*, and *Twelfth Night*. In a different vein were Shakespeare's next so-called comedies, *Troilus and Cressida*, 1603, a story of woman's fickleness embedded in an impressive series of philosophic deliverances, and *Measure for Measure*, 1604, a study of sexual sin in a tragic vein. To *Pericles*, 1608, an ill-constructed romantic piece by an inferior hand, Shakespeare contributed a few scenes. Finally, Shakespeare, in *The Winter's Tale*, 1610, and *Cymbeline*, 1611, fused the separate types of comedy and tragedy into romantic tragic-comedy, and his latest comedy, *The Tempest*, 1611, is a vivid romance instinct with both poetry and philosophy.

Historical Plays and Tragedies

Meanwhile, Shakespeare applied himself no less successfully to tragedy, and to the dramatisation of the past history of his country. His first essay in history was a revision of the three parts of *Henry VI*, the early drafts of which were from the pens of Robert Greene and George Peele, with some help from Christopher Marlowe, who may be called Shakespeare's tutor in tragedy. Marlowe's influence is plainly seen in Shakespeare's earliest unassisted history plays, *Richard III* and *Richard II*, 1593. *King John*, 1594, though based directly on an older anonymous play, is rich in searching character studies, but Shakespeare's full-developed capacity as an historian-dramatist is seen in the two parts of *Henry IV*, 1596-98, which are rendered memorable by the unhistoric introduction of Falstaff, the supreme embodiment of Shakespeare's gift of humour. Shakespeare's endeavours in history were brought to a close in *Henry V*, 1598, a glorification of English heroism, which has a happy ending. In his latest years, Shakespeare aided his fellow-playwright, John Fletcher, in the loosely-jointed and pageant-like history-play of *Henry VIII*, 1611-12.

Shakespeare, in his earliest tragedy, *Romeo and Juliet*, 1592, the greatest of all tragic dramas of love, showed a master's youthful hand. Little of the Shakespearean touch is discernible in *Titus Andronicus*, 1593, a crude tragedy of

blood, and it was not until his genius was fully matured that he proved his pre-eminence in tragedy throughout its range. Between 1600 and 1609 he produced in quick succession those tragedies which rank above all others, of whatever age or country. After drawing a tragic plot from Roman history in *Julius Caesar*, 1609, he penned in 1602 *Hamlet*, which was followed by *Othello* in 1604, by *Macbeth* in 1606, and by *King Lear* in 1607. Then, having rendered some little aid to the halting author of *Timon of Athens*, 1608, he completed his great tragic series in two pieces based like *Julius Caesar* on Roman history, viz. *Antony and Cleopatra*, 1608, and *Coriolanus*, 1609.

It was as a writer of narrative poems—paraphrases of classical legends—that Shakespeare first caught the ear of the reading public. His *Venus and Adonis*, which he calls "the first heir of my invention," came from the press in 1593. *Lucrece* followed in 1594 and was received with equal favour. Both were dedicated in prose epistles to a young courtier of literary tastes, Henry Wriothesley, 3rd earl of Southampton. In 1599 William Jaggard issued a small poetic anthology which he misleadingly entitled "The Passionate Pilgrim, by W. Shakespeare." Only five of the twenty poems can be placed to Shakespeare's credit; two of them are sonnets, not previously published, and three are poetic extracts from the already published *Love's Labour's Lost*.

The Sonnets

The most important of Shakespeare's non-dramatic compositions are his Sonnets, which were not published till 1609, though both internal and external evidence shows that the majority of them, like the two which figure in *The Passionate Pilgrim*, were written at a far earlier date for circulation in MS. The Sonnets, which number 154, vary in poetic value. Many are the finest fruits of Shakespeare's poetic power; others sunk almost into inanity beneath the burden of conventional conceits, and echo the artificiality of the modish Elizabethan sonnet, which took its cue from Italy or France.

Thomas Thorpe, the original publisher, who habitually acquired dispersed MSS. as he could and published them without authority, dedicated Shakespeare's Sonnets (above his initials T. T.) in a conventional formula to a friend in the trade, "Mr. W. H., the onelie begetter [i.e. procurer] of these insuing sonnets."

With Thorpe's arrangement of the poems, the poet had small concern. Of the sonnets numbered by Thorpe i-cxxvi, some eighty are addressed in terms of deep affection to a young man. Twenty of these describe the youth as a patron of the poet's verse, and episodically complain that his favours have been for a time alienated by a rival poet. The young patron was, clearly, the earl of Southampton, to whom Shakespeare had already dedicated his narrative poems. The rival poet would seem to have been some obscure protégé of Southampton, in all probability Barnabe Barnes. Many of the later Sonnets (cxxvii-cxli) are addressed to a fickle, dark-complexioned mistress, who is represented as having intrigued with the poet's friend.

The Mary Fitton Legend

Like all great lyrics, the Sonnets convey the illusion of personal confession, but before the extent of their autobiographical veracity can be accurately gauged allowance has to be made for Shakespeare's unapproached dramatic power of interpreting objectively every phase of emotion, and for his assimilation of many predecessors' themes and turns of thought and expression. It is a futile fancy to seek the original of the "dark lady" in Mary Fitton or Fytton, a fair-haired mistress of the 3rd earl of Pembroke.

The steady development of Shakespeare's popularity as both poet and dramatist is well attested. As early as Sept., 1592, a rival playwright, Robert Greene, ran- rancorously described him as "an absolute *Johannes factotum* . . . and in his owne conceit, the onely Shake-scene in a countrey." More significant is the eulogy pronounced in 1598 by Francis Meres, a divine and schoolmaster, who declared, in his *Palladis Tamia* (*Wit's Treasury*), that "the Muses would speak Shakespeare's fine-fil'd phrase if they could speak English," and that "among the English he is most excellent in both kinds for the stage" (i.e. in tragedy and comedy). In witness of that statement Meres cited the titles of six comedies and six tragedies, together with his two narrative poems, and his "sugred Sonnets among his private friends," as yet unpublished. In Shakespeare's later days laudatory references to his work abound in contemporary literature. The tenor of such eulogy is finely elaborated in Ben Jonson's far-famed lines before the First Folio.

It is unlikely that Shakespeare, after his departure from Stratford

5. Chandos portrait. 6. Death mask, discovered at Mainz, 1849, now at Darmstadt.

SHAKESPEARE: PORTRAITS AND MEMORIALS OF ENGLAND'S SUPREME POET

in early manhood, revisited the place until 1596. During his absence his father's fortunes steadily declined. In 1596 an application to the Heralds' College was made in his father's name, but in his own behalf, for a coat-of-arms. A shield and crest were provisionally granted in the following terms: "Gold on a bend sable, a spear of the first, the point steeled proper, and for his crest or cognizance a falcon, his wings displayed argent, standing on a wreath of his colours, supporting a spear gold steeled as aforesaid." *Non Sans Droict* was the allotted motto. The grant was not finally confirmed until 1599. The arms are displayed with full heraldic elaboration on the poet's monument in Stratford Church.

Purchase of New Place

Shakespeare, as soon as his financial position in London was secure, acquired much property in his native place. On May 4, 1597, he purchased New Place, the second largest house in the town, although the poet did not regularly occupy it before 1611. Shakespeare's growing affluence was well recognized by his fellow townsmen, and they appealed to him in 1598 to use his influence in London in order to exempt the town from taxation. On Oct. 25, 1598, a local friend of the dramatist, Richard Quiney, who was in London on municipal business, wrote a pressing letter, asking for a loan of £30. This letter, which is preserved at Shakespeare's birthplace, is the only extant letter which was addressed to the poet.

The death of Shakespeare's father on Sept. 8, 1601, left Shakespeare owner of his birthplace in Henley Street. On May 1, 1602, Shakespeare purchased, for £320, a large plot of 107 acres of arable land near the town, to which he subsequently added 20 acres of pasture land. A larger investment was made on July 24, 1605, when Shakespeare bought, for £440, a lease of "a moiety of the tithes" (i.e. the tithe-estate) of Stratford.

Not until 1611, soon after the production of *The Tempest*, did he make Stratford his main home. Even then he paid frequent visits to London, where his financial interests in *The Globe* and Blackfriars theatres were undiminished. Early in 1613 he joined his friend and fellow-shareholder, the actor Burbage, in devising an heraldic emblem, technically known as an impresa (a symbolic vignette with motto), for the shield of Francis Manners, 6th earl of Rutland, which the earl bore at a great tournament held at Whitehall on

March 24, 1613. On March 10, 1613, he bought, for £140, a house with a yard attached, near the Blackfriars theatre. He left £60 of the purchase money on mortgage, signing a deed to that effect next day. Two years later, April 26, 1615, Shakespeare, with six other owners of adjoining Blackfriars property, brought a successful action in the court of chancery against a former owner for the recovery of the title-deeds.

Shakespeare's social circle at Stratford at the close of his life included all the better-to-do tradesfolk, as well as many of the country gentry. John Combe, a resident at Stratford, who owned much landed property in the neighbourhood, left him £5 on his death in 1614. Shakespeare took small part in local affairs, but an effort was made to draw him into local controversy in his last days, through the high-handed endeavour of John Combe's nephews, William and Thomas Combe (of whom the latter was his uncle's heir), to enclose in their personal interest the common lands of the town. Shakespeare, according to local records, preserved a strict neutrality. Ultimately, in 1618, after Shakespeare's death, the Combes suffered defeat.

In Jan., 1616, Francis Collins, a solicitor in good practice at Warwick, drafted Shakespeare's will, which was finally executed, after revision, in March. One of the five witnesses was Julius Shaw, bailiff or chief magistrate of the town. Early next month, according to the gossiping diary of John Ward, who was vicar of the town in Charles II's time, Shakespeare entertained at New Place two literary friends, Michael Drayton and Ben Jonson. The vicar suggests, unconvincedly, that at this "merry meeting" Shakespeare "drank too hard," for he "died of a favour there contracted."

The Tomb in Stratford Church

Shakespeare died at New Place on Tuesday, April 23, 1616, having just completed his 52nd year. Two days later he was buried in the chancel of Stratford Church, in front of the altar. In order to guard against the common practice of profaning graves by moving the bones soon after burial to the charnel house of the churchyard, Shakespeare directed the following lines to be inscribed on his tombstone:

Good friend, for Jesus' sake forbear
To dig the dust enclosed here.
Blest be the man that spares these stones,
And curst be he that moves my bones.

Well before 1623, a sculptured monument, enclosing within a central arch a half-length figure

of the poet, was affixed to the N. wall of the chancel, overlooking the grave. The monument was designed and executed by a well-known tomb-maker in Southwark. A panel below the dramatist's effigy bears the inscription:

Judicio Pylum, genio Socratem, arte
Maronem;
Tota legi, populus maeret, Olympus
haeret.

Stay passenger, why goest thou by so

fast?
Read, if thou canst, whom envious death
hath plast

Within this monument, Shakespeare with

whome

Quick nature dide; whose name doth deck

ys tombe

Far more than cost; sith all yt he hath

writ,

Leaves living art, but page to serve his

wit

Obit ano. dei 1616 Aetatis 53 Die 23 Ap.

The crude elegy acknowledges Shakespeare to be the greatest man of letters of his age, whom other living writers were only fit to serve as "page" or menial.

Shakespeare's Will

Shakespeare's will, the original of which is in Somerset House, was proved in London by the executors, his elder daughter Susanna, and her husband, John Hall, on June 23, 1616. The main part of the poet's estate was left to Mrs. Hall, with remainder to her issue in strict entail. Small legacies were left to the younger daughter, Mrs. Judith Quiney, and to the poet's sister, Mrs. Joan Hart, and her three sons. To his wife he left only "his second best bed, with the furniture" (i.e. the bedding). Recognitions of friends outside the family circle were numerous. His sword went to Thomas Combe, nephew of his friend John Combe, and seven suits of 26s. 8d. each, wherewith to buy memorial rings, were respectively allotted to four Stratford associates, and to three of his playhouse colleagues, Richard Burbage, the great actor who had created most of his tragic rôles, John Heminges, and Henry Condell; the two latter, though well known as actors, were mainly occupied in theatrical management.

In Shakespeare's lifetime there were printed separately in quarto his two narrative poems, *Venus and Adonis* (1st edit. 1593), *Lucrece* (1st edit. 1594), his *Sonnets* (1609), and fifteen plays, to which *Othello* was added posthumously in 1622. In 1623 thirty-six plays were issued collectively in the volume known as the *First Folio* (*Percules*, which had appeared in quarto, was excluded). This volume was undertaken by Shakespeare's friends and fellow actors, Heminges and Condell, who dedicated it to the brothers William Herbert, 3rd earl of Pembroke, lord chamberlain, and Philip, earl of Montgomery. Three brief panegyrics in verse

were contributed by little-known authors. But the most striking feature of the preliminary pages is a long eulogy by Ben Jonson, "To the memory of my beloved, the Author, Mr. William Shakespeare: and what he hath left us." There Jonson apostrophises Shakespeare as "Sweet Swan of Avon," whose dramatic genius excelled that of any dramatist of the ancient or modern world.

The Second Folio, published in 1632, includes among the prefatory verse Milton's famous epitaph: "What needs my Shakespeare for his honoured bones," etc. The Third Folio appeared in 1663; a re-issue in 1664 prints in an appendix Pericles, and six spurious plays which were erroneously attributed to Shakespeare by enterprising publishers in his lifetime. The Fourth Folio, dated 1685, reprints the 1664 issue of the Third Folio. The first attempt to edit Shakespeare's plays was made by Nicholas Rowe, in 1709, and his successors between that date and the present day have been legion.

Shakespeare was survived by his two daughters (Susanna, wife of John Hall, a medical practitioner of local repute, and Judith, wife of Thomas Quiney), and by Mrs. Hall's only child Elizabeth. His granddaughter, Elizabeth Hall, was his last direct descendant, and although she married twice, had no issue. Shakespeare's line only survives collaterally in the descendants of his nephew, Thomas Hart, the only married child of his sister, Mrs. Joan Hart.

Shakespeare's Handwriting

The sole extant relics of Shakespeare's handwriting that are of unquestioned authenticity are six signatures attached respectively to the following legal documents: a deposition dated May 11, 1612, in the law-suit Bellott v. Montjoy, now in the Public Record Office; the purchase deed, dated March 10, 1612-13, of the house in Blackfriars, now in the Guildhall Library, London; a deed dated March 11, 1612-13, mortgaging the Blackfriars house, now in the British Museum; Shakespeare's will, with his signature at the foot of each of the three sheets of paper, now at Somerset House. On the third and last sheet of the will the words "By me," in the dramatist's handwriting, precede the signature. Other alleged signatures appearing in the preliminary pages of books of the 16th or early 17th centuries may be regarded as fabrications. A recent attempt has been made, with doubtful success, to prove on

purely palaeographical grounds that a notable scene in an anonymous play, Sir Thomas More, which is extant in Brit. Mus. Harleian MS. 7368 (8a, 8b, 9a), is in Shakespeare's autograph.

No lifetime portrait of Shakespeare is known. Two were produced soon after his death, viz. the bust, a mechanical piece of sculpture, on the monument in Stratford Church, and the rather lifeless engraving by Martin Droeshout, on the title-page of the First Folio. Ben Jonson, in verses printed on a flyleaf facing Droeshout's print, declares "the graver" to have "hit" to perfection the poet's "face." The "Chandos" portrait in the National Portrait Gallery, although it was once the property of William D'Avenant, Shakespeare's reputed godson, is a fanciful version of Droeshout's engraving.

Portraits and Monuments

A portrait in the memorial gallery at Stratford, known as the "Flower portrait," has been claimed as the original painting on which Droeshout worked. It is probably of later date than the engraving, and based upon it. Other portraits, alleged to be of Shakespeare, by various artists of the 17th and 18th centuries, are very numerous, but of none has the authenticity been proved. A bust now in the Garrick Club, to which much historic interest has been assigned, is probably by Roubiliac, a French sculptor of the 18th century, whose full-length statue of the poet is in the British Museum. A monument with a statue, by Peter Scheemakers, after the Chandos portrait, was placed in Westminster Abbey by public subscription in 1741. Other statues have been erected in Leicester Square, London; at Stratford-on-Avon; in Paris; in Central Park, New York; in Lincoln Park, Chicago; and at Weimar. Sculptured memorials have been placed at Verona and in Southwark cathedral.

Shakespeare Memorial Theatre. Theatre at Stratford-on-Avon where Shakespeare festivals are held annually. The first memorial theatre, built 1877-79, and standing in a pleasant riverside garden overlooking the Avon, was burnt down, March 6, 1926.

Shakespeare Memorial Theatre. Front view of the building at Stratford-on-Avon opened in 1932. It replaced a building destroyed by fire six years earlier

Archibald Flower, later knighted, then began a campaign for funds to build a new theatre, towards which £100,000 was given by John D. Rockefeller. The new building, constructed on the same site at a cost of £200,000 was opened April 23, 1932. Its striking design, by Elisabeth Scott, John Shepherd, and Maurice Chesterton, was for a time the subject of much controversy. The theatre can accommodate 1,258 people.

Shakespeare's Cliff. Precipitous cliff of chalk, 350 ft. in height, S.W. of Dover. The name preserves a supposition that it is the "steep" from which, in Shakespeare's King Lear, act 4, sc. 6, Gloucester seeks to destroy himself. Through the cliff runs a rly. tunnel, $\frac{3}{4}$ m. long. See Dover.

Shakhty. Town in the Azov-Black Sea region of the U.S.S.R. About 50 m. N.E. of Rostov, with which there is rly. communication, it is the centre of a coal mining area; the anthracite found here is 94 p.c. carbon. In July, 1942, the town was captured by the Germans, to be liberated Feb. 12, 1943. Its former name was Alexandrovsk-Grushevsk. Pop. 155,081.

Shaking Palsy. Disease occurring usually after middle life, characterised by tremor of the limbs. See Paralysis Agitans.

Shakuntala or **SAKUNTALA.** In Hindu legend, daughter of Visvama, and a water nymph. She was brought up by a hermit. King Dushyanta persuaded her to marry him. A son was born, who became founder of the Bharata dynasty. The drama on the subject by the ancient Indian poet Kalidasa was translated into English by Sir W. Jones, 1789, and by Sir M. Monier-Williams, 1856.

Shale (Ger. *schale*, shell). Laminated deposit of clay. Shales vary considerably in appearance and composition, and grade insensibly into sandstones or limestones, according as there is an increase in calcium carbonate, etc. They are found in all geological epochs from the Cambrian to the Tertiary. Some shales are highly refractory, and used in the manufacture of firebricks. Limestone shales are components of Portland cement, iron oxide shales are used in the manufacture of mineral paint, and shales containing alum in the manufacture of alum.

Bituminous shales or oil shales are sources of petroleum. In Scotland such rocks of Carboniferous age have been artificially heated and crude oil obtained from them.

The important oil reservoirs of the world are, however, the result of natural migration; the oil moves or is driven out of the shale into a more porous reservoir rock, whence it can be drawn off by a well. See Geology; Oil; Sedimentary Rocks.

Shalimar (Skt., abode, or hall, of love). Name given to a villa built, according to legend, at the N.E. corner of the Dal lake in Kashmir by Pravarsena II, founder of the city of Srinagar, who reigned in Kashmir from A.D. 79 to 139. The king often visited a saint named Sukarma Swami, living near Harwan, and rested in this villa on his way. The royal garden vanished, but a village which sprang up in its neighbourhood was called Shalimar. Another garden made on the old site in 1619 by the emperor Jehangir still remains. Shah Jehan, Jehangir's son and successor, built a Shalimar Bagh (garden) at Lahore on the model of his father's garden in Kashmir. A third Shalimar Bagh, now ruined, was built at Delhi by one of Shah Jehan's wives. Consult Gardens of the Great Mughals, C. M. Villiers-Stuart, 1913.

Shallot (*Allium ascalonicum*). Small bulbous-rooted member of the onion family. A native of Palestine, it was introduced to Great Britain about 1546. The bulbs are edible, and are usually pickled. Shallots are raised from bulblets, planted in a warm sunny bed or border in March, one foot apart every way. They are cultivated in the same manner as the onion (*q.v.*), omitting hardening the soil surface after planting.

Shallow. Character in King Henry IV, Part 2, who also appears in The Merry Wives of Windsor. A rustic justice of the peace, fond of descending upon his salad days in the inns of court, he is thought to be a caricature of Sir Thomas Lucy. See Shakespeare.

Shamrock. Plant of the species of clover adopted as an Irish national emblem. Inset left, leaf; right, flower

Shalmaneser. Name of five Assyrian kings. Shalmaneser I, about 1300 B.C., transferred the capital from Asshur to Calah. Shalmaneser III, formerly called II, 860-825, recounted on his black obelisk, now in the British Museum, 32 expeditions; it portrays Jehu and describes Hazael paying tribute (1 Kings 19). Shalmaneser V, 727-722, captured Hoshea and besieged Samaria (2 Kings 17). See Balawat; Karkar.

Shalott, THE LADY OF. Short poem by Tennyson. First published in 1832, it was much altered ten years later. The theme, taken from an Italian novelette, Donna di Scalotta, is of a magic mirror and the curse attached to it, and the versification is admired for descriptive effects.

Shamal. Name given to the prevailing N.W. wind which in summer blows over the plain of Iraq. During the day these winds are strong and carry much dust, but at night there is a lull. They are accompanied by cloudless skies and intensely hot, dry weather.

Shamanism. Form of spirit-worship developed in N. Asia. The Tungus name shaman denotes a medicine-man, whose soothsaying and exorcising are aided by ancestral ghosts or spirits.

The shaman cult, rooted in aboriginal Asia, and reminiscent of early Sumerian demonology, still prevails with the E. Siberian palaeasiatics and some lamaist Tibetans. The term is often applied loosely to N. American Indian spirit-worship.

Shamash. Babylonian and Assyrian sun-god. As son of Sin and brother of Ishtar, his worship, once centred in Larsa and Sippara, spread to Babylon and Nineveh. He is portrayed upon the stele bearing the Hammurabi code.

Shampoo (Hind. *chāmpnā*, to press). Friction, especially of the head, after washing in hot water. Originally, a shampoo consisted in gentle massage or kneading of the whole body by an attendant in the hot baths taken in the East. Now, the word is specifically used by hairdressers for a method of washing the hair with various preparations, and then rubbing and brushing it. In the "dry" shampoo washing with hot water is replaced by friction with a volatile essence. The preparations are now themselves commonly termed shampoos.

Shamrock, WHITE CLOVER, OR DUTCH CLOVER (*Trifolium repens*). Perennial herb of the family Leguminosae. A native of Europe, N. Africa, Asia, and N. America,

it has creeping stems, and the leaves are divided into three small heart-shaped leaflets, often with a curved whitish band near the base. The white flowers form a round head. According to some authorities wood-sorrel (*Oxalis acetosella*) is the shamrock.

Shamrock. In heraldry, the badge of Ireland. It is supposed to have been adopted by S. Patrick as an illustration of the Holy Trinity. It should have three heart-shaped lobes and a wavy stalk, thus differing from the trefoil, which has three pear-shaped lobes, and, if

Shamrock
in heraldry

"slipped," a straight stalk.

Shamrock. Name given by Sir Thomas Lipton to the yachts built by him to compete for the America Cup. They were numbered I, II, III, IV and V. See America Cup; Lipton, Sir T.

Shamyl (1797-1871). Caucasian patriot. Born in Daghestan, and elected imam in 1835, he led the Caucasian tribes in a long guerrilla war against Russia, thus assisting England and France during the Crimean War (1854-56). He was captured by the Russians at Cunib in 1859, and taken to Russia, where he lived in honourable confinement, but died while on a pilgrimage to Mecca.

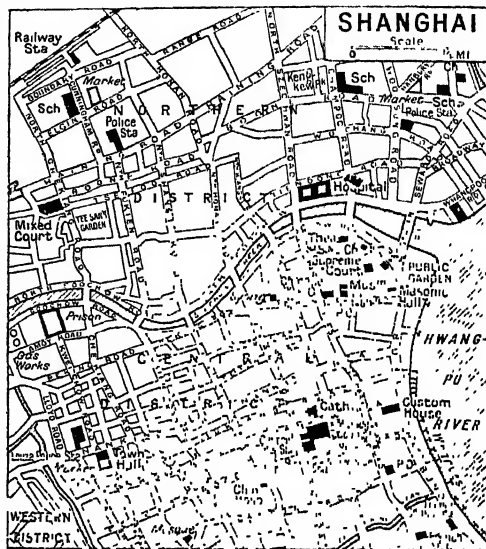

Shan. Burmese name for the people of the Burmese Shan State and S. China. Of T'ai (free) origin. The Shans entered Burma in the 13th century after the overthrow of their Nanchao kingdom (founded before the 7th century round Talifu) by Kublai Khan in 1253.

Like the Burmese they are Buddhists. The women dress as Burmese women do, but the men wear loose trousers and a bigger turban than do the Burmese. Often they wear a broad-brimmed bamboo hat. Short, hardy, light yellow, and straight-nosed, they are peaceable, keen traders, and skilful artisans.

The Shan states formerly under British rule numbered six northern states, with an area of 14,294 sq. m. and a pop. of 669,000, a mountainous dist. N.E. of Mandalay and adjacent to China; 37 southern states with an area of 40,434 sq. m. and a pop. of 927,000. Bounded by China and Siam, they are traversed by the R. Salween, and are not inhabited exclusively by Shans. They were separately administered, govt. by chiefs being maintained, and were formed into a federation, 1922, with a commissioner at its head directly answerable to the governor. Under the constitution of Burma from 1948, the federation, with the Wa states (pop. 82,614), became a part of the union of Burma as the Shan State.

Shangani. River of S. Rhodesia. It flows N.W. to the Gwai river, a S. tributary of the Zambezi. Here on Dec. 3, 1893, a small British force under Major Allen

Wilson was surrounded and killed by Lobengula's Matabele. Shangani station is 69 m. by rly. N.E. of Bulawayo, and stands at a height of 4,507 ft. above sea level. See Matoppos Hills.

Shanghai. Map of the European and business quarter of the important seaport of Central China

Shanghai. Seaport of China, in the prov. of Kiangsu. It stands 12 m. from the Yang-tse estuary on the tidal Hwangpu. Soochow Creek or Wosung river crosses the city, and the suburb of Pootung lies across the Hwangpu. Shanghai lies on the edge of a low, flat, and intensively cultivated area traversed by numerous small watercourses.

Shanghai was made a city in 1360, and the old part was surrounded by walls 3½ m. in circuit with 6 gates. The former European quarter lay N. of this city and occupied more than 9 sq. m. The former French concession, adjoining the Chinese city, dated from 1847, and the British concession N. of it was ceded in 1843 by the treaty of Nanking. What was formerly known as the American quarter lay within the British municipality. The streets of the commercial quarter are well kept, well lit, and contain many fine buildings in traditional Western styles including Trinity cathedral.

By the renunciation of extra-territorial rights in China by Great Britain (1943), the U.S.A., and other powers, the foreign concessions and the international settlement in Shanghai reverted to Chinese rule at the end of the Second Great War. The whole city

Shanghai, China. An aerial view of the city looking south along the busy Whangpoo river

and the surrounding area thus came under Chinese jurisdiction.

During 1925-27 there was considerable trouble in Shanghai, when British troops, with French and American marines, protected the international settlement. The British troops were withdrawn in 1928.

After their occupation of Manchuria in 1931, Japanese troops occupied Chapei, the district of Shanghai bordering the French concession. Fierce fighting took place between Chinese and Japanese for a year. During the China-Japan conflict, 1937-45, the invaders gained control of greater Shanghai in 1937. British troops were withdrawn in 1940, and on her entry into the Second Great War Japan occupied the international settlement. A British gunboat was sunk in the harbour by Japanese warships on Dec. 9, 1941. On April 24, 1942, Chinese guerrillas raided the port, damaging a power plant and the Japanese naval h.q., and in 1944 and 1945 military targets were attacked by U.S. aircraft. On Aug. 24, 1945, Chinese nationalist troops entered Shanghai. In the Communist drive of 1948-49, Shanghai surrendered May 27, 1949.

Normally Shanghai, with 6 m. of harbour, does nearly half the foreign trade of China. Much traffic passes up the Yang-tse, and there is rly. connexion with Hangchow, Nanking, and Peking. Navigable channels connect the port with the terminus of the Grand canal, 47 m. to the W., at Soochow. Winter conditions are pleasant, but the summer is trying. Snow falls in Jan. and Feb., and there is heavy rain in June. Pop. 3,489,998.

Shangri-la. Symbol of a desired home. This was the name of an imaginary monastery of Tibet in *Lost Horizon*, a novel by James Hilton, 1933, which was later filmed. Those who reached the place grew no older and were ideally happy. But any who returned to the outside world resumed their real ages and appearances.

Shankarsett, Jagannath (1800-65). Indian reformer. Born in Bombay of a Hindu family, he amassed a fortune in commerce, and devoted himself to the social and educational advancement of his countrymen. Among works for which he was responsible were the Bombay native institute, 1824, a Sanskrit college and library, and other educational establishments, and extensive improvements in roads, railways, and the town planning of parts of Bombay. He was nominated the first Indian

member of the Bombay legislative council in 1861. He died there July 31, 1865.

Shanklin. Urban dist. and holiday resort of the Isle of Wight. It is on the S.E. coast, 9 m. from Ryde, with a rly. station. It developed during the 19th century from a small fishing village nestling in the shelter of Shanklin Chine. The town is on the top of a cliff, from which

Shanklin arms

a steep road descends to the sea level esplanade. There are fine sands, stretching to Sandown and beyond, and a pier. Behind are the downs. Shanklin suffered from German "tip and run" raids during the Second Great War, most of the houses facing the esplanade being wrecked. The chief building is the Perpendicular church of S. John the Baptist. Pop. 5,071.

Shanks, Edward Richard Buxton (b. 1892). British writer. He was born in London, June 11, 1892, and educated at Merchant Taylors' and Trinity College, Cambridge, where he was editor of *The Granta*, 1912-13. After being invalided out of the army during the First Great War, he worked at the War office. His

earliest book of poems appeared in 1915, collected poems in 1926, and in 1919 he was the first winner of the Hawthornden prize. Assistant editor of the *London Mercury*, 1919-22, he became known as a literary critic, and later wrote novels, e.g. *Queer Street*, 1932; *Tom Tiddler's Ground*, 1934; *Old King Cole*, 1936. He produced critical studies of Poe, 1937, and Kipling, 1939.

Shannon. British warship famous for her encounter with the Chesapeake in the American War of 1812-14. A 38-gun frigate, she was commanded by Sir Philip Broke off the French and Spanish coasts, 1806-11. On June 1, 1813, she gave battle to the Chesapeake in Massachusetts Bay, and after fifteen minutes disabled the American vessel and took her prisoner to Halifax. See *American War*: Broke; Chesapeake.

Shannon. Longest river of Eire. It rises in Shannonpot, W. of Culecagh, Cavan, where the water emerges from an underground channel in the limestone rock. Thence it flows in a valley between the mts. of Culecagh and Benbrack to Lough Allen. From the lake it flows in general S. to the head of the Shannon estuary at Limerick, about 160 m. from the source. Below Lough Allen the course may be considered as composed of three reaches separated by Loughs Ree and Derg. The river falls 97 ft. in the 17 m. between Killaloe and Limerick. At Clondara there is connexion with the Royal Canal. From Limerick the estuary leads for about 70 m. almost due W. to the Atlantic Ocean; its width varies between 2 and 10 m. Below Limerick, where the river becomes

Shanklin, Isle of Wight. The cliffs, sea front, and pier, looking north

tidal, the fall is 144 ft. Vessels of 1,000 tons reach Limerick, and small steamers can get to Athlone.

The drainage area is 4,544 sq. m. Shannon salmon fishing is famous and profitable; trout fishing is not commercially exploited, except by owners of the river banks, who let sporting rights. Islands in the loughs show remains of religious institutions; most noteworthy on the banks are the seven churches of Clonmacnoise.

Use of the Shannon for hydroelectric power was projected when the Irish Free State was set up in 1921; work on the scheme began in 1924, the first stage being completed before 1930, but the second phase lapsed, the Second Great War preventing import of machinery. The work completed by the German firm of Siemens-Schuckert utilises the river fall between Lough Derg and Limerick in a race

head which leaves the Shannon at Parteen, above O'Brien's Bridge, and extends $6\frac{1}{2}$ m. to Ardacrusha. Here are installed three vertical turbines of 38,500 h.p. each. In 1946 the Irish electricity supply board announced that electricity produced in Eire amounted to 482 million units, 293 of them from the Shannon development scheme.

Shannon, CHARLES HAZLEWOOD (1863-1937). British artist. Born at Sleaford, April 26, 1863, he was trained at the Slade school. He soon attracted notice by his painting, romantic in feeling, marked by its graceful and flowing design and its rich and harmonious colour. An early member of the New English art club, he was elected A.R.A. in 1911 and R.A. in 1920. Shannon was also a lithographer. His works include *An Idyll*; *The Sapphire Bay*; *The Sleeping Nymph*. He died March 18, 1937.

Charles Shannon,
British artist

His first notable portrait appeared at the R.A. in 1881, and in 1887 he showed full powers with his painting of Henry Vigne. He became specially successful with women's and children's portraits. An original member of the New English art club, he became A.R.A. in 1907 and R.A. in 1909. He died March 6, 1923, having been knighted the previous year.

Shannon, SIR JAMES JEBUSA (1862-1923). An Anglo-American artist. Born at Auburn, N.Y., he came to England from Canada in 1878, and studied at S. Kensington, where he won the gold medal for figure painting. His first notable portrait appeared at the R.A. in 1881, and in 1887 he showed full powers with his painting of Henry Vigne. He became specially successful with women's and children's portraits. An original member of the New English art club, he became A.R.A. in 1907 and R.A. in 1909. He died March 6, 1923, having been knighted the previous year.

Shannon Airport. Irish airport. Situated 15 m. W. of Limerick, it comprises 800 acres, including the adjacent seaplane base and the former airport at Foynes. It is a landplane junction on the main trans-Atlantic air routes. In 1947 it became the first custom-free airport in the world. Its Irish name is Rineanna.

Shansi. Province of N. China. Touching Mongolia on the N., it covers 60,394 sq. m. and contains 105 counties, with Taiyuan its capital. Other cities are Tatung and Puchow. The Great Wall crosses the prov., which has for centuries been regarded as a strategically vital area, with its mt. passes. It is served by main rlys. Shansi has half the anthracite deposits of China; its iron ore industry is among the oldest in the

world; and it yields wheat, cotton, wool, and wine. There are many Muslims in a pop. of 11,601,000.

Shantung. Silk originally made in Shantung prov., China. It is produced by a wild silkworm, *Attacus Cynthia*, which feeds on the ailanto tree, and was introduced into Europe in 1857, where it fed on the castor oil plant. Originally shantung was a soft, undressed, undyed washing silk, but since 1907 processes have been perfected by which shantung can be bleached and dyed any colour.

Shantung. Maritime prov. of N. China, bounded N. and W. by Chihli (Hopei), S.W. by Honan, S. by Kiangsu, E. by the Yellow Sea. Here are the capital city Tsinan, the seaports Chefoo, Weihaiwei, and Tsingtao, Chufu the birthplace of Confucius, and Taishan the former sacred mt. There are excellent harbours, the lower course of the Yellow River, the Grand Canal, and good rly. communications. Coal and iron occur, wheat, cotton, peanuts, and silk (*v.s.*) are produced, and there are tanneries and match factories. Pop. 38,099,741, including many Muslims.

Shap. Market town and urban dist. of Westmorland, England. It is 12 m. S. of Penrith. The chief building is S. Michael's church, mainly 13th century. Granite is quarried in the neighbourhood, and cattle and horse fairs are held in the town. Four miles away is Shap Wells, where are a saline spring and an hotel. Shap Fell is the name of a neck of land between the Pennine Chain and the mts. of the Lake district, over which the rly. and the main road pass. Market day, Mon. Pop. est. 1,500.

Shapinshay. Island of the Orkney group, Scotland. It is 4 m. N. by E. of Kirkwall, and has an area of 11 sq. m. It is generally flat, the highest point being 162 ft., and is for the most part under cultivation. Pop. est. 500.

Shapka (Polish *czapka*, cap). Flat cap with a square crown, forming part of the national costume of Poland. From it was derived the typical cap formerly worn by the lancers of most armies, as the first lancer regiment formed as Napoleon's Polish Lancers (1807).

Share. An Anglo-Saxon word meaning part cut off, a portion. Shares and sharing are an important part of social activity. The

word share is particularly used in business to denote one of the parts into which the capital of a company is divided, e.g. a company might be registered with a share capital of £120,000, divided into 50,000 5 p.c. preference shares of £1 each, 50,000 ordinary shares of £1 each, and 40,000 deferred shares of 10s. each. Preference shares carry a prior right to be paid dividends, deferred shares give a right to participate in profits only after the claims of the owners of preference and ordinary shares have been satisfied. Those to whom shares are allotted are called shareholders or members of the company. When shares are fully paid they may be converted by the company into stock (*q.v.*).

Shares may be divided into three classes, according to the proof of ownership and the method of transfer. Inscribed shares (now rarely seen, but formerly general) are those the title to which consists in an entry in an official register; transfers are effected by the personal attendance of old and new owners or their agents. Registered shares (now most common in Great Britain) are those for which the company registrar maintains records of ownership, issuing a certificate of registration, usually termed a share certificate. Transfer of registered shares is effected by the shareholder executing a deed of transfer. Bearer shares are those for which the holding of a share warrant affords prima facie evidence of ownership. *See* Company Law; Debenture; Stock Exchange.

Shari or **CHARI.** River of French Equatorial Africa. It rises as the Gribingi, in the watershed about 100 m. N. of the Ubangi river, and runs N.W. to Lake Chad. The Shari forms, with the Benue route, the principal means of access to some districts of French Equatorial Africa. *See* Ubangi-Shari.

Shark. Group of primitive fishes with cartilaginous skeletons, of almost world-wide distribution, but most abundant in tropical and sub-tropical waters. The gills are in from 5 to 7 (usually 5) separate pouches, each with a distinct passage from the back part of the mouth, and a separate exit in the form of a vertical slit on the neck.

There are abundant teeth in several rows in each jaw. The Port Jackson shark (*Heterodontus philippi*) of Australia, which feeds upon molluscs, has flat, pavement-like teeth for crushing the hard shells; in others, feeding upon fish and crustaceans, the teeth are

Shapka, as worn
by Polish army
officers, 1945

more or less triangular, with saw-like edges. The eggs are fertilised in the body of the female, for which purpose the male is provided with a pair of intromittent "claspers." In most cases the eggs are retained until they have hatched, but in the dog-fishes they are shed with horny capsules, which are attached to seaweeds. The majority are marine. A small species, *Carcharinus gangeticus*, of Indian rivers, has been found also in the Tigris and its ally, *C. zambesiensis*, 120 m. up the Zambezi; while *C. nicaraguensis* is found only in the Lake of Nicaragua.

The list of sharks found in the British seas includes as many as sixteen species, though among these are several that are either occasional or rare visitors; likewise the two common dog-fishes (*Scylliorhinus stellaris* and *S. caniculus*), which are not regarded popularly as sharks. Most remarkable of these visitors is the hammer-head (*Sphyrna zygaena*).

The blue shark (*Carcharinus glaucus*) of the Atlantic and Pacific is a regular summer visitor to the English Channel. The tope (*Eugaleus galeus*) is a regular inhabitant of British seas, where it feeds on fishes, crabs, and starfish; it is 5 or 6 ft. long, and dark grey above, paler beneath. The smooth hound (*Mustelus mustelus*), somewhat similar to the tope, is only about 3 ft., but it has the first back fin much nearer to the head than is usual in the tribe, and its teeth are of the kind that denotes a diet of molluscs.

The porbeagle (*Lamna cornubica*), about 10 ft. in length, has a deeper, more rounded body, with the large dorsal fin in the centre of the back, and the slender teeth long and tapering. It frequents both N. Atlantic and N. Pacific, visiting the W. coasts of the British Isles, and sometimes the E. coasts. The thrasher (*Alopias vulpes*), whose bluish coloration causes it frequently to be mistaken for the dangerous blue shark, is the commonest of the large British sharks; its food consists chiefly of herrings, pilchards and sprats. It is a regular visitor in the summer to the S. and W. coasts, where it sometimes gets entangled in nets. It reaches a total length of 15 ft., but more than half this measurement is accounted for by the extraordinary upper lobe of the tail, which it appears to use for rounding up herrings, etc.

Among occasional visitors to the British coasts may be mentioned

Shark. Principal species of the primitive fish. 1. Smooth Hound, 3-4 ft. 2. Greenland Shark, 26 ft. 3. Tope, 5-6 ft. 4. White Shark, 40 ft. 5. Porbeagle, 10 ft. 6. Nurse Hound, 4-5 ft.

also the black-mouth dog (*Pristiurus melanostomus*); the Greenland shark (*Sommiosus microcephalus*), 26 ft., which feeds on whales; and the spinous shark (*Echinorhinus spinosus*).

Notable sharks that are not British include the enormous but harmless whale shark (*Rhinodon typicus*) of the Indian and Pacific Oceans, whose length is 60 ft., but whose teeth are minute; the great white shark (*Carcharodon carcharias*) of the tropics, feared as a man eater; and the curious frilled shark (*Chlamydoselache anguineus*) of Japan, the Azores, and Norway, whose mouth at the extremity of the eel-like head, and the frilled flaps to the six gill clefts, establish a connexion with the more primitive fossil sharks. See Angel Fish; Basking Shark; Blue Shark; Dog Fish; Elasmobranchs; Fish; Hammer-headed Shark.

Shark Liver Oil. Red to brown oil rich in vitamin A, obtained from several varieties of shark.

Shark Bay. Inlet of the S. Indian Ocean in W. Australia. A narrow peninsula, Edsel Land, projects N.; off the N. end of it Dirk Hartog, Dorre, and Bernier Islands form a long chain extending N., all forming the W. side of the bay. The S. of the bay is divided into Freycinet Estuary and Hamelin Pool by Peron Peninsula. The Gascoyne and the Wooramel rivers enter the bay on the E. shore. The bay is a centre for the pearling industry.

Sharkiya or SHARQIYA. Prov. in Lower Egypt. It lies E. of the Nile delta, with a coast on Lake Manzala. Area, 1,933 sq. m. Pop. 1,355,362.

Sharon, PLAIN OF. Region of Palestine. Noted of old for its beauty and fertility, it lies between

the hills of Central Palestine on the E., and the Mediterranean on the W. It starts on the S. from Jaffa (Joppa), and reaches on the N. to Qisara (Caesarea), about 20 m. S. of Mt. Carmel. It is some 25 m. in length and 8 m. in width. The rose of Sharon, in Song of Solomon, chap. 2, was probably the narcissus. During the First Great War the Plain of Sharon was the scene of the infantry and cavalry advance of the British, which led to the conquest of Palestine.

Sharp. Sign used in music to denote the raising of a natural note by one semitone, thus : \sharp

In early days the sign for a natural was employed for the same purpose. The confusion thus occasioned was remedied towards the close of the 17th century by using a double, \times , or a single, \times , cross. The former was superseded by the present sign, and the latter (double sharp) now indicates that a natural is to be raised a whole tone. At one time sharp was used in Germany as synonymous with major, as when Beethoven described his Leonora overture no. 1 in C as being in C sharp. When a performer plays or sings a little above the true pitch, he is said to be "too sharp." See Flat; Harmony; Natural.

Sharp, BECKY. Character in Thackeray's novel *Vanity Fair*, of which she is the dominating personality. She typifies the heartless, self-seeking adventuress, with a peculiar power of fascination over widely different types of person. See Sedley, Amelia.

Sharp, CECIL JAMES (1859-1924). British musician. Born Nov. 22, 1859, he was educated at Uppingham and Clare College, Cambridge, held a legal post in Australia, 1883-89, and was principal of the Hampstead conservatoire of music, 1896-1905. He was

Cecil Sharp,
British musician

especially noteworthy as an indefatigable collector of English folk-songs and folk-dances. He died June 23, 1924. See Morris Dance. Consult Life, A. H. Fox-Strangways and M. Karpeles, 1933.

Sharp, GRANVILLE (1735-1813). British anti-slavery advocate. Born at Durham, Nov. 10,

1735, he was educated at Durham grammar school, and apprenticed to a London linen draper, afterwards obtaining an appointment in the government ordinance department. Sharp wrote some 60 pamphlets and books, but his important work was the defence of the negro slave, which after seven years' labour secured the momentous decision from the courts that "as soon as any slave sets his foot on English territory he becomes free." With Thomas Clarkson (q.v.) he founded the Association for the Abolition of Slavery, 1787. He died at Fulham, July 6, 1813. Consult Memoirs, P. Hoare, 1820.

Sharp, JAMES (1618-79). Scottish ecclesiastic. Born at Banff Castle, May 4, 1618, he was educated at King's College, Aberdeen, and at Oxford. He became professor of philosophy at St. Andrews, and in 1648 was ordained Presbyterian minister of Crail, Fifeshire. A prominent

James Sharp,
Scottish divine
After Lely

leader of the Presbyterian party, he was captured at Alyth in 1651, and imprisoned in the Tower of London until 1652. In 1660 he definitely crossed to the episcopal party, negotiated with Monk, and went to Charles II at Breda. In 1661 he was consecrated archbishop of St. Andrews, and became primate in 1664. His zeal in the establishment of episcopacy and his harsh treatment of the Presbyterians, whom he had formerly led, made him bitterly hated. His life was attempted in Edinburgh in 1668, and on May 3, 1679, he was brutally assassinated in his carriage on Magus Moor, Fifeshire.

Sharp, WILLIAM (1749-1824). British line engraver. Born in London, Jan. 29, 1749, he was apprenticed to Barak Longmate, a well-known heraldic engraver, and afterwards devoted himself to engraving works after Van Dyck, Guido, West, Reynolds, and others. Associated in his youth with Horne Tooke and Thomas Paine, he became in turn a disciple of Swedenborg and Johanna Southcott. He died at Chiswick, July 25, 1824.

Sharp, WILLIAM (1856-1905). Scottish man of letters. Born at Paisley, Sept. 12, 1856, and educated at Glasgow university he settled in London in 1878, and began to write. Among the products

of his pen were his poems *Earth's Voices*, 1884; *Romantic Ballads*, 1886; *Sospiri di Roma*, 1892; and novels and tales such as *The Children of To-morrow*, 1889; *Wives in Exile*, 1896; *Silence Farm*, 1899, besides biographies of the poets and other miscellaneous writings. His fame rests chiefly on the Celtic romantic tales which he wrote under the pseudonym of Fiona Macleod, such as *Pharais*, 1894; *The Mountain Lovers*, 1895; *Green Firc*, 1896; *The Winged Destiny*, 1904; and two plays, *The House of Usna*, 1900, *The Immortal Hour*, 1900; the last named was set to music by Rutland Boughton. The identity of Sharp with the supposed Highland prosopoeist, endowed with Celtic genius, and steeped in Celtic lore, though suspected in some quarters, was not revealed until after his death in Sicily, Dec. 14, 1905. A Memoir by his wife appeared in 1910.

William Sharp,
Scottish poet

Sharpsburg, BATTLE OF. Engagement in the American Civil War, sometimes called the battle of Antietam, Sept. 16-17, 1862. After his successful summer campaign, Lee crossed the Potomac with an army of 40,000, intending to invade Pennsylvania. On hearing of McClellan's advance from Washington he took up his position on the Antietam creek in front of Sharpsburg. Skirmishing began on Sept. 16, and the battle opened next day with a Federal advance which drove back Jackson on the Confederate left; after bitter fighting it seemed indecisive, but eventually it proved a Federal victory by forcing Lee to abandon his Pennsylvania campaign and retreat to Virginia. The losses on either side were heavy. Of 75,000 men engaged on the Federal side, 12,000 became casualties; the Confederates lost 11,000 men.

Sharpshooter. Word formerly used for a soldier specially employed as a marksman in time of war. The modern equivalent is sniper. Sharpshooters were often organized in regts., and were prominent in the war of American Independence. See Sniper.

Shasi. Town in Hupeh province, China. Standing on the Yang-tse river, 882 m. from the mouth, it was opened as a treaty port in 1896. Shasi dates from before the Christian era, but was

entirely destroyed in the 13th century. A large embankment protects the town from the river floods. Here much cotton cloth is manufactured. Pop. 110,590.

Shasta, Mr. Extinct volcano of California, U.S.A. It rises to 14,380 ft. in the Sierra Nevada. The summit is snow-clad, and small glaciers lie on the N. slope. A large crater, $\frac{2}{3}$ m. across and 2,500 ft. deep, is 1,400 ft. below the top.

Shasta Dam. Irrigation, flood control, and hydro-electric power dam across the Sacramento river, Calif., U.S.A. This key structure of the Central Valley project was completed in 1945, and has a maximum height of 602 ft. and is 3,500 ft. long, 6,413,000 cu. yds. of concrete being used. Twenty-five p.c. of the water impounded irrigates 255,000 acres in the Sacramento valley, while the remainder operates generating plants with a capacity of 379,000 kW.

Shatt-al-Arab. The "river of Arabia." Formed by the junction of the Euphrates and the Tigris, near Kurna in Lower Iraq, it flows down from the N. past Basra into the Persian Gulf, after receiving the waters of the Karun from the N.E. It is about 100 m. long, its width averaging about 600 yds.

Shatt-al-Hai. River of Iraq. It flows out of the Tigris at Kut-el-Amara on the N., and joins the Euphrates at Nasrieh on the S. About 150 m. in length, it has a town on its banks called Hai, 20 m. S. of Kut, and is navigable for small native craft for some distance for four or five months of the year. It is subject to floods. It was prominent in the operations for the capture and relief of Kut in the First Great War. See Kut; Mesopotamia Campaign.

Shavli. Lithuanian town whose name is also spelt Siaulhai (*q.v.*).

Shaw. Market town of Lancs, England, which comes within the urban dist. of Crompton. It stands on the Beal, 3 m. N. of Oldham, with a rly. station. The principal buildings are Holy Trinity church and the town hall. The chief industry is the manufacture of cotton goods. Market day, Thurs. Pop. 12,530.

Shaw, ALFRED (1842-1907). English cricketer. Born Aug. 20, 1842, at Burton Joyce, near Nottingham, he was apprenticed to a hosier, but secured an appointment with a cricket club at Grant-ham as a professional. In 1864 he joined the ground staff at Lord's and began to play regularly for Notts. For about 20 years from

Alfred Shaw,
English cricketer
Russell

1867 Shaw was at the top of his powers, and was perhaps the greatest bowler in England, certainly the greatest slow bowler. He played for England in seven test matches against Australia, going there five times and twice to America. He died Jan. 16, 1907.

Shaw, SIR EYRE MASSEY (1830-1908). Chief of the London metropolitan fire brigade. Born Jan. 17, 1830, he graduated at Dublin university and then entered the army, but retired in 1860, upon appointment as chief constable of Belfast. There he reorganized the fire brigade so efficiently that in 1861 he became chief of the London fire brigade.

Sir E. M. Shaw,
Chief of London Fire
Brigade

During his 30 years of office he introduced numberless improvements and entirely remodelled the brigade. On his retirement, 1891, he was knighted, and later became chairman of the Metropolitan Electric Supply company. He died Aug. 25, 1908. Shaw wrote books on fighting and preventing fire. He was the Captain Shaw apostrophised in Iolanthe as "type of true love kept under." The firefloat kept moored on the Thames is named after him. See Firefloat; Fire Service.

Shaw, FLORA LOUISE (d. 1929). British journalist. Wife of Lord Lugard (*q.v.*), she was head of the colonial department of The Times from 1890 to 1902. A strong believer in Rhodes, she had a considerable influence on the S. African policy of The Times, for which she undertook special missions to S. Africa, Australia (where she investigated the use of Kanaka labour in the Queensland sugar industry), and Canada. During the First Great War she founded the Lady Lugard hospitality committee and received the D.B.E. Among her books the most noteworthy was A Tropical Dependency, 1905. She died Jan. 25, 1929.

GEORGE BERNARD SHAW

Hesketh Pearson, author, *Bernard Shaw, His Life and Personality*

An outline of the career of one of the outstanding literary figures of the 20th century, dramatist, sociologist, critic, and famous public character. His most important plays are noticed separately under their own headings

Born in Dublin on July 26, 1856, Bernard Shaw went to several schools, learning nothing at any of them, but educating himself in music, literature, and painting. His sense of humour was derived from his father, his love and knowledge of music from his mother. Having wasted some years in a land agent's office, at the age of twenty he joined his mother in London, where she had gone to teach singing, and spent the years 1879-83 writing five novels at her expense. Each was sent to every publisher in London, and each was rejected. He detested all of them, and was ashamed of them when they were published some time after his reputation had been made as a critic and a dramatist.

But the drudgery of composition taught him how to write, and they reveal the phases of his mental development. The first two, *Immaturity* and *The Irrational Knot*, show him as a rationalist, a materialist, and a freethinker. The third, *Love Among the Artists*,

abandons rationalism and plunges into the conflict between aesthetic genius and common sense; it contains not a little of the playwright-to-be. The fourth, *Cashel Byron's Profession*, which later became a best-seller, displays his interest in boxing, including its economics, and was written for fun. The fifth, *An Unsocial Socialist*, is the first fruit of his reading of Karl Marx and complete conversion to socialism. But this premature attempt to grapple with the whole social problem convinced him that he was unequipped for the task; and he gave it up after two unbearably long chapters. The book we have is merely a scrap of fiction covering an aborted attempt at a treatise.

In 1881 Shaw, still only an ardent Shelleyan politically, became a vegetarian, and as he never drank alcohol and never smoked, his time and vitality had to be expended in other directions. Though nervous and shy by nature, he forced himself to speak in public; and having become

interested in economics by hearing Henry George, and converted to socialism by reading Karl Marx, he joined the Fabian Society in 1884, and with Lord Passfield (then Sidney Webb) initiated its work of "taking socialism off the barricades" and making it practical, respectable, and constitutional. As its missionary he took part in all the social agitations of the period, including "Bloody Sunday" in Trafalgar Square (1887), and soon won fame as a first-rate speaker and a superb debater, at first in the open air and among working-class audiences in free seats in the East End, but finally as a star orator drawing fashionable paying audiences in the central halls, a change so little to his taste that his later appearances on the platform, lucrative for his hosts (he never lectured professionally), were rare and occasional.

Meanwhile, he and Sidney Webb forced the Liberal party to adopt the Newcastle programme of Fabian Socialism and win the 1892 election on it. On its repudiation when it had served its turn Shaw and Webb issued two tracts, *To your Tents, O Israel*, and *A Plan of Campaign for Labour*. The result was the formation of the Labour Party and its establishment in parliament in 1906.

"Corno di Bassetto"

Helped by William Archer, Shaw started to earn his livelihood in 1885 as a critic of books for *The Pall Mall Gazette* and of pictures for *The World*; but his reputation was made as a critic of music for *The Star*, under the pseudonym of "Corno di Bassetto," from May, 1888, to May, 1890, and consolidated between 1890 and 1894 as music critic to *The World*, when the initials G.B.S. first delighted the reading public and infuriated the orthodox. This was followed by three years as theatre critic to *The Saturday Review* (1895-98).

In his critical work Shaw was classical, but irreverent and extremely readable. He knocked some popular idols off their pedestals and set up his own in their place. He never pontificated unless and until he knew, and then did so with apparent levity, making his most deeply considered judgements read like the sallies of a buffoon. He hated slovenly work of any description and was not mild in his censure of it. He attacked Shakespeare's plays, which he loved, because everyone else was absurdly uncritical of

them and glorified the mutilated versions produced by Henry Irving; and he paved the way for a proper understanding in England of Ibsen and Wagner, of whose works he wrote appreciations: *The Quintessence of Ibsenism* and *The Perfect Wagnerite*. He may be claimed as the most individual, provocative, and amusing critic in the English language.

G. Bernard Shaw

Meanwhile he had been making his first experiments in play-writing. The earliest, a tragicomedy of slum landlordism called *Widowers' Houses*, was produced by the Independent Theatre on Dec. 9, 1892, and had a mixed reception; the next, *The Philanderer*, a satire on the Ibsenites, remained unacted for many years; while the third, *Mrs. Warren's Profession*, dealing with immoral earnings, outraged the conventions of that time and was censored, though it silenced the critics who had slighted him as a pamphleteer who was mistaking his vocation. He then turned his

attention to more agreeable topics, writing *Arms and the Man*, *Candida*, *You Never Can Tell*, and *The Devil's Disciple*, all of which provided the backbone of the English repertory movement in the early decades of the 20th century. In Germany and America two of them proved box-office successes, and enriched their author sufficiently to justify him in marrying Charlotte Payne-Townshend in 1898. Following this, in spite of a breakdown in health, he produced one of his greatest works, *Caesar and Cleopatra*, which, by initiating a natural and humorous treatment of historical subjects, has influenced subsequent drama and biography.

Fame as a Playwright

During 1897-1903 he served first as vestryman and then as borough councillor for St. Pancras. In the latter part of this period he wrote *Man and Superman*, which contains the essence of his faith as an evolutionist, his belief in a creative purpose, all living creatures being experiments in the production of instruments of that purpose, which is the attainment of power over matter and circumstance with the necessary accompanying knowledge and comprehension. His fame as a playwright was firmly established during the Vedrenne-Barker season at the Court Theatre (1904-07), where John Bull's Other Island, *Man and Superman*, *Major Barbara*, *The Doctor's Dilemma*, *Captain Brassbound's Conversion*, and earlier plays were performed. The West End managers now clamoured for his work, and big successes were scored with *Fanny's First Play* and *Pygmalion*; though *Androcles and The Lion* (1913), "a pantomime for children of all ages," his finest comedy, was funny enough to be misunderstood.

In the 1914-18 war, when Shaw, to avert hostilities, proposed the foreign policy afterwards adopted at Locarno, his objective and critical Irish view of British diplomacy, jarring on British patriotism, made him unpopular for a while; but his sanity and the inevitable ebb of the war excitement enabled him to weather the storm. During the conflict he wrote *Heartbreak House* and began *Back to Methuselah*, which was his testament to the human race, his main achievement as a prophet. His career as a playwright was crowned with *Saint Joan* (1923), which, with *Caesar and Androcles*, will probably out-

last his modern sociological plays. After that he spent three years writing *The Intelligent Woman's Guide to Socialism*, which contains his economic doctrine, much of it already set forth in the prefaces to his various works. The most successful of his later pieces for the theatre was *The Apple Cart*, produced in 1929 at the first Malvern Festival, inaugurated by Sir Barry Jackson in his honour. It should be added that Shaw produced his plays, and supplemented the film versions of them. The popularity of the latter, coupled with his success as a broadcaster, made him famous from the Arctic to the Antipodes.

In 1925 Shaw was awarded the Nobel prize for literature. An offer of a peerage was refused, and the Order of Merit was rejected as superfluous on the ground that he had already conferred it on himself. This was perfectly true. As a playwright he stands next to Shakespeare in English literature, having overthrown the dominance of the British drama by the French system of "constructed" plays and restored dramatic subject matter to its ancient classical universality, upsetting all the conventions of what a "well-made" play should be, attacking current morality, and introducing politics, religion, and science to a form of entertainment that had previously dealt chiefly with crime, adultery and pseudo-romanticism.

As a critic he is more versatile and entertaining than his predecessor G. H. Lewes, and lighter in hand than Hazlitt. As a thinker he had a greater effect on his age than any other writer. As a reformer he and his fellow-Fabians created a new political force in England. And as a man he showed that singleness of purpose and undeviating sincerity can be united with genial toleration and unflinching gaiety.

Shaw, HENRY WHEELER (1818-85). American humorist known by his pen-name Josh Billings (*q.v.*).

Shaw, JOHN BYAM LISTON (1872-1919). British artist. Born at Madras, India, Nov. 13, 1872, he was taken to England in 1878, and studied art at the St. John's Wood and the R.A. schools. As a painter with a taste for brilliant decorative colour, he achieved success, but his reputation depends equally on his black-and-white work, particularly his illustrations to the Chiswick Shakespeare. He died Jan. 26, 1919.

Shaw, MARTIN FALLAS (b. 1875). English musician. Born in London, he had his musical education at the Royal College of Music under Stanford. He toured the Continent as musical director to Isadora Duncan during 1906-08, and later occupied various posts as organist, being master of the music at St. Martin-in-the-Fields, 1920-24. He edited much music, *e.g.* Songs of Britain, Songs of Praise (in collaboration with Vaughan Williams), and the English Carol Book. He composed choral settings of poems by John Massfield, Laurence Binyon, and T. S. Eliot.

Shaw, RICHARD NORMAN (1831-1912). British architect. Born in Edinburgh, May 7, 1831, he was articled to an architect in London. Studying at the R.A. schools, he won a medal and a studentship, and in 1863 began to practise on his own account.

He soon made a reputation by his country houses, one of which was Lord Armstrong's residence, Cragside, but is also known as the architect of New Scotland Yard (*q.v.*), the Piccadilly Hotel, and other London buildings, as also of houses on the Bedford Park estate. R.A. in 1877, he died Nov. 17, 1912.

Shaw, THOMAS (1872-1938). English politician. He was born at Colne, Lancs, April 9, 1872, and worked in a cotton mill when young. He took a prominent part in the trade union movement, and became in 1911 secretary of the international federation of textile workers, a post which he continued to hold for many years. M.P. for Preston, 1918-31, he was minister of Labour in 1924, and war secretary 1929-31. Tom Shaw died Sept. 26, 1938.

Shaw, SIR (WILLIAM) NAPIER (1854-1945). A British meteorologist. He was born in Birmingham, March 4, 1854, and educated

at Emmanuel College, Cambridge, of which he was a fellow, 1877-1906, and senior tutor, 1890-99. In 1879 he studied under Helmholtz in Berlin and in 1898 became assistant director of the Cavendish laboratory, at which, in 1877, he had been one of the first research workers under Clerk-Maxwell. As director of the meteorological office, 1905-20, Shaw did much to raise British prestige in international meteorology. Towards the end of the First Great War he acted as scientific adviser to the govt. He was knighted in 1915. On retirement he was appointed first professor of meteorology in London university, 1920-24. F.R.S., 1891, he was awarded a royal medal in 1923. His original contributions to science were considerable, but he is best known as the author of a *Manual of Meteorology*. He died in London, March 23, 1945.

Shawcross, SIR WILLIAM HARTLEY (b. 1902). British lawyer and politician. Born in Germany, Feb. 4, 1902, he was educated at Dulwich and at Geneva. Called to the bar, 1925, he was lecturer in law at Liverpool university, 1927-34, during which time he practised on the northern circuit.

In 1939 he became a K.C. He was chairman of the enemy aliens' tribunal, 1939-40, recorder of Salford, 1941-45, and in 1945 became Labour M.P. for St. Helens. In the same year he became attorney-general. At Nuremberg trials he was chief prosecutor for Great Britain; he also prosecuted at the trials for treason in London of William Joyce and Norman Baillie-Stewart; and took part in the proceedings of the Lyskney tribunal, 1948. He became recorder of Kingston-upon-Thames the same year. Knighted in 1945, he was made a privy councillor in 1946.

Shawinigan Falls. City of Quebec, Canada. It stands on the St. Maurice river, 21 m. from Three Rivers, and is important because the falls, 150 ft. high, here generate 200,000 h.p. It is on the C.P.R. and the C.N.R. Its manufactures are connected with the pulp, aluminium, carbide, and lumber industries. Pop. 24,750.

Shawl (Pers. *shāl*). Square of material worn draped from the

Norman Shaw,
British architect

Sir W. Hartley
Shawcross,
British lawyer
and politician

shoulders. A garment of great antiquity and wide distribution, the best shawls are those of Kashmir, which, with their characteristic cone pattern, fine quality, and beauty and depth of colour, have gained wide fame. The fine under-hair of the shawl goat, called pashm, is used, and the process of weaving after the thread has been made and dyed is long.

Some of the finest shawls cost in Kashmir itself as much as £300, though those of simple design and few colours may be as low as £15 or £16. Shawls of an inferior kind, but also made of pashm mixed with other wool, are manufactured at Amritsar, Jalalpur, and other places in the Punjab, where artisans from Kashmir have emigrated.

Early in the 19th century the fashion for wearing shawls arose among women in Europe, and the demand for them was such that large manufactures sprang up to cope with it, notably in France and Austria, while the shawls of Paisley in Renfrewshire, imitating those of Kashmir, became famous.

Shawm (Fr. *chalumeau*, from Lat. *calamus*, a reed). Double reed instrument like the oboe, but having a larger conical bore and a wider bell. It is of ancient origin, a similar instrument being known to the Romans. It became extremely popular from about the 12th century. In England it formed a part of the king's household band, and was also much used by the watchman or waits, whence it was known as the wayte pipe. Like other instruments of the 16th and 17th centuries, the shawm was made in various sizes from treble to contra-bass, the illustration being of the latter. Each had a compass of about an octave and a half. The shawm was eventually superseded by the oboe, but the treble pipe is still used in conjunction with the bagpipe by wandering minstrels on the Continent. The word shawm in the Prayer-book version of the Psalms is a mistranslation of the word Shofar (*q.v.*).

Shea Butter. Lard-like substance extracted from the seeds of *Bassia parkii*. See Butter-tree.

Sheaf. River of Derbyshire and Yorkshire, England. It rises in the Peak district of Derbyshire and for about four miles separates that county from Yorkshire. It falls into the Don at Sheffield.

Shear. In mechanics, the kind of strain produced in a substance by pressure, in which successive layers of the substance slide over one another laterally. In riveted joints, for example, sideways pressure may cause the rivets to part as if cut by shears. The strain produced by a shearing stress is also termed shearing. See Strain; Stress.

Shearer, NORMA (b. 1904). Canadian-born American film actress. Born in Montreal, Aug. 10, 1904, she worked there as a photographer's model. Going to New York, she played in film comedies, and then went to Hollywood. Films of this accepted beauty of the screen included *Smilin' Through*, 1933; *The Barretts of Wimpole Street*; *Romeo and Juliet*; *The Women*; and *Her Cardboard Lover*, 1942. Her first husband was the film director Irving Thalberg (d. 1936).

Norma Shearer, Canadian-born American film actress

Shear Legs or **SHEERS**. In engineering, a support for lifting-tackle. They consist of two almost vertical legs, of equal length, connected at the top to a third steadying leg. Shear legs are used in dockyards for handling boilers, machinery, and big guns. As the shear legs are raised or lowered

Shear Legs. Diagram illustrating action of shear legs lifting steam boiler from a quay and depositing it in a barge. A. Steam cylinder. B. Crank shaft. C. Winch barrel

in the process of hoisting, they open out or close in, somewhat in the manner of a pair of shears. They were used for masting sailing ships.

Shears. Name given to various appliances having a pair of opposed cutting edges which work by being crossed, or by meeting on the material to be cut. One type resembles a large pair of scissors,

(*q.v.*), having two level-edged blades pivoted together and sliding one over the other, used for cutting cloth, sheet metal, etc. In another type the blades are not separate and pivoted, but are joined at the top by a spring bow which normally keeps them apart. For cutting sheet metal there is a shearing machine with a pair of rotating cutters, the edges of which overlap. Another kind of shearing machine for cutting metal rod or bars is usually operated by power.

Shear steel was the name given to a grade of steel made from blister steel by a hammering process at welding heat. Single-shear steel on which the process was repeated was called double-shear steel. Both were formerly used for sheep shears and similar cutting tools. See Steel.

Shearwater. Name given to a genus of birds, related to the petrels. The Manx shearwater (*Puffinus puffinus*) is 15 ins. long, and has the plumage black on the upper parts and white below, the neck being slightly mottled with brown. It occurs around the S. and W. coasts of Great Britain and Ireland, but is most abundant on St. Kilda, and in the Orkney and Shetland Isles. During summer it remains in burrows by day, and goes fishing at night; but in winter it is about during the day. The sooty shearwater, greater shearwater, and dusky shearwater are occasionally met with during the winter months.

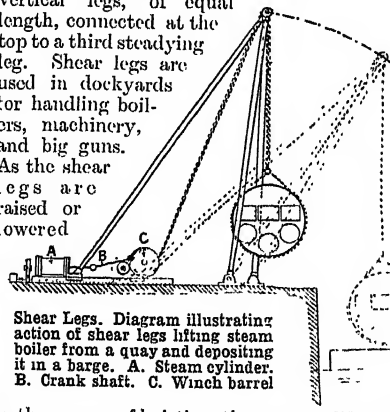

Sheat Fish. Large family of fishes, known as the Siluridae. Numbering about a thousand species, they are characterised by the presence of conspicuous barbels round the mouth and by the absence of scales. The skin is sometimes smooth, but in some species covered with small bony plates or knobs. The fish are found in the rivers and estuaries of most warm parts of the world, but only one species, the

Wels (*Silurus glanis*), is known in Europe, where it is found in the rivers E. of the Rhine. From 6 to 9 ft. long, black on the back, with green sides and yellowish underparts, it eats frogs and fish, and sometimes waterfowl.

Sheath (Anglo-Saxon *scæth*). Closely fitting protective covering of an object, such as the blade of

Shawm. Obsolete wind instrument

a tool or weapon; e.g. the scabbard of a sword. In botany the term is used for the base of a leaf enveloping a stem, also for a spathe or stipule with a similar function; and in zoology for a skin or other tissue enclosing an elongated part; the elytron or wing-case of a beetle; and the protective covering of certain protozoa. *See* Sword.

Sheathbill (*Chionis*). Small group of birds, placed by zoologists between the snipes and the gulls. Found in S. America and the Falkland Islands, they are about the size of pigeons, have white plumage, and bear some superficial resemblance to gulls. They are common about the coasts, nesting among the rocks, and their food consists of small molluscs and refuse.

Sheathbill, the yellow-billed species
W. S. Berridge, F.Z.S.

Sheba. Ancient kingdom in the S. part of Arabia Felix. Celebrated for its gold, frankincense, spices, and precious stones, and by some identified with Yemen, its queen came from the "utmost parts of the earth" to hear the wisdom of Solomon (1 Kings 10; Matt. 12). Its people were known as Sabaeans. Abyssinian tradition dates its royal house from Solomon and the queen of Sheba, but it is doubtful whether Solomon's visitor came from the Arabian Sheba or from the Ethiopian Seba, whose people were also known as Sabaeans. Sheba is the name of three persons mentioned in Genesis: 10, v. 7; 10, v. 28; 25, v. 3. *Consult* The Queen of Sheba, Sir Wallis Budge, 1922.

Shebat. Eleventh month of the Jewish sacred, and 5th of the civil year, mentioned by Zechariah (1, v. 7). It corresponds approximately with Jan. or Feb. *See* Calendar.

Shebeen. Term applied, especially in Ireland and Scotland, to a house where excisable liquor is retailed without a licence, and hence generally to a mean inn. The termination -een points to an Irish origin, but the derivation of the word is uncertain.

Sheboygan. City of Wisconsin, U.S.A., the co. seat of Sheboygan co. It stands on Lake Michigan, at the mouth of the Sheboygan river, 50 m. N. of Milwaukee, and is served by the Chicago and North-

Western rly. It has a state fish hatchery, and in 1938 the city was the largest cheese-shipping centre in the U.S.A. Pop. 40,638.

Shechem. Ancient name for Nablus (*q.v.*), a town of Ephraim, near Mount Gerizim and on the main road from Jerusalem to the North. The battle fought here, in which the British defeated the Turks, Sept., 1918, known as the battle of Shechem, resulted in the conquest of Palestine. Under Allenby, the British army consisted of 12,000 sabres, 57,000 rifles, and 540 guns. The great majority of the men were Indians. The total strength of the Turks and Germans under Liman von Sanders was upwards of 100,000 men, of whom about 36,000 were effectives, with proportionate artillery. Opposed to the Turks were also the Hejaz Arab army, estimated at 40,000.

At 4.30 a.m. on Sept. 19, after a short but powerful bombardment, the main attack was launched on a front of about 16 m., from Rafat to the sea. Taking the Turks completely by surprise, it overran their entire defensive system, in some places to a depth of five m., within three hours. Then the cavalry poured across the broken trenches, and by Sept. 20, the infantry were converging on Shechem from W., S., and E. On Sept. 21 the Turkish rearguards were driven in, and British and French troops entered Shechem.

By Sept. 24 the last remnants of the two Turkish armies, the 7th and 8th, that had held Palestine W. of the Jordan, were gathered in. More than 25,000 prisoners and 250 guns had been taken.

Shechinah (Heb., dwelling). Term used in extra-Biblical Jewish literature. Its use seems to have been suggested by Exod. 10, v. 35, where a cloud, symbolising God's presence, is said to have dwelt above the tent of meeting. Thus the expression is employed either as a periphrasis for the divine name, to render the language less anthropomorphic, or as a designation of the divine presence.

Shee, Sir Martin Archer (1769-1850). British artist. Born in Dublin, Dec. 20, 1769, he studied art in Dublin and came to London in 1788, entering the Royal Academy schools in 1790. He first exhibited at the R.A. in 1791, and

Sir Martin Shee,
British artist

gained a great reputation as a portrait painter. He took the place of Lawrence as the portraitist of the day, his sitters including members of the royal family. Elected A.R.A. in 1798, he became R.A. in 1800, assisted in the foundation of the British Institution in 1807, and was elected P.R.A. and knighted in 1830. Shee was a friend of Burke and Byron, and published some poems, several novels, and a tragedy. He died at Brighton, Aug. 19, 1850.

Sheehy-Skeffington, FRANCIS (1878-1916). Irish writer and politician. Born at Baileboro, co. Cork, Dec. 23, 1878, he entered University College, Dublin, in 1890, becoming registrar there, 1902-04. An eager Irish nationalist, and a leader of the Irish Independent Labour Party from 1908, in 1915 he served a term of imprisonment for speeches prejudicial to recruiting, and on April 26, 1916, during the disturbances arising out of the Easter rising (*see* Ireland), he was shot by a British officer in Portobello Barracks, Dublin. He wrote a Life of Michael Davitt, 1908; a novel, In Dark and Evil Days, was published posthumously in 1916.

Sheen, EAST. District of Greater London, part of the co. of Barnes, Mortlake, and E. Sheen, Surrey, England. It is situated between Richmond Park, S., and Mortlake, N.; Sheen Common being on its S.W. border and Palewell Common, S.E. The district is largely residential. *See* Barnes.

Sheep. Name applied to ungulate mammals of the genus *Ovis*. Several species of wild sheep exist in the high mountainous areas of the world, but the vast majority of the world's sheep belong to domesticated breeds, their number being estimated to be some 600,000,000. Of these domesticated sheep, about half the total number are wool-bearing. The remainder have a skin covering of rough hair, but this is sometimes underlain with an under-coat of fine wool.

Most sheep without wool inhabit the hotter and drier parts of the world, being found chiefly in Asia and Africa. Many are desert dwellers, carrying stores of fat in rump or tail. Such sheep provide meat and milk for human use, but not as a rule fibre for textiles. The closely curled coat of the newly-born lamb of the Karakul, however, a breed native to E. Asia, but reared extensively in S.W. Africa, is the Persian

lamb and Astrakhan fur of commerce.

Most wool-bearing sheep are found in Europe and in the newer countries of America, Africa, and Australasia which have been colonised from Europe. Their products—wool and mutton—are important in international trade. Thus, wool and mutton grown in Australia, New Zealand, S. Africa, S. America are transported to thickly populated Europe for manufacture and consumption.

Although all the wool-bearing breeds of sheep produce both wool and mutton, the relative value and importance of these two products varies in different breeds. Thus, the finest and most valuable wool is produced by merino sheep, a breed in which the mutton is of inferior quality. Merino sheep, so far as history records, originated in Spain, and for a long period the growing of merino wool was a monopoly of Spain. After the Napoleonic wars, however, merino sheep spread to the rest of Europe, including England, and subsequently to all quarters of the world, until Australia and the Union of S. Africa became the two chief centres of merino fine wool production.

English Wool and Mutton

England has always been famous for its sheep, although no English breed ever equalled the Spanish merino in fineness and quality of fleece. Nevertheless, in medieval England, wool-growing was one of the most important national industries and a major source of the country's wealth. English wools were of two types—short and long. English short-wool was in competition with Spanish wools, being used for rather similar purposes in textile manufacture. English long-wool, characterised by great length, strength, and thickness of fibre was, on the contrary, unique, and unrivalled in its class by the wools of any other country. English sheep in medieval times were, therefore, bred primarily for their wool. In the latter part of the 18th century, however, two factors led to a change in the breeding of English sheep, by which mutton became of greater importance than wool. One factor was the competition of the wool producing industry of the British colonies; the other was the increased meat consumption of the expanding industrial population of the English towns.

One English breeder who was a pioneer in improving the mutton qualities of English sheep was

Robert Bakewell of Dishley Grange, Leics, who, working with the long-wool sheep native to his county, attained his object—to breed sheep that fattened more easily and became mature at an earlier age by producing the new or improved Leicester sheep which were subsequently used to improve the mutton qualities of virtually all the long-wool breeds of England. John Ellman of Lewes, in Sussex, who evolved the Southdown breed, used to improve the mutton qualities of virtually all other English short-wools, did for them what Bakewell did for the long-wools.

Thanks to these two great sheep-breeders, the mutton-producing qualities of English sheep came to surpass those of any other country. Consequently, whenever and wherever it was desired to change the primary product of sheep from wool to mutton, the quickest and most effective means of doing so was to cross with rams of the improved English mutton breeds. This led to an important export trade in English pure-bred sheep, a trade that reached its greatest prosperity after 1880, when the invention of refrigeration led to the development of an international traffic in frozen meat. Several countries of the southern hemisphere—notably New Zealand and Argentina—changed the emphasis of their sheep industries over from wool to mutton, since the commerce in frozen mutton gave a new outlet and possibility of much greater profit. This change resulted in a great demand from these countries for English mutton sheep. At first this demand was almost entirely for English long-wools, since these were found to give an excellent cross with the fine-wooled merino. The long-wool merino cross produced a mutton carcass better than that of either parent breed; the fleece combined a good deal of the fine quality of merino wool with the length and weight of the long-wool. Various long-wool breeds—Leicester, Lincoln, Romney Marsh—were widely used. The original and famous Canterbury New Zealand lamb was a cross between the Leicester and merino breeds. The Lincoln—the English long-wool that produces the heaviest fleece and strongest wool of all sheep breeds—became the most popular breed in S. America. The Romney Marsh found a second home in New Zealand.

As the trade in frozen mutton developed and technique of re-

frigeration improved, competition between mutton-exporting countries became ever keener. To secure the finest quality of frozen lamb carcasses, a demand arose for the improved mutton breeds of English short-wools, particularly for the Down breeds, among which, as regards mutton quality, the Southdown remains supreme. In New Zealand, the cross between English long-wool and Spanish merino has become stabilised as a new and distinct breed, the Corriedale. In Australia, the Polwarth is a new and distinct breed of somewhat similar origin. These new breeds (and similar breeds have been evolved in America) produce good mutton and good wool.

Sheep-rearing also constitutes an important element in general farming, and there are breeds or crosses suitable for all situations. In Great Britain alone there are more than 30 recognized breeds: in addition to the long-wools (Leicester, Lincoln, Romney Marsh, Wensleydale, Border Leicester, etc.), and the short-wools (Southdown, Suffolk, Shropshire, Oxford, Ryeland, Dorset and Devon, etc.) there are the hill breeds, specially hardy and by far the most numerous and economically important sheep breeds in the U.K. Usually they produce mutton of excellent quality, although most hill sheep require fattening in the lowlands before slaughter. Their wool is often, but not always, of rather coarse quality and low market value. The most important British hill breeds are Scottish Blackface, Welsh Mountain, Cheviot, Swaledale, and Herdwick.

In some countries, the sheep is of some importance as a dairy animal. The Dutch East Friesian sheep gives as much milk as a goat. The milk of several European sheep breeds is made into cheese, and in certain of the countries of Europe with a peasant economy—e.g. Greece and Albania—there is actually more butter and cheese made from the milk of sheep than from that of cows.

By courtesy of The Farmer and Stock-Breeder

ease known as sheep scab, due to a mite (*Psoroptes communis*) that burrows in the skin. The Sheep Scab Order (1905) of the board of agriculture, intended to eradicate this pest, prescribes notification of the disease to the police, and makes dipping in some solution compulsory. There are many approved proprietary dips, the use of which involves little trouble; or a home-made dip can be prepared by dissolving 5 lb. of soft soap—with gentle warming—in 3 quarts of liquid carbolic acid (not less than 97 p.c. in strength), and adding water to make up 100 galls. Various hand-baths and swim-baths are in use, the latter being preferable. Dipping destroys other parasites that may be present and improves the quality of the wool.

Sheepdog. The old English breed of sheepdog much used by shepherds, drovers, and farmers, is from its most striking feature often known as the bob-tailed sheepdog. It should be born without a tail, but the fact that tailed specimens appear in most litters shows that this feature is not permanent. This dog, which has

Sheepdog. Shetland sheepdog, known as a toomie. Top, champion of the old English breed

remarkable intelligence, is a large and heavily built animal, with a rough, harsh coat of grey or bluish colour. The head is square and massive, and the tuft of wavy hair on the forehead makes it appear larger than it really is. Abundant exercise is absolutely necessary for this breed, and it should never be kept chained up or confined in a yard. In Scotland and the English Border country sheepdog trials (in which collies and Shetland sheepdogs figure as well as the

old English sheepdog) and competitions in driving and penning sheep are popular events. See Dog, colour plate.

Sheep Ked (*Melophagus ovinus*). Wingless insect of the order Diptera, family Hippoboscidae. Living as a blood-sucking external parasite on sheep, it is popularly known as sheep tick.

Sheep Maggot Fly (*Lucilia*). Metallic green or bluish fly of the family Tachinidae, popularly known as green bottle. Certain species lay their eggs in the soiled wool on sheep, and the maggots on hatching penetrate the skin, causing festering sores.

Sheep's-bit Scabious (*Jasione montana*). Annual downy herb of the family Campanulaceae. A native of Europe, N. Africa, and W. Asia, it has oblong leaves, and small lilac-blue flowers packed into a half-round head. It is found on

heathy pastures in Great Britain and Ireland.

Sheepshanks, JOHN (1787-1863). British art collector. Born at Leeds, son of a rich cloth manufacturer, he entered his father's business. Having developed a great interest in art, he acquired a large

collection of works by British artists. In 1857 he presented 233 oil-paintings and nearly 300 drawings to the nation, the collection being housed in South Kensington Museum. He died in London, Oct. 5, 1863.

Sheepshanks, RICHARD (1794-1855). British astronomer. A younger brother of John Sheepshanks, he was born in Leeds, July 30, 1794, and educated at Richmond School and Trinity College, Cambridge. Elected fellow of Trinity, he became a barrister and was ordained, but did not work at either profession, his main interest being astronomy. In 1829 he became secretary of the Royal Astronomical Society, and he did a great deal of work for the royal commission on weights and measures, of which he was a member. Sheepshanks, who died at Reading, Aug. 4, 1855, made a valuable collection of astronomical instruments.

Sheepshead (*Sargus oris*). An American food fish of the family Sparidae. Found along the Atlantic coast of the U.S.A., it grows to a length of 30 ins. and an aver-

age weight of about 7 lb., though specimens have been found weighing 20 lb. It is deep in the body, marked by seven or eight dark transverse bands. The name is derived from the shape of the head and the prominent incisor teeth. Except during the spawning season, March-June, it is gregarious in habit. It feeds on small crustaceans and shellfish, which it detaches from the sea bottom by means of its incisors.

Sheep Stealing. In English law, a felony under the Larceny Act. Once a capital offence, it is now punishable with imprisonment up to 14 years.

Sheerness. Seaport and urban district of Kent, England. It stands at the mouth of the Medway, on the N.W. of the Isle of Sheppey, 52 m. from London. It is served by rly., and by steamers to and from London, Southend, and elsewhere. The town is divided into three districts, Blue Town, Mile Town, and Marine Town. Blue Town is the dockyard quarter. The industries centre upon the royal dockyard, which is strongly fortified, and includes wet and dry docks, storehouses, etc. Connected with it are naval barracks and a coastguard station. A bronze tablet in the dockyard church commemorates the 1,070 officers and men who lost their lives when the warships Bulwark and Princess Irene were destroyed in the harbour by internal explosions Nov. 26, 1914, and May 27, 1915, respectively.

The modern portion of the town, Sheerness-on-Sea, is a watering-place, with good beach, esplanade, and bathing facilities. Sheerness originated in a fort built about 1660, to protect the Thames and Medway entrances. A dockyard was established which grew considerably during the 19th century. In 1667 the Dutch fleet captured the fort, but it was quickly recovered by the English. Pop. 16,400.

Sheet Anchor. Largest anchor used on a ship and cast in case of danger. Its more correct name is shoot anchor, as it is released or shot quickly from the hawse-pipe.

Sheet-Flood. In geology, a shallow flood of water moving down a gentle slope not adequately provided with drainage channels. Sheet-floods often occur in arid or semi-arid countries where rainfall is sporadic but heavy. Rain falling several inches an hour cannot percolate or drain away, and the water, carrying with it surface débris, moves down hill as a sheet.

Sheet Metal. Flat rolled product, the dimensions of which come within certain limits. These limits vary according to material, method of rolling, and other factors. Sheet is rarely more than $\frac{1}{4}$ in. thick. If it exceeds this, and if its width is relatively large, the metal is termed plate, while if the width and thickness are similar it is bar. If the thickness is somewhat less than $\frac{1}{4}$ in., and the width is small, the metal may be termed strip.

Sheet Metal Working. This industry is concerned with the manufacture of articles from flat sheet metal, usually not more than $\frac{1}{16}$ in. thick. The trade known as panel-beating is manual sheet metal working in its most skilled form. A panel-beater can produce rounded convex and concave shapes from flat sheet by a process consisting mainly of manual hammering. To some extent panel-beating has been superseded by the mechanical processes of pressing and deep drawing, but it is still used for repair work and when small numbers of an article are required. Tin cans, milk cans, domestic water tanks, ventilating ducts, metal boiler flues, motor car bodies, and metal coach bodies are typical sheet metal products. Riveting and soldering were formerly needed for making joints in sheet metal work, but fusion, spot, projection, and seam welding have now greatly widened the scope of the work and largely replaced the older methods.

Sheet Piles. Piles driven side by side, usually of steel and generally interlocked along their edges. They are used to retain earthwork with a vertical or nearly vertical face, especially when in contact with water, as with wharves and quay walls, or for protecting river banks, and where it is necessary to prevent ingress of water. They are also used in building bridge piers and under-water foundations. *See* Bridge; Pile Driving.

Sheffield. City of Yorkshire (W.R.), England. It is situated on the border of Derbyshire, where four tributaries flow into the River Don, 157 m. from London. It is

served by rlys., and linked by water with the Humber. Since 1911 it has been the largest city in Yorkshire and fifth in England. Area, 39,596 acres. Pop. 508,370.

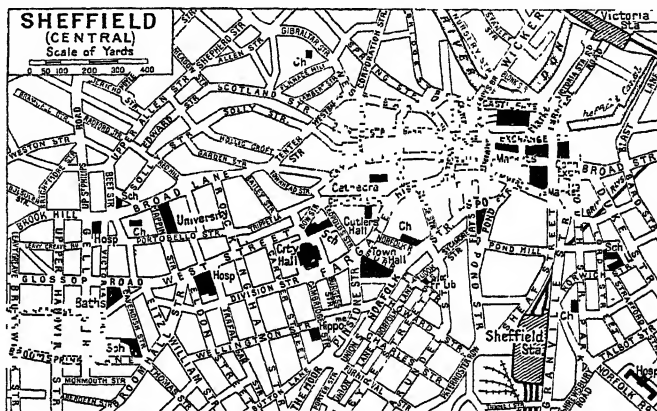

Sheffield arms

The Saxon manor was entirely rural, and was the principal manor in the sub-shire of Hallamshire. Sheffield as an urban centre originated when a Norman lord, William de Lovetot, built a castle at the junction of the Sheaf and the Don early in the 12th century. At the end of that century the manor passed to the family of Furnival, and then to the Talbots, earls of Shrewsbury. In the 17th century, through one of the co-heiresses of the Talbots, who married Thomas Howard, earl of Arundel and Surrey, it passed to the Howards, afterwards dukes of Norfolk. Mary Queen of Scots was imprisoned in Sheffield, 1570-84, living generally in the castle but for short periods in the Manor Lodge of which the remains still

the Company of Cutlers in Hallamshire was incorporated, replacing an earlier manorial system of control; though many of its ancient powers have devolved upon other authorities, it is still the sole authority over trade marks on any metal in Hallamshire.

About 1742 Benjamin Huntsman, who came to the town from Doncaster, invented the crucible process of steelmaking, and by the middle of the 19th century Sheffield had become the national centre for the making of fine steel. A succession of pioneers in steel-making processes, many (though not all) Sheffield men, built up a huge industry in special steels, armour plate, and guns, and important engineering products such as crank axles and pistons, tram-

Sheffield, Yorkshire. Plan of the central districts of the city

exist. In 1643 the castle was taken for the king by the duke of Newcastle. The next year it surrendered to the parliamentary forces, and was demolished 1648.

The presence of water power, timber for charcoal, local iron ore, sandstone for grindstones, and (important at a later date) coal, limestone, and refractory materials determined the local industries. Knives were made in the town in the 14th cent., iron was worked near by in the 12th cent. After the adoption of water power in the 15th cent., the manufacture of cutlery developed rapidly as a domestic industry. Although steam power was largely substituted for water power at the industrial revolution, the "little mester" continued to be important right through the 19th cent. There are still many small firms beside the big ones. Cutlery includes knives, razors, scissors, agricultural implements, surgical instruments, and edge tools of all kinds. In 1624

way crossings, boilers, propeller shafts and cranks, and castings of all kinds.

In 1740 Thomas Boulsover invented the plating process known as Old Sheffield Plate, and a silver industry was established. About 1850 the process was superseded by electro-plating, and the making of solid silver and electro-plated wares is still an important element in Sheffield trade. Coalmining, typefounding, brewing, and some smaller industries are also carried on. The study of glass technology has become important latterly.

As a result of the development of these industries, Sheffield grew rapidly from the mid-18th century onwards. In 1843 it was incorporated as a borough, and in 1893 became a city. The city has had a lord mayor since 1897. It returns 7 M.P.s.

The town, which until very recent times was small, crowded, and mean, with narrow winding streets and rough industrial build-

Sheffield, Yorkshire. 1. Town Hall, opened 1897. 2. High Street. 3. City Hall, built 1932, which seats 5,500. 4. Weston Park and City Museum. 5. Cathedral church of SS. Peter and Paul

ings in the centre, began to grow in the 18th cent. along the valleys of the Sheaf and the Don. During the 19th cent. the built-up area gradually covered all the inner ring of the magnificent hills which rise from the Don valley, and residential suburbs were built in the west, while to the N.E. the great works of the heavy industries extended to the borders of Rotherham. After 1900 the boundary was extended to include large parts of the neighbouring parishes and of N. Derbyshire.

The first parish church was built by William de Lovetot in the 12th century, but the oldest part of the fabric now standing is the 15th century tower and chancel. The diocese of Sheffield was created 1914, when the parish church of S. Peter and S. Paul became the cathedral church.

The chief R.C. church is that of S. Marie in Norfolk Row. Nonconformist churches include the Victoria Hall (Methodist), Nether Chapel (Congregational), and Upper Chapel (now Unitarian, with a dissenting tradition back to the mid-17th century). Within the city boundary are the remains of Beauchief Abbey.

The city's other prominent buildings include the town hall, opened 1897, enlarged 1923, containing council chamber, banquet-

ing hall, and municipal offices, and tower 180 ft. high, bearing a statue of Vulcan; the central library and Graves art gallery, 1934; the city hall, 1932, with seats for 5,500 for concerts and meetings; the cutlers' hall, built 1832, enlarged 1888; the city museum in Weston Park; and the Ruskin museum in Meersbrook Park. The university received its charter in 1905.

German air raids of the Second Great War caused damage to residential, industrial, and commercial property within the city, especially the concentrated raids made on Dec. 12 and Dec. 15, 1940.

The Sheffield city council is composed of 100 members, of whom 25 are aldermen. The city is divided into 25 wards. Since 1888 the council has owned the waterworks, which now include 13 storage reservoirs in four of the valleys tributary to the Don, and a quarter share in the reservoirs of the Derwent Valley water board. The electric supply department was owned by the corporation 1898-1948, and has a generating plant with a total capacity of 317,000 kW. An excellent system of tramways and buses is run by the corporation. The market rights, first granted in 1296, were bought in 1899 by the corporation,

who have greatly extended the market accommodation. There are 2,955 acres of public park and woodland, good facilities for sport, and ample schools and hospitals. Two commercial theatres, the Playhouse (run by the Sheffield Repertory Company), and many cinemas cater for amusements. Market days, Tues., Fri. and Sat.

Sheffield, UNIVERSITY OF. English university. It was founded in 1905, being an extension of Firth College, dating from 1879, and including also the Sheffield school of medicine, established in 1828, and the technical school of 1884. The faculties include arts, law, science, medicine, engineering, and metallurgy, with departments of architecture and glass technology. The buildings are in two main blocks; one, a modern pile in the Tudor style, adjoins Weston Park. They include a fine library, laboratories of all kinds, and an observatory. There are two residential halls for men and two for women. See Gowns, colour plate.

Sheffield, JOHN BAKER HOLROYD, 1ST EARL OF (1735-1821). British politician. Son of Isaac Holroyd, a man of Yorkshire descent with Irish estates, Holroyd bought the Sheffield Place estate, Sussex, from Lord de la Warr, 1769, and as a soldier and politician became prominent in the suppre-

sion of the Gordon riots, 1780. He was created Baron Sheffield in the peerage of Ireland in 1781, and while an Irish peer represented Bristol in parliament, when he supported the Union. In 1816 he was made earl of Sheffield, also an Irish title. He was president of the board of agriculture, 1803, and a lord of the board of trade, 1809. Sheffield was the most intimate friend of Gibbon, whose works he edited in 1796. He died May 30, 1821.

Sheffield Plate. Name given to articles made of copper and plated with silver by a process of fusion or soldering. In 1742-43 Thomas Boulsover (1704-88), a Sheffield mechanic, discovered a method of fusing copper and silver, which he turned to account in the manufacture of various small plated articles. His invention was developed into an important industry by Joseph Hancock, from 1758 onwards, and Sheffield plating, now an extinct art, held the field until the introduction of electro-plating in 1840. Hancock found that Boulsover's invention could be employed in plating copper candlesticks, coffee-pots, salvers, etc., of elaborate design, in imitation of wrought silver, and his example was followed by other manufacturers in Sheffield and Birmingham, where Boulton began to produce plated goods in 1764.

To form the sheets of metal required in the manufacture of Sheffield plate, an oblong ingot of copper was carefully planed to receive on one or both sides a thin plate of silver. A sheet of copper was placed over the silver to protect it, and the whole was bound together with wire. The ingot was put in the plating furnace, and heated to a critical temperature just below that of complete fusion. It was withdrawn, the silver now being solidly united with the copper base, and allowed to cool. The wires and copper sheet having been removed, the ingot was converted in a rolling mill into a sheet of the required thickness. See *Electro-Plating*.

Sheffield Shield. Cricket trophy competed for between the states of Australia. It was presented in 1892 by Henry North Holroyd (1832-1909), 3rd earl of Sheffield, who took an eleven to Australia 1892-93. The Sheffield Shield competition provides the chief matches in Australian cricket.

Sheffield Telegraph. British daily newspaper. It was established in 1855 as the Sheffield Daily Telegraph, and came under

the control of the Leng family in 1864. In 1925 the paper was bought by Allied (now Kemsley) newspapers, and in 1938 incorporated the Sheffield Independent. The Sheffield Star is an evening paper published by the same organization.

Sheffield United. English professional Association football club. They entered the Football League in 1893, and their record includes the League championship for 1898, and the F.A. Cup in 1899, 1902, 1915, and 1925. The final Cup tie was lost in 1901 and 1936. Their ground is at Bramall Lane.

Sheffield Wednesday. English professional Association football club. Established in 1866, they became a member of the Football League in 1892, and won the championship in 1903, 1904, 1929, and 1930. The Wednesday carried off the F.A. Cup, in 1896, 1907, and 1935, and were defeated by Blackburn Rovers in the final in 1890. Their ground is at Hillsborough.

Shefford. Market town of Bedfordshire, England. It stands on the Ivel, 9 m. S.E. of Bedford, with a rly. station. Near is the village of Warden, with ruins of a Cistercian abbey, founded here about 1150. Pop. 2,000.

Sheik or **SHEIKH** (Arab., old man). Arab title of respect. It is applied to Arab chiefs, headmen of villages, preachers, heads of religious orders or communities, and to local saints. The Sheik was the title of a famous novel (pub. 1919) by E. M. Hull (d. 1947). See *Shaikh*. *Pron.* sheekh or shaykh.

Sheil, RICHARD LALOR (1791-1851). Irish dramatist and politician. Born at Drumdowney, co. Kilkenny, Aug. 17, 1791, he was educated at Stonyhurst and Trinity College, Dublin. He was called to the Irish bar in 1814, and while waiting for briefs wrote or adapted with success several dramas—*Adelaide*, or *The Emigrants*, 1814; *The Apostate*, 1817; *Evadne*, 1819. From 1823 he supported O'Connell in agitation for Catholic emancipation until the cause was gained in 1829. Subsequently Sheil sat in parliament for several Irish constituencies, held office under Melbourne and Russell, and was the first R.C. to be made a privy councillor, 1839. Eventually he became

Richard Sheil,
Irish dramatist
After Catterson Smith

British minister to Tuscany, and died in Florence, May 23, 1851.

Shekel (Heb., weight). Name of a Jewish weight or coin. In the former sense it weighed about 225-

Shekel. Both sides of the Jewish silver coin. Actual diameter, $\frac{1}{2}$ in.

253 grs. or 10 dwts. Troy, according to the system in use. Fifty shekels went to the maneh, of which sixty went to a talent. As coined, the silver shekel was worth about 2s. 8d., and the gold shekel about £2. No gold examples are extant, but silver coins of various dates have been discovered. The emblems on the coin represent a chalice and a flowering lily.

Sheldon, GILBERT (1598-1677). English prelate. Born July 19, 1598, he was educated at Trinity College, Oxford, and was ordained in 1622. He was elected warden of All Souls in 1626 and appointed chaplain to Charles I. He suffered imprisonment under the parliamentary regime, but at the Restoration was made bishop of London, 1660. He was also master of the Savoy, and member of the privy council. In 1663 he was chosen archbishop of Canterbury in succession to Juxon, and took a prominent part in political affairs, becoming one of Charles II's principal advisers. As visitor and chancellor of his university he was energetic and liberal, building at his own expense the Sheldonian Theatre. He died Nov. 9, 1677. See *Oxford*; consult also *Worthies of All Souls*, M. Burrows, 1874.

Gilbert Sheldon,
English prelate

Sheldrake (*Tadorna*). Genus of wild ducks, of which two species occur in Great Britain. The common sheldrake (*T. tadorna*) is about 26 ins. long, and the plumage is dark green on the head; green, white, and brown in bands on the neck; black and white on the wings; and dark brown and white beneath. The beak is bright red and has a conspicuous basal knob. The bird holds an intermediate place between the ducks and the geese, and is found on sandy

Sheldrake. Variegated species, or Paradise duck
W. S. Berridge, F.Z.S.

shores, where it feeds on molluscs and marine worms. The nest is usually constructed in a deserted rabbit burrow. The ruddy sheldrake (*Casarca ferruginea*) is an occasional visitor to British shores.

Shell. Hard outer covering of various animals and plants, e.g. seeds and fruits, birds' eggs. The word is more especially used of the external skeleton of certain invertebrate animals. The most important of these are the protozoa, mollusca, and brachiopoda. The shell is usually calcareous (though sometimes siliceous). That of the crustacea (lobsters and crabs) is not a true example, for it is merely a hardening by calcification of the horny cuticle found on other arthropods. The carapace of the tortoise is not a shell but a special skeletal development. Most protozoans possessing a shell belong to the foraminiferan (calcareous) or radiolarian (siliceous) groups. These are found in great numbers in chalk and in ooze from deep oceanic beds.

The typical shell is the molluscan, being found in its simplest form in the bivalves, which possess two valves joined by a horny ligament and composed of a crystalline form of calcium carbonate and a horny material, conchyolin. The calcareous crystals are either of aragonite or of calcite, the exact form varying. The conchyolin forms a thin outer coat (*periostracum*) and inside there are calcareous layers which may show prismatic and pearly iridescent structures. These usually contain some organic material. The outer layers are secreted by cells near the edge of the mantle, and changes in the shape of the mantle are thus incorporated in the valve as ridges or knobs. The valves are usually held together by muscles, the shell opening by the relaxation of these and a force exerted by a ligament joining the two valves.

In the gastropods a univalve coiled shell is found, as in the

common garden snail, although it is sometimes tent-shaped, as in the limpet, or reduced and internal, as in the sea hare (*Aplysia*). In the cephalopods the univalve, coiled, and chambered shell of the pearly nautilus is notable, but other living forms, e.g. squids, have a much reduced internal shell. Another molluscan group, the chitons, have a shell made up of eight plates. See Bivalves; Brachiopoda; Cephalopoda; Cowry; Gastropoda; Mollusca; Pearl.

Shell. Hollow projectile containing an explosive charge and fired from guns, mortars, or howitzers. Spherical cast-iron shells were invented early in the 17th century, and consisted of hollow cannon balls, 80 p.c. of the interior being filled with gunpowder and the remainder containing a slow-burning composition to act as a fuse. In the 18th century a hollow cylindrical shell filled with powder and shot was introduced for use against troops in the open, a length of slow match allowing it to be fused to explode at predetermined height and distance.

There was little alteration in the design of shells until the early 19th century, when a new type of fuse was introduced. This was a wooden tube filled with powder, cut to different lengths to regulate the moment of explosion. In 1845 the time-tube was replaced by the percussion cap, which exploded the shell on impact. Spherical shells were used as recently as the Russo-Japanese war of 1904.

Cylindrical shells with a pointed nose-cap containing an impact fuse were invented by Palliser in 1872, and were made of cast iron. Designed for discharge from rifled guns, they were caused to rotate in flight by metal studs, arranged spirally on the outside of the case, which engaged with the rifling of the gun. As the studs allowed the escape of propellant gases between shell and barrel, so creating erosion of the gun's bore, they were replaced by a lead band. The lead, however, was liable to clog the bands during rotation, and in 1888 was abandoned in favour of the present copper driving band.

Gunpowder was the only explosive used in shells until 1886, when picric acid was introduced, to be replaced by the present trinitrotoluene in 1902. With the introduction of armour plating, cast iron proved ineffective; and shell cases are now made from forged or cast steel. With the exception of shrapnel (*q.v.*), shells are essentially destroyers of material,

and the object of the designer of projectiles is to fill the shell with high explosive of maximum destructive effect.

Except those discharged from light howitzers, all modern shells are of cylindro-conical shape. The head is sometimes fitted with a long, tapering, dummy cap, which, by reducing wind resistance, increases range. The largest shell yet used in warfare is the naval 16-in., weighing over a ton. Shells up to 4.5 ins. in diameter incorporate the case containing the propellant charge; the charge of bigger ones is contained in a separate case, which is inserted into the breach after the shell.

Other types of shell include smoke shells, filled with chemicals which on bursting combine to generate dense smoke. Star shells enclose a parachute and chemical candle; when the explosive charge bursts, the parachute is released and the candle ignites to illuminate the ground. Gas shells are filled with poisonous gas released when the case bursts. A.A. shells are similar to the destructive type used on the ground, except that they have a stronger propellant charge, do not exceed 5.5 ins. in diameter, and have either a time fuse or a radio-proximity fuse. Shells for use against armoured fighting vehicles have thick steel noses which penetrate the plating before bursting. See Ammunition; Bomb; Cartridge; Chemical Warfare; Explosives; Fuse; Incendiary Weapons; Shrapnel; Star Shell; Tracer Shell.

David Le Roi

Shellac. Resinous preparation from the *Ficus religiosa* and other similar East Indian trees. See Lac.

Shellal. Village of Egypt. It is situated on the Nile, opposite Philae above the Assuan dam, and is the terminus of the rly. from Cairo, and the starting point of river steamers, which serve to connect the Egyptian state and Sudan rly. systems.

Shelley, MARY WOLLSTONECRAFT (1797–1851). British author. Born in Somers Town, London, Aug. 30, 1797,

Mary Wollstonecraft Shelley, British author
After R. Rothwell

she was the daughter of William Godwin and Mary Wollstonecraft Godwin. In 1814 she met the poet Shelley, then alienated from Harriet Westbrook, and

three months later left England with him. On the death of Harriet in 1816 she became the poet's wife. In 1818 appeared Frankenstein, her famous story of the man who created a monster and gave it life. This was followed by the less successful Valperga, 1823.

After Shelley's death in 1822 Mary returned to England, where for some time her lines were cast in hard places, owing to the unsympathetic attitude of Shelley's father, Sir Timothy. In 1840, however, Sir Timothy settled a suitable allowance upon her son. She died Feb. 21, 1851. In 1826 she had published The Last Man, a romance in which she scarcely rises to her theme. Lodore, 1835, is the story of Shelley and Harriet cast in the form of a novel. Her Journal of a Six Weeks' Tour is interesting as a source of information regarding her husband's life. *Consult* Life, R. G. Grylls, 1938.

Shelley, Percy Bysshe (1792-1822). British poet. He was born, August 4, 1792, at Field Place, Warnham, Sussex, the eldest son of Timothy Shelley, a wealthy landowner who subsequently succeeded to a baronetcy. After some schooling at Isleworth, Shelley went to Eton in 1804, where he wrote, in the style of Mrs. Ann Radcliffe, two lurid romances, *Zastrozzi*, 1808, and *St. Irvyne*, 1810. Proceeding to University College, Oxford, in 1810, his chosen studies were metaphysics and religious polemics, and he here developed his "passion for reforming the world." His brief university career ended abruptly in April, 1811, by his expulsion for circulating his pamphlet on *The Necessity of Atheism*.

After leaving Oxford, in disgrace with his father, Shelley went to London lodgings in Soho, and made the acquaintance of Harriet Westbrook. In a mood of pity and mistaken chivalry, he committed the gravest mistake of his life by eloping with Miss Westbrook in Sept., 1811, to Edinburgh, where they were married.

During a sojourn at the Lakes he met Southey, then the idol of his fancy, and in 1812 he paid a flying visit to Dublin, where he made his sole public appearance as a politician, supporting the cause of Catholic emancipation and

the repeal of the Union by delivering speeches and circulating his *Address to the Irish People*. Shelley's first published volume,

M. Shelley

Margaret Nicholson, 1810, and a collection of verse written, with his sister Elizabeth, under the name of Victor and Cazire, 1811, are without promise. His philo-

sophical poem *Queen Mab*, however, begun at Dublin, and printed privately in 1813, although immature, is the work of a poet.

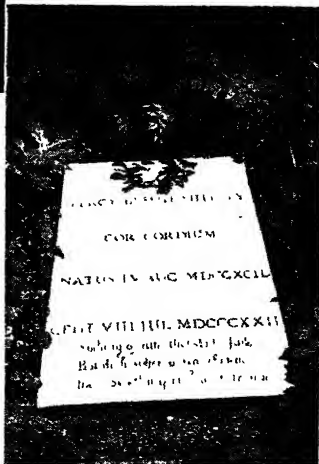

In the meantime, Shelley's marriage turned out badly. The pair were ill-matched, and by the spring of 1814 Harriet Shelley left her husband for a prolonged visit to Bath. During her absence he was frequently at the house of his friend and mentor, William Godwin, of whose extreme republican writings he was an enthusiastic admirer. Here he met Godwin's daughter, Mary, a girl of sixteen with whom he eloped to Switzerland in July, 1814, and to whom he was married in Dec., 1816, after the suicide of his wife. He visited Geneva in the summer of 1816, and was in daily intercourse with

Byron. On his return to England he issued *Alastor* and other Poems, 1816, in which his gifts were first seen in their maturity. His longer poem, *The Revolt of Islam*, 1818, originally entitled *Laon and Cythna*, written at Great Marlow, although abounding in fine passages, like its successor *Rosalind and Helen*, 1819, is but a stepping-stone to what was to come.

In March, 1818, Shelley left England, in search of health, for Italy, and in this more genial climate his genius developed to its full. The noble tragedy of *The Cenci*, 1819, was followed by *Prometheus Unbound*, 1820, written at Este, Rome, and Florence. The "choral song of the regenerated universe," it is his most characteristic work, great alike in conception and performance. In 1821 he settled at Pisa, where he wrote *Epipsychidion*, 1821, the most passionate love-song in the language, and *Adonais*, 1821, his tribute to the memory of Keats. The unwelcome companionship of Byron, who arrived at Pisa in the winter of 1821, caused Shelley to seek solitude at Lerici on the bay of Spezia. On July 8, 1822, he met his death returning by sea from Leghorn, where he had gone to welcome his friend, Leigh Hunt, to Italy. His body was burnt some days later, on the seashore where it had been washed up, and his ashes were afterwards buried in the Protestant cemetery at Rome.

Trelawny, new ed. 1906; Ariel, A. Maurois. 1923; S. at Oxford, ed. W. S. Scott, 1945; S. and the Romantic Revolution, F. A. Lea. 1945; Shelley, E. Blunden. 1946; Shelley, N. I. White, 1947.

Shell-fish. Name given to certain edible mollusca, including lobster, crab, prawn, shrimp, oyster, cockle, mussel, whelk, winkie. etc See separate entries.

Shell Implements. Tools and utensils made from the calcareous integuments of univalve and bivalve mollusca, especially in primitive culture. Examples are scanty from Palaeolithic Europe, where

Shell Implements used in Melanesia and Oceania. 1. Side and end views of adze blade, Fiji Islands. 2 and 3. Fish-hooks, Sandwich Islands

By courtesy of the Trustees, British Museum

the available shells were inferior in size and effectiveness to other natural utensils and to worked bone and flint. They were pierced for amulets and beads, and in Neolithic Egypt and central Europe were ground down into armlets.

The early use of shells as natural cups and as scrapers survives among the most primitive peoples, including Andamanese, Australians, and Fuegians, but was most important in Oceania. In aboriginal N. America shellcraft was specially developed, clams and mussels being used as spoons, besides being hafted for scraping and digging, wrought into knives and hooks, and ground into adzes for canoe making. Conchs served as drinking cups, picks, gouges, and trumpets. The Pacific coast abalone or ear-shell furnished pins, and shell scalpels were used in S. America.

In the Oceanic islands the lack of metal and workable stone imparted to shells a special importance. They furnish Melanesian knives and adzes, Polynesian pearl-shell fish-hooks, Hawaiian cowry net-sinkers—probably amuletic—and breadfruit-strippers in the Carolines. The Ainu use mussels as sickles for harvesting, and the nautilus drinking-cup is widespread. Conchs are still used in W. Mediterranean islands for calling fishermen and field labourers to work. See Conch; Cowry.

Shell Money. Medium of exchange. Shells have been used from prehistoric times by native tribes of Africa, Asia, America, and Australasia. The cowry shell is most common, but the tusk shell, clam shells, and others, or parts cut and ground from them, have been extensively used. Shell money in the Solomon Islands was made by grinding down various sea shells to fixed shapes, and these passed as money in exactly the same way as modern coinage. The wampum of the N. American Indians consisted of a string of shells, often 6 ft. in length. The use of shell money has practically died out as a result of modern methods of coin-manufacture by machinery. See Cowry.

Shell-Shock. Term applied during and after the First Great War to a form of neurasthenia brought on by an explosion or series of explosions. The condition was frequently preceded by concussion of the brain and unconsciousness, and had as symptoms impaired memory, lack of concentration, inability to make decisions, sleeplessness. Absolute rest and suitable psychological and general treatment were prescribed. The term was not used medically during the Second Great War.

Shelta or **SHELDHERU.** Peculiar jargon used by tinkers and other wayfarers in the British Isles. C. G. Leland drew attention to it in The Gypsies, 1882. Later, J. Sampson and Kuno Meyer showed that it is a deliberately perverted form of Gaelic, though Gypsy elements have been introduced into it. An early form of Shelta is found in an 11th century MS., and it probably arose as the secret language of the bards.

Shemakha. Town of Azerbaijan S.S.R. It is 80 m. W. by N. of Baku, near the river Pirsagat. There are fat, soap, dye, and brick works and tanneries. It was once famous for its silk trade, which greatly declined after the disastrous earthquake of 1902. The old

town, mentioned by Ptolemy, was destroyed by Nadir Shah, 1734. Pop. est. 23,000.

Shenandoah (American Indian, daughter of the stars). Former U.S. airship. Based on the design of the German Zeppelin L49, she was completed at Lakehurst, N.J., in 1923. Her length was 700 ft. and maximum diameter 80 ft., the gas bag being inflated with 2,148,000 cu. ft. of helium. On her trial flight, Oct. 22-26, 1923, she covered 9,000 m. in adverse weather conditions, but she was wrecked in a squall over Ohio, Sept. 2, 1925. 14 of her crew being lost.

Shenandoah. River of Virginia, U.S.A. It rises in two branches and flows 170 m. N.E. through the picturesque and fertile valley between the central range of the Appalachians and the Blue Ridge to join the Potomac at Harper's Ferry. Its valley was the scene of important operations in 1862-64. See American Civil War.

Shenandoah. Borough of Pennsylvania, U.S.A., in Schuylkill co. Situated 107 m. N.W. of Philadelphia, and served by rlys., it is a centre of a rich anthracite coal region. Shenandoah was incorporated in 1866. In 1884 Russian immigrants organized the first Orthodox parish in the nation here. Pop. 19,790.

Shendy. Town of the Anglo-Egyptian Sudan. On the E. bank of the Nile, 105 m. S. of Atbara, it was once a Dervish stronghold. It is an important rly. centre, with cotton factories and iron-works.

Shengjin (Ital. San Giovanni di Medua). Seaport of Albania. It is situated on the Adriatic, 20 m. S. of Shkoder, and has only primitive facilities, though it exports (chiefly to Italy) small quantities of hides, salt, and tobacco.

Shensi. Province of N.W. China. Situated between Kansu and Shansi, it is bounded N. by the Great Wall and W. by the Yellow river. The prov. is intersected by the Weiho. The N. half is a tableland of loess, liable to droughts; across the S. half run the Tsingling Mts., an extension of the Kwenlun range. Coal and iron abound, though they are little exploited. Other minerals found are salt, gold, nickel, and petroleum. The Lungghai rly. runs through the prov. The capital is Sian (Changan). The most disastrous earthquake in recorded history happened in Shensi, Jan. 24, 1556; it is said to have caused 830,000 deaths. Part of the province was already under Communist domination during the China-Japan conflict,

Yenan in the N. being the Communist "capital" 1936-47. Area, 72,919 sq. m. Pop. 9,650,000.

Shenstone, WILLIAM (1714-63). English poet. The son of a farmer who owned a small prop-

William Shenstone,
English poet

erty called the Leasowes, near Halesowen, Worcs, where he issued some early poems for private circulation. He was the author of

The Schoolmistress, a pretty poem burlesquing the Spenserian stanza. There is a certain charm also in his Pastoral Ballads and elegiac verses, in which are appreciable foreshadowings of the return to nature. Shenstone spent more than he could afford on the beautifying of the grounds and gardens of Leasowes, of which he was inordinately proud and which were visited by many famous people. A confirmed bachelor, he died Feb. 11, 1763.

Shepard, ERNEST HOWARD (b. 1879). British black-and-white artist and cartoonist. Born at St. John's Wood, Dec. 10, 1879, he was educated at S. Paul's School, and studied art at Heatherleys' and the R.A. schools. He started drawing for *Punch* in 1907, and became a member of the staff in 1921. In 1945 he succeeded Sir Bernard Partridge as chief cartoonist. Shepard's dainty, airy style of line drawing is perhaps seen to greatest advantage in his illustrations to A. A. Milne's children's books, e.g. *When We Were Very Young*, 1924; *Winnie the Pooh*, 1926; *The House at Pooh Corner*, 1928. These endeared his pictures to a whole generation of children; but almost as well known were his illustrations to *Everybody's Pepsys*, 1926; *Everybody's Boswell*, 1930; *Everybody's Lamb*, 1933; as well as those to works by Kenneth Grahame and Laurence Housman's plays about Queen Victoria.

Shepherdes Calendar, THE. Series of 12 pastoral eclogues "proportionable to the twelve monethes," the first important work of Edmund Spenser (*q.v.*). Dedicated to Sir Philip Sidney, and published in the winter of 1579-80, the eclogues deal with widely varying subjects. Three are concerned with Colin Cloute's unrequited love for Rosalind, i.e. Spenser's passion for an unknown lady;

three others discuss religious matters; one sings the praises of Elizabeth; another is an elegy upon the death of some noble lady; and the remaining four are less definite in their subjects.

The language, so archaic that a glossary was provided after each eclogue, was derived from the theories of Continental contemporaries and the tendencies of Spenser's predecessors. The form is based upon the classical model which the Renaissance had made popular in England as well as in France and Italy. The Calendar revealed Spenser's extraordinary fluency and grace of style, and gained for him immediate recognition as a poet of the first rank.

One of the most popular books of the Middle Ages was a semi-religious compilation known in English in the *Kalendar of Shepherds*, and in French as *Le compost el Kalendar des bergiers*. Its original compiler is unknown, but its description of the Seven Deadly Sins was derived from a 13th century treatise by Friar Lourens (Lawrence), confessor to Philip III of France, which was eventually translated into English by Caxton. The earliest known version of the complete work was printed in Paris, 1493.

This was illustrated by a series of extraordinarily vigorous woodcuts representing country life throughout the year. These appeared in successive French editions dated 1499, 1529, and 1541. The demand for the book persisted for 200 years or more and many English editions were published, including a notable one by Pynson, 1506, though without the wealth of illustration found in the early French issues. Consult *The Kalendar of Shepherdes*, ed. H. O. Sommer, 1892.

Shepherd. One employed in the guarding, feeding, and tending of sheep. The term is also used figuratively for anyone who looks after the spiritual welfare of a number of others. Shepherds are favourite figures in pastoral poetry

Pan was regarded as their tutelary god. See *Sheep*; *Sheepdog*.

Shepherd, JAMES AFFLECK (1867-1946). British artist. Born Nov. 29, 1867, he studied art under Alfred Bryan, the caricaturist. He excelled in animal subjects, becoming famous for his *Zig-Zags* at the Zoo, illustrations in his angular style in the *Strand* magazine. In 1893 he joined *Punch*, and he was later with the *Illustrated London News*. Although best known for humorous drawings—he was awarded a gold medal at an international exhibition of humorous art in Italy, 1911—he made serious studies, his *Captive*, a lithograph of monkeys, being in the British Museum. Publications include *Zig-Zag Fables*, 1897. *Nights with Uncle Remus*, 1903; *The Life of a Foxhound*, 1910; *The Bodley Head Natural History*, 1913. Shepherd died May 11, 1946.

Shepherd's Bush. Dist. of London. In the bor. of Hammer-smith (*q.v.*), it has a green, and stations on the Central and District lines. Trolley-buses run to many suburbs. Here is the White City (*q.v.*), and the Lime Grove film studios bought by the B.B.C. in 1949 for its television service.

Shepherd's Pie. Dish of re-cooked meat and potatoes. The meat is minced, flavoured with onions, carrots, etc., and baked in a pie-dish with a thick covering of mashed potatoes.

Shepherd's-purse OR PICK-POCKET (*Capsella bursa-pastoris*). Annual weed of the family Cruciferae. It is a native of Europe, N. Africa, and temperate Asia. It has a rosette of variable, lobed leaves, and a branched stem bearing minute white flowers. The pods are heart-shaped, two-valved, like an ancient purse, with many seeds.

Sheppard, ALFRED TRESIDDER (1871-1947). British author. He was born June 17, 1871, and educated at Bishop's Stortford. After working for years in an insurance office, he devoted himself to historical fiction. His works included *The Red Cravat*, 1905; *The Autobiography of Judas Iscariot*, 1920; *Here Comes an Old Sailor*, 1927; *Art and Practice of Historical Fiction*, 1930; *Rome's Gift*, 1936; *The Matins of Bruges*, 1938. He died May 10, 1947.

Sheppard, HUGH RICHARD LAWRIE (1880-1937). A British cleric and pacifist, known as Dick Sheppard. He was educated at Marlborough, Trinity Hall, Cambridge, and Cuddesdon College. He was prominent as a pacifist before the Second Great War,

Shepherd's-purse.
Plant showing
leaves, flowers,
and heart-shaped
pods

and in 1934, as a result of his appeal for people to sign a declaration to renounce war, the Peace

H. R. L. Sheppard,
British cleric

Pledge Union was formed. In 1936 he wrote to Hitler asking permission to carry his pacifist movement to Germany, but received no reply; and he was prevented by the Foreign office from flying to Spain to intercede with Gen. Franco for the lives of the people of Madrid. Eight days before his death, Oct. 31, 1937, he was elected rector of Glasgow university, gaining 538 votes; while Winston Churchill polled 281.

Sheppard began his career as chaplain of Oxford House, Bethnal Green, 1907, and was its head, 1909-10. He was chaplain of the order of S. John of Jerusalem, 1910. After being priest-in-ordinary to George V, he was chaplain to the king, 1916-29. In the First Great War he went to France. Returning to take up duty as vicar of S. Martin-in-the-Fields, London, he did much work for the homeless, and the wartime experiment of keeping the church open day and night for prayer and shelter became permanent. His broadcast services from S. Martin's made him a national figure. He left in 1927, and was dean of Canterbury, 1929-31, and canon and precentor of S. Paul's, 1934-37. In later years he was troubled by chronic asthma. His works include *Two Days Before*, 1924; *The Human Parson*, 1924; *Sheppard's Pie*; *If I were Dictator*; *We Say, No*. *Consult Life and Letters*, R. E. Roberts, 1942; *Dick Sheppard: Man of Peace*, C. H. S. Matthews, 1948.

Sheppard, JOHN (1702-24). English highwayman. Jack Sheppard was born at Stepney, London, and took to crime as a lad. Running away from his master, Owen Wood, a carpenter of Wych Street, in the Strand, he moved to Mayfair and Parsons Green, but was several times in prison, on each occasion making his escape with characteristic audacity. A daring highwayman and expert thief, he was at the summit of his career in the summer of 1724, when he

Jack Sheppard,
English highwayman

fell foul of Jonathan Wild. Wild gave him up to justice; he was tried at the Old Bailey on Aug. 14, but he made a daring escape. Captured again, he was chained to the floor of the strongest cell in Newgate, but on Sept. 16 he broke free from his shackles, lowered himself from the roof by aid of blankets, and so escaped. Nine days later he was seized in Clare Market and taken back to Newgate. He was hanged at Tyburn, Nov. 16, his body being buried in the churchyard of S. Martin-in-the-Fields. Jack Sheppard furnished the theme for several plays and books, notably Ainsworth's *Jack Sheppard*, 1840. His portrait was painted in Newgate by Thornhill.

LACK SHEPPARD

The highwayman's name, carved by himself on a beam in his master's workshop

Shepparton. Township of Victoria, Australia. On Goulburn river, 113 m. by rly. N. of Melbourne, it has extensive irrigation works, cattle yards, and frozen meat works. Pop. 7,914.

Claude Shepperson,
British artist

Shepperson, CLAUDE ALLIN (1867-1921). British artist. Born at Beckenham, Oct. 25, 1867, he first studied for the law, but turned to art and studied in Paris and London. The graceful quality of line in his drawing made him well known as an illustrator in black and white, and he was long a regular contributor of drawings to *Punch*. The same gift, with a freshness of colour, is seen in his painting. An associate of the Royal Society of Painters in Water Colours, he was elected A.R.A. in 1919. He died Dec. 30, 1921.

Shepperton. Village of Middlesex, England. A popular angling resort and residential district, it is on the N. bank of the Thames, between Sunbury and Chertsey, 19 m. S.W. of London, with which it has rly. connections. It belonged to the abbey of Westminster.

and the oldest part of its church dates from the 10th cent. William Grocyn was rector, 1504-13. Pop. 3,424.

Sheppey. Island of Kent, England. It is separated from the mainland by the Swale, which connects the Medway and the Thames. It is 10½ m. long and 5 broad, having an area of about 30 sq. m. Although mainly flat, the ground rises gradually from the S. to the N., where the cliffs reach 80 ft. Cereals are cultivated in the N.; in the S. the chief industry is rearing sheep. Sheerness and Queenborough are on the W. side; other places are Minster and Leysdown. The name means sheep island. See Eastchurch.

Shepstone, SIR THEOPHILUS (1817-93). South African statesman. Born Jan. 8, 1817, he was taken to Cape Colony as a child. Proficient in the Kaffir language, he was an interpreter in the war of 1835, and four years later became British resident among native tribes in Kaffraria. Agent for the natives in Natal, 1845, he was appointed judicial assessor in native causes in 1855 and was secretary for native affairs in the Natal government, 1856-77. Trusted and loved by the natives, he had unbounded influence, and little trouble occurred during his administration. Knighted in 1876, he was entrusted with the settlement of the South African states, and in 1877 annexed the Transvaal to Great Britain. He retired in 1880, and died at Pietermaritzburg, June 23, 1893.

Shepton Mallet. Market town and urban district of Somerset, England. Known locally as Shepun, it is 22 m. S.S.W. of Bath by rly. It stands on the little river Sheppey, hence its name. The church of SS. Peter and Paul is a notable old building, famous for its oak roof and various memorials. The town has a beautiful hexagonal

Shepton Mallet, Somerset. Parish church of SS. Peter and Paul, from the south-east

market cross built in 1500 and a grammar school of the 17th century. The chief industries are brewing and the manufacture of silk, velvet, rope, and pottery. There are stone quarries, plaster works, and an agricultural trade. Shepton was long the property of the Mallet family. It was granted a market in the 14th century. In the Second Great War several state records and documents were taken from London and concealed at Shepton Mallet, e.g. Domesday Book, Becket's seal, Wellington's dispatches, and the log of the Victory. Market day, Fri. Pop. 4,100.

Sherard, ROBERT HARBOROUGH (1861-1943). English author. A great-grandson of Wordsworth, he was born in London, Dec. 3, 1861, and lived in Paris. He wrote *Twenty Years in Paris*, 1905, and two works on Oscar Wilde. He died Jan. 31, 1943.

Sherardising. Method of producing a zinc coating on steel in order to improve its resistance to corrosion. It differs from galvanising in that the steel surface is impregnated with zinc in solid powder form at about 350° C., whereas in galvanising the steel is coated either by dipping into a bath of molten zinc or by electro-deposition.

Sheraton, THOMAS (1751-1806). British furniture designer and cabinet-maker. Born at Stockton and wholly self-educated, he settled in London about 1790. He published, among other works, *Designs for Furniture*; *The Cabinet-maker and Upholsterer's Drawing-Book*, 1791; *The Cabinet Dictionary*, 1803. Although highly appreciated, he remained very poor, and eked out his livelihood by teaching drawing. A Baptist, he wrote several religious works. He died in Soho, London, Oct. 22, 1806.

The Sheraton style, which he introduced, marks a reaction against Chippendale (*q.v.*), and is influenced by R. Adam and Hepplewhite. It is in the main an English version of the

Directoire style. It is marked, in its earlier and best stage, by severely simple outline, emphasising the structural lines, and favouring the square form and straight legs, which were often tapered and fluted or reeded. For

Sherborne, Dorset. The 15th-century abbey church. Top, almshouses, also dating back to the 15th century

chair backs we find the lyre and heart shapes, also pillared slats and low carved swags. Canework is often introduced in the chairs and settees, while upholstery is kept down. We find curved lines in the tracery, also low relief carving for Greek mouldings and other patterns. Ornament, chiefly marqueterie, is restrained, though veneer, lacquer, and painting are skilfully used.

Sheraton was a clever mechanic, and devised a great deal of combination furniture, such as folding bedsteads, cabinet-wash-stands, cellaret sideboards with urns for hot and cold water, folding writing tables, and many other contrivances. See *Chair*; *Sideboard*. Consult *Sheraton Furniture Designs*, R. Edwards, 1946.

Sherbet (Arab. *sharbat*). Oriental beverage made of fruit juices, water, and sugar, cooled with snow. In England the name is given to a powder composed of sodium bicarbonate, tartaric acid or oil of lemon, and sugar; when dissolved in cold water, it makes a refreshing, effervescent beverage.

Sherborne. Market town and urban dist. of Dorset, England. It is 13 m. N. of Dorchester, and has a rly. station. Apart from the school (*v.i.*), the chief building is the church of S. Mary the Virgin, a fine cruciform edifice in the Perpendicular style, noted specially for its beautiful roof, once belonging to a Benedictine abbey. There is a 15th century hospital. Sherborne Castle, seat of the family of Wingfield-Digby, was built by Raleigh about 1600. The town has some manufactures, and an agricultural trade.

Settled by the Anglo-Saxons, Sherborne was made the seat of a bishop in 705, remaining so until the see was transferred to Sarum in 1075. For a short time it was capital of Wessex. In the 12th century the Normans founded here an abbey and built a castle.

During restoration of the lady chapel the stone coffin of King Ethelbert was found. Market days, Thurs. and Sat. Pop. 6,400.

Another Sherborne is a village of Warwickshire, 3 m. S.E. of Warwick and just S. of the main road between Warwick and Stratford-on-Avon.

Sherborne School. English public school, at Sherborne, Dorset (*v.s.*). It was founded in 1550 as a grammar school, although there was a school here at a much earlier date, this being connected with the Benedictine abbey. The grammar school took over some of the abbey buildings, and is in a sense the successor of the earlier foundation. In 1870 it was reconstituted as a public school. The buildings include laboratories.

Sherborne School. The gateway and main entrance

museum, workshops, etc., and there are a rifle range and extensive playing fields. The school has room for about 500 boys.

Sherbro OR **SHERBORO**. Island and district of Sierra Leone. The island and Turner's Peninsula, in itself an island separated from the mainland by a long lagoon, form part of the original colony of Sierra Leone, while the dist. known as N. Sherbro, forms an administrative division of the Sierra Leone protectorate.

Sherbrooke. City of Quebec, Canada. It stands at the junction of the rivers St. Francis and Magog, 100 m. E. from Montreal, and is served by C.P.R., C.N.R., and Quebec Central rly. It has a Roman Catholic cathedral. Industries include the making of clothing, machinery, tools, etc. Sherbrooke is the centre of a mixed farming and dairying district, with lumbering and mining in the vicinity. Pop. est. 38,000.

Sherbrooke, **ROBERT LOWE**, **VISCOUNT** (1811-92). British statesman. Born at Bingham, Notts, Dec. 4, 1811, he was educated at Winchester and University College, Oxford, and became a barrister. During 1842-50 he lived in Sydney, as politician, lawyer, and writer. In 1852 he was chosen M.P. for Kidderminster, and in 1859 for Calne, being secretary of the board of control and then vice-president of the board of trade in Liberal governments. From 1859 Lowe was vice-president of the council, being responsible for the education department. No friend to democracy, Lowe in 1864 left office and led the group which Bright called "the cave of Adullam." His brilliant speeches had much to do with the defeat of the Reform Bill of 1866. Nevertheless, now M.P. for the university of London, he became in 1868 chancellor of the exchequer under Gladstone. In 1873 he was transferred to the Home Office for a year. Created a viscount in 1880, he died at Warlingham, Jan. 27, 1892.

Sherburn-in-Elmet. A town, formerly a market town, of Yorkshire (W.R.), England. It is 13 m. E. of Leeds and is served by rly. The chief buildings are the church, mainly Norman, with a noble tower, and an old grammar school. Sherburn was the residence of King Athelstan, and later the archbishop of York had a palace here. Scales are made. Pop. 2,600.

Another Yorkshire village, in the E. Riding, 10 m. E.N.E. of Malton, is also called Sherburn.

Another Sherburn is a village near Durham. A coal mining centre. It is noted for the remains of a 13th century hospital. Pop. 3,182.

Shere Ali (1825-79). Ameer of Afghanistan. Ascending the throne on the death of his father, Dost Mahomed, in 1863, he gained undisputed possession of Kabul in 1869. Friendly relations with the British government became strained about 1875. His refusal to

Shere Ali,
Ameer of Afghanistan

admit a British resident to Herat finally led to war, 1878, and the British invasion of Afghanistan. Shere Ali made his escape to Turkistan, where he died, Feb. 21, 1879. See Afghanistan; Afghan Wars.

Sheria. Town of Palestine. It is 15 m. N.W. of Beersheba (q.v.), on the rly. from the latter town to Damascus. Also known as Tel el Sheria, it is on a hill with the Wady es Sheria in front of it, and gives its name to a battle fought there in the First Great War, when British troops under Allenby, advancing into Palestine, defeated the Turks and entered Sheria, Nov. 6, 1917.

Sheridan, **PHILIP HENRY** (1831-88). American soldier. He was born at Albany, N.Y., March 6, 1831, and educated for the army at West Point. During the Civil War he came into prominence as a skilful and daring cavalry leader, playing a conspicuous part in the battle of Chickamauga. In 1864 he was given command of the cavalry in the army of the Potomac, and the same year became

P. H. Sheridan,
American soldier

commander of the army of Shenandoah. In the last stages of the war Sheridan fought under Grant in Virginia. Sheridan's later service included the conduct of the Indian campaigns, 1868-69. From 1883 until his death, Aug. 5, 1888, he was commander-in-chief.

Sheridan, **RICHARD BRINSLEY BUTLER** (1751-1816). British dramatist and politician. He was born in Dublin, Oct. 30, 1751, a son of Thomas Sheridan (1719-88), the actor, who is also known for his *Life of Swift*. He was at school at

Harrow. His education, however, owed much to his father, who had a passion for oratory, and to his mother, Frances (1724-66), who wrote plays. In 1773 Richard, having begun to write, married Elizabeth, the beautiful daughter of Thomas Linley, the composer, and settled in London. There in 1775 his play *The Rivals* won immediate favour. On the death of Garrick, Sheridan purchased, with his father-in-law and another, the actor's interest in Drury Lane Theatre, and produced *The School for Scandal* there in 1777. His next was a farce, *The Critic*, 1779. These plays receive separate entries in this Encyclopedia.

Sheridan's ready wit and social qualities had made him a great favourite with some of the Whig leaders. He was persuaded to

Richard Sheridan.
After Sir Joshua Reynolds

enter politics, and his election for Stafford in 1780 was the beginning of a parliamentary career. Opposing the war with the American colonies, he made his mark as one of the finest orators of his time; but his greatest speech was delivered on the impeachment of Hastings. Sheridan was an under-secretary in Rockingham's ministry (1782) and a secretary of the treasury in the coalition ministry (1783). In the French wars he stood for non-intervention until Napoleon menaced England directly. He was against the union with Ireland, and championed the freedom of the press.

The concluding portion of his life was overshadowed by financial embarrassments. Drury Lane did

not prosper under his management, and he was a slave to the gambling mania of the age. A heavy blow fell on him when the theatre was destroyed by fire in 1809. Sheridan was assisted by friends, including the prince regent, whose cause he had often supported in parliament. But his ruin was completed when the loss of his seat in parliament, 1812, delivered him into the hands of his creditors, and he died July 7, 1816, with bailiffs in his house. His friends provided for a funeral in Westminster Abbey.

Besides being an honourable politician, an orator, and a playwright, who has added names and phrases to the language, Sheridan was one of the wittiest men of any age. His three daughters, renowned for their beauty, became Lady Dufferin, Mrs. Norton, and the duchess of Somerset. His only son, Thomas (1775-1817), was a poet. See Drama; English Literature; consult Lives, Mrs. Oliphant, 1885; L. C. Sanders, 1890; W. Fraser Rae, 1896; W. Sichel, 1909; L. Gibbs, 1947. The plays were edited by A. W. Pollard, 1900.

Sherif or **SHEREEF** (Arab., noble). Title of the descendants of Mahomet through his daughter Fatima. The governor of Mecca and the sovereign and district governors of Morocco are sherifs. See Hejaz; Hussein; Mahomet.

Sheriff. Public official in England, Scotland, and elsewhere. The word is a corruption of shire reeve, for the first sheriffs were persons appointed by the kings to look after their interests in the various shires. They became powerful, and it was necessary for Henry II to take measures to check them, and to prevent them making their office hereditary. The office is now mainly a ceremonial one.

In England and Wales each county has its high sheriff. He is chosen for one year, three names being submitted to the king, who makes his selection by pricking one name with a silver bodkin. The three are selected by the chancellor of the exchequer, and others on Nov. 12 each year from among landholders in the county. In the cities the sheriff is elected annually by the council. In Scotland the sheriff is a lawyer who receives a salary and presides over the courts of justice. There are sheriffs in certain old English cities, e.g. Bristol, Nottingham, and Norwich, while the city of London has two. The high sheriff is responsible for receiving the judges when on circuit, and has other duties con-

nected with the administration of justice and the return of members to parliament. He usually appoints an under-sheriff, a paid official. (See County; Reeve.)

IN THE U.S.A. A sheriff is a county official, usually elected by popular vote. He must be not less than 21 years of age and resident in the county. His functions approximate in some respects to those of the English police. As readers of American detective fiction have learnt, he is often the first person to whom the discovery of a murder is communicated. He is required to keep peace and order, guard prisoners and juries, attend the sessions of the local courts, and serve their processes and execute their judgments as administrative officer of the law. His main judicial duty is to determine damages or writs of inquiry.

Sheriff, LAURENCE (d. 1567). Founder of Rugby School. Born in or near Rugby, he settled in London as a grocer, and was made an esquire, and given a grant of arms by Elizabeth. Appointed second warden of the Grocers' Company in 1566, he died Oct. 20, 1567, bequeathing considerable estates for the foundation and endowment of a school in Rugby.

Sheriff Court. In Scotland, a court held nominally by the sheriff of a county, but in practice by the sheriff-depute, or substitute. The sheriff has civil jurisdiction in contracts, possessory actions, etc.; also summary jurisdiction in small debt cases and criminal jurisdiction in minor offences.

Sheriffmuir, BATTLE OF. Engagement between the Jacobites and the Hanoverian forces, Nov. 13, 1715. The Old Pretender ordered the earl of Mar to raise an army for him in the north, and 9,000 Highlanders flocked to his standard. Unable or afraid to take the offensive, Mar waited until the Royalist army of some 3,500 regulars, under Argyll, advanced upon him at Sheriffmuir, Perthshire. The battle was stubbornly fought until, unable to gain a decisive victory, Argyll withdrew to Stirling, leaving the Pretender, who had arrived on the field, to enjoy his barren victory.

Sheriff's Tourn or **TURN**. In England, a court of record formerly held by the sheriff twice a year at different places within the county. It corresponded with the court-leet (q.v.), and having long fallen into desuetude, was abolished by the Sheriff's Act, 1887.

Sheringham. Urban dist. and holiday resort of Norfolk, England. It is 4 m. W.N.W. of Cromer, with which it has a rly. connexion. There are golf-links and other

Sheringham, Norfolk. The beach and cliffs from the N.W.

attractions, which have made the place increasingly popular. Near are the remains of Beeston Priory, a religious house which was founded in the 13th century. Pop. est. 4,000.

Sheringham, GEORGE (1884-1937). British artist. He received his training at the Slade School and in Paris, where he first exhibited at the Salon. He gave one-man exhibitions in London, Paris, New York, and Melbourne, and his work is in many permanent collections. Sheringham designed scenery and costumes for plays, and (with James Laver) wrote Design in the Theatre. His adaptation of fluorescent lighting, by which artists could work in artificial light, was called Sheringham daylight. He published Pen and Pencil Drawings, 1922. He died Nov. 11, 1937.

Sherkot. Town of the Uttar union, India, in Bijnor district. Situated on the Kho river, it has a trade in sugar and makes carpets. Two Hindu temples lie outside the town. Pop. 20,100.

Sherman. City of Texas, U.S.A., the co. seat of Grayson co. It is 63 m. N. of Dallas by rly. It is the seat of Austin College, which has a million dollar endowment. The main industry is cotton. Settled in 1848, Sherman became a city in 1895. Pop. 17,156.

Sherman, JOHN (1823-1900). American financier and statesman. Born at Lancaster, Ohio, May 10,

1823, brother of W. T. Sherman, he became a lawyer in 1844. In 1855 he entered the house of representatives, and in 1861

John Sherman

became a member of the senate, wherein he remained until 1877. A member of the Republican party, he became prominent as a financier, and was secretary to the treasury, 1877-81. Again in the senate, 1881-97, Sherman was secretary of state under McKinley, 1897-98. He is chiefly known for the silver law of 1890, called after him, and for a measure against trusts for which he was responsible. Sherman died at Washington, Oct. 22, 1900. Consult his *Reminiscences*, 1895, also *Life*. T. E. Burton, 1906.

Sherman, WILLIAM TECUMSEH (1820-91). American soldier.

Born at Lancaster, Ohio, Feb. 8, 1820, he was educated at West Point. After 13 years in the army he resigned his commission, but on the outbreak of the Civil War he rejoined, and was soon made

a brigadier-general. Sent to Kentucky, he was relieved of his command for asking for 200,000 men, but was reinstated shortly afterwards, and in Feb., 1862, was given the command of the army of Tennessee, and contributed largely to the victory of Shiloh.

During the next two years he assisted Grant in the campaign against Vicksburg, and in the battles around Chattanooga, and also did brilliant work in Mississippi. In May, 1864, he set about the invasion of Georgia, and after defeating Gen. Joseph E. Johnston, began his famous march to the sea. Sherman became c.-in.-c. of the U.S. army in 1869, and died in New York, Feb. 14, 1891. His *Memoirs* appeared in 1875. See *American Civil War*. Consult *Life*, L. Hart, 1930.

Sherman Anti-Trust Act. Act passed by the congress of the U.S.A. on July 2, 1890, during Harrison's presidency. Its first section ran: "Every contract,

combination in the form of trust or otherwise, or conspiracy in restraint of trade or commerce among the several states or with foreign nations is hereby declared to be illegal," and its second pronounced anyone taking part in such contract, combination, or conspiracy to be guilty of a misdemeanour. The act did not have the effect intended. The supreme court sustained several powerful monopolies against attempts by the govt. to break them up, and at the same time held that, in so far as trade unions restrained trade by strikes, they were violating the act. For a time the Sherman Act became virtually a dead letter; it was revived by Theodore Roosevelt, and came to be interpreted as forbidding only restraints and monopolies that the court considered unreasonable. By 1950 the anti-trust div. of the U.S. dept. of Justice, set up to deal with alleged infringements of anti-trust acts, had invoked the Sherman Act about a thousand times.

Sherriff, ROBERT CEDRIC (b. 1896). British playwright and novelist. Born June 6, 1896, he was

educated at Kingston grammar school and New College, Oxford. His play, *Journey's End* (q.v.), brought him fame when it was produced in London 1929. Other plays included *Badger's Green*, 1930; *Miss Mabel*, 1948; *Home at Seven*, 1950. His novels, studies of the middle class, included *Greengates*, 1936; *Chedworth*, 1944, and *Another Year*, 1946. He also worked on the scripts of many films.

Sherrington, SIR CHARLES SCOTT (b. 1861). British scientist. Educated at Caius College, Cambridge,

Sir Charles Sherrington, British scientist

he studied science and medicine. He was made a fellow of his college, and in Cambridge began his work as a physiologist. Professor of physiology in University College, Liverpool, 1895-1913 he was appointed Waynflete professor of physiology at Oxford in 1913. Sherrington held a professorship at the Royal Institution, 1914-17,

and was professor of pathology in the university of London. In 1920 he was president of the British Association, and received the O.M. 1924. His work gained him the Nobel prize for medicine, 1932. His writings include *Mammalian Physiology*, 1916, *Selected Writings*, 1939, *Assaying of Brabantius*, 1939, and *The Endeavour of Jean Fernel*, 1946.

Sherry. White Spanish wine. It is grown in a small region between the mouths of the Guadalquivir and Guadalete, and is named from Jerez, the centre of the sherry industry. The grapes, both red and white, are fully matured, and natural sherry is somewhat harsh. Condensed wine liqueur, sugar, and spirit are usually added, and the resultant wines are blended to the required taste. The two chief varieties are the pale, or dry, and the brown, or sweet. Typical of the former is Manzanilla; of the latter, Oloroso. Amontillado (q.v.), Fino, and Vino de Pasto are other types, while trade names include palma, raya, solera, and palo.

Sherry improves by keeping, and the name East India was formerly applied to sherry which had made a long sea-voyage. It is a delicate, full-bodied wine of rich flavour. See *Madeira*; *Sack*; *Wine*.

Sherwood, ROBERT EMMET (b. 1896). American novelist and playwright. He was born April 4, 1896, and educated at Harvard university. He was a fervent admirer of F. D. Roosevelt, and did much to prepare America's entry into the Second Great War by a nation-wide advertising campaign sponsored by prominent U.S. business men. During the war he was head of the American political warfare division. Among his many highly successful plays are *The Road to Rome*, *Waterloo Bridge*, *The Petrified Forest*, *Idiot's Delight*, *Acropolis*, and *There Shall be no Night*.

Sherwood Forest. Formerly a royal forest in Nottinghamshire. It lay in the W. and N. of the county, stretching W. from Nottingham, as far as Worksop, and including Mansfield, and covering an area of about 200 sq. m. Most of it has been deafforested, but there are remains in the Dukeries. The forest was crown property, and herein King John and other Plantagenet kings had a hunting residence. It is also associated with the exploits of Robin Hood. The old forest included the domains now known as Bestwood, Newstead, and Rufford. The name Sherwood

is now that of one of the northern suburbs of the city of Nottingham. Since the beginning of the 19th century coal pits have been sunk, and Edwinstowe is a mining centre. See Dukeries; Robin Hood.

Sherwood Foresters. Regiment of the British army. Known also as the Nottinghamshire and

Derbyshire Regiment, it was formed in 1881 from the 45th and 56th Foot, which had been raised in 1740 and 1823 respectively. The 45th gained its first honour in the capture of Louisburg in 1763,

and after more than 40 years in Canada, went to the Peninsula, where, attached to Picton's division, it won fourteen battle honours and the nickname Old Stubborns. The regiment had distinguished service in the Burma War, 1824-26, and the Kaffir War, 1846-47, and gained three honours in the Crimea. The 56th Foot spent its early years in India and went back during the Mutiny after having fought in the Crimea.

The combined regiment fought in the Egyptian campaign of 1882 the Tirah expedition, and major engagements of the S. African War. Thirty battalions of the Sherwood Foresters were raised for service in the First Great War and gained the honours: Aisne, 1914,'18; Neuve Chapelle; Loos; Somme, 1916,'18; Ypres, 1917,'18; Cambrai, 1917,'18; St. Quentin Canal; France and Flanders, 1914,'18; Italy, 1917,'18; Gallipoli 1915. In the Second Great War, the Sherwood Foresters gained distinction in France (1940), N. Africa, and at the Anzio and Salerno landings. The regimental depot is at Derby.

Sheshuan. CHESHAWEN, OR XEHAUEN. Holy city of Spanish Morocco. It is 30 m. direct S. of Tetuan. Built in 1471 by fanatics headed by Malai Ali Ben Rachid, whose mosque is the principal building, in order to be isolated from the spread of Christian civilization it was for many centuries a secret city, a natural barrier of mountains surrounding it. Until 1920, when captured by Spanish troops, it had never been penetrated by white men. It has many mosques and bazaars. Pop. 12,397.

She Stoops to Conquer. Five-act comedy by Oliver Goldsmith, produced at Covent Garden Theatre, March 15, 1773, and published immediately after with the full

title, *She Stoops to Conquer, or The Mistakes of a Night*. This delightfully humorous play, in which Tony Lumpkin and Kate Hardcastle are famous characters, was one of the first effective blows against the fashionable genteel or sentimental comedy, the overthrow of which was completed by Sheridan's *School for Scandal* (q.v.).

Shetland or **ZETLAND.** Group of islands off the N. coast of Scotland. The Orkneys lie between them and the mainland. They form a county, and with the Orkneys send a member to parliament. They number about 30, and in addition there are some 70 uninhabited islets. The area is 551 sq. m. The largest island is Mainland; others are Yell, Unst, Fetlar, Bressay, Whalsay, Trondra, East and

plane and naval base and formed part of the chain of radar warning stations upon which depended the air raid defence of Great Britain. Frequently raided by German aircraft, they were the target of the first bombs to fall on British soil. Nov. 13, 1939, when the only casualty was the famous rabbit which German propaganda magnified into a cruiser. The rabbit was later dropped over Germany by the R.A.F., addressed Field-Marshal Goering. Consult S. and the Shetlanders, W. P. Livingstone, 1947.

Shetland Pony or **SHELTY.** Smallest British breed of horse. It is produced in the Shetland Isles and by some authorities is considered to be the direct descendant of the British horse of prehistoric times. The sheltie stands from 9 to 11 hands high, with rough shaggy mane and forelock that almost conceal the small head. The usual colour is either bay, brown, or a rusty black. It is a powerful little beast, capable of carrying heavy weights and of continuous exertion. See Horse colour plate; Pony.

Shetleston. Residential suburb of E. Glasgow, Scotland. Formerly a small weaving village, it became dependent principally on coal mining. The parish has a pop. of some 50,000, and returns one M.P.

Shibboleth (Heb., ear of corn, flood). Password of the Gileadites under Jephthah, at a ford of the Jordan, during their war with the Ephraimite invaders (Judges 12, r. 6). Because of a defect in speech, the fleeing Ephraimites pronounced the word sibboleth, thus betraying their identity, and were subjected to great slaughter. The word has come into general use as a derogatory term for the watchword or pet phrase of a political or other party or class.

Shiel. Loch or lake of Scotland. Forming part of the boundary between Inverness-shire and Argyllshire, it extends from Glenfinnan in a S.W. direction for 17 m. and has a breadth of 1 m. and a

Shetland. Map of the group of islands off the north coast of Scotland

West Burra, Mousa, and Foula. Fair Isle is the most southerly. On Mainland are Strom Loch and other lakes. The chief industries are breeding cattle and sheep, and fishing. Oats, barley, and potatoes are grown, and poultry are kept on the holdings of the crofters. Shetland ponies are bred. Lerwick is the capital, having superseded Scalloway, a fishing village. Pop. est. 20,200.

The islands are thought to have been the Ultima Thule of classical writers. They were part of Norway from 875 to 1468, when they were ceded to Scotland. In 1764 they became the property of the Dundas family, who take from them, in the form of Zetland, the title of marquess. In the Second Great War the Shetlands were a sea-

Shiel. The Scottish loch, with monument where the Young Pretender unfurled his flag in 1745

greatest depth of 420 ft. Its surplus waters are discharged by the river Shiel through Loch Moidart to the sea. At Glenfinnan a monument marks the spot where Prince Charles Edward unfurled his banner, Aug. 19, 1745.

Shiel, MATTHEW PHIPPS (1865-1947). British novelist. He was born at Plymouth, Montserrat,

M. P. Shiel,
British novelist

July 21, 1865, the son of M. D. Shiell, a shipowner, who induced the bishop of Antigua to crown his son king of the unclaimed neighbouring isle of Redonda on his 15th

birthday. Educated at Harrison College, Barbados, and King's College, London, Shiel was for a time a mathematics teacher and a medical student. Thanks to encouragement from Mrs. Gladstone, he wrote *Prince Zuleski*, which appeared as his first book in 1895. Several novels quickly followed, of which *The Yellow Danger*, 1898, was the most distinctive. In 1901 appeared the memorable *The Purple Cloud*; later novels were *Children of the Wind*, 1923, and *How the Old Woman Got Home*, 1927. Other books were written in collaboration with his biographer, John Gawsworth, who was designated his successor to the throne of Redonda and who edited *The Best Short Stories of M. P. Shiel*, 1947. Shiel died Feb. 17, 1947.

Shield (A.S. scild). Piece of defensive armour, usually carried on the left arm. Though apparently unknown in the Stone Age, and among very primitive peoples, its use in various forms was widespread until the introduction of firearms, and still survives in remote parts of the world. The materials were chiefly wood, hide stretched over a wooden or wicker frame, and metal. In the late Minoan Age of Crete, large convex shields, covering the whole body, were used. The shield of the Bronze Age, long retained as the target of the Highlands and elsewhere, was round with a central boss and numerous studs. It was one type of Homeric shield, another being the long figure-of-eight shield that is represented on early vases.

In classical times the Greek shield was often round, with a leather apron hanging from it. Roman legionaries carried an oblong convex shield (*scutum*) of

wood and leather with a metal rim. Smaller round shields were the *clipeus* of bronze and the *parma* of leather. In medieval Europe many types were common, those of the early Germans being large and oblong. The Normans of the 11th century used the kite-shaped shield from which was developed the form familiar in heraldry. See Africa; Armour; Celt colour plate; Dinka; Greek Art.

Shield. In engineering, elaborate mechanical device used in tunnelling operations. The shield is used in particular when the tunnel has to pass through water-bearing strata, below the beds of rivers, etc. It consists essentially of a steel-plate cylinder, with a powerful cutting edge at the forward end. The rear end of the shield overlaps the completed tunnel lining. By hydraulic rams the shield is forced slowly forward, and the earth excavated through openings in the end of the cylinder. Compressed air is generally used with the shield to equalise the pressure of water trying to enter. See Greathed Shield; Tunnel.

Shield or Escutcheon. In heraldry, the field on which the charges and ornaments constituting arms are blazoned. Its shape varied with fashion, and highly decorative shields were occasionally employed. The Norman shields were of two types, the kite

and the pear-shaped, with straight or rounded top.

Knights banneret displayed their arms on square shields, representing their square military banners. Ladies place their arms on diamond-shaped shields, heraldically known as lozenges. British heralds insisted on "illegitimate" arms, traders' marks, and other non-registered devices, being displayed on round targets. But on the Continent both round and oblong shields were, and still are, much used. The Spanish royal arms were almost invariably placed on an oval. See Heraldry; Tournament.

Shields, NORTH. Seaport and market town of Northumberland, England, part of the county borough of Tynemouth. It stands at the mouth of the Tyne, on the bank of the river opposite S. Shields, being 8 m. W.N.W. of Newcastle. It is served by rly. and a steam ferry connects it with S. Shields. There are docks from which coal and many other products are exported. Other industries are shipbuilding and the manufacture of cables, anchors, chemicals, rope, etc., as well as light engineering industries on the W. Chipton trading estate. It is also the most flourishing fishing port between the Humber and Aberdeen. The name Shields is derived from a word akin to the

Shield used in tunnelling for the London tube railways, showing workmen excavating through the opening of the shield, which has been forced forward by hydraulic pressure

Gaelic shieling, meaning a hut, and is due to the fact that the fishermen of the Tyne built a number of huts here. See Tynemouth.

Shields, *Southern*. County borough and seaport of Durham, England. It stands at the mouth of the Tyne, on the S. bank of the river, opposite N. Shields. It is 8 m. W. of Newcastle and is served by rly., while a steam ferry crosses the river here. The chief church is S. Hilda's, rebuilt except for its tower. Other public buildings include the town hall and municipal buildings, the latter a 20th century acquisition. There are a free library and museum, custom house, and marine school.

One of the Tyne ports, S. Shields has a harbour accessible to the largest vessels, and protected by a large breakwater, a mile long and called the south pier, and by another called the north pier. Connected with it are extensive docks and wharves. The industries include the mining and shipping of coal, the manufacture of clothing, biscuits, chemicals, boilers, iron and brass products, radio components, cables, etc., and ship-building and ship repairing yards. It was at one time a centre of the salt industry. The Lawe, an eminence in the town, was the site of a Roman station. In 1851 South Shields was made a corporate town. One member is returned to parliament. Market day, Sat. Pop. 103,130.

Shifnal. Market town of Shropshire, England. It is 17 m. E.S.E. of Shrewsbury and 154 m. N.W. of London, with a rly. station. The chief building is S. Andrew's church, a fine cruciform edifice, with a little Norman work. Features are the Moreton chapel and a number of monuments. The town has several interesting old houses. The industries include blast furnaces and iron foundries, and around are coal and ironstone mines. There is also a trade in cattle. The early name of Shifnal was Idsall. Near by are Tong Castle, Boscobel, and White Ladies. Market day, Mon. Pop. 3,660. See Tong; White Ladies.

Shigatze or *DIGARSKI*. Town of S. Tibet. Near the junction of the Nyanchu and Tsangpo, it is situated at an alt. of 12,000 ft. It contains the Tashi-lunpo, the residence of the Tashi Lama. This monastery was founded in 1445.

Shiites or *SHIAHS* (Arab. *shi'ah*, party). One of the two chief divisions of Mahomedans, the other being the Sunnis or Sunnites. They regard Ali, cousin of Maho-

met, as the Prophet's first true successor, and observe the anniversary of Ali's assassination with special reverence. The more cultured among the Shiites, who are more numerous in Persia than elsewhere, do not believe in the story that passages of the Koran favourable to Ali were omitted by Zaid or Usman. See Ali; Hasan; Kerbelā; Mahomedanism.

Shikari (Hind., hunter). Anglo-Indian term for a hunter of big game. It is applied alike to the European sportsman and to the trained native who assists him.

Shikarpur. Town of Pakistan, in the dist. of Sukkur, Sind province. It is 18 m. from the right bank of the Indus; is the starting-point of an ancient trade route through the Bolan Pass to Afghanistan and E. Persia; and is on the modern strategic rly. which follows the same route to Baluchistan. Carpets and coarse cottons are manufactured. Pop. 62,746. Smaller towns of the same name in India are (1) S. in Bulandshahr dist., the United Provinces, and (2) S. in Shimoga dist., in Mysore.

Shildon. A market town of Durham, England. It is 9 m. N.E. of Darlington, with a rly. station. The main industries are railway wagon repairing, coal mining, and light engineering. Market day, Fri. Pop. 14,550.

Shilka. River of E. Siberia, in the Mongol-Buryat A.S.S.R. It is one of the two upper branches of the Amur, formed by the union of the Onon, which rises in the Altai Mountains, and the Ingoda. After a course of 450 m. it joins the Argun, and forms the Amur. It is frozen from Nov. to May.

Shillelagh or *SHILLALY*. Irish cudgel, generally of blackthorn or oak. It is supposed to derive its name from Shillelagh in Co. Wicklow, Eire, famous for its oaks. *Pron.* Shi-lay-li.

Shilleto, *RICHARD* (1809-76). British classical scholar. He was born at Ulleskelf, Yorks, Nov. 25, 1809, and educated at Repton, Shrewsbury, and Trinity College, Cambridge. He became a coach, and had as pupils many outstanding scholars of his time. Shilleto himself was one of the greatest Greek scholars England has produced. Demosthenes, Thucydides, and Aristotle were his special studies. He spent his whole life in Cambridge, was elected fellow of Peterhouse in 1867, and died Sept. 24, 1876.

Shillibeer, *GEORGE* (1797-1866). British coachbuilder. Born in

London, he served in the navy, learnt coachbuilding in Long Acre, started a business in Paris, and in 1829 introduced and gave its name to the first omnibus in London, starting a service from Paddington to the Bank, with coaches holding 22 passengers. Later he became an undertaker, and invented a funeral coach known as a shillibeer. He died at Brighton, Aug. 22, 1866.

Shilling. British coin. It is derived from the Anglo-Saxon silver scyelling, which had a value

Shilling. Obverse and reverse sides of the British coin. Top, shilling of Henry VII

of about 5d.; this was indented with a cross along the lines of which it could be broken into four pieces; whence the word farthing (fourth part). The shilling equal in value to 1/20th of a £ or to twelve pence was first struck in 1504. In Charles II's reign it was given a milled edge. The lion device on the reverse was introduced for George IV. When first coined, the shilling consisted of 925 parts of silver to 75 of other metals, but its fineness was reduced to 500 parts of silver by the Coinage Act of 1920. By the Coinage Act of 1946, the silver shilling was withdrawn and replaced by a coin with a standard composition of 75 p.c. copper and 25 p.c. nickel. See Coinage; Numismatics.

Shillong. Capital of Assam, India, and h.q. of the subdivision of the Khasi and Jaintia Hills. It is 4,900 ft. above sea level and about 63 m. S. of Gauhati on the Brahmaputra. The entire town was wrecked by an earthquake in 1897, was rebuilt, and is picturesquely laid out amid pinewoods. Average rainfall is 81 ins. annually. Here are a Pasteur institute, a Welsh Presbyterian mission, and B.C. colleges and schools. Pop. 27,000.

Shillong first became capital of Assam under British rule in 1874.

In 1905, on the creation of the prov. of Bengal and Assam, it lost part of that status, as Dacca (now in Pakistan) became the cold weather capital, Shillong remaining the summer h.q. of government. In 1912, when Assam again became a separate prov., Shillong was restored to full capital rank. During the Second Great War it was a centre of communication, and on the transfer of power from British to Indian hands in 1947 its significance increased as the capital of a frontier prov. bordering Tibet, China, Burma, and Pakistan.

Shilluk. Nilotic negro people. They are mostly found on the grasslands of the W. Nile bank in the Upper Nile prov., Sudan. With the largest Hamitic strain of all the Nilotes, they are dark, woolly-haired, long-headed, 5 ft. 10 ins., of Nilotic speech, and present the most compact political organization of any Sudanese people. They breed cattle and sheep. Their rain-maker chiefs, deemed to incarnate the semi-divine legendary founder Nyakang, were until recent times ceremonially slain, with their own consent, when advanced in age.

Shiloh. Town of Palestine. Between Bethel and Shechem, it is about 19 m. N. of Jerusalem, and is now known as Seilun. It was the resting-place of the Ark of the Covenant in the days of Samuel.

Shiloh, BATTLE OF. Battle of the American Civil War fought near Pittsburg Landing on the river Tennessee, April 6-7, 1862. Its name is derived from Shiloh church, where the Confederates under Johnston had concentrated. The Federals were under Grant. On Sunday, April 6, the Confederates attacked Sherman's division which formed Grant's right flank near this church, and in a few hours threw back the entire Federal line (33,000 men) towards the Landing.

Grant arrived post haste from Savannah after ordering Buell's advanced guard to cross the river at Pittsburg. Meanwhile the success of the Confederates had been dearly purchased by the death of Johnston. The fighting died away at nightfall, through exhaustion of the troops on both sides. Grant reinforced his left with the divisions of Nelson, McCook, and Crittenden (20,000 men), and at 6 a.m. the Confederates, reduced by losses to less than half their original numbers, were assailed by the force they deemed defeated. By 2 p.m. the Confederates were back five miles, and the Federals were again in possession of Shiloh. Nearly 25,000 men fell in this battle.

Shimoga. Dist. and town of Mysore, India. The dist. lies in the N.W. of the state, adjacent to Bombay state. It is crossed by the rly. N.W. from Bangalore. Only a third of the area is cultivable and but a fifth is tilled, mainly for rice and ragi. Area, 4,058 sq. m. The town is on the Tunga, 171 m. N.W. of Bangalore, and is convenient for visiting the Gersoppa Falls. Iron and steel works opened in 1923 at Bhadravati have the only plant for wood distillation in India. Pop., dist., 551,149; town, 27,712.

Shimonoseki or **AKAMAGASEKI.** Fortified town and seaport of Japan. It stands at the S.W. end of Honshu, opposite Kyushu, on the Strait of Shimonoseki, the W. outlet of the Inland Sea, and is the W. terminus of the rly. extending from Tokyo along the S. coast. Opened to foreign trade in 1890, it is an important commercial town with a secure and capacious harbour. In 1863 it was bombarded by the united squadrons of Great Britain, France, the U.S.A., and the Netherlands. Here in 1895 was concluded the treaty with China by which Japan acquired Formosa and the Pescadores (qq.v.). Engineers blasting a tunnel between Honshu and Kyushu met in the middle of the strait on April 19, 1939. Pop. 132,737.

Shin. Loch of Sutherland, Scotland. It is 17 m. long, $\frac{1}{2}$ to $1\frac{1}{2}$ m. broad, and 161 ft. deep. Its surplus waters discharge into the river Shin, on which stands Lairg.

Shinar, PLAIN OF. District of Babylonia, mentioned in the Bible. According to some authorities it was situated in the S. of Babylonia, but others place it in the N.

Shingle. Rounded water-worn material found on the seashore. It is usually distinguished from gravel which is composed of much smaller particles. The word is used for thin pieces of wood used in roofing (v.i.). The Shingles is a sandbank between the Isle of Wight and Hurst Castle, $2\frac{1}{2}$ m. long.

Shingle. Roofing unit of wood, widely used in America and Scandinavia. Old shingles were of oak and pine, but most contemporary examples are of Western red cedar, which contains a natural preservative oil. These are imported into Great Britain. The best shingles have a life up to 60 years, are of light weight, moderate cost, and go a pleasant silver grey colour through weathering. They are nailed to battens and lapped on pitched roofs, like tiles.

Shingle. Style of women's hairdressing, in which the hair was

cut close to the back of the head. This was popular in the 1920s.

Shingles. Acute eruption on the skin characterised by the appearance of groups of small vesicles. See Herpes.

Shingling. In metallurgy, the process of bearing or squeezing impurities out of "blooms" (q.v.) and consolidating them. In making wrought iron, whether direct from ore or from pig iron, the masses—"balls" or "blooms"—as they come from the furnace, the refinery, or the forge, are loose and spongy and contain much slag more or less molten. Shingling drives out the impurities and consolidates the blooms into a condition which makes them fit to be passed on to the next stage, the forge train. Formerly shingling was done by tilt or helve hammers, still used in some regions, but is now generally done by steam hammers or hydraulic presses. See Helve; Iron; Wrought Iron.

Shintoism (Chin. *shin-tao*, way of the gods). Religion of Japan. Of unknown antiquity and primitive type, it appears to be of native origin, though it has affinities with N. Asiatic Shamanism, and has been overlaid with Buddhist and Confucian practices and ideas. Its crude mythology and cosmogony are recorded in the Kojiki, written 712. The numerous divinities are (1) powers of nature, like the sun, the earth, fire, rain-storm; (2) deities presiding over human affairs, e.g. the food-goddess; (3) abstractions, such as growth; (4) deified men, like Temmangu, god of learning, originally the 9th century sage, Michizane. The chief deity is Amaterasu, the sun-goddess. From her the emperors claimed descent, and therefore up to the occupation of Japan by the Allies were venerated as divine.

There are no idols, but the souls of the gods are held to inhabit chests in the temples, containing sacred emblems, generally a sword, mirror, or jewel. Worship takes the form of offerings, prayers for temporal blessings, litanies read by the priests, and dances. Pilgrimages are frequent, and there are annual festivals, as at harvest. Twice a year there is a day of purification of the people. Simplicity and austerity characterise Shinto ritual.

Ethically the religion is little developed. Reverence for ancestors and loyalty to the state are enjoined. The human heart is held to be essentially good. Purity, to which great importance is attached, is little more than the avoidance of

ceremonial uncleanness. The spirit passes at death into the shadowy world of Yomi, from which it exerts an influence over posterity.

In the 18th century, Shintoism began to reject Buddhist accretions, and became again a political force, which contributed to the movement for the restoration of the temporal power of the mikado. After the revolution of 1868 the government encouraged Shintoism at the expense of Buddhism. Shintoism as a state religion was abolished by a directive from Gen. MacArthur, Allied c.-in-c., Dec. 15, 1945. See Japan.

Shinty OR CAMANACHD. Ancient game of the Scottish Highlands, intermediate between hurling and hockey. The field of play varies from 250 yds. to 140 yds. in length and 100 to 70 yds. in width. The goals, termed hails, are 12 ft. wide and 10 ft. in height, backed by a netting. A goal is scored by the ball being hit between the hails and passing into the netting. There are 12 players on a side, distributed over the field much in the manner of an Association football team. The ball, consisting of a cork core bound with worsted and covered in leather sewn with coarse seams, is about 2 ins. in diameter and weighs between 3 and 4 oz. The caman or club for striking the ball has a triangular head. A game occupies one hour and a half, with five minutes' interval at half-time. The controlling body is the Camanachd Association.

Shinwell, EMANUEL (b. 1884). British politician, born Oct. 18, 1884. Though a Londoner, he was

E. Shinwell,
British politician

M.P. for Linlithgow 1922-24 and 1928-31. He was secretary for mines in the first Labour government, also in 1930-31 after a brief term as financial secretary to the war office. In a remarkable election at Seaham in 1935 he defeated by more than 20,000 votes Ramsay MacDonald, then second-in-command of a national government. He refused a post in Churchill's war govt., but became minister of fuel and power 1945, passing through the Act nationalising the coal industry in 1946. In 1947 he was made war secretary. Elected, 1950, by the new constituency of Easington (including Seaham), he became minister of defence.

SHIP AND SHIPBUILDING

Frank C. Bowen, Author of *The Golden Age of Sail, etc.*

The history of sea-going vessels as here related from their earliest known beginnings in Crete and is followed by a description of contemporary shipbuilding. See Clipper; Dock; Galleon; Liberty Ship; Lloyd's Register; Navy, and other associated subjects; also Battleship; and under the names of famous ships—e.g. Comet; Golden Hind; Great Eastern; Normandie; Queen Elizabeth; Santa Maria

The term ship is usually applied to any fair-sized decked vessel that can be worked in the open sea, as opposed to a small open boat; but strictly a ship is a sailing vessel with more than two masts, square-rigged on all of them. The term has changed its significance with the ages and was formerly applied only to the largest vessels, irrespective of rig. The date when the dug-out canoe made from a single tree trunk, or the raft supported by inflated skins, both of them suitable only for river or lagoon work, developed into the vessel able to make coastal and then overseas passages is unknown; but the Cretans are generally given the credit for being the first deep sea mariners, perhaps from as far back as 4000 B.C. or even earlier until the catastrophe, probably about 1100 B.C., which ended their prosperity. In the meantime the Egyptians had developed their spoon-shaped Nile boats, whose construction was limited by the short lengths of the acacia wood of which they were built, into sea-going ships of considerable size, built of imported timber. The Egyptians also built war galleys, but they were not natural seamen and preferred to leave long distance journeys to subject races.

The people of the Phoenician ports on and off the coast of Syria, who are believed to have originated in the Persian Gulf, came into prominence as shipbuilders and sailors soon after 3000 B.C., and for long received the credit for earlier work done by the Cretans. Their ships, undoubtedly the finest of their age, were taken across the Mediterranean and into the open Atlantic, although their captains probably hugged the coast and beached them in bad weather or at night whenever possible. There is evidence that they were carvel-built—the planks placed edge to edge—and relied on their sails rather than oars for propulsion, but the Phoenicians maintained such close secrecy concerning all their doings that there is no definite evidence of their design. The Greeks also had ships of burden, which collected Black Sea grain in exchange for wine and pottery, while the Romans, al-

though preferring to leave merchant shipping in the hands of subject races, had developed a fine type of seagoing ship, with an elaborate sail plan on very practical lines, by the beginning of the Christian era. The biggest of these were the ships carrying tribute grain from Egypt, which could carry a large cargo as well as numerous passengers. S. Paul's ship was typical of those vessels.

Ships of the Northern Countries

In the N. a different type of vessel was developed, which was centuries later than the Mediterranean types in adopting sail. They were all clinker or clench-built—the planks over-lapping—with keel and frames making a strong skeleton instead of being only a reinforcement of the planking. Caesar specially mentioned the strength of the ships which he found on the N. coast of Gaul. From an early date their double-ended hulls had a big sheer both forward and aft for seaworthiness in the rougher waters of the N., and from them developed the Viking ships which made voyages to Iceland, Greenland, and even Vinland, on the mainland of N. America.

In both the N. and the Mediterranean there were long ships for fighting and piracy, and round ships for trading; but the greatest different influence on design, apart from the heavier weather to be expected, was that the northern ships were rowed by free fighting men and not by slaves, as in the Mediterranean.

In the N. the Viking type of hull persisted for centuries, latterly easily converted into a warship by the addition of fighting castles forward and aft and at the top of the mast, although certain modifications were introduced through the seamen's observations in the Mediterranean during the Crusades. Although there is no definite evidence, according to contemporary stories the three-masted Turkish dromon, which was finally sunk by Richard I's Crusaders after they had found her sides too high for boarding, was big enough to carry 1,500 men.

In the S. the galley type of ship persisted, both for fighting

and also for carrying fine cargoes, with high value on a small weight, from the Mediterranean countries and also brought overland from the E. to Syria, Egypt, and Constantinople. The big Venetian trading galleys made annual voyages to Britain and Flanders with valuable cargoes of wines,

others, proved invaluable in finding the sea route to the E. by way of the Cape of Good Hope, but it was unsuitable for crossing the Atlantic, for which the galleon type, square-rigged on two masts and with a fuller body, was more satisfactory. Columbus's ship, the *Santa Maria*, was an ordinary square-rigged vessel of her day, the replica built in 1892 from

their towering ends were the more serviceable, but in Elizabeth's day the former were in greater favour and, manned by fighting sailors, showed their superiority over the high-charged Spanish ships manned by soldiers at sea in the Armada fighting. The great difference had been made by the introduction of the heavy muzzle-loading gun, placed low in the ship and firing through a port, which could damage or sink a ship, whereas the earlier breech-loading guns were useful only against her personnel on deck. Heavier guns made greater strength of hull necessary; this was partly secured by introducing the tumble-home, or inward slope of the sides; but the absence of a continuous strength deck, forming a girder with the keel and frames, was long a source of weakness.

As longer voyages became common, the design and construction of ships improved rapidly, the teaching of scientific naval architecture in France under Colbert having a big influence. The ship rig, originating with the square mizzen topsail to facilitate

station-keeping in convoy, was developed, and design was more specialised for various purposes.

During the 17th century, and even earlier, a number of inventions were put forward which have been claimed as the predecessors of the steamship, but in every case there is grave doubt. The specifications of the patents or grants were generally very vague and most of the inventions were probably paddles or some other form of propulsion driven by man or animal power, a revival of the principle tried by the Romans.

Ships of the 18th Century

The 18th century, with its colonial development and almost continuous wars, accelerated improvement in ship design and construction. Hulls were built suitable for voyages to any part of the world. The sail plan was made more scientific and designers began to study such factors as the centre of effort. The staying of masts was carefully thought out and dismasting was reduced, while speed was greatly increased, although principally for privateering, smuggling, or slaving. At the end of the century there was a great increase in the size of ships, especially men-of-war and East

spices, silks, and glass, but Genoa, defeated at sea and finding it difficult to secure galley slaves, replaced the galley by high freeboard sailing carracks. In the N. the high freeboard sailing ships of various types—cogs, carracks, nefes, hulks, all designed to carry big cargoes—were in general use, although for many years the Hanseatic league had a virtual monopoly of them and by force of arms prevented the English from building and running them.

Sailing the World

The 15th century was the great turning point of naval architecture. The longer voyages permitted by growing knowledge of the world, understanding of the compass and its variation, and the improved methods of navigation, not only demanded ships large enough to carry the necessary victuals, water, and cables, but also ships which could be sailed nearer the wind than the older types. To the single mast of the N. was added a second, and immediately afterwards a third, and the topsail was revived after being neglected since Roman days. The Iberian caravel, developed from a Portuguese coaster with square sails on the foremast and fore-and-aft canvas on the

faked plans supposed to have been discovered in a Spanish dockyard being really a typical ship of the late 16th century. In the Mediterranean the galley design was blended with that of the high freeboard sailing ship to make the galleasse.

By the time, under the Tudors, that English ships became prominent, the world's most profitable trades were subject to national monopolies, so that ships of English traders on the long distance voyages had to be built to defend themselves and to take the offensive when necessary. The capital required for building such ships was raised by companies—e.g. the Russian, the African, the Levant, and the East India—to which the crown granted charters and monopolies. These ships could carry sufficient arms to make them invaluable also to the navy. The ships of the Gentlemen Adventurers were equally useful, and although their carrying capacity was small it was sufficient for spice cargoes, or loot taken from the Spaniards.

In the latter part of the 16th century there was great argument as to whether the handier ships of comparatively low freeboard or the "high-charged" ships with

Indiamen. The E. India co. was forced to build bigger ships, increasing the normal size from under 1,000 to as much as 1,500 tons between 1786 and 1797, while in the scarcity of naturally

bent timber it had to resort to iron knees with unexpected success, leading to other means of obtaining much stronger ships.

In the 18th century experiments in various countries were gradually

working towards a practical steamer, although none of them could claim much success. Iron hulls were tried for barges.

In the 19th century the French wars caused technical development

SHIP: DETAILS OF HULL AND RIGGING OF A THREE-MASTED SAILING SHIP

in Europe to be neglected in favour of rapid production, but in the U.S.A. a wise alteration in the rules for measuring tonnage led to much faster and safer sailing ships. Steamboats made rapid progress. In 1802 Symington's Charlotte Dundas would have been a successful canal tug had vested interests not prevented her from running; in the U.S.A. Fulton produced the Clermont in 1807 and followed her with other river steamers of rapidly improving design. Bell's Comet, launched on the Clyde in 1812, was the first of a big fleet of passenger ships on British rivers.

First Sea-going Steamers

After Waterloo improvement in the hulls and rigging of all types of men-of-war was brought about after the Admiralty had been persuaded to abandon the "establishments" which rigidly linked displacement with gun power. Navies adopted steamers first as tugs and tenders but, in spite of the disadvantage of the paddle wheel for combatant work, soon built steam sloops and frigates carrying the heaviest guns. On the mercantile side the coastal steamer began to make short sea voyages in the 1820s, and by the 1840s had developed sufficiently to make ocean voyages to every sea, although on many routes it was not yet economical to use steamships with their very extravagant paddle engines and low pressure boilers. In spite of auxiliary sail the paddle liner could carry only a small cargo compared with her bunkers, and was used almost exclusively for passengers and mails. The development of the screw propeller, although it was not really efficient for many years, made a big difference, and by the middle of the 19th century iron-hulled, screw-propelled steamers were beginning to appear all over the world.

At the same time the design of sailing ships was rapidly reaching its peak. The clipper ship, which had been slowly developing in the U.S.A., suddenly got its opportunity with the discovery of gold in California in 1849, followed by the Australian gold rush in the early 1850s. Big ships were built to carry the gold-seekers, fine in line and with a tremendous spread of canvas; they made wonderful passages, but the strain on their fabric and the water-soaking of their softwood hulls gave most of them very short lives. The end of the Navigation Acts gave these American clippers the opportunity of entering the British tea trade

from China, but new British tonnage rules and hardwood hulls soon permitted British builders to produce better ships for the purpose, and American competition disappeared in a few years. For added strength composite construction was adopted: an iron framework with hardwood planking, which later developed into iron and steel hulls, each giving greater strength with less weight. The temptation to sacrifice strength for lightness, and to carry experiment to dangerous lengths, was checked by the operations of Lloyd's Register and other later registration societies and by govt. action.

Contemporaneously with these improvements in sailing ships the steamer was made more efficient and economical, the hull form being improved to reduce the resistance to the water that absorbed h.p., so that increased competition soon forced the sailing ship owners to build with full lines to carry the biggest possible cargo, and to redesign their rig to be run with smaller crews.

The Great Eastern

In spite of improvements, the sailing ships were fighting a losing battle, and the architects and engineers centred their interest on improving steamers. The famous Great Eastern (18,915 gross tons) showed that iron construction permitted a ship of virtually any size, although in practice the increase had to await increased trade. The Great Eastern was hopelessly unprofitable, although most of her features later proved practical. The fast blockade-runners built for the American Civil War were also uneconomical for ordinary trading, but their features frequently proved permanent.

There was steady improvement in normal designs. Experiments with models in tanks greatly improved hull lines, with such excellent results that these experiments came to be carried out even for the smallest vessels. Passenger liners were made much more economical by the improvement in the engines—first with compound, then with triple expansion, and then with a few quadruple expansion engines coupled with higher-pressure boilers. Cargo liner design developed rapidly after the opening of the Suez Canal and the speed steadily increased; while slow tramp steamers, which had been introduced in the late 1870s, captured more and more of the sailing ship's trade.

Naval design improved at the same time, first by the introduction of iron hulls and then by improvement in guns and armour.

Competition between the various navies had a big influence on mercantile design; when it was appreciated that the fastest liners on the Atlantic services could serve in emergency as auxiliary cruisers, all the naval powers gave subsidies which permitted ships of new standards to be built, and in the late 1880s twin-screw ships were built for the European-U.S.A. route with a gross tonnage of 10,000 and a speed of 20 knots. Very soon trans-Atlantic ships exceeded 20,000 tons and the speed had gone up to 23 knots; while the turbine engine, first tried in river and cross-Channel steamers, was extended to trans-Atlantic liners of moderate standards. The Cunard ships *Lusitania* and *Mauretania* were built in 1907 with govt. subsidy; they had a gross tonnage of 32,000 and turbine engines with a nominal speed of 25 knots but capable of much more. Some companies, however, decided that ships of large size and extreme comfort, with moderate speed, paid better than the record-breakers. The long-distance liners were naturally more conservative in their design and slower in their development. All types benefited by the discovery of the virtues of the cruiser stern instead of the overhanging counter, although it was not generally adopted until after 1918.

The Diesel internal combustion engine was introduced for ocean-going cargo ships by Danish and British builders in 1912, and proved to possess many advantages for certain types and trades. As an alternative, oil fuel was substituted for coal under the boilers of certain steamers, greatly reducing the bunker space required and the size of crew necessary and giving far better results.

Between the Wars

During the First Great War the British and American govts. built a very large number of tramp-type ships which flooded the market when they were put on the sale list after the armistice. Technical improvement was thus limited for some years. But the desire for luxury and speed in passenger liners had not died, and the German *Bremen* and *Europa* (c. 52,000 tons), the Italian *Rex* and *Conte di Savoia* (48,000 to 51,000 tons), the French *Normandie* (33,423 tons), and the Cunard *White Star Queen Mary* (81,235

*The Great Western, completed Jan., 1838, inaugurated the first regular steamship service across the Atlantic.

tons) followed one another in rapid succession, each in its turn breaking the Atlantic record. The Queen Elizabeth (83,673 net tons), completed during the Second Great War, was used as a troopship before making her maiden voyage as a passenger liner in Oct., 1946. Cargo liners and tankers to carry oil in bulk were also greatly improved in design. The competition of Diesel propulsion brought about great improvements in steam engineering, while electric drive, with current generated by turbines or Diesel engines, gave excellent results. It was not until some years after the end of the First Great War that the improved hull lines of tramps greatly reduced their fuel bills.

After the Second Great War there was again in the market an excess of tramp-type ships built by the British and U.S. govts., although fast tonnage suitable for regular services had also been built. Numerous wartime practices were found safe and continued in peace, while full advantage was taken of scientific experiments made officially. The great improvement of aluminium alloys in their resistance to corrosion at sea led to their adoption for many parts of the ship, and the use of plastics became general. In some directions design was greatly simplified, in others it was considerably complicated.

SHIPBUILDING. Most steel ships, and very few are built in the 20th century of anything else save in wartime, are laid down on an inclined slipway on shore whose lower end reaches sufficiently far into the water for the ship to be floated off when she is launched. A few large vessels are built in a dry dock with level floor to avoid the risk of accidents in launching; some of exceptional size have even been built half in one dock and half in another, the two ends being joined later.

The proposed lines of the ship having been tested in an experimental tank, detailed working plans are produced and enlarged to actual size with chalk on the floor of the mould loft, where they are corrected and faired as necessary. Patterns are made for every part of the ship and are reproduced in steel; some of them are obtained to shape from the steelworks and only completed in the yard, while others are shaped in the yard. Careful checking to ensure accuracy at every point is necessary.

The keel, which no longer projects below the hull as it did in sailing ships and which, with the keelsons, makes the backbone of the ship, is laid on the carefully levelled blocks of the slipway and the

floors or floor plates are attached to it and adjacent plating by either riveting or welding (*q.v.*). The floors are the counterpart of the joists in a house ashore; under them is the bottom plating of the ship and laid on them, in virtually all ships of any size, are the tank tops. The double bottom of the ship is thus a very strongly-built raft, the space under the tank tops being used for water ballast, fresh water, or oil fuel. A complicated system of valves and pipes to the pumps allows the different compartments to be filled and emptied as required. It is made

watertight and of considerable strength so that if the ship strands, and the outer plating is pierced, the water is unlikely to get into the holds. In a few ships the double bottom is carried some distance up the side to give greater protection in case of collision.

The big stem (bow) and stern posts are erected at the ends of the keel. The floors are continued vertically after the turn of the bilge as frames, with horizontal stringers between them; but some ships, *e.g.* tankers, which are likely to be subjected to unusual longitudinal strains, are built with the horizontal frames more numerous and of greater strength than the uprights. That system was tried in the famous Great Eastern and revived by Sir Joseph Isherwood; later the two systems were generally combined.

Horizontal beams are stretched across the ship at intervals between the frames to support the various decks and 'tween decks, appropriately strengthened where they are cut through for hatchways into the holds.

When the frames are in place and held firmly by the beams, the plating or skin of the ship is continued up her sides from the tank tops. The long steel plates, which have to pass a careful examination by the surveyors of the classifica-

Shipbuilding. The Cape Town Castle, 25,000-ton motor ship of the Union-Castle Line, on the stocks at Harland and Wolff's yards at Belfast

tion societies or ministry like all the other material in the ship, are, in the case of a riveted ship, carefully marked and accurately punched so that the rivet holes coincide exactly with those in the frames and plates to which they are to be attached. The plates are placed in relation to one another on different systems in different ships, but care is taken to avoid too long a continuous line of rivet holes, particularly vertically, as that would seriously weaken the structure.

As the ship's sides rise, the bulkheads—transverse walls, which divide her into watertight com-

partments—are put in place. Their placing is governed by regulations and their construction is very carefully surveyed. In some ships, and in certain positions, watertight doors may be inserted in the bulkheads, but every precaution has to be taken.

The main or strength deck is built to heavier scantlings to give the whole ship girder strength in conjunction with the keel and double bottom. The side plating and frames above the strength deck may be of lighter material in certain types of ship, but if so the authorities insist on greater freeboard in placing the Plimsoll line than they would in the case of a ship with the same scantlings to her weather deck.

The superstructure is not called upon to withstand nearly as great a strain as the hull proper, so that in many ships it is constructed of an aluminium alloy, designed to resist the corrosion of sea water, instead of steel, in order to save weight, an important consideration both for the cost of propulsion and for stability.

Complete prefabrication of ships is practical only in wartime, when large numbers are built to precisely

the same design, but fabrication of parts is a feature of every 20th century shipyard. Big sections—deckhouses, bulkheads, and the like—are constructed in the shops instead of on the slipway, to which they are transported to be fixed in position. This permits work to be done in all weathers, and makes unnecessary overhead riveting or welding, which is a very severe strain on the shipwrights.

Welding is extensively used in the making of every new ship; but riveting, more usual in British yards, has several advantages in those parts of the ship which are subject to great strain. If riveted she is more elastic and will bend to the small extent that may prevent her from breaking, and bad workmanship is much more easily detected in the yard before she is put to the final test of heavy weather at sea. Hydraulic machines and pneumatic hammers are used wherever possible, but in some awkward corners hand-riveting may be necessary.

When the hull is sufficiently complete to float and to have stability, preparations are made to launch it. Increased weight means increased risk of accident at the launch, so that it normally takes the water as soon as possible, although on the Continent and in the U.S.A. a number of big ships have been launched with everything on board, and sometimes actually with steam up ready to sail away.

As the ship approaches the launching stage sliding ways are placed on the two parallel standing ways; the surfaces of the latter are freely lubricated with tallow, wax, or oil so that the sliding ways will travel down them without a hitch. By means of wedges driven by a large number of men working in perfect time the weight of the ship is lifted from the blocks on which she has been built and transferred to the sliding ways with massive timber cradles to support the ends. Just before the launch everything holding her in place is removed to the limit of safety and she is held only by the launching triggers, which are tripped when the traditional bottle of cham-

pagne is broken over her bow and she receives her name. If all goes well she immediately starts down the ways by her own weight; but powerful hydraulic rammers are invariably fitted under her bow to start her off if there is any sign of her sticking. If she does that in approximately the same position in which she was built no great harm is done, but if, generally owing to freezing of the tallow or other lubricant, she sticks when half the length of the ship is waterborne and the other half on dry land, there is a big chance of her breaking in two. Various means, carefully calculated beforehand, are taken to prevent her from "taking charge" when she is waterborne: most shipyards are on comparatively narrow rivers, and some newly launched ships have been wrecked on the opposite bank.

Except when launched broadside on, a ship is always launched stern foremost because the after lines, particularly above the waterline, are so much fuller than the bow lines that they give her buoyancy the moment the water reaches a certain height up her side; if she were launched with her finelined bow foremost there would be the danger of her diving and the water finding its way below.

Immediately the hull is launched tugs take charge and tow it to the fitting-out berth. There the engines and boilers are installed, the accommodation for passengers and crew is fitted, and she is completed and painted. The time taken on fitting is often as long as that during which the ship was being constructed on the stocks.

In the last stages she runs basin trials while made fast to the dock wall to make sure that her machinery is running smoothly. Any faults which show themselves are then rectified and she is taken out on her sea trials to prove to the owners that the builders have satisfied their guarantee as to her speed at a given draught, her fuel consumption, steering, and other points which vary according to the contract made.

Ship Canal. Artificial waterway for the passage of sea-going vessels. A ship canal may constitute a connecting link between two seas or oceans, or may merely provide a means of access from the sea to an inland town or district, or a navigable river or lake. Ship canals may be most conveniently classified as those with locks and those without locks.

The essential conditions for a ship canal without locks are that

Shipbuilding. The second *Mauretania* at Cammell Laird's yard, Birkenhead, showing the skeleton hull

water level at both ends should be approximately the same; that circumstances permit of an approx-

Shipka Pass, Bulgaria. Winding road over the pass which traverses the Balkan Mountains from north to south

imately level channel being constructed from end to end of the canal; and that any slight differences in level resulting in a gradient or fall must be capable of being made good by a reliable and adequate supply of water at the highest levels reached. The Suez Canal, between the Mediterranean and Red seas, is an early example of a ship canal without locks.

When the construction of a canal at the same level throughout its length is impossible, or is rendered prohibitive by reason of the cost, locks are introduced, by means of which it may rise in the interior far above sea level. In such cases, it is essential that an ample and constant supply of water should be available to make good the wastage at the locks. The most notable example of this type is the Panama Canal.

The Kiel Canal connects the Baltic and North seas. Other ship canals are the Midland Canal, an E.-W. link in Germany's waterways; the Corinth Canal, connecting the Adriatic and Aegean seas, length four miles; the Manchester Ship Canal, length 35½ m.; and the Kronstadt to Leningrad canal, length 17½ m. In America are the two short but important ship canals at Sault Ste. Marie, connecting Lakes Superior and Huron; one is in the United States, and the other in Canada. In Canada also is the Welland Canal, uniting Lakes Ontario and Erie. See Canal; Kiel Canal; Manchester Ship Canal; Panama Canal; Sault Ste. Marie Canals; Suez Canal; Welland Canal.

Shipka Pass (Wild Rose pass). Noted pass in the Balkan Mts., Bulgaria. It leads from Plevna by the Yantra valley to the upper Tunja valley and to Plovdiv, 52 m. to the S.S.W. The summit is

4,370 ft. alt. The majority of the distilleries of attar of roses are at Karlovo and Kazanlik, at the S. end of the pass. In July, 1877, the Turks occupied the pass, but were soon compelled by the Russians to evacuate it. See Russo-Turkish Wars.

Shipley. Urban dist. of the W. Riding of Yorkshire, on the R. Aire. At the junction of the Leeds-Bradford and Leeds-Cardiff rlys., it is also

served by the Leeds-Liverpool canal. The main industries are textiles and engineering. Open spaces include the Northcliff woods and playing fields (115 acres). Saltaire (*q.v.*) is within the district. Shipley gives its name to a co. constituency. Shipley glen, a beauty spot and gateway to the Ilkley moors, is N. of the river. Pop. 32,000.

Another Shipley, near Horsham, Sussex, was long the residence of Hilaire Belloc, who restored the old mill.

Shipley, Sir ARTHUR EVERETT (1861-1927). British zoologist. Born Mar. 10, 1861, he graduated at

Cambridge in 1882, and three years later was appointed demonstrator of comparative anatomy. In 1894 he became lecturer on the advanced morphology of the invertebrata. In 1887 he had been elected a fellow of Christ's College of which he became master in 1910. Shipley was vice-chancellor of the university, 1917-19. He wrote on zoology and kindred sciences, and was joint editor and part author of the Cambridge Natural History, 1905-09. He was created G.B.E. in 1920, and died Sept. 22, 1927.

Ship Money. Tax levied by Charles I in 1634, and memorable owing to the resistance of John Hampden. In previous reigns it had been usual for seaport towns to fit out ships to defend the coasts, but only in time of war. Acting on the advice of Noy, the attorney-general, Charles, in 1634, demanded ship-money from the seaport towns, ostensibly on the ground

that more ships were wanted to deal with the coastal pirates.

In 1635 the writs were repeated, but this time they were also sent to inland towns, which had never previously paid the tax. Many, however, paid, and a third time the tax was levied, the judges having declared that, as the kingdom was in danger, the impost was legal. Hampden, however, refused to pay, although the amount due by him was small, and the case came before the court of exchequer in 1637. Of twelve judges, seven decided that Charles was justified in levying the tax.

Shipping. The industry of conveying passengers and cargo in ships. No record exists of the transitional stage from the dug-out log and reed raft to the seagoing ship. The adventures and contrivances of mankind during this evolutionary era remain a closed book. Historical record begins with the period when seagoing vessels, equipped with oars, sails and steering-gear of a primitive kind, were extending trade in an early civilization.

The Phoenicians who settled along the Syrian coast developed overseas trade to an extent that their prosperity came to depend largely on shipping—the first of the human race to become thus dependent. Notable also among the seafarers of the ancient world were the Chinese, Malays, Arabs, and Egyptians. Voyages were being made between Arabia and India at least 3,000 years B.C.

During the classical era and that of the Roman Empire, voyages were made to Britain and the W. coast of Africa. Sea trade developed in the early centuries A.D., when, not uncommonly, both ship and cargo were owned by the same trader. It was customary, too, for a group of traders to charter a vessel, or, alternatively, to arrange with the ship owner for cargo space.

Probably the largest ships were not more than 300 tons—slow, cumbersome craft owing to their broad beam, deep draught when laden, and clumsy rig. Most voyages were undertaken in summer, and seafarers of Roman times navigated mainly by keeping within sight of land.

For many centuries the Mediterranean was the hub of shipping activity. Seaborne trade increased considerably, but the slow-moving vessels conveying trade goods invited the attention of piratical craft of more rakish design. Protection to shipping was given accordingly by the Roman

Sir Arthur Shipley,
British zoologist
Russell

fleets, consisting of oar-propelled galleys which were easily manoeuvrable and comparatively fast. These primitive warships almost succeeded in eliminating the menace of Mediterranean pirates. Meanwhile shipping became an organized industry. Laws in connexion with maritime affairs in that early epoch provided the foundation for all the intricate legislation relating to the vast modern shipping industry.

Seaborne trade expanded, and Venice and Genoa gained renown in maritime affairs. The English, whose seamanship was developed largely in coastal fisheries, enjoyed little prestige until the dawn of the 16th century.

Marine insurance, expanded systematically by the Italians, helped to stabilise shipping as an industry. The wide extension of trade during the Middle Ages was due in part to improved methods of navigation. Further progress was due to the enterprise of daring navigators, e.g. Magellan, Columbus, Vasco da Gama, and John Cabot, whose voyages of discovery over uncharted oceans opened new lands for colonisation. In the intense activity of this period Spain secured the position of first maritime power and held it until the defeat of the Armada. England became the great naval power in Elizabeth's reign, but the Dutch were dominant in commercial shipping. In 1600 England had roughly 200 ships of commerce of 100 tons and over, most of the larger types being owned by the various chartered companies.

The Dutch trade gradually declined during the latter half of the 18th century. On the other hand, English shipping received a strong impetus in this period when colonisation was creating new overseas markets. Exact figures are not available, but there is reason to believe that by 1770 the clearances of vessels from English ports amounted to about 700,000 tons, and that 200 of these ships were engaged in the slave trade.

Registration of shipping became compulsory in 1786, and about fifty years later (1837) Lloyd's Register classed an iron-built ship for the first time. Meanwhile American enterprise produced fast clippers and packets which plied in the Atlantic, won renown in the China tea trade, and proved a national boon by conveying migrants and stores during the years of the California gold rush in the middle 19th century. Stimulated by this healthy competition, Great

Britain proceeded to construct clippers of such beauty and speed that their epoch is immortalised as the "golden age of sail." Before the advent of 1900, however, the transition from wood to iron and from iron to steel in shipbuilding, and from sail to steam in ship propulsion, brought about far-reaching changes in all seaborne trade.

National fleets expanded in numbers, and ship units in size, power, and speed. Whereas the 19th century clippers were of 1,500 to 2,000 tons, contemporary liners range from 5,000 to 80,000 tons. Two nations, the Germans and the Japanese, achieved prominence in the shipping industry, but were eliminated from world competition for a period after defeat in the Second Great War.

The forms of ownership and organization in the industry have changed greatly with the centuries, through the evolution of the ship and conditions in general. The era of the chartered companies gave place in the 18th century to ownership by individuals or partners. In the 19th century many ships were owned on a system whereby numbers of people shared proportionately to the amount of the purchase money subscribed by each. Then, as ships became larger and costlier, this system was superseded by the joint stock company.

Two factors have had a powerful effect on shipping. One is the use of oil and oil products, for fuel and a thousand-and-one other purposes. Nowadays the specially constructed oil tanker is a common sight everywhere at sea. The other factor is the impact on the industry of two world wars involving the chief maritime powers and causing immense destruction of shipping. Inevitably, after the Second Great War, the U.S.A., which had suffered far less physically and economically than Great Britain (for long supreme on the seas), emerged as the principal naval power and also as the possessor of the largest mercantile fleet.

The gross tonnage of shipping owned in 1947-48 by Great Britain and Northern

Ireland (excluding vessels of less than 100 tons) was: steamships, 12,623,273; motorships, 5,224,624; sailing vessels and barges, 100,942; total 17,948,839 gross tons. Other maritime countries owned, in gross tons: U.S.A. (seagoing ships and Great Lakes vessels), 32,890,745; British Empire, 21,549,225; Norway, 3,761,771; Netherlands, 2,441,359; France, 2,326,864; U.S.S.R., 2,164,467; Sweden, 1,829,992; Panama, 1,706,858; Italy, 1,317,155; Spain, 1,140,035; Greece, 1,027,101; Germany, 598,252. No exact figure was available for tonnage owned by Japan in 1947-48, but it is known that that country lost more than 4,000,000 tons gross of shipping in the Second Great War. See Lloyd's Merchant Navy; Navigation Acts; Ship. Consult Appendix to Lloyd's Register Book (annually).

W. E. Stanton-Hope

Shipping Forecast. Special forecast made by the meteorological office of the Air Ministry at Dunstable of weather conditions prevailing over the coastal areas around the British Isles during the ensuing 24 hrs. Such forecasts are broadcast four times daily by the B.B.C. For convenience the survey is divided into forecasts for four areas, N., E., W., and S., and further sub-divided into districts, e.g. districts Shannon, Dogger, Forties, Wight (see the accompanying map). A gale warning may be broadcast with a shipping forecast, but is not strictly a part of it.

Shipping Forecast. Sea areas off the British Isles referred to in the daily shipping forecasts from 1948

Ship's Company. Synonym for a ship's crew. It does not include the officers. The correct way of describing the complement of a ship is officers and crew, or ship's company and officers.

Shipton, MOTHER. Legendary English soothsayer. The earliest known reference to her is in an anonymous pamphlet published in London in 1641: *The Prophecies of Mother Shipton in the Raigne of King Henry 8th*, foretelling the death of Cardinal Wolsey, the Lord Percy, and others, as also what should happen in ensuing Times. Lilly, the astrologer, quoted 18 of her predictions in his *Collection of Prophecies*, 1645, de-

Mother Shipton, the legendary English prophetess. From a drawing by Sir W. Ouseley

claring that 16 of them had been fulfilled. In the reign of Charles II, Richard Head wrote her *Life and Death*, representing her as a daughter of the devil. An anonymous pamphlet of 1686 states that she was born at Knaresborough in 1488, and died in 1561, her maiden name being Ursula Southill. Her existence is, however, very doubtful. Prophecies attributed to her, notably those forged by Charles Hindley, 1862, were widely accepted by the ignorant, and caused widespread alarm in rural districts in 1881, when people gathered to pray in the fields, anticipating the end of the world. Consult *Mother Shipton Investigated*, W. H. Harrison, 1881.

Shipworm. Popular name for the mollusc *Teredo* (q.v.).

Shiraz. Walled city of Persia. Situated in a fertile valley, it is the capital of the prov. of Fars, 125 m. E.N.E. of Bushire, and has long been an important centre of trade. It does much business in wine, cottons, gums, opium, carpets, and otto of roses, and lies on the caravan road from Bushire, on the Persian Gulf, to Ispahan, which lies 220 m. almost due N. It has

cable connexion with Bushire, and a radio station. It is famous as the birthplace of the poets Hafiz and Sa'di. Its inhabitants are credited with speaking the purest Persian in the country. Founded in 697, it was formerly one of the chief places of the Zoroastrians, and 2 m. away are the ruins of the Zoroastrian temple of Mossella. Of the numerous pleasant gardens (bagh), one of the oldest is the Bagh-i-Takht-i-Kajar. In 1812, 1824, and 1853 disastrous earthquakes caused much damage to the city.

Before the outbreak of the First Great War British troops occupied Shiraz on account of the disturbed state of S.W. Persia, but after some months were withdrawn. During the war disbanded gendarmes broke into revolt in the city in 1915, and imprisoned the British consul, with other British subjects, for several months. Order was restored by Sir Percy Sykes. Pop. 129,000. See Persia.

Shire (A.S. *sciran*, to divide; cf. share and shear). In England, term applied from about the 8th century onwards to the districts into which the country was divided. To some extent these districts corresponded to the kingdoms which became united under one overlord. They were ruled, not by petty kings, as at first, but by earls or aldermen, whose authority

Shiraz, Persia. Bagh-i-Takht-i-Kajar, the splendid throne garden and palace to the north of the city

other questions discussed was that of the shire boundaries, which were occasionally rather indefinite in consequence of the activities of the border thanes.

Some of the shires, e.g. Hallamshire, became absorbed. In the Midlands the shire is the same as the modern county, but several counties, e.g. Durham, Norfolk, Surrey, Cornwall, were never called shires. All the Welsh counties except Anglesey are shires, and in Scotland nearly all the county names end in -shire. In N. Ireland and Eire, on the other hand, county is the usual prefix, e.g. co. Down, co. Kerry. See County.

Shire. River of the Nyasaland protectorate and Mozambique. It is 295 m. long and forms the S. outlet of Lake Nyasa, passing through the reedy swamp of Lake Malombe. Navigation is obstructed by cataracts for 35 m., at the Murchison Falls, 80 m. below the lake, and although at one time possible as far as Chiromo is now

extremely difficult, owing to the fall in the level of the river. The only important tributary is the Ruu. The chief settlements are Fort Johnston, Liwonde, Chiromo, Port Herald, and Chindio.

Shire Horse. Largest and heaviest breed of horse, believed to be descended directly from the old English "great horse" or war horse. It is large limbed, with full, flowing mane and tail, and the fet-

Shire Horse. Champion specimen of the heavy breed of horse, descended from the old English war horse

Gambier Bolton, F.Z.S.

locks are clothed with long, silky hair. The maintenance and improvement of the breed is looked after by the Shire Horse Society. See Horse colour plate.

Shirley. Novel by Charlotte Brontë, first published under the pseudonym of Currer Bell, in 1849. It is a story of Yorkshire life, full of characters more or less closely drawn from people whom the author knew, and containing episodes based on events brought within her personal knowledge.

Shirley, JAMES (1596-1666). English dramatic poet. Born in London, Sept. 18, 1596, he was

James Shirley,
English dramatist.
After J. Thurston

educated at Merchant Taylors' School, St. John's College, Oxford, and Catharine Hall, Cambridge, afterwards being by turns clergyman, schoolmaster, playwright, soldier in the Royalist cause, and again schoolmaster. He and his wife died in Oct., 1666, on the same day, of shock and distress at their losses caused by the Great Fire. Of Shirley's plays the best are the comedy *The Lady of Pleasure* and the tragedy *The Traitor*. He wrote some exquisite lyrics, notably "The glories of our blood and state," and excellent dialogue, and dramatised Sidney's *Arcadia*. There are editions of his plays by Gifford and Dyce (1833) and E. Gosse (1888). *Consult* Life, A. H. Nason, 1915.

Shirreff, JOHN (1759-1818). British agriculturist. After travelling abroad he settled down to farming in Haddingtonshire, and, in 1793, was one of a committee of three appointed to make an agricultural survey of the W. Riding of Yorkshire. He then experimented with various methods for improving agricultural implements and the methods of tilling, and contributed articles to farmers' and other magazines. In 1804 he surveyed the Orkney and Shetland Islands. Shirreff died Nov. 2, 1818.

Shirt (Dan. *skiorte*, shortened garment). Under-garment of linen, cotton, or flannel, for men. In Saxon times shirts were worn by both sexes, and at various periods have been embroidered, especially during the Tudor period, when the needlework on them was very elaborate. Skirt, strictly the lower part of the shirt, is used as the name for the part of a woman's dress which covers the body from the waist downwards. (*See* Costume.)

Of materials used for shirts the bleached cotton shirtings of the British home trade are calicoes, but

there are also coloured and fancy woven shirtings. Oxford shirting is woven with the warp threads lifted in pairs, and usually with coloured warp stripes. Harvard shirting has a harder feel than Oxford. Grandrelle shirting is made with particularly coloured twisted yarn. Fancy shirtings, with woven or printed stripes or figures, are made in great variety from cotton. Poplin shirtings are of warp-ribbed cotton. Union and Ceylon shirtings contain more or less wool. Rayon is used for sports wear.

Shirwa or **CHILWA**. Lake of Central Africa. It lies on the border between Nyasaland and Portuguese East Africa, 60 m. S.E. of Lake Nyasa. Situated amid mountains, it is shrinking in size through excessive evaporation, and is now a swamp 40 m. long and 18 m. wide, haunted by waterfowl. It was discovered by Livingstone in 1859.

Shishak. Name of four Egyptian kings of the XXIIInd dynasty. The Biblical spelling represents the Egyptian Sheshenq or Sheshonk. Shishak I (c. 945-924 B.C.) invaded Palestine and despoiled Solomon's temple and palace at Jerusalem under Rehoboam (1 Kings 14). On a Karnak temple-wall 156 Asiatic figures symbolise places in Palestine which, it is claimed, he captured.

Shittim Wood. Wood of an acacia tree (*A. seyal*), which is found in the valleys around and S. of the Dead Sea, Palestine. Hard and close-grained, the wood was largely used in the construction of the Tabernacle.

Shizuoka. Town of Honshu, Japan. The capital of Shizuoka prefecture, it stands on Suruga bay, 95 m. S.W. of Tokyo, with which it is connected by rly. It was the seat of the last of the Tokugawa Shoguns, Prince Yoshinobu, whose castle still stands. Tea, lacquer, and bamboo wares are produced. Pop. 181,212.

Shkara Mt. Peak in the Caucasus Mts. It lies S.E. of Elburz, and rises to 17,000 ft.

Shkoder or **SCUTARI**. Town of Albania. Situated on the Bojana, S.E. of Lake Shkoder, it lies some 12 m. from the Adriatic. It has a small woollen industry and exports hides, salt, and tobacco. It is the capital of the prefecture of the same name. In the first Balkan War the town was besieged by the Montenegrins and afterwards by the Serbians, but it held out until April, 1913. During the First Great War it was occupied at first by Montenegro, but after Serbia and Montenegro were overrun in

1915-16, it was seized by the Austrians, who held it until the autumn of 1918. In the Second Great War it was occupied by Italian troops. Lake Shkoder (or Scutari), partly in Albania and partly in Yugoslavia, is 27 m. long, with a maximum width of 10 m.

Shkumbi or **SCUMBI**. River of Albania. It rises in the Eastern Mts. and flows almost due W. past Elbasan to the Adriatic Sea. The old route to Constantinople, the Via Egnatia, and the modern rly. follow the valley up to Elbasan.

Shoa. Central dist. of Abyssinia, at one time an independent kingdom. It is in the south-central portion of the country, and is a mountainous dist. chiefly inhabited by Abyssinians and Gallas. The chief town is Addis Ababa. In 1889 Menelek II, the king of Shoa, became king of Abyssinia (*q.v.*).

Shoal (akin to *shallow*). Place where the water of a river, lake, or sea shallows. Shoals occur over sandbanks, bars, or reefs, and are to be distinguished from submarine banks such as the Dogger, in that they rise sufficiently close to the watersurface to interfere with navigation. Shoals run for hundreds of miles along the West African coast, between Lagos and Freetown, necessitating the transfer of everything to small surf boats.

Shock. Medical term, used to describe the condition which follows prolonged anxiety. It also applies to the more severe condition of surgical shock, which is caused by a decrease in strength of the blood-vessel walls, allowing the blood-fluid to escape into the tissues. It follows severe injuries.

Simple shock is treated by lowering the head, rest, warmth, and mental reassurance, together with any simple remedy which is available. Surgical shock demands replacement of the circulating fluids by blood transfusion or saline injections, together with oxygen inhalation and the use of drugs, such as adrenalin, which keep up the blood pressure.

Shock Troops. Soldiers specially trained to carry out mass assault action immediately after a heavy bombardment, particularly against strongly defended positions. They were used extensively by the Russian and German armies on the eastern front in the Second Great War. In the British army the functions of shock troops were carried out by commando (*q.v.*) units.

Shock Wave. A short, sharp pressure wave, such as the wave which carries outwards the first

force of an explosion (*q.v.*). The pressure in the first crest of the wave will usually be high (up to many atmospheres); a correspondingly great rarefaction in the trough following is impossible, since the pressure cannot drop below zero. Hence the wave form is distorted: the front is steep, the crest of high pressure is of extremely short duration, the following rarefaction is spread out over a much longer period. In some respects such a wave is analogous to a surface wave in shallow water. Shock waves are also produced by shells, rockets, aeroplanes, etc., travelling faster than sound. Here the high-pressure front is built up by the nose or leading-edge continually overtaking the sound waves which would otherwise dissipate the energy forward. This is analogous to the waves at the bows of a ship.

Shoe-bill. Head, showing the broad, heavy beak
W. S. Berridge, F.Z.S.

Shoddy (A.S. *scéadan*, to shed). Word loosely used to denote any twice-used wool. Shoddy is the long fibre obtained from shredding stockings, worsted, carpets, and the like. The qualities vary with the source of origin. Large quantities of clippings of cloth from tailors' shops and factories are converted into shoddy, and the utilisation of similar waste has an antiquity of four or five hundred years. Shoddy-making has been a systematised factory industry since the beginning of the 19th century, and its centre in U.K. is Dewsbury. The materials are thoroughly cleansed before unpicking, all cotton threads removed, and sorted into various colours and qualities. They are then oiled to facilitate the separation of the threads, and "teased" into a fibrous mass, from which the material can be freshly spun. The fibres are usually short, and are mixed with new, long fibres before being made into yarn. *See* Rags.

Shoe (A.S. *scéa*). Covering for the foot. It is often distinguished from a boot in that it reaches only to the ankle, but in the U.S.A. all articles of footwear are called shoes. (*See* Boots and Shoes.) A shoeblack is the name given to one who cleans shoes. Through the efforts of J. Macgregor (*q.v.*), shoe-black brigades were started in London in 1851. They are associated with the Shaftesbury Society (*q.v.*).

The name shoe is also applied to various articles whose shape or use is similar to that of the shoe. The plate of metal nailed to the hoof of a horse to prevent wear is called a horseshoe. In building, a shoe is the short section at the bottom of a rain-water pipe that directs the issuing water. It is also the iron point of a pile; part of a brake (*q.v.*); and a piece of wood attached to an anchor to prevent it, when rising, from tearing the ship's side. *See* Farrier.

Shoe-bill OR **WHALE-HEAD** (*Balaeniceps rex*). Species of heron, found rather rarely in Equatorial Africa. It is distinguished by the enormous beak, which somewhat resembles a shoe or boat in shape. The bird is of large size, has very long legs and grey plumage, and is found among the reeds by the side of rivers. Its food consists of fish and carrion.

Shoeburyness. Locality on the estuary of the Thames, Essex, England; a suburb in the corner of Southend-on-Sea, in which it was incorporated in 1933. Served by rly., it has a fine beach and bathing facilities. There is a school of gunnery at Shoebury garrison. St. Andrew's, a Perpendicular edifice, is the parish church at St. Shoebury; a former vicar, Arthur Dent, wrote *The Plaine Man's Path-Way to Heaven*, 1601. Pop. est. 6,700. Shoebury Ness is a cape where the coast turns N.E. On the average it is about the driest spot in England. To their encampment here the Danes retreated after their defeat by Alfred at Benfleet in 894.

Shoe Lane. London thoroughfare linking Fleet Street with Charterhouse Street, E.C. Formerly it extended from Holborn to Bridewell. Residents have included the Black Friars, who settled here about 1230; Henry de Lacy, earl of Lincoln, who acquired their house; and John Florio, translator of Montaigne. In Gunpowder Alley the poet Lovelace died in poverty. Chatterton was buried in the graveyard later covered by Farringdon Avenue.

Quite near St. Andrew's church was Bangor House, built about 1378, destroyed 1828; and, nearly opposite, the palace of Oldbourne Hall, described as old by Stow in 1598, later covered by a brass foundry. At an inn known as The Windmill Felton conceived the murder of the duke of Bucking-

ham. Wotton and Pepys refer to a cockpit in Shoe Lane. Ben Jonson's Court and tavern stood near the S.E. corner.

During the Second Great War Shoe Lane was extensively damaged by bombing. On the E. side an area nearly 200 yds. long and extending in places as far as Farringdon St. was razed. At the N. end, from Charterhouse St. to Holborn Viaduct, all the buildings were destroyed, and St. Andrew's church and the City Temple (*q.v.*) were gutted. The glass-walled offices of the Daily Express adjoin Shoe Lane at the S. end, and in the street are the offices of the Evening Standard and the Hulton Press.

Shofar. Hebrew trumpet frequently mentioned in the Bible,

Shofar. Hebrew trumpet used on New Year's Day

and still used in the modern synagogue. It is the horn of a ram or any clean animal, and produces only the natural series of harmonics from its fundamental note, these being obtained by the increasing pressure of the air from the lips. In practice the notes sounded are the octave twelfth, and double octave only, more importance being attached to the rhythm than to the pitch of the notes. The following is a shofar call (Teruah shebarim):

Shogun (Jap., general). Originally, the title of a military commander. In 1192 the emperor conferred on Yoritomo Minamoto, the leader of one of the two great military families of the period, the title of sei-i-tai-shogun (barbarian-quelling great general). From that time the shoguns—who were always formally appointed by the emperor—became so powerful that they came to be regarded as the temporal rulers of Japan, and the mikados as the spiritual rulers. The shogunate was abolished in 1868. The shogun was also called tycoon, Chinese for "great lord."

Shola OR **SOLAH**. Pith of the plant *Aeschynomene aspera*, a native of India. The pith is extensively used, on account of its lightness, in hats and helmets.

Sholapur. Dist. and town of India, in the Central division, Bombay state. The dist. lies E. of

the W. Ghats and marches with Hyderabad on the E. It occupies a fertile portion of the Deccan, and has an annual rainfall of 26 ins. The town is a great road centre 147 m. S. E. of Poona, and is on the rly. from Bombay to Madras. It has considerable trade in locally grown cotton, and makes silk and cotton goods. It was one of the great centres of Mahratta authority, and its fort was captured in 1818 by Gen. Munro in the Mahratta Wars. Area, 4,572 sq. m. Pop., dist. 1,014,670; town, 212,620.

Shooting. Art of using firearms. Shooting is of two chief kinds, in war and in sport. The former, however, is more usually known as gunnery or marksmanship, leaving the word shooting in common speech to the latter. (See Artillery; Bisley; Gunnery; Revolver; Rifle, etc.)

In the British Isles the chief objects of this form of sport are pheasants, partridges, grouse, rabbits, snipe, etc. The shooting of stags is generally known as deer-stalking (*q.v.*). Another form, confined to very few parts of the world, is big game shooting.

In shooting as a sport, the sportsman should always break his gun and remove the charge or charges when walking from one part of the shoot to another, and when putting the gun away or otherwise letting it out of his hands; on the other hand, an axiom of good sportsmanship is that *a gun is always loaded*, i.e. should invariably be handled as though it were loaded. A gun should always be carried pointing to the ground, and should never in any circumstances be pointed at any person. Shooting accidents occur either because a man walking with a loaded gun has stumbled or slipped, thus losing control of his weapon, or because a gun has been handled carelessly or pointed jocularly, the handler believing it to be unloaded.

The correct position in which to stand when firing; the method of shooting at flying game so as to judge on the instant the exact spot where the charge and the quarry will come in contact; the manner of changing guns with the man who is loading, and all the intricacies of the science of shooting can be acquired only by actual practice and demonstrated instruction.

Grouse, partridge, and pheasant shooting, now that birds are usually driven towards the guns, require great skill on the part of the shooter, as the birds fly at a high rate of speed, especially when com-

ing down wind, and the correct timing of them entails good judgement of pace. See Big Game; Bisley; Clay Bird; Game Laws; Grouse; Gun Licence; Partridge; Pheasant; Pigeon Shooting; Snipe; Sporting Gun.

Shooting Star. Popular name given to the incandescent passage of meteors through the earth's atmosphere. See Meteor.

Shop (A.S. *scoppa*, stall or booth). Room or building in which goods are sold. Originally shops were selling points at fairs and markets, and much business is still done at market stalls. Shops may range in size from the front room or front window of a cottage to an elegantly fitted mansion, including within itself many shops. Such establishments are commonly called department stores. Companies may own numerous shops, all selling similar goods. Some manufacturers, e.g. of cooked food, boots and shoes, ready-made clothing or drugs, have their own multiple shop organization as the principal outlet for their goods.

Statistics of shops are defective, but according to figures issued by the ministry of Food, there were in the U.K. in 1946 598,000 retail outlets for the sale of food-stuffs; of these, 45,000 were butchers, 100,000 dairymen, 27,000 fishmongers, 22,000 fish friers, 147,000 grocers, provision merchants, and general food shops, 110,000 retailers of fresh fruit and vegetables, and 25,000 bakers. Chocolate and sugar confectionery were sold at 226,000 places.

Towards the end of the 19th century various Shops Acts were passed. These regulated hours and conditions of labour. The Shops Act of 1912 provided, among other things, (a) that no person under 18 may be employed for more than 74 hours, including mealtimes, in any one week; (b) that at least one seat must be available for every 3 female assistants; (c) that on at least one day in each week each shop assistant

shall not be employed after 1.30 p.m.; (d) that assistants shall not work continuously for more than six hours without at least 20 mins. interval, or between 11.30 and 2.30 without a break for a meal of 45 mins., or between 4 to 7 p.m. without 30 mins. for tea. Moreover, every shop (unless exempted) must close at 1 p.m. on one day in every week, the local authority having the power to decide the early closing day, and also to exempt certain shopkeepers. The hour of closing was regulated by the Shops Act of 1928. The Early Closing Association, of 1-3, St. Paul's Churchyard, London, E.C.4, encourages earlier closing of shops.

Shop Steward. Representative of trade union within the

Jane Shore imprisoned as a witch in the dungeons of Ludgate. From the painting by J. N. Robert-Fleury. See p. 7530.

Luxembourg, Paris

workshop, elected by his fellow-workers to act as the link between the factory and the branch of the union, to carry out union business within the factory, to express the views of his own group of members at branch meetings, to advise members in difficulties with their supervisors, and to interview the management on members' behalf. A shop steward is a full-time employee of the company for which he works, but most trade union agreements provide that shop stewards shall be permitted reasonable facilities to attend to trade union business. The chief shop steward of a large works may have his own office, and may be engaged almost full-time on union business, although paid by the company.

The shop steward movement originated during the First Great War. The Munitions of War Act, 1915, made strikes and lock outs illegal over the greater part of industry, and substituted compulsory arbitration for the settlement of disputes. This encouraged "unofficial action" on the spot, and the election of leaders within the works to negotiate with the management. During the Second Great War shop stewards were generally among those elected by the workpeople to the joint production committees set up in war factories; they were sometimes an important factor in the success of wartime production efforts.

Shore, JANE (d. c. 1527). Mistress of Edward IV of England. The daughter of Thomas Wainstead, a London mercer, she married a goldsmith named William Shore, but about 1470 became Edward IV's mistress, having attracted him by her liveliness and wit. She used her political influence well, but after Edward's death was charged by Richard III with sorcery, was made to do penance, imprisoned, and deprived of her wealth. She died in great poverty. Jane Shore was celebrated by the poets Churchyard and Drayton, by T. Heywood in his *Edward IV*, and is the subject of plays by N. Rowe, 1714, and W. G. Wills, 1876. See *illus.* p. 7529.

Shoreditch. Met. bor. of the co. of London. It lies N.E. of the City, with Finsbury W., Islington N.W.,

Shoreditch arms

Hackney and Bethnal Green E., and Stepney S.E., includes the dists. of Moorfields, Hoxton, Haggerston, and Kingsland, and has tram and bus connexion with Liverpool Street. It is named after the Soerdiches, lords of the manor in the time of Edward III.

Covering about one sq. m., it once possessed a Benedictine nunnery, of which Holywell Lane is a reminder, and on part of the site of which James Burbage built the first theatre in London, The Theatre, about 1576, a little later erecting The Curtain, commemorated by Curtain Road. The Theatre was taken down in 1599; parts of The Curtain existed down to 1772. In S. James's church was a window in memory of Shakespeare's connexion with the two theatres.

The parish church of S. Leonard, founded in the 13th century, was rebuilt about 1740, and restored in

Shoreditch. Parish church of S. Leonard, rebuilt about 1740

1890; it is known as the actors' church, Richard Tarleton and James and Richard Burbage being buried here. The church suffered considerable damage in the Second Great War. The churchyard is now a public garden. Near to the church is the Geffrye museum (*q.v.*). The fine town hall, 1866, extended 1901, was reconstructed 1905-06, after a fire in 1904. The winner at the archery contests held here was known as "duke of Shoreditch." Chatterton lived in Shoreditch in 1770. It shares an M.P. with Finsbury. Pop. 45,000.

Shoreham-by-Sea. Seaport and watering place of Sussex, England. It stands at the mouth of the Adur 6 m. from Brighton, and is an urban dist. consisting of New Shoreham, Old Shoreham, Shoreham Beach, and Kingston-Buci. It has a rly. station on the main Brighton-Portsmouth line. There are three fine old churches: S. Nicholas, Old Shoreham, Saxon and Norman; S. Mary, New Shoreham, Norman to Early English; S. Julian, Kingston-Buci, Early English. The Marlpins, an ancient building in the High St., dates from 1120 and houses a museum. There are two cinemas. The harbour is used for coasting and continental trade. Shoreham Beach to the S. of the town, is separated from it by the Adur and is approached by bridges.

Shoreham was an important

port in the Middle Ages, and its chief industry was shipbuilding. The town had formerly a high constable elected annually. From 1295 to 1885 New Shoreham sent two M.P.s to parliament. From 1950 Arundel and Shoreham was the name of a co. constituency. Pop. est. 12,020.

Another Shoreham is a village in Kent. It is 22 m. from London, with a fine old church.

Shore-Line. Thin strip or zone of land lying between the line of low-tide and the line of sea cliffs. The shore is divided into the back-shore, which lies between the base of the cliffs and the normal high tide level, the fore-shore, which lies between high and low tide limits, and the off-shore zone, which is the gently sloping continuation of the shore beyond low-tide level. The classification of shore-lines depends on the relative movement of land and sea that brought the shore into being. Shore-lines of emergence are those which have developed as a result of the rising of the land or the falling of the sea level. They are characterised by gently sloping shores protected by bars behind which are extensive lagoons. Shore-lines of submergence have been formed when the land has sunk or the sea risen; such shore-lines are to be recognized by their very irregular plan view and the prevalence of drowned valleys, *e.g.*, Plymouth, Milford Haven, Hong Kong, etc. Neutral shore-lines are those formed by the building out of the land into the sea, *e.g.* by deltas, volcanoes, coral reefs, where no movement of land relative to sea has taken place. See Coast; Earth Movement.

Shoring. Additional or temporary support to a wall. There are three principal methods of shoring. (1) Where an intermediate portion of a building has been removed, leaving an open space

Shoreham, Sussex. Parish church of S. Mary, a fine specimen of Norman and Early English architecture

between two walls, vertical plates of timber are placed against the two walls, opposite to each other and secured to the walls by short, horizontal pieces let into the brickwork. Horizontal struts are then placed between the vertical plates to resist any outward thrust from the walls, and when necessary the horizontal members are stiffened by raking and vertical scantlings. (2) Where a single wall has to be shored, vertical plates are secured to it as above described, and the outward thrust is resisted by two, three, or more raking struts one

Shoring. Diagram of three methods. 1. Flying shore. 2. Multiple raking shore. 3. Single shore. See text

above another, sometimes braced together, firmly supported at ground level at a distance from the wall and secured to the vertical plates. (3) Where a wall has been weakened at only one point and at no great height, a single raking strut from ground level may be fixed, secured to the wall at the weak spot. The timbers used for these purposes are known as shores.

A dead shore consists of vertical timbers in pairs with horizontal needle timbers on which walls are supported in underpinning operations.

Shorncliffe. Village of Kent, England. Situated 2 m. W. of Folkestone, it has a large military camp first set up in the early 19th century and made permanent in 1855. There Moore trained the Light Division for service in the Peninsular War. In 1923 his statue, by Tweed, was unveiled in the camp. In the First Great War Shorncliffe was a depot for the Canadian army, and in the Second Great War an infantry and artillery training centre.

Short. Name of three brothers, Horace, Eustace, and Hugh Oswald, who founded the oldest established British aircraft manufacturing firm, Short Brothers (Rochester and Bedford), Ltd. They started a balloon factory in Battersea in 1898 and began building aeroplanes in 1908, first at Laysdown, Sheppey, and then from the aerodrome at nearby Eastchurch. Their second original

biplane, in the hands of J. T. C. Moore-Brabazon (later Lord Brabazon), made the first historic circular mile flight in 1909. In 1914 Shorts moved to Rochester, where a succession of outstanding marine aircraft was produced, culminating in the commercial Empire boat of 1936, and its military counterpart, the Sunderland (*q.v.*). This basic design was developed after the Second Great War, when the factory was moved to Belfast. In its early days the firm constructed airships at Bedford. There were other notable Short machines, including the large Calcutta, Scipio, and Singapore flying-boats, as well as the

Stirling (*q.v.*) four-engined bomber. See *Aeroplane* illus. p. 135.

Short, SIR FRANK (1857-1945). British artist. Born June 19, 1857, he was originally trained as an engineer,

but found his vocation as an etcher and engraver, in which he attained the highest honours. He was also a landscape painter. Knighted in 1911, he was made R.A. the same year. Treasurer of the academy, 1919-32, he was also for many years president of the Royal Society of Painter-Etchers. He died April 22, 1945.

Short Circuit. In electricity, the creation—accidental or otherwise—of an additional circuit between two points (*see* Shunt), having a resistance negligible compared with the original circuit through which the current should travel. An example is the short-circuiting of two cores of a cable by an excavator's pick. Since the resistance is so low, the current may be very high, and serious damage and fires may result. Protective methods include the use of fuses (*q.v.*) or circuit breakers (*q.v.*) for opening the circuit and cutting off the supply. In some instances, however, a short circuit serves a useful purpose. The operation of electric automatic rly. signals depends on the short-circuiting by the train wheels of a current which normally passes through the magnet holding a signal "off." See *Circuit, Electric*; *Electricity*.

Shorter, CLEMENT KING (1857-1926). British journalist. Born in London, July 19, 1857, he was educated at Downham Market. His first literary work was for *The Dover Express*. In the civil service,

1877-90, he contributed literary biographies to a Scottish encyclopedia, and piquant literary gossip to *The Star*. Editor of *The Illustrated London News*, 1891, he founded

Clement King Shorter
Hoppe

The Sketch in 1893, and edited both *News and Sketch*, together with *The English Illustrated Magazine*, until 1900. With Hugh Spottiswoode he next founded *The Sphere* (*q.v.*), starting its companion, *The Tatler*, in 1901. From a literary as well as a pictorial standpoint, Shorter introduced a new spirit into illustrated journalism. His weekly literary letter in *The Sphere* was one of the most widely read pages of its day. This bibliophile also won distinction as an authority on the Brontës, Borrow, and Napoleon. He was among the first to appreciate Meredith and Hardy, and published a masterly little *Handbook to Victorian Literature*, 1897. His autobiography appeared in 1924, and he died Nov. 19, 1926.

Shorter married Dora Sigerson (1872-1918), Irish poet and novelist, in 1896. She was born in Dublin, daughter

Dora Sigerson Shorter, Irish poet

of George Sigerson (*q.v.*). In addition to ten volumes of poems, the first of which appeared in 1894, she wrote a novel, *Through Wintry Terrors*, 1907; was a gifted exponent of the short story, as in *The Father Confessor*, 1900, and *The Country House Party*, 1905; and produced books of prose sketches. She died Jan. 6, 1918.

Shorter Catechism. Name given to a confession of faith which sets forth the doctrines of the Presbyterian churches of Scotland. Drawn up by the Westminster assembly of divines in 1647, it received the sanction of the general assembly. It was called shorter to distinguish it from the larger catechism, which was somewhat too difficult for ordinary instruction, and became the popular medium through which Scottish children became acquainted with the various religious tenets and duties. See *Catechism*; *Presbyterianism*; *Westminster Assembly*.

SHORTHAND AND ITS SYSTEMS

W. J. Carlton, Hon. Life Associate, Incorporated Phonographic Society

For correlated topics see *Journalism*; *Newspaper*; *Reporting*.
Consult also the articles on *Gurney*; *Putman*; *Phonetics*; *Writing*

Shorthand is a term applied to methods of handwriting by forms briefer than those in current use, designed primarily for the recording of language with greater speed than is attainable by longhand characters.

Shorthand systems may be divided into three main groups: geometric, script- (or semi-) geometric, and graphic. They may also be classified as orthographic or phonetic, and, again, according to methods of vowel representation. The distinguishing feature of geometric systems is the employment of Euclidean figures, while the characters of script, graphic, or cursive systems are derived from longhand letters. Script-geometric systems admit geometric characters but exclude the vertical and left diagonal slopes

A few systems, such as "Dot and Dash" and the so-called stave shorthands, do not fall within these categories. Phonetic systems seek to provide a stenographic sign for each speech sound, regardless of spelling. Syllabic systems aim at representing each syllable by a single pen-stroke or "inflexion." Stave systems involve the use of staves of three, four, or more bars, usually intersected by perpendicular lines. Practically all systems have for their elements right lines and curves (stems), to which may be attached auxiliary circles, loops, and hooks (appendages); abbreviating devices consisting largely in distinction of length and thickness, position in relation to a real or imaginary line or sign, and diacritical marks. Geometric systems predominate in Western Europe; script or cursive systems are almost exclusively in vogue east of the Rhine. In America geometric and script systems are practised in about equal proportion.

The art of shorthand writing, generally known as stenography outside the British Empire, has become the indispensable handmaid of oratory and commerce. Methods of brief writing were known to the Greeks before the Christian era, and Tiro, a freedman of Cicero, is credited with the invention of a system of *notae* practised extensively by the Romans and highly valued by them. Cato's speech on the Catilinian conspiracy was reported in the Roman senate by the aid of these notes in 63 B.C., and shorthand writing became an accomplishment of emperors and

slaves. Tironian notes disappeared after the decline of the Roman Empire, but the Renaissance brought with it the revival of shorthand.

England is the birthplace of modern shorthand. In 1588 Dr. Timothy Bright, physician of St. Bartholomew's Hospital, published, under the title *Characterie*: An arte of shorte, swifte, and secrete writing by Character, the result of experiments on which he had been engaged at least two years earlier. He allocated arbitrary symbols to some 536 key words which had to be memorised, and provided for the formation of others by ingenious modifications:

 a b c d e f g h i j k

 l m n o p r s t u v w x y z

Bright's alphabet

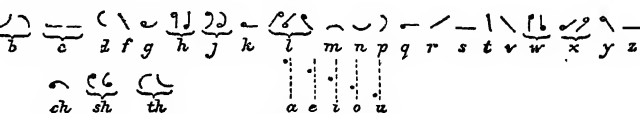

It has been assumed, on inconclusive evidence, that certain Shakespearean plays were reported surreptitiously by this crude contrivance. Bright's work was superseded by that of a London clergyman, John Willis, who devised the first stenographic alphabet capable of being welded into words, and printed his invention in 1602. Willis provided a distinct character for each consonant and leading vowel, expressing medial and final vowels by the position of one consonant in relation to another or by detached dots:

 a b c d e f g h i j k l m

 n o p q r s t u v w x y z ch ck

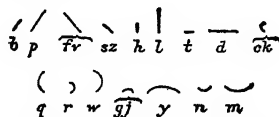

Willis's alphabet

Subsequent system-makers simplified many of Willis's compound characters, and the art was popularised by Shelton, 1626; Metcalf, 1635; and Rich, 1646. Pepys penned his Diary in Shelton's tachygraphy, and Rich's (origi-

 a b c d e f g h i j k l m n o p q r s t u v w x y z

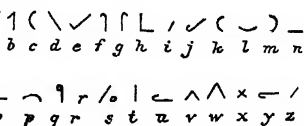

Byrom's alphabet

nally Cartwright's) method was commended by Locke and taught by Doddridge. Ingenuity rather than simplicity characterised early attempts at shorthand construction. A notable exception is an anonymous MS. entitled *Characterisme*, which embodies an alphabet of simple characters grouped in phonetic pairs and differentiated by length:

 p fr sz h l t d ck
 q r w x y n m

Alphabet of "Characterisme"

Shorthand writing became a common accomplishment in the 17th century, the literature of the art including tiny stenographic editions of the Psalms and N.T. The complete Bible was engraved and printed in 1687. In the system of Coles, 1674, syllabic writing and the use of position in relation to the line of writing were first adumbrated. Mason, a London writing-master, produced three successive systems, embodying various improvements, and the last of them was republished by Thomas Gurney, the founder of a family of shorthand writers. He became official shorthand writer to the Old Bailey about 1737 and later to the Houses of Parliament, while he practised in other law courts in London and Westminster. Gurney's method, in which Dickens was an adept, is still in use. The alphabet of the system is as follows:

 a b c d e f g h i j k l m n
 o p q r s t u v w x y z

Gurney's alphabet

An important stage in the evolution of the art was marked by John Byrom's invention about 1720. By means of alternative forms he evolved a system which excelled all its predecessors in point of lineality and ease of junction. He was the first to introduce the diagonal quadrants () but the large number of characters with an initial circle militated against speed:

Byrom taught his method extensively (to the Wesleys among others), but it was not published until after his death. He formed a shorthand society in 1726, and his pupils styled him Grand Master.

From the time of Willis the omission of silent letters and writing by sound had been advocated, but the first system constructed on a strictly phonetic basis was that of Tiffin, 1751:

Although the phonetic principle is now generally adopted, an orthographic basis is advocated by some on the score of greater legibility.

Attempts by Williamson, 1775, and Mayor, 1780, to improve on Byrom's plan led to the publication in 1786 of Samuel Taylor's Essay intended to establish a Standard for a Universal System of Stenography, which was adapted to nearly all the languages of Europe, and secured world-wide fame for its author:

Taylor achieved extreme simplicity by fixity of form and the virtual suppression of vowels, a dot in any position serving to express each of them. Rejecting Byrom's duplicate forms and diagonal quadrants, he allotted one sign to each letter, sacrificing symmetry of outline to the attainment of greater speed. Many expert reporters have been writers of Taylor's system. As modified by Harding, 1823, it was learned by Isaac Pitman, whose Stenographic Soundhand, 1837, was rearranged and issued as Phonography, 1840. Pitman's alphabet consists of simple signs phonetically paired, thick and thin strokes serving for the consonants and light and heavy dots and dashes for vowels:

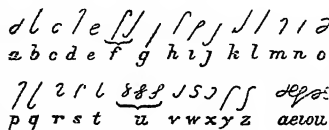

Among the fundamental principles of the system are alternative signs, halving for the addition of *t* and *d*, lengthening for *thr*, *tr*, *dr*, initial hooks for *r* and *l*, final hooks for *n*, *f*, and *tion*. By reintroducing alternative signs to ensure lineality and diversity of outline, and a vowel scale by which the exact vowel could be expressed, Pitman reverted in great measure to Byrom's plan. Pitman's phonography gradually ousted older methods, and the percentage of Pitman writers throughout the British Empire to-day is very high. Its popularity was due to the intrinsic merit of the system, the energy of its inventor, and the enthusiasm of his disciples. The system is founded on a close analysis of the language, and recognizes three stages: the learners', the corresponding, and reporting

styles. In the U.S.A. writers of "Isaac Pitman" are in a minority. A standardised system evolved by the National Shorthand Reporters' Association was intended to supersede the multiplicity of Pitmanic methods varying only in detail—Benn Pitman, Graham, Munson, Longley, Osgoodby, and others. In the struggle for supremacy issue now seems to be joined between the Pitmanic systems and those having a monoslope basis, of which Gregg's is the most conspicuous.

Although Folkingham's Brachygraphy of 1620 contains the germ of the monoslope idea, the first system on that basis was that of Simon Bordley, 1787:

Bordley was followed by Roe, 1802, and Oxley, 1816, in England; and by Thibierge, 1808, Fayet, 1832, and Gabelsberger, 1834, on the Continent. The last-mentioned system, an entirely original one, is the most important representative of the cursive theory. Its success was immediate, and an immense number of societies exist in Germany for its study and propagation. One of its salient features is the use of the connective "hair-stroke" of longhand to indicate the presence or absence of a vowel, and the abbreviating rules enable vowels, consonants, and syllables to be omitted at the writer's discretion. Adopting the view that vowels and consonants are inseparable, Gabelsberger expresses certain vowels by a slight deformation, displacement, or thickening of the consonantal signs:

The system of Stolze, 1841, proved a serious rival to Gabelsberger, and an attempt to combine the best features of both by Schrey, 1887, met with some success. The Sächsische Stenographische Landesamt, formerly the Royal Stenographic Institute, founded at Dresden in 1834, housed the world's most important shorthand library, but many books were destroyed in the air raids of 1945. The originator of script-geometric shorthand was George C. Mares, 1885, the alphabet of whose system follows

The most widely known system of this school for the English language is that of John R. Gregg, 1888. Among its leading principles are blended consonants, vowel group signs, and the assignment of upstrokes to the dentals to preserve lineality. A comprehensive list of prefixes and affixes compensates for lack of abbreviating power of compendious signs. (See next page.)

The problem of vowel representation has greatly exercised shorthand system framers, and the diversity of theories is so great that classification is difficult. In the older systems the disjunction of two consonants indicated an intervening vowel, the nature of which was determined by the relative position of the consonants, a

plan revived by Everett, 1852, and some other modern inventors. Detached dots for all vowels were introduced by Byrom, who wrote the consonants in sequence and allotted five positions for the vowels in close juxtaposition to the consonantal signs. Stackhouse, 1775, and Blanchard, 1779, provided alphabetic characters for vowels, to be joined to the consonants in their natural order. Towndrow, 1841, represented the vowels by the same signs as the consonants, preceded by a circle, and Bishop, 1886, applied this plan to Pitman's system. In many modern styles the presence, place, and in some cases the exact nature of the vowel are shown by varying the length, form, or position of the preceding or following consonant.

Melville Bell, 1855, provided consonants of three lengths, the longest implying a preceding vowel, the normal length a following vowel, and the shortest indicating

ciples. Much depends on the object in view. A system admirably adapted for personal use, such as keeping a diary or making extracts, may be of little or no use for reporting a rapid speaker where speed is the primary requisite, or even for taking down from dictation. Machine shorthand (stenotypy) is practised extensively in the U.S.A. Shorthand writing is a mental as much as a manual process, the writer counting for more than the system. Shorthand systems have been devised for recording musical compositions, for chess notation, and for the use of the blind.

The first international shorthand congress took place in London in 1887. It was followed by others in France, Germany, U.S.A., Sweden, Belgium, Spain, Switzerland, Italy, Hungary, and Holland. At the London congress of 1937 the centenary of Pitman's and the jubilee of Gregg's shorthand were commemorated. Professional short-

antiquity, but it was not until nearly the close of the 18th century that the breed was scientifically developed by a little group of British farmers. The breed is still widely known as the Durham.

Shorthorns vary in colour from pure red to white, but a roan blend is the most common. The horns are short, curved, and flat, and may tend to turn either upwards or downwards. The body is symmetrical and very bulky in proportion to the size of the skeleton. The breed is of the general utility type, ranking high as a milk-producer. It matures speedily and attains great weight. *See Bull; Cattle, colour plate.*

Shorthouse, JOSEPH HENRY (1834-1903). British novelist. Born in Birmingham, Sept. 9, 1834,

of Quaker parents, he was educated at Tottenham, and then entered his father's business of chemical manufacturer. He became a convert to Angli-

J. H. Shorthouse,
British novelist

canism at the age of 27, and his strong Anglo-Catholic sympathies are reflected in his romance, *John Inglesant* (q.v.), published first privately and then by Macmillan in 1881. The book attracted the attention of Gladstone, Huxley, Cardinal Manning, and others, and brought its author great fame. His other works include *Little Schoolmaster Mark*, 1883; *The Countess Eve*, 1888; and *Blanche, Lady Falaise*, 1891. Shorthouse died at Edgbaston, March 4, 1903. *Consult Life, Letters, and Literary Remains*, edited by his wife, 1905.

Shortness. Term used in metallurgy to denote brittleness in metals. This brittleness may occur at temps. either above or below the recrystallisation temp.; if above, it is termed hot shortness, if below cold shortness. The phenomenon is of considerable practical importance, because within the shortness temp. range the metals cannot accommodate strains, and therefore crack. Shortness is frequently the reason for the presence of cracks in castings where restraint of the normal thermal contraction during cooling has given rise to strain.

Short Sight. Error of refraction due to excessive elongation of the eyeball, so that the image falls short of the retina. It is corrected by the use of spectacles. *See Eye; Myopia, Sight.*

Gregg's alphabet. *See previous page*

the absence of any vowel. Pocknell, 1881, also contrived an alphabet of triple characters, each consonant being represented by a straight stroke and two opposite curves of the same length and slope, the cavity of the curve implying the presence of a vowel. The subordination of consonants to vowels has been attempted more or less successfully in some systems, notably those of Fielding, 1892, in which the so-called "back strokes" are assigned to vowels and the "forward strokes" to consonants, and Walpole, 1921, in which vowels are represented by straight lines and consonants by curves. The latter system was substituted for Pitman's by its author in his professional practice.

Among other systems for the English language in current use are Sloan-Duployan, "Oxford," and Dutton's. The trend of modern shorthand development has been mainly in three directions: (1) brevity by geometric signs, (2) legibility by connective vowels, (3) fluency by monoslope characters. Attempts to impose a unified system under the aegis of the state in Germany, Italy, and the U.S.S.R. have been only partially successful. There is no "best" system, excellent work having been done with systems based on totally different prin-

hand reporters are represented in Great Britain by the Institute of Shorthand Writers and the Association of Official Shorthand Writers. The oldest shorthand society in the world is the Incorporated Phonographic Society, which seeks to promote the interests of Pitman writers, while the National Gregg Association caters for those who use Gregg's. The Stenographers' Club, Oxford, is open to writers of all systems who have attained a minimum speed of 80 words a minute.

Shorthorn. Breed of domestic cattle. Of British origin, its merits and remarkable adaptability to almost any climate have caused it to become distributed throughout the world. It is of considerable

Short Story. The earliest form of this kind of fiction is the folk tale, originally oral but recorded in some form of writing at an early stage of history, e.g. by the Egyptians. Other early forms were fables of animal life such as inspired the Greek collection known as Aesop's Fables; narrations in the Hebrew scriptures, as retained in the Old Testament; and the parables of Jesus and the Buddha. Of ancient Greek short stories a good example survives in the *Widow of Ephesus*, in the Latin of Petronius, which also gives an example of one of the beautiful old myths in *Cupid and Psyche*.

After the decline of Greco-Roman culture the short story remained as an ornament to Christian sermons as well as in medieval stories of love and adventure like *Aucassin and Nicolette*, and in popular tale-tellers' collections like *The Arabian Nights Entertainments*. French minstrelsy produced in the *Fabliaux* the germ of the modern short story. The Italians expanded the art into the form of brilliant little novels such as those contained in Boccaccio's *Decameron*. Until the 19th century the short story throughout Europe was usually told in that form or in the guise of a folk tale, in either case presenting a direct, circumstantial narrative, with little shape. Such tales were frequently interpolated into longer novels in the early days of the novel. Examples are to be found in the works of Sterne and Scott, and as late as Dickens's *Pickwick Papers* and Nicholas Nickleby.

It was an American writer, Edgar Allan Poe, who first developed the short story as a conscious art, by making it concentrate on a single direct effect and studiously eliminating any paragraph or epithet that did not contribute to that effect. Poe had little immediate influence on English writers, but Frenchmen like Baudelaire, Mérimée, Gautier, Flaubert, and Daudet were quick to follow his ideas, and produced short stories that challenged comparison with the art of the novel both as powerful means of expression and as things deeply satisfying in themselves by reason of their form. Maupassant carried the art even further, distilling into miniature compass both the life around him and the life within him, and hundreds of European writers followed his formulas, which formed the base of most popular instruction in the winning of wealth or fame by the writing of short

stories. The French themselves were leaders in the business of transforming anecdotes into Maupassant-like *contes*. Their newspapers began to reserve space every day for a little tale, at the foot of a page. For this a style of vivid conciseness was required, together with a literary effect which could compete with the news in attracting attention. The practice produced many masters of brevity, though at the total expense of depth.

The English Short Story

Among a rising generation of English writers a spirit of emulation was aroused. The great period of the English short story began in the mid-1880s and had passed its zenith by the end of the century. R. L. Stevenson was directly inspired by Poe, Kipling by both Poe and Maupassant; but each gradually evolved a method of his own. These were the leaders. Other names associated with this period of fine flowering, when every literary aspirant was anxious to excel in the short story, include Barrie, Morley Roberts, Gissing, H. G. Wells, Stephen Crane, Conrad, Jerome K. Jerome, George Moore, Grant Allen, George Egerton, Henry Harland, and Arthur Morrison. Such periodicals as the *National Observer*, the *Fortnightly Review*, *Longman's Magazine*, and later the *New Review* and the *Yellow Book* gave every encouragement to the art.

The advent of the popular sixpenny magazines during the 1890s created a vast new public for the short story, and this led inevitably to the commercialising of the formula, a reduction of the art to terms consistent with what this new public was supposed to want. It is significant to note that Arnold Bennett's first literary effort, a short story, was originally sent to *Tit-Bits* and was rejected as unsuitable; but it was accepted and printed in the *Yellow Book*. Yet virile and imaginative writers for a long time set a high standard even within the conventions of the sixpenny magazine. Conan Doyle, who with Sherlock Holmes and Brigadier Gerard first made popular the series type of short story in which the chief character reappeared regularly from tale to tale is an outstanding example. But the popular magazines may also claim to have discovered and fostered such great masters of the short story as W. W. Jacobs, Pett Ridge, and P. G. Wodehouse and in America the imitable O. Henry. Kipling's *Stalky*, Chester

ton's *Father Brown*, and Cutcliffe Hyne's *Capt. Kettle* all first saw the light in short stories in popular magazines.

Meanwhile, the Russian writer Chekhov had startled a new generation of readers and writers by the subtlety with which he could use his short stories as the vehicle of his own sad, if courageous, despair. His influence upon the art, which was widespread, was the reverse of Maupassant's, his technique being calculated to emphasise depth of feeling. His stories were not intended to amuse or to arouse, rather they invited readers to feel and share, if only for a few moments, in the essential human tragedy. Among writers in English no disciple of Chekhov was perhaps more successful than Katharine Mansfield.

Yet the truth is that no limitation of form or content can be put upon the short story except in the one matter of length. H. G. Wells once wrote that the only essential of a short story is that it should take from 15 to 50 minutes to read aloud. Most people would agree at least with the upward limit. Otherwise, the short story is a myriad-mirror of a many-sided world and of our own many-sided natures. It can be objective or subjective, have a purpose or no purpose, be profound or flippant, all atmosphere or as hard and dry as a nut, romantic or realistic, sentimental (e.g. O. Henry) or sardonic (e.g. Maugham, H. H. Munro). It can open little windows on worlds distant or imaginary. It can give vivid new meaning to the infinitely small or to the whole universe or to both at once.

Of anthologies none is more representative than the *Masterpiece Library of Short Stories*, ed. J. A. Hammerton, 20 vols., 1920. Consult also *The Short Story*, S. O'Faoláin, 1948.

Shoshone Falls. Noted waterfalls on Snake river, Idaho, U.S.A. The river makes a first descent of 30 ft. through a number of rocky channels, and then drops 190 ft. in one vast sheet, 1,000 ft. in breadth. During the flood season the volume of water is little less than that of Niagara. See illus. p 7536

Shoshong. Town of Bechuanaland, S. Africa. It stands at an alt. of 3,310 ft., on the fringe of the Kalahari Desert, about 120 m. N.E. of Mopolole. It was formerly the capital of the Bamangwato, under Khama, who vacated the town for Palapye and afterwards for Serowe

Shoshone Falls, Idaho. Cataract and falls from the left bank of the Snake River. See p. 7535

Shoshoni. Group of North American Indian tribes in Wyoming, Idaho, and Nevada. Sometimes called Snake Indians, they number some 3,000. They give their name to the widespread Shoshonean family. See American Indians, colour plate.

Shostakovich, DMITRY DMITRYEVICH (b. 1906). Russian composer. Born Sept. 25, 1906, he was taught music by his mother, a fine pianist. In 1919 he entered the Leningrad Conservatoire, and in 1926 his first symphony was an instantaneous success in Leningrad. His seventh symphony, written, and first performed by a scratch orchestra, in Leningrad during the siege of that city in the Second Great War, was widely acclaimed in Russia, but was less successful abroad. With Prokofiev and Khachaturian, he was in 1948 attacked by the central committee of the Russian Communist party. His music was said to show "anti-democratic tendencies alien to the Soviet people and their artistic tastes;" he publicly admitted the charge and repented. His works included the operas *The Nose*, *Lady Macbeth of Olzensk*; the ballets *The Golden Age*, *Clear Stream*; nine symphonies; a cello sonata; a concerto for piano; and music for films.

Shotley. Village of Suffolk, England. It stands near the coast, on the Orwell, 10 m. S.E. of Ipswich and 2 m. N.W. of Harwich. Here are fortifications commanding the entrance of Harwich harbour, and a naval training school for boys. Boys entering for seamen ratings spend a year at H.M.S. Ganges, as the shore establishment is called.

Shottery. Village of Warwickshire, England, 1 m. from Stratford-on-Avon. A thatched half-timbered cottage, with gable facing the road, is preserved by the Shakespeare Birthday Trust as the

home of Anne Hathaway (*q.v.*), and the scene of Shakespeare's courtship. Acquired by the trust in 1892, it has an old-world garden.

Shotts. Parish and village of Lanarkshire, Scotland. The village, 21 m. E. by S. of Glasgow, has passenger and goods railway stations. Coal

mines, iron foundries, brickworks, and a spinning factory give employment to a pop. of 17,000. The parish takes in several mining villages.

Shoulder Joint. Ball-and-socket joint formed between the head of the humerus or bone of the upper arm, and the curved, shallow depression known as the glenoid cavity of the shoulder blade. The shoulder joint is the freest of all the joints in the body, permitting movements of the arm at the shoulder in every direction. The joint is surrounded by strong ligaments and muscles, and is further protected by a bony arch formed by the end of the clavicle, or collarbone, and partly by the coracoid process of the shoulder blade which overhangs the joint, and forms, as it were, a secondary socket for the head of the humerus.

Shoulder. Diagram showing relative positions of the bones. Inset, section of shoulder joint

In spite of the strengthening of the joint, dislocation of the shoulder occurs as frequently as dislocation of all the other joints of the body together. This is mainly due to the shallowness of the glenoid cavity, and the laxity of the ligaments necessary to permit the great freedom of movement. The dislocation usually

results from falls on the hand or elbow, when the arm is widely outstretched. The head of the humerus may be displaced in one of several directions, giving an appearance of flattening of the shoulder with rigidity, bruising, and other abnormal signs. Reduction can be effected by manipulation or extension of the limb by skilled hands, usually under an anaesthetic. See Dislocation.

Shove - ha'penny. Game played with five small metal disks which are pushed with the base of the thumb

along a board divided by lines into nine equal spaces or beds, and having a cushion round the edges. The game was played by the ancient Egyptians, and was introduced into England after the Crusades, when, as today, it became popular in taverns. The coin most commonly used in Tudor England was a shilling, especially one coined for Edward VI, called a shovel-board shilling. Later, pennies and halfpennies were used, but the game is now played with nickel or brass disks having a hole in the centre.

Any number of players may take part, and each has five consecutive shoves at a time, counting his score when all five have been shoved. The object is to score three points in each of the nine beds, so that 27 points are required to win. If a player scores more points in any one bed than he needs, the next man may claim the excess score if he requires it for that bed. Convention varies as to how close to the line the disk may lie to be counted as in. A disk shoved off the board goes out of play.

Long in ill-repute, the game about 1935 gained respectability, and now in the S. of England contests are held before large audiences. In 1937 there was a "gate" of 2,000 to watch a final at Reading, and in 1938 the B.B.C. included a match in a television programme.

Shovell, SIR CLOUDESLEY OR CLOWDESLEY (1650-1707). English sailor. He was born at Cockthorpe, Norfolk, and went to sea as a lad. After service in the Mediterranean, he commanded the *Edgar* in the battle of Bantry Bay

Shove-ha'penny board

(*q.v.*), being knighted in 1689 for his gallantry, and given command of a squadron. He distinguished

Sir Cloudesley Shovell,
English sailor

himself in the battles of Beachy Head, 1690; La Hogue, 1692; and Dunkirk, 1695; was M.P. for Rochester, 1698–1707; took part in the capture of Gibraltar and served at Malaga, 1704; and being appointed admiral and commander-in-chief of the fleet, fought at Barcelona and Toulon. On his return his ship, Association, was wrecked on the Bishop and Clerk rocks, Scilly Islands, when 800 of the officers and crew were drowned, Oct. 22, 1707. Shovell, it was discovered 30 years later through a woman's dying confession, was thrown ashore at Porthellick Cove, still alive, but was killed for an emerald ring on his finger. He was buried in Westminster Abbey.

Shoveller (*Spatula clypeata*). Species of the duck family, remarkable for its broad and spoon-like bill. The plumage of the drake, green on the head, dark brown on the back, pale blue on the shoulders, brown and white on the wings, and chestnut on the breast, makes it the handsomest of the duck family. Widely dis-

Shoveller. Broad-billed species of duck with mottled plumage

tributed over Europe, Asia, N. Africa, and N. America, it occurs in Great Britain as a winter visitant, but breeds in a few places in England, the Hebrides, and Ireland.

Shrapnel. Type of shell containing a large number of bullets which are released and travel forward at high velocity when the shell is opened by the bursting charge. It was invented in 1784 by Colonel Shrapnel (*v.i.*), and adopted in 1803 by the British army. It was used extensively in the First Great War, especially against troops in the open. In the Second Great War shrapnel shell was replaced by the fragmentation

shell and bomb, in which the break-up of the outer metal case was controlled to give fragments of definite size and velocity range. Both types of shell are usually fused so as to burst in the air at a specified range and height, and are effective against troops in slit trenches. See Ammunition; Artillery; Shell.

Shrapnel, HENRY (1761–1842). British soldier. Born June 3, 1761. He entered the Royal Artillery in 1779, and in 1784 began at his own expense the experiments which eventually led to the invention that bears his name. Shrapnel shell appears to have been first

Henry Shrapnel,
British soldier
After F. Arrowsmith

used at the siege of Surinam in 1804, and its efficacy was acknowledged in the Peninsular War and at Waterloo. Shrapnel retired from the active list with the rank of major-general in 1825, and died at Southampton, March 13, 1842. Numerous other innovations in connexion with artillery testify to his inventive skill.

Shreveport. Second city of Louisiana, U.S.A., the capital of Caddo parish. It stands on the Red river, 170 m. E. of Dallas, and is served by the Texas and Pacific and other rlys. There is steamer connexion with New Orleans. Shreveport, which was settled in 1836, incorporated after three years, and raised to civic rank in 1871, boasts that within a century it has come "from wigwags to skyscrapers." This is largely the result of petroleum beds being discovered nearby in 1910. Other industries are concerned with cotton goods and timber. A third of the 98,167 inhabitants are negroes.

Shrew. Family of small insectivorous mammals (*Soricidae*). There are numerous species distributed over most of the tropical and temperate regions of the world. In general appearance most of them resemble mice, but they usually have long and conspicuous snouts. In Great Britain the shrews are represented by five species. The common shrew (*Sorex araneus*) is

Shrapnel shell shown in section. A, case; B, bursting charge; C, bullets; D, fuse; E, central tube of explosive material

not quite 3 ins. long in body and has a tail about 1½ ins. It is brownish-grey on the back and grey or pale buff below. Sometimes the fur is much darker approaching black, while very rarely white patches are present. The ear is very small and is rounded in outline. Common in most parts of England and Scotland, but not occurring in Ireland or the Hebrides, this animal lives in burrows in banks. The food consists of insects, snails, and worms.

The pygmy shrew (*S. minutus*) is the smallest British mammal, little more than 2 ins. long in body. Otherwise its general appearance is that of the common shrew; but the fur is brighter and more silky. It is abundant in Ireland and the W. islands of Scotland; but elsewhere is very local, occurring most frequently in the S. of England.

The water shrew (*Neomys fodiens*) has a total length of slightly over 6 ins., of which more than half is taken up by the tail. Its fur is blackish-grey above and whitish below, and sometimes there is a reddish tinge on the throat. Common in England and Wales, rare in Scotland, and absent from Ireland, it lives in burrows beside streams and ponds, and the entrance is under the water. See Jumping Shrew.

Shrew Mole. Mammal more correctly known as Mole Shrew and so entered in this work.

Shrewsbury. Mun. borough and county town of Shropshire, England. It stands on the Severn 163 m. N.W. of London and 43 m. N.W. of Birmingham, and has a rly. station. The town stands on a peninsula formed by the river across which bridges lead to the suburbs, Abbey Foregate, Frankwell, Kingsland, Bellevue, Colcham.

Shrew. Common shrew, the mouse-like insectivorous mammal

Of several churches the chief are the abbey church of Holy Cross with its Norman nave—part of the

Shrewsbury arms

rebuilt in the 18th century, excepting the towers; S. Chad's was entirely rebuilt, and S. Giles much restored. There is a R.C. cathedral. Secular buildings include the old market hall of the 16th century, the council house, and the drapers' hall of about the same date, a modern guildhall, shire hall, corn exchange, and Royal Salop infirmary. The streets are made picturesque by many wooden houses. A museum and library occupy the old grammar school building. The castle has been much modernised, but some parts of the

Norman building still stand; and there are slight remains of the town's fortifications. Noted for its cakes and ale, Shrewsbury's other industries include glass staining, malting, iron founding, and the making of agricultural implements, motor vehicles, safes, and corsets.

Known as Pengwern, Shrewsbury was the capital of the kingdom of Powis before it was taken by the English and added to Mercia. It was then called Scrobcesbyrig, from which its present name has developed. It figured prominently in the wars against the Welsh, for its position on the borders made it a strategic centre, and the Normans built here a castle, which doubtless replaced a Saxon fortress. The battle of 1403 is described below. Shrewsbury secured several charters and was a corporate town with a gild merchant in the Middle Ages. From 1295 to 1885 it had two M.P.s, thereafter one, now giving its name to a co. constituency. Mkt. days, Wed. and Sat. Pop. 44,430.

Shrewsbury, BATTLE OF.

Fought July 21, 1403, between Henry IV of England and a combination of his enemies. Led by Sir Henry Percy (Hotspur), the Percys rebelled, and, with a few Scots, seized Chester, where they waited for their Welsh allies. The two armies reached

Shrewsbury almost simultaneously, but Henry secured the town, while the Percys were encamped on Hayteley Field, 2 m. to the N. Henry marched out of Shrewsbury, and after futile negotiations the battle began. At first the royalists suffered heavily from the archers of their foes, who then charged, but after a severe struggle the king's superior numbers began to tell. Hotspur was killed, and his followers fled. Other leaders were taken prisoners and beheaded. Both sides lost heavily, about 1,600 being killed altogether, but the rising was scotched.

Shrewsbury, CHARLES TALBOT, DUKE OF (1660-1718). English statesman. Born July 24, 1660,

Duke of Shrewsbury, English statesman
After Kneller

son of Francis, 11th earl of Shrewsbury, he held various minor offices under Charles II and James II. He was one of the seven who formally invited William of Orange to occupy the English throne. William appointed Shrewsbury his secretary of state, 1689-90 and 1694-1700. But Shrewsbury's career was impeded by vacillation. His one consistency was the support of the Protestant succession, and as lord high treasurer in 1714 he took the principal part in securing the accession of George I. He had been a duke since 1694, and died at Isleworth, Feb. 1, 1718, when the title became extinct. *Consult* his Correspondence, ed. Coxe, 1821.

Shrewsbury, EARL OF. English title borne since 1442 by the family of Talbot. Its holder ranks as the premier English earl. William the Conqueror handed over the county of Shropshire to Roger Montgomery, one of the Norman invaders, who styled himself earl of Shrewsbury, his castle being there. His descendant, Robert, lost his earldom and estates in 1102 for rebelling against Henry I.

In 1442 the soldier John Talbot (v.i.) was made earl of Shrewsbury. His son John, lord high treasurer, was killed at the battle of Northampton by the Yorkists. Descendants of the 1st earl kept the title, although it did not follow the direct line, and in 1668 it came to Charles Talbot (v.s.) as 12th earl. He was made a duke in 1694, but as he had no sons this title lapsed on his death in 1718. The earldom, however, passed to a

Shrewsbury, Shropshire. 1. Museum and Free Library occupying the old school building. 2. The castle founded in 1070. 3. Gateway of the old council house. 4. Abbey church, founded in the 11th century

cousin, Gilbert Talbot, from whom the subsequent earls are descended. The 20th earl (1860-1921) was the first to start cabs fitted with noiseless tires, both in London and Paris. His grandson John (b. Dec. 1, 1914) became 21st earl. He is also earl of Waterford, an Irish title given to the 1st earl in 1446. His chief seat is Ingestre Hall, Stafford, his estates being mainly in that county and in Cheshire. The earl's eldest son is called Viscount Ingestre. See Alton Towers.

Shrewsbury, JOHN TALBOT, 1ST EARL OF (c. 1388-1453). English soldier. Son of the 4th baron

1st earl of Shrewsbury, English soldier

Talbot, he was appointed lieutenant of Ireland in 1414 and busied himself in subduing the natives. He served in the French war in 1419, and on his return engaged in a bitter feud with the Ormondes, but in 1427 he went again to France, where he was made governor of Anjou and Maine, and took part in the siege of Orléans. Defeated and captured in 1429 at Patay, he remained in captivity until 1433. Next year in France he conducted another successful campaign, being made governor and lieutenant-general of France and Normandy in 1439. Created earl of Shrewsbury in 1442, he was killed at the battle of Castillon, July 17, 1453.

Shrewsbury, ARTHUR (1856-1903). English cricketer. Born in Nottingham, April 11, 1856, and educated there, he became a professional cricketer about 1874, and until 1902 was one of the leading members of the Notts eleven. Four times he went with teams to Australia. In 1887 his batting average was 78, and five times he was at the head of the averages. He was in business as a sporting outfitter in Nottingham. On May 19, 1903, he shot himself.

Shrewsbury, ELIZABETH TALBOT, COUNTESS OF (1518-1608). English peeress known as Bess of Hardwick. The daughter

Bess of Hardwick, Countess of Shrewsbury National Portrait Gallery

married Sir William St. Loe, and in 1568, George, earl of Shrewsbury (d. 1590). She died Feb. 13, 1608, and is buried in All Saints' Church, Derby. She had six children by Cavendish, two of whom founded the ducal houses of Devonshire and Newcastle. A daughter was the mother of Arabella Stuart. Very wealthy and a great builder, she was responsible for Hardwick (q.v.) and Chatsworth (q.v.).

Shrewsbury School. English public school. Founded in 1552 by Edward VI, it has accommodation for about 450 boys, all of whom, except a few day boys, live in eight houses. The buildings include library and picture gallery, in addition to the usual requirements of a large school. Until 1882 the school was in the town, but in that year it was removed to a site at Kingsland, just outside. The Severn flows by it, and consequently rowing is one of the regular sports. Shrewsbury owes its growth to a grammar school to a large public school primarily to Dr. Samuel Butler, headmaster, 1798-1836, but it was under Dr. Kennedy, 1836-66, that it won a high reputation for scholarship.

Shrike (A.S. *scric*). Correct name for the butcher bird, first applied by Turner (1544) to the

of John Hardwick, of Derbyshire, she was married in 1532 to John Barlow, and in 1549 became the third wife of Sir William Cavendish. After his death in 1557, she married Sir William St. Loe, and in 1568, George, earl of Shrewsbury (d. 1590). She died Feb. 13, 1608, and is buried in All Saints' Church, Derby. She had six children by Cavendish, two of whom founded the ducal houses of Devonshire and Newcastle. A daughter was the mother of Arabella Stuart. Very wealthy and a great builder, she was responsible for Hardwick (q.v.) and Chatsworth (q.v.).

Shrewsbury School arms

Shrewsbury School. The school and boat-house Frith

great grey S. (*Lanius excubitor*). The genus *Lanius* includes about 50 species of world-wide distribution, with the exception of S. America. Only one, the red-backed S. (*L. collurio*), breeds in Great Britain; but others, the great grey S. (*L. excubitor*), the lesser grey S. (*L. minor*), and the wood-

Shrike. Great grey shrike, a winter visitant to Great Britain W. S. Berridge, F.Z.S.

chat (*L. senator*), are winter visitors, the first regularly, the others occasionally. See Butcher Bird; Eggs, colour plate.

Shrimp. Popular name for a number of small decapod crustaceans, but applied particularly to the edible brown shrimp (*Crangon vulgaris*). The brown colour is not a character of the living shrimp, but is due to cooking, like the redness of the prawn and lobster. The natural tint of the shrimp is greenish grey speckled with brown. It differs from the prawn (q.v.) in several respects;

Shrimp. common edible species found in the shallow waters around the British coasts

the carapace or helmet which covers the head and fore-part of the body is not extended forward into a long rostrum; only one pair of antennae are at all long; and there are no nippers to the walking feet.

It swarms in huge numbers, and forms a considerable part of the food of flat-fish and other shallow water species. It feeds on minute marine organisms and debris, swimming over the sand (to which its coloration assimilates) by incessant motion of its swimmerets, and with these when alarmed it sinks itself into the sand and becomes invisible. These swimmerets are utilised also by the

female for carrying her numerous eggs. A slightly different species (*C. allmanni*) is found in deeper water off the coasts of Great Britain and Norway: this and the banded shrimp (*C. fasciatus*) are sometimes regarded as constituting a separate genus (*Egeon*). Shrimps are caught in a large net attached to a T-shaped handle which is pushed over the submerged sands by the wading shrimp. See Crustacea.

Shrine (A.S. *scrin*, ark of the covenant, from Lat. *scrinium*, writing-desk, chest). Box or reliquary in which were placed the relics of saints. Shrines were often lavishly adorned with jewels and took the form of a church. The term shrine was also applied to a saint's tomb, and hence in a more general sense to the church or cathedral in which it was the object of veneration by pilgrims. See Cave Temple; Dagoba; Santiago de Compostela.

Shrivenham. Village of Berkshire, England. Situated 6 m. N.E. of Swindon, it was a U.S. army base in the Second Great War. In 1945 there was set up here an educational establishment to prepare U.S. soldiers proceeding to universities on demobilisation. Shrivenham church has a 15th century tower and 13th century font.

Shropshire or **SALOP.** County of England. With an area of 1,347 sq. m., it is bounded on the W. by

Shropshire arms

Wales and is crossed by the Severn. Except for the Wrekin, the upper or N. portion is level, but the rest is generally hilly. Ranges are the Cleve Hills, Wenlock Edge, and the Breidden Hills; the highest point is Brown Cleve, 1,800 ft. Shropshire is of outstanding interest to the geologist, who finds some of the oldest rocks in the British Isles. The Severn and its tributaries, Rea, Roden, and others, water the county, which contains a number of lakes or meres, of which Ellesmere is the largest. Clun Forest and the Wyre Forest are rough, infertile regions in the south.

Shropshire is in the main an agricultural county, although there is a coalfield in the E. around Coalbrookdale, where Abraham Darby revolutionised the iron ore industry in the 18th century. Barley, oats, wheat, and other crops are produced. The Shropshire sheep

Shropshire. Map of the English agricultural county on the border of Wales

are a noted breed, while cattle are reared, and there are many dairy farms. The co. is served by rlys. and several canals. Shrewsbury is the co. town, and places of great historical interest include Ludlow, Wenlock, and Oswestry. Other places are Wellington, Bridgnorth, Newport, Whitechurch, Market Drayton, Shifnal, Oakengates, Bishop's Castle, and Church Stretton. Shropshire has many evidences of Roman occupation, but its history is mainly that of a border shire, alert to repel the inroads of the Welsh. Herein are the Roman Uriconium (Wroxeter), Offa's Dyke, and the remains of many castles built by the Normans. Four members are returned to parliament. The county is in the dioceses of Lichfield and Worcester. Pop. 244,156.

LITERARY ASSOCIATIONS. These may be said to begin with Piers Plowman, for Langland is supposed to have been born at Cleobury Mortimer. Farquhar wrote The Recruiting Officer at Shrewsbury. In the council hall of Ludlow Castle Milton's *Comus* was performed, 1634, and in the castle gatehouse Samuel Butler wrote much of *Hudibras*. The Ludlow district inspired much of the poetry in A. E. Housman's *A Shropshire Lad*, and the whole

county gives background to the novels of Mary Webb, born at Leighton. At Clive Hall, near Wem, Wycherley was born. Clun Castle is the Garde Doloureuse of Scott's *The Betrothed*, and Boscobel, scene of Charles II's escape, affords the subject of one of Ainsworth's romances. The *Victoria History* of the co. appeared in 1908; a vol. in the *Land of Britain Series*, 1942; consult also *Shropshire Hills*, Timperley, 1948.

Shropshire Light Infantry, KING'S. Regiment of the British army formed in 1881 by an amalgamation of the 53rd and 85th Foot. Raised in 1755, the 53rd took part in the American and European campaigns of the late 18th century, and was at the defence of Gibraltar. In 1782 it became the Shropshire Regiment, and served in the Peninsula under Wellington. After Waterloo it went to St. Helena for three years to provide guards for the exiled Napoleon. Then followed service in the Sikh war of 1844, the Crimea, and the Indian Mutiny.

Raised in 1793 by Colonel Nugent as the Bucks Volunteers,

Shropshire Light Infantry badge

the 85th Foot won its first battle honour under the duke of York at Nieuport, 1793, being the only British regiment to hold that honour. Converted to light infantry in 1808, it won nine battle honours in the Peninsula, and then served in the American war of 1812-14. In 1815 it was given the title The Duke of York's Own, but in 1821 this was altered to The King's Light Infantry. In the Indian Mutiny the 85th formed part of Campbell's force that relieved Lucknow.

From 1881 the 53rd and 85th Foot were the 1st and 2nd battalions of the King's Shropshire Light Infantry. This regiment fought in Egypt and the Suakin campaign, and throughout the S. African War, having a major share in the Boer defeat at Paardeberg. Thirteen battalions were raised for service in the First Great War and earned the battle honours: Armentières, 1914; Ypres, 1915, '17; Frezenburg; Somme, 1916, '18; Arras, 1917, '18; Cambrai, 1917, '18; Bligny; Épehy; Dorian, 1917, '18; Jerusalem. In the Second Great War, they served as lorried infantry in N. Africa, Italy, and Europe. The depot is at Shrewsbury.

Shroud (Old Eng. *scrud*, a garment). Sheet of white cloth in which a corpse is wound for burial. In nautical usage, the shrouds are the ropes stretching from the masthead to the ship's side and supporting the mast. (*See Ship*.)

In engineering shrouding is a flange brought up around the teeth of a wheel to give added strength, or a similar flange on other members for protection.

Shrove Tuesday (A.S. *scrfan*, to shrive). Day preceding Ash Wednesday. As the last day before Lent, in medieval times it was largely a day of preparation for the Lenten fast, penitents being then shriven, whence the name. The day was also characterised by merry-making and feasting, a relic of which is the eating of pancakes, this giving the popular name of Pancake Day. The French equivalent is Mardi Gras (*q.v.*).

Shrub (A.S. *scrob*, scrub, undergrowth). Horticultural term for any perennial, hard-wooded plant which has branches springing immediately from the roots or ground level. Its application appears merely to rest upon convention and custom, in order to distinguish a shrub from a tree, which has a solitary trunk rising for some distance from the ground before the branches are produced.

Some flowering shrubs, such as rhododendrons, are best in masses or clumps, while others, chiefly notable for their beauty of form, are seen to most advantage if planted singly upon a lawn, or in other open ground. Where space is available, belts of shrubs may be established instead of hedges as a dividing line, and they can also be used as screens for tender-growing plants, and as backgrounds for groups or masses of flowering bulbs. Dwarf shrubs can be placed to some extent on rock gardens, but care is necessary in the choice of subjects, otherwise the soil will become denuded of nourishment.

Shrub (Arab. *sharab*, beverage). Cordial compounded of currant juice, sugar, and water, with added spirit, usually rum. One form of this liquor is made of orange and lemon juice, peel, sugar, rum, and water, generally hot.

Shrubb, ALFRED (b. 1878). English long-distance runner. Born at Slinfold, Sussex, Dec. 12, 1878,

Alfred Shrubb, English long-distance runner

he joined the Horsham Blue Star Harriers in 1898, and carried off three Sussex championships: the mile, three miles, and four miles. His later successes included the southern counties cross-country championship, 1901 to 1904; the international cross-country, 1903 and 1904; and the national corresponding event, 1901-04. Shrubb held records, both amateur and professional, for distances from 2 to 25 m., including world records from 8 to 11 m. Over 15 m. he defeated Longboat, St. Yves, Dorando, and Hayes. He wrote on long distance running and training. *See Running*.

Shumen (Turk. Shumla). Town of Bulgaria, capital of the county of the same name. Strategically important as a rly. and road centre, it is about 55 m. W. of Varna, and stands on a plain at the foot of the N.E. Balkans. It is a chief military post, has woollen, cotton, and leather industries, and exports cloth, wine, and copper. It was attacked by the Russians without success in 1774, 1810, and 1828, but they occupied it in 1878 on its evacuation by the Turks after the Russo-Turkish War. Pop. 25,486. Co., area, 5,690 sq. m.; pop., 1,020,499.

Shunt. In electricity, an alternative circuit connected in parallel with an instrument or another circuit, so as to form an alternative path for the current. (A Short Circuit, *q.v.*, may be regarded as a shunt of negligible resistance.) A low resistance shunt is connected across delicate measuring instruments such as a D.C. ammeter, where it is impracticable to wind the instrument to take more than a small proportion of the current; since the drop across the resistance of the shunt varies directly with the current, the instrument can nevertheless measure the total current passing. In generators and motors, shunt-wound means that the field windings are connected directly across the armature, as opposed to series windings. *See Dynamo*.

Shuntienfu. Name given by the Mongols to the city now called Peking, and so described in this work. It has also been known as Yenking and Peiping.

Shushan (Heb., lily). Biblical name for the ancient city of Susa, in Elam, the winter residence of the Persian kings (Neh. 1; Esther 1, v. 4; 8, v. 9; Dan. 8; Ezra 4). Its ruins are about 30 m. W. of Shushtar. *See Susa*.

Shushtar. Town of Persia. Situated on the Karun, in the prov. of Khuzistan, it has become increasingly important during the 20th century on account of the oil fields, worked by the Anglo-Iranian Oil Co. It lies about 170 m. W. of Ispahan, manufactures carpets, and exports wool, gums, and grain. The chief of many imposing edifices is the mosque, Masjid-i-Juma. During the First Great War, early in the Mesopotamian campaign, it was the scene of operations which resulted in its occupation. Pop. 12,000.

Shutter. In photography, means whereby the amount of light permitted to affect the light-sensitive material is controlled. The simplest form of shutter is a cap fitted over the lens which can be removed and replaced. The shortest exposure which can be thus made is about one second. Most modern shutters have an adjustable pointer which can be set to either of the letters T, B, or I. T (time) means that one movement of the release opens the shutter and a second pressure is needed to close it. With B (bulb) the shutter remains open so long as pressure on the release is maintained. With I (instantaneous) a single pressure opens the shutter which closes again automatically.

after a pre-determined period. Most common is the between-lens type, which gives automatic speeds of from one or two secs. down to 1/500 sec. It has a series of very thin metal blades which overlap in the centre of the lens when closed. Its efficiency is dependent on the time during which it is fully open; it should spend as little time as possible on the actual operations of opening and closing. A delayed-action device is often incorporated in shutters, to allow an interval for the photographer to leave the camera and include himself in the picture before the shutter is released. *See Camera.*

Shuttle. Device used in weaving to carry the weft across the loom. It carries the weft in the form of a bobbin or cop, and when passed across the loom goes between the upper and lower lines of the warp, leaving behind it a thread of weft. The shuttle, made from hard wood, tapers at the ends, where there are metal tips, and has at one end an eye through which the weft passes. Shuttles vary in size and weight according to the type and width of the loom; a 45-in. linen loom uses a shuttle 13 ins. long and 1½ in. wide and weighing 10 oz. Before Kay's invention of the flying shuttle in 1733, the device was manually worked.

The term shuttle service describes road or rail transport to and from over short distances, usually operated by a single vehicle. When there is an obstruction on a rly. line, a shuttle service of road vehicles is organized to convey passengers from one side of the obstruction to the other.

Shuttleworth College. British educational establishment. Situated at Old Warden, Beds, and opened in 1946, it was founded by Mrs. D. C. Shuttleworth, in memory of her son, R. O. Shuttleworth, who was killed while flying during the Second Great War. She gave her house and estate of some 6,000 acres to be devoted to the training of boys in forestry, agriculture, and aviation. The home farm of 480 acres has its own pedigree herd of Guernsey cattle.

Shuya. Town of R.S.F.S.R. It is in the region of Ivanovo, and is situated 70 m. N.N.E. of Vladimir, on the river Teza, and 150 m. N.E. of Moscow, on the rly. from Vladimir to Ivanovo-Voznesensk. The chief occupations of the town are cotton-spinning, dyeing, and printing, the first being specially important. The population is estimated at 58,000.

Shwebo. Dist. and town of Burma, in the Sagaing division. The dist. includes much of the hill country between the Irawadi and the Chindwin valleys, and is bounded E. by the Irawadi. Rice is practically the only crop. The town is some distance W. of the Irawadi, on the rly. N. from Mandalay. Occupied by the Japanese in May, 1942, the town was the scene of violent fighting in Jan., 1945, when Indian troops of the 14th army broke in on the 7th, occupying the rly. station; the Japanese resisted until the 10th, when they withdrew, leaving the streets and houses mined and set with booby traps. Area, 5,714 sq. m. Pop., dist., 496,185; town, 14,000.

Shylock. Character in Shakespeare's *The Merchant of Venice* (q.v.). A Jewish moneylender, he takes advantage of the fact that Antonio, a Christian merchant, has forfeited a pound of his flesh through his failure to repay a loan

of 3,000 ducats within three months. Refusing the offer made by Bassanio, the friend for whom Antonio borrowed the money, to pay the sum threefold, Shylock presses his claim in court, but is baffled by Portia (q.v.). *See Irving, Sir H.; Jessica.*

Sialkot. District and town of Punjab, Pakistan, in the Lahore division. It occupies a portion of the Rechna doab, between the Ravi and the Chenab, and is irrigated by the Upper Chenab Canal. Wheat is the chief crop. The Jats are the chief tribesmen. The town is an important centre of trade, and manufactures paper, tents, and athletic appliances, though this trade was much dislocated by the migration of 1947. In the centre of the town is an ancient fort, built more than a thousand years ago, and gallantly defended during the Mutiny. Area (dist.), 1,576 sq. m. Pop., dist., 1,190,497; town, 138,348.

SIAM: LAND OF THE T'AI PEOPLE

Neville Whyman, Ph.D., Litt.D.

The history and geography of the country of S.E. Asia called by its inhabitants Muang T'ai, or land of free people, is here given, together with some particulars of its state of development

An ancient and modern kingdom of S.E. Asia, forming part of the Indo-Chinese peninsula and having

Siam arms

land boundaries on the W. with Burma, on the S. with Malaya, on the E. with the federation of Indo-China, Siam's native name is Muang T'ai, land of free people, sometimes translated as Thailand.

Siam lies entirely within the monsoon area. Its southern extremity is within 6° of the equator, its northern is 21° N. It lies between 98° and 105° E. of Greenwich. The rainy season is from May to Oct., corresponding with the prevalence of the S.W. monsoon in the Bay of Bengal. The influence of the bay on Siam is somewhat reduced by the range of hills on the country's W. border. Siam is a mixture of readily accessible and luxuriant plains and thick, impenetrable jungle, parts of which have never been explored. Its area is 200,148 sq. m. and its pop. (est.) was 15,718,000 in 1940. Primary education is free and, in theory, compulsory.

There are numerous streams in the country, of little use to any but small river craft. The one navigable river, the Menam, is deep and sluggish, except in the autumn

when swollen by the summer rains. It is affected by tides for 50 m. from its mouth.

The most is made of Siam's rivers by an elaborate system of canals, these waterways providing the chief transport in the interior. Expenses incurred in keeping the canals clear and the landing-stages in good order are covered by the collection of tolls (small in amount but, by virtue of the amount of traffic, more than adequate to meet all costs). There are about 2,000 m. of rlys., owned by the state. Normally the country is not only self-supporting, being mostly agricultural, but has a surplus for export; only in times of drought or other disaster is it

Siam flag: red, white, blue, white, red.

necessary to import rice and other foodstuffs from neighbouring countries.

There are very few towns of any size, most places being villages or small towns of from a few score to a thousand or so inhabitants. Industrialisation has made little headway; what industry there is lies about Bangkok and Chiang-mai. Saraburi, 108 m. N.E. of Bangkok, was chosen 1945 to replace it as capital. Siam's mining

assets have been grossly overestimated (probably because some of the "Malayan" tin mines, actually on Siamese territory, produced very well in their early years). The country has, however, fair deposits of most of the minerals most needed by the world's industry; e.g. it ranks fourth in the international production of tin. Lead, tungsten, and coal are also found; but the mines are far away in jungle country, transport costs are high, and the quality of their products is not such as to attract the foreign market at the price at which they are normally offered.

Dense forests, which cover a great part of the N. and centre of the country, provide valuable woods in quantity, and the waterways offer means of floating the logs to towns where they can be cut and stored. The N. and W. provs. are well supplied with teak, and ironwood and ebony are also plentiful. Altogether some 20 varieties of wood, suitable for high-grade furniture, building, etc., as well as for fine cabinet-making, are exported from or worked in Siam.

HISTORY. Siam has a long history of foreign relations and trade. For more than 2,000 yrs., according to Chinese records and Siamese tradition, there have been close relations between China and Siam. There is also evidence that relations of great amity were maintained with India, the E. Indian islands, and even with Japan as long as 15 centuries ago. Much of the factual history of Siam has foreign records as its only basis, for the accounts given in earlier works written in Siamese are legendary. Throughout its history, Siamese literature has been under the domination of Buddhism. This faith, especially in its earlier development, relied much on oral tradition among the people, and the stories received accretions as they passed from mouth to mouth. Thus in the early records one finds miraculous stories of speaking animals carrying warnings to erring rulers, the appearance of strange omens in normal surroundings, as well as the attribution of human characteristics to beasts of the jungle. Some animals even became judges and passed verdicts on men and gods. Siam possesses some of the very earliest texts of the Buddhist canon, as well as some of the oldest commentaries on the sayings of the Buddha.

Until the sixth century A.D. the country was occupied by a group of T'ai-speaking peoples who kept themselves more or less separate

in isolated communities on either side of the mountain ranges. The unifying force was Buddhism and the gradual infiltration of Chinese culture from the N. rather than any local political or economic circumstance.

By about 1000 A.D. the fusion of tribes was well established and a Siamese script and language were in common use. Incursions from the N. and E. (particularly that of Kublai Khan in the 13th century) showed the necessity for a common front against outside foes. The Siamese T'ai swept southward, setting up capital cities ever nearer the southern extremity of the country.

The city famous in Siamese history and legend is Ayuthia. This city was founded in 1350 on the spot where a former capital (Sano) had been reduced to flames in battle. The fabulous wealth and luxury of this city, and of the court which reigned there, drew envious eyes from across the border. Several attempts were made by Burma and Pegu (then powerful, independent kingdoms) to conquer Siam, which by the 15th century had reached out and covered the whole of the Malacca peninsula.

The Portuguese were active in Indonesian waters in the 16th century and some of their mercenaries joined the Siamese defenders in their efforts to expel the invaders. For a long time these combined efforts were successful, but in 1555 the city of Ayuthia was taken and the country made a dependency. The outstanding name in Siamese history at this time is that of the patriot Phra Narai who, within a few years had subdued Laos and Cambodia and invaded Pegu, which kingdom fell to his successors early in the 17th century. The 18th century brought civil war in Siam, and Burma took possession of her

Siam. Map of the south-east Asian kingdom and part of the Indo-Chinese peninsula

W. limits, invaded the N., and, by a concerted double advance, marched on Ayuthia and after besieging it for two years took it, and finished by subduing the whole country.

European contacts with Siam began with the arrival of the Portuguese in 1511. They were, however, supplanted in the next century by the Dutch, although Phra Narain had been constrained to send an embassy to Louis XIV somewhere about 1680. There is abundant evidence of contact between England and Siam in friendly letters exchanged, through merchants in the Indies, between James I and the king of Siam. The East India Company had a factory at Ayuthia in the middle of the 17th century, abandoned, after quarrels and massacres, in 1688. In 1824 the British govt. signed a treaty with the Dutch which gave the U.K. control over Siam in so far as trade and similar matters were concerned. In 1826 Captain Burney signed the first treaty of friendship and commerce with Siam; seven years later Siam

signed a similar treaty with the U.S.A. She signed a treaty with Japan in 1898, with Russia in 1899.

When the U.K. had incorporated Burma into the British Empire and France had acquired lower Cochin-China, Annam, and Tongking, Siam was relieved of the danger from her neighbours which had for centuries oppressed her. The early years of the 20th century brought numerous discussions between the Siamese and the French, until Siam yielded up her rights in Cambodia and Laos; while agreements between the U.K. and France defined the position of Siam in Further India and her rôle in international affairs under the protection of France. A succession of treaties signed by the U.S.A., Japan, France, the Netherlands, Denmark, Spain, Portugal, Germany, and the U.K. confirmed these arrangements.

Internal Dissensions

After the First Great War internal troubles began to afflict Siam. Prajadhipok, who succeeded to the throne in Nov., 1925, found an uneasy situation, owing largely to increasing national consciousness among a people who had never previously thought of questioning the absolute monarchy under which they had lived. In June, 1932, a small middle-class group, part civilian and part military, began the first of a series of revolutions designed to set up a system of constitutional monarchy on the western pattern. But the revolutionaries could not agree among themselves, and many abortive risings followed. After ten years of near anarchy Prajadhipok (d. 1941) abdicated Mar. 2, 1935. At this time the split between civilian and military authorities was complete, and the deadlock was still unbroken when the Second Great War started.

During the late 1930s Japan had flooded Siam with agents, ostensibly on trade missions, but in fact emissaries of Japanese military intelligence. The Siamese began to deprive foreigners of their pre-eminence in trade, and raised anew the questions of Siamese sovereignty over territories which had, by treaty, been yielded to France. Japan was already exerting pressure on Indo-China, where her "tourists" were busy spreading the Asia for the Asiatics doctrine, and she brought all her influence to bear on the side of the Siamese. Border incidents won back part of Cambodia, including the towns of Battambang and

Sisophon, and Laos W. of the Mekong, confirmed to Siam by the Vichy govt. in Indo-China May 5, 1941, after "mediation" by the Japanese, whose influence in Siam grew steadily.

When on Dec. 8, 1941, Japanese forces landed in S. Siam and crossed the frontier near Battambang from Indo-China, Siamese troops resisted for only 5½ hrs., the govt. then giving permission for the passage of Japanese troops to Malaya. The Japanese occupied Bangkok the same evening. The first Allied air raid on Raheng on Jan. 3, 1942, was followed at intervals by others, Bangkok, Chiang-mai, and the Burma-Siam rly. (q.v.) being particular objects of attack. Siam declared war on the U.K. and the U.S.A. on Jan. 25, 1942, but took no active part in hostilities beyond annexing, with Japanese connivance, Kentung and Mong Pan, two of the Shan states in Burma, and the Malay states of Kelantan, Kedah, Trengganu, and Perlis. A broadcast from Bangkok on Aug. 16, 1945, announced that Siam had withdrawn her declaration of war against the U.K. and the U.S.A. and was prepared to hand back to the U.K. the annexed territories.

A peace treaty between the U.K. and India on the one hand, and Siam on the other, was signed at Singapore on Jan. 1, 1946. Diplomatic relations with the U.S.A. were restored on Jan. 5. Agreement with France was effected on

Oct. 15, 1946, when the Siamese national assembly agreed to the return to Indo-China of the areas ceded by the Vichy govt. in 1941.

CONSTITUTION. Siam is a monarchy, until 1932 absolute. The constitution set up in 1932 was superseded by a new constitution in 1946 under which the king as head of the nation exercised legislative power through a representative assembly, half the members of which were nominated by the king, half elected for four years by men and women over 20. A state council of 14 to 24 appointed by the king, 14 of whom plus the president were chosen from the assembly, exercises executive power. Siam is divided for administrative purposes into 70 provs. (*changwads*) with local legislative and executive bodies having limited powers.

The 20-year old King Ananda Mahidol was found dead from a gunshot wound on June 9, 1946, and was succeeded by his brother Phumibol Aduldet, then 18 years of age. The commission set up to inquire into Ananda Mahidol's death decided by a majority vote that murder was the most likely explanation. Renewed efforts on the part of malcontents to seize power gave the military leader who had collaborated with the Japanese during the war years, Marshal Luang Pibul Songgram, the chance to engineer, Nov. 9, 1947, a *coup d'état* which made him virtual dictator.

Bibliography. Journal du Voyage de Siam, L'Abbé de Choisy, 1741; The Kingdom of Siam, A. C. Carter, 1904; Siam, W. A. Graham, 1924; History of Siam, W. A. R. Wood, 1926; Siamese State Ceremonies: their History and Function, H. G. Q. Wales, 1932; Siam in Transition, 1932-37, K. P. Landon, 1940; Siam: Past and Future, J. Crosby, 1945.

Siam, GULF OF. Wide and deep indentation of S.E. Asia. Across the mouth between Cambodia and the Malay peninsula it measures 240 m.; the Menam river delta in Siam is 470 m. N. of the mouth.

Siamang (*Hylobates syndactylus*). Gibbon or long-armed ape, native of Sumatra and the Malay archipelago. The siamang is the largest species of the genus, and is distinguished from its congeners by the middle and index toes being united by the skin for half their length. It stands about 3 ft. high, and is of a uniformly black colour, save for a few scattered grey hairs on cheek and chin. The ears are almost hidden by the thick growth of long fur; and on the neck there

Siam. A well-to-do Siamese man

Siambang. Ape notable for the length of its hind limbs
W. S. Berridge, F.Z.S.

is a large sac which is inflated when the siamangs indulge in their concerted howling. See Gibbon.

Siamese Twins. Name given to twins joined at birth. Chang and Eng (1811-74) were born of Chinese parents in Siam, and, their breastbones being united by a band of flesh, were sold by their parents and were exhibited in England and America. They died Jan. 17, 1874, one surviving the other by 2½ hours and then dying from shock.

These original twins were succeeded by Rosa and Josepha Blazek, born in 1878 in Skerychov, Bohemia. They lived in Czechoslovakia, but toured Europe in 1921, visited the U.S.A., where they contracted jaundice, and died in Chicago, March 30, 1922. The occurrence of "Siamese twins" is not infrequent; many are separated surgically at an early age.

Sian, HSIAN, OR SI-NGAN. Capital of Shensi prov., China. It was the capital of China under the Chou dynasty, about 1100 B.C. In 190 B.C. the name was changed to Changan. It was again made the capital of China in A.D. 589. Sian contains a mosque, among many fine old buildings, and here is set up the Nestorian tablet, which was dug up within 30 m. of the city in 1625. The inscription states that the stone was set up on Feb. 4, 781, and it is surmised that it was buried in 845 at the time of the persecution of the Nestorians. In 1900, during the Boxer rebellion, the Peking court withdrew to Sian. The city, which is walled and has an est. pop. of more than a million, is a great depot for trade. The Peilin or Forest of Tablets is a celebrated museum.

Siang. River of China. Rising in the N. of Kwangsi prov., it flows N.E. and N. through Hunan. It enters the Tungting Lake, and its length is 550 m.

Siangtan. Town of Hunan prov., China. It extends three miles along the Siang river, 30 m. above Changsha. Pop. 317,115.

Siauliai OR SHAULI. Town of Lithuanian S.S.R., centre of the country's road and rly. communications, 80 m. N.N.W. of Kaunas. Its chief manufactures are flour, spirits, and tobacco. In German occupation from soon after the invasion of Russia in 1941, Siauliai was liberated July 27, 1944. The German armies in Estonia and

Latvia were thus virtually cut off from Germany. Pop. 31,299.

Siamese Twins. Chang and Eng at the age of 18
From a print of 1829

Sibawaihi OR SIBUYA (c. 753-793). Arabic scholar. A Persian by birth, after studying at Basra he went to Baghdad, where he gained notoriety in a spirited dispute with the grammarian Kisai. Returning to Persia, he settled at Shiraz, where he died. He is famous for his Kitab (book), or Arabic Grammar.

Sibbald, SIR ROBERT (1641-1722). Scottish scientist, born in Edinburgh, April 15, 1641. After studying at Leyden and Angers, he settled as a physician in his native city, where in 1667 he planted a medicinal herb garden which later became the botanic gardens. President of the Royal College of Physicians of Edinburgh in 1684, the following year he was appointed royal physician and geographer of Scotland, being professor of medicine at the university. He died in Aug., 1722.

Sibelius, JEAN JULIUS CHRISTIAN (b. 1865). Finnish composer From Tavastehus, where he was

born Dec. 8, 1865, he went to study law at the university of Helsinki, but transferred in 1886 to the conservatoire, continuing his musical education in Berlin and Vienna. Returning in 1893 to teach composition and violin playing at Helsinki, he gained such eminence as a national musician that in 1897 a state pension set him free to devote his life to composition. He paid frequent visits to England and the U.S.A.

Jean Sibelius,
Finnish composer

Of all 20th century writers for full orchestra, Sibelius is most widely accepted as carrying on the great classical tradition. His work suggests vast intellectual resources, but its austerity is warmed by an imagination set going chiefly by thoughts on Finnish history and the national epic, Kalevala. Of his symphonies, No. 1 in E minor is most accessible; No. 5 in E flat most attractive; No. 4 in A minor is regarded as his highest conception but remote and fragmentary themes make it unloved; the last, No. 7 in C, is compressed into a single movement. With these may be ranked the violin concerto. Symphonic poems include Tapiola, a picture of northern forests, and such legends as The Swan of Tuonela, The Return of Lemminkainen, and Pohjola's Daughter. Characteristic methods are the scurry of strings, and the projection upon a sustained background of brass or woodwind in some unrelated key, but Sibelius must not be disregarded as a melodist, as the early, popular Finlandia and Valse Triste prove. He contributed to chamber music the string quartet, Voices Intimate, and wrote over 100 songs. The best study in English is by Cecil Gray, 1931.

Sibenik (Ital. Sebenico). Town of Yugoslavia, in Dalmatia. It is situated 31 m. N.W. of Split on the Adriatic Sea at the mouth of the Kerka, and contains a 15th-16th century cathedral, partly Gothic, partly Renaissance. It is connected with Split by steamer and by rly., 57 m. Pop. 37,284.

Siberia (Russian Sibir). Name given to the vast area of N. Asia which was the first part of that continent to be acquired by Russia. Covering over 4 000,000 sq m., it

lies between 46° and 78° 25' lat. N., and 55° long. E. and 170° long. W. It is bordered N. by the Arctic Ocean; E. by the Bering Strait, the sea of Okhotsk, and the Pacific Ocean; S. by China and the Kirghiz S.S.R.; and W. it is divided from European Russia by the Ural mts. It is part of the R.S.F.S.R. and is divided into the Far Eastern region, the Yakutsk A.S.S.R., Buriat-Mongol A.S.S.R., Tuva autonomous region, and the W. Siberian and E. Siberian regions.

From the Arctic sea-board extending for several hundreds of miles inland is a broad tract of marshy barren tundra only a few feet above sea level, which is frozen for the greater part of the year. Then comes a virgin forest (*taiga*, jungle). Farther S. is the huge border-ridge fringing the N. slope of the great plateau of central Asia.

Some of the longest rivers in the world intersect this vast region. The Yenisei emerges from the high plateau of Mongolia and flows due N. into the Kara Sea, a wide inlet of the Arctic Ocean, a distance of 2,950 m.; the Ob, which also enters the Arctic Ocean, at the great gulf of Ob, takes its rise in the Altai mts. 2,100 m. distant; the Lena rises in the Baikal mts. and empties into the Arctic Ocean after a course of 2,600 m.; and the Amur flowing into the Pacific Ocean, is the second largest river of Siberia, 2,920 m. from its source in Transbaikalia to its mouth in the Gulf of Tartary.

All these immense waterways are fed by big tributaries which are important rivers in themselves, e.g. the Angara 1,100 m., the Selenga 600 m., the Irtysh 252 m., and the Sungari, and constitute a vast network of rivers in every direction, the basin of the Yenisei alone being estimated to cover 1,950,000 sq. m. In addition to these four principal rivers, there are others of lesser magnitude, e.g. the Kolima, the Indigirka, and the Khatanga, which run into the Arctic Ocean, and the Anadir into the Pacific. On many of these rivers steamers ply during the summer months, but as their mouths and much of their courses are ice-bound for many months of the year their value to external trade and lumbering is limited. Siberia's principal lake, Baikal, is one of the largest freshwater lakes in the world.

As a result of its great distance from the sea and of its segrega-

tion by mt. barriers from the warmer influences to the S., central Siberia experiences the most extreme type of continental climate. At Verkhoyansk, where 127° of frost in the air has been recorded, the monthly mean temp. on the average ranges from about -60° F. in Jan. to +60° F. in July. Even in the southern regions—in the same lat. as London—winter (Oct.-April) temps. frequently drop below 0° F. In such intense cold, rivers freeze solid and become highways for sledges. Rain falls chiefly in the summer months when the crops in the better watered parts of the steppes grow with extraordinary rapidity; corn sown in May is ready for harvesting early in Aug.

Varieties of Inhabitants

The peoples of Siberia are varied. Samoyedes and Ostiaks live in the N.; Voguls along the slopes of the Urals; Mongols, including Kalmucks and Buriats, along the S. border; and Tartars everywhere. Since the 18th cent. political and criminal prisoners have been transported from Russia to Siberia, and a large part of the pop. is Russian, composed of such exiles and descendants of such exiles. Total pop. is some 14,000,000. Among the principal towns are Novosibirsk, Tobolsk, Tomsk, Krasnoyarsk, Yeniseisk, Irkutsk, Yakutsk, Omsk, Chita, Blagoveshchensk, Khabarovsk, and Vladivostok. Even before the revolution of 1917, in all these places municipal organization was becoming efficient, a system of primary education was developing. Collegiate schools and colleges had been opened in every town, while the university of Tomsk was famous throughout Russia. After the revolution administrative, educational, and industrial development was steadily encouraged.

The first rly. in Siberia, 479 m. long, running from Vladivostok to the Amur river, was opened in 1898. The Trans-Siberian rly. (q.v.), from Moscow to Vladivostok, was built between 1891 and 1905: this crossed Manchuria in the E. A new line, started in 1905 and completed during the First Great War, runs from Chita through Russian territory to meet the Vladivostok-Amur rly. at Khabarovsk. Another line, constructed since the 1917 revolution, leaves the old line at Omsk, runs S. of it through Barnaul and Stalinsk to Nijni Udinsk, and then N., following the valleys of the Lena and its trib. the Vilim for some way, to Port Soviet on the gulf

of Tartary. The Turksib rly. (q.v.) connects Siberia, at Barnaul, with Tashkent in Uzbek S.S.R.

Before the 1917 revolution trade was in the hands of a few rich merchants, and was carried on principally at the great annual fairs of Tomsk, Irkutsk, and Nijni-Udinsk. The Soviet govt. greatly developed production, the area under cultivation increasing from some 130,000 acres in 1915 to 790,000 acres in 1944. Agriculture is pushed even farther N.; flax and sugar beet have been grown in the tundra, and kok-sagyz, a central Asian plant cultivated during the Second Great War by the Russians for its rubber content, has been grown within the Arctic Circle. The forested areas continue to produce furs; and timber production has been stimulated, though the fact that the rivers, themselves frozen for long periods, drain into the Arctic Ocean limits lumbering possibilities. The Far Eastern region raises great quantities of soya beans, and has considerable fisheries. Silver and lead as well as coal are worked in Yakutsk A.S.S.R. Cattle breeding is the chief occupation in the Buriat-Mongol A.S.S.R., bee-keeping, poultry rearing, and fox farming being other industries. Eastern Siberia, especially in the Irkutsk region, is rich in coal, mica, and non-ferrous metals, but its chief products remain timber, furs, and gold. W. Siberia produces coal, grain, livestock, and timber. See Russia. Consult A Journey in Southern Siberia, J. Curtin, 1910; Through Siberia: The Land of the Future, F. Nansen, 1914; Conquest of the Arctic, L. Segal, 1939; Conquest of Siberia, Y. Semyonov, 1944; Soviet and Tsarist Siberia, G. Borodin, 1944.

Sibi. Town of Baluchistan, Pakistan. Important as a rly. junction, it lies in the valley of the Nari, near the entrance to the Bolan pass, and about 70 m. S.E. of Quetta. Occupied by the British during 1841-42, it was ceded to the U.K. by the treaty of Gandamak, 1879. It is famous for its horse fairs. Pop. 8,000.

Sibilant (Lat. *sibilar*, to hiss). Name given to letters that have a hissing or s-sound. The voiceless and voiced fricatives (s, sh, z, zh) and the consonantal diphthongs ch (as in church) and j (as in gem) are commonly known as sibilants.

Sibiu (Ger. Hermannstadt, Hung. Nagy-Szeben). Prov. and town of Transylvania, Rumania.

Before the First Great War the town lay in Hungary. It occupies a strategic situation on the R. Sibiu in a fertile valley near the N. end of the Rothen Turm pass through the Transylvanian Alps, and is an important rly. junction. Originally one of the main 12th century Saxon settlements in Transylvania, it contains a characteristic fortress church, and has stone houses connected underground. The chief building is the Brukenenthal palace; the town hall is of considerable antiquity. Its manufactures include cloth, candles, and soap. Pop. (1939) 50,247.

Sibyl (Gr. *Sibylla*). In classical legend, the designation of a number of prophetesses, inspired by Apollo. Ten were enumerated by late writers. The Cumaean Sibyl directed Aeneas to his father in the under-world (Aen. 6). She also offered to sell Tarquin the Proud nine prophetic books, and on his refusal burnt three, and again three, finally selling him the remaining three for the original price of the whole. Oracles in Greek verse, now lost, believed by the Romans to be these books, were consulted when danger threatened Rome.

The extant Sibylline Oracles, some 4,000 Greek hexameters, mostly written 200 B.C.-A.D. 300, are Jewish and Christian predictions, partly Messianic. Revered in the Middle Ages, they are alluded to in *Dies Irae*. As pagan witnesses to Christ, the Sibyls were represented in art, notably by Michelangelo in the Sistine Chapel in the Vatican. See *Cumae*; *Delphi*; *Oracle. Consult also* The Sibylline Oracles, Eng. trans. M. S. Terry, 1890.

Siccative (Lat. *siccus*, dry). Preparation of oil mixed with painters' colours to cause them to dry quickly. The drying power of a siccative is hastened by boiling the oil in manufacture and adding sugar of lead, acetate of lead, white copperas, and certain other substances.

Siciliano. In music, a movement of quiet pastoral character found in some 18th century suites and sonatas, but more often used as a form of vocal music, especially by Handel. It was derived from a popular Sicilian dance-song. The time was generally 6-8.

Sicilian Vespers. Name given to the massacre of the French in Sicily on Easter Monday, March 30, 1282. The death in 1230 of the Hohenstaufen emperor, Frederick II, left Sicily at the mercy of many parties. For 16 years

the French attempted to curb the spirit of the islanders and divide their lands. At last the Sicilians broke into revolt as the bells of Palermo were sounding for vespers, and massacred nearly every Frenchman in the island. Verdi's overture with this title is often played.

Sicily. Largest island in the Mediterranean Sea, forming part of the republic of Italy. It has a triangular shape and lies just off the toe of Italy, from which it is separated by the Strait of Messina. The mountains are a S.W. continuation of the Apennines and lie

Sicily arms

close to the N. coast, forming the Peloric Range (Monte Tre Fontane, 4,508 ft.) and Madonian Range (Pizzo dell' Antenna, 6,478 ft.). A ridge connects the central part of these mts. with the S.E. tablelands. Etna (10,755 ft.) is the highest point in the island.

The short, rapid rivers, the chief of which are the Simeto, Salso, and Platani, frequently dry up during the droughty summers, which are typically Mediterranean. The island is the world's second largest source of sulphur, while rock-salt and asphalt are also mined. Large quantities of salt are obtained through sea-water evaporation. Cereals are grown on the large estates, but fruit growing is the main occupation, lemons, oranges, olives, grapes, and almonds being the chief products. Tunny, sardines, coral, and sponges are the chief yield of the fisheries.

which provide extensive employment. With the neighbouring Lipari and Aegadian is. and islets, Sicily forms a region of Italy, with nine provs. It was granted some measure of autonomy in 1946. It has an area of 9,926 sq. m., and a pop. of 4,400,000. Palermo, the capital, Catania, and Messina are the chief ports. For an account of the Second Great War in Sicily, see *Italy: Campaign in, 1943-45*. The island, owing to the rapidity of its conquest, suffered comparatively little damage, no great treasures of art or architecture being lost.

Sicily has the most varied history of any portion of Europe. Little is known of its prehistoric inhabitants, who were of Iberian origin. When the Phoenicians began to colonise the island, c. 1000 B.C., they found the E. portion of the island inhabited by the Siceli and parts of the N.W. by the Elymi, a race of unknown origin. The Greeks founded their first colony in 735 B.C., and in the next few years Syracuse, Messina, and other considerable colonies were planted. Greek civilization spread throughout the island, and by 450 B.C. the greater number of the temples and monuments which now constitute some of the most famous ruins in the world had been built. A long series of wars with Carthage impelled the Greek inhabitants to invoke Roman aid, but after the expulsion of the Carthaginians the Romans remained, Sicily becoming a Roman province in 210 B.C.

Under the rule of the Romans the prosperity of the island declined. The Servile Wars (q.v.) and

Sicily Map of this historical Mediterranean island off the south of Italy

civil wars devastated the country, making it defenceless against the attacks of the Franks, who sacked Syracuse, A.D. 278. In 440 Gaiseric conquered the island, and it was ruled by the Goths until Belisarius conquered it in 535, when Sicily became part of the Eastern Empire. Soon afterwards the Saracens began their attacks along the Sicilian coast, and in 878 Syracuse fell to them. The greater part of the island later shared this fate, and became a seat of Arab culture.

The Normans in Sicily

In 1061 the Normans appeared under Robert Guiscard and Roger, sons of Tancred, and began the conquest of the island, which was completed 30 years later. Among the kings of one of the most thoroughly Normanised states in Europe were Roger II (d. 1154), whose victorious fleets defeated the Arabs and planted a colony on the shores of Greece, and William the Good (d. 1189).

On William's death a dispute arose about the succession, and the throne was eventually seized by Henry VI of Germany, son of Frederick Barbarossa. Henry died in 1197 and was succeeded by his son, the Emperor Frederick II, but after the defeat of Frederick's grandson Conradin in 1268 the Sicilian throne passed to Charles of Anjou. The Angevin rule was short-lived, for the massacre called the Sicilian Vespers (v.s.), 1282, slew or drove from the shores of Sicily every foreigner. The island then appealed to Spain for protection against further aggression; Peter of Aragon was crowned king in Palermo, and Sicily became little more than a Spanish possession. In 1718 it was reabsorbed in the kingdom of the Two Sicilies.

KINGDOM OF THE TWO SICILIES. This Italian state, which included Naples and Sicily, first came into existence during the 12th century, and after prolonged periods of dissolution and restoration, finally disappeared in 1861. It was a union of two dominions, that part of Italy lying S. of the Papal States, and the island of Sicily. In the second half of the 11th century the Norman adventurers, Robert Guiscard and his brother Roger, carved for themselves dominions in these regions. Robert became duke of Apulia, and Roger count of Sicily, and the history of the kingdom is thenceforward, until the expulsion of the Angevin dynasty, that of Sicily.

The Aragonese dynasty was established in Sicily in 1282, while the Angevin dynasty maintained

its separate rule in Naples. At the end of the 15th century Naples became a bone of contention between the house of Aragon and the French kings as representing the house of Anjou. In 1504 the French were finally driven out and the Two Sicilies again united.

For another two hundred years the Sicilies remained under the crown of Spain, though they formed a separate kingdom. On the partition of the Spanish dominions at the treaty of Utrecht (1713), the kingdom of Naples was transferred to Austria, and that of Sicily to the duke of Savoy, who later exchanged it for Sardinia; but after the war of the Polish succession (1733-1738) Austria gave up the kingdom of the Two Sicilies to Don Carlos, younger son of Philip V, king of Spain. A Bourbon dynasty was thus established at Naples, ruling over the Two Sicilies. During the Napoleonic wars Ferdinand IV was temporarily ejected from Naples, though not from Sicily; but on the fall of Napoleon, whose general Murat had been made king of Naples, Ferdinand was restored as Ferdinand I, king of the Two Sicilies. In 1860 Garibaldi came to the aid of malcontents, started a movement which swept the Bourbons out of Sicily, invaded the kingdom of Naples, expelled Francis II, and then laid down the dictatorship he had assumed in order that the kingdom of the Two Sicilies might form a part of the kingdom of Italy, to which it was joined in 1861. See Etna; Garibaldi; Italy; Messina; Naples.

Johnston, 1904; Southern Italy and Sicily, F. M. Crawford, 1905; Garibaldi and the Thousand, G. M. Trevelyan, 1909; Siciliana: Sketches of Naples and Sicily in the 19th Century, F. Gregorovius, Eng. trans. 1914.

Sicinius Dentatus, LUCIUS. Hero of the ancient Roman republic. Tribune in 454 B.C., he was called the Roman Achilles on account of his prowess as a soldier. He was said to have fought in 120 battles and to have been wounded 45 times. He is not to be confused with Lucius Sicinius Bellutus, leader of the people in the first secession to the Sacred Mount in 494 B.C., and one of the first tribunes, who appears as a character in Shakespeare's *Coriolanus*.

Sickert, WALTER RICHARD (1860-1942). British painter.

Born in Munich of Danish descent, he was educated at Bayswater and King's College, London. He

Walter Sickert,
British artist

also studied at the Slade school and at Heatherley's, becoming later an assistant to Whistler, who with Degas was the main formative influence upon his art. This showed careful preparation before painting and preoccupation with light and tone. Among well-known paintings by Sickert were *Mamma Mia Poareta*, a portrait-study of an old Venetian woman, *The Raising of Lazarus*, *The Area Steps*, and *Ennui*. He found peculiar inspiration in the architecture and atmosphere of old music halls, and also painted many Victorian domestic scenes, both indoors and out, many of which in his later years he reconstructed from photographs and prints. He became president of the R.B.A. in 1928, but soon resigned. R.A. in 1934, he resigned the following year in protest against the "in-action" of the Academy over the decision of the S. Rhodesian govt. to destroy the Epstein statues on their building in the Strand. Sickert died Jan. 22, 1942. His third wife, Thérèse Lessore, who died Dec. 10, 1945, was also a painter of distinction. *Consult* Lives, R. Emmons, 1941; L. Browne, 1944; *A Free House*, ed. Sir O. Sitwell, 1947.

Sickingen, FRANZ VON (1481-1523). German knight. Born at the castle of Ebernburg near Kreuznach, March 2, 1481, he fought in the Venetian war in 1508. A champion of the Lutheran cause, in 1522 he raised the nobility of the Rhineland against the archbishop of Treves, and unsuccessfully laid siege to that city. In turn he was besieged in his castle of Landstuhl, where he died May 7, 1523.

Sickle. Hand implement, also called a reaping hook. It is used for cutting corn, and now mostly

Sickle employed in agriculture

Mrs. Siddons. This portrait of the celebrated British actress is from Sir Joshua Reynolds's painting representing her as The Tragic Muse

Pop. approx. 71,000. See Chislehurst.

Siddal, ELIZABETH ELEANOR (1834-62). Wife of Dante Gabriel Rossetti, whom she married May 23, 1860. This beautiful auburn-haired woman was the model for many paintings by the Pre-Raphaelite Brotherhood, the best-known being Millais's *Ophelia*. Daughter of a Sheffield cutler, she worked for a time as a milliner's assistant. At the time of her marriage she was far advanced in consumption, but her death on Feb. 11, 1862, was due to an overdose of laudanum, taken for neuralgia. See portrait under Rossetti, D. G.

Siddons, SARAH (1755-1831). British actress. Born at Brecon, July 5, 1755, daughter of Roger Kemble, an actor-manager, she was given a good education, and in 1773 married William Siddons, a member of her father's company. She made her debut at Drury Lane as Portia, Dec. 29, 1775, but achieved no success, though helped by Garrick, until during 1776-77 when she played in popular tragedies in Manchester. After achieving further triumphs at Bath and Bristol, she returned to Drury Lane, Oct. 10, 1782, as Isabella in Garrick's version of Southerne's *The Fatal Marriage*. For 30 years thereafter she remained the unrivalled queen of tragedy on the British stage, acting frequently with her brother, John Philip Kemble. She made a farewell appearance, June 29, 1812, at Covent Garden, as Lady Macbeth, but

reappeared frequently in benefit and charity performances. She died June 8, 1831, and was buried in the churchyard of S. Mary's, Paddington Green; there is a statue on the green itself.

The favourite equally of critics and ordinary playgoers, Mrs. Siddons probably carried her audiences into greater transports of enthusiasm than any other actress. She was admired not only for histrionic ability but also for a statuesque beauty. She was praised for domestic virtues and devotion to family interests. All the masters of portraiture delighted in painting her, and Reynolds's *The Tragic Muse* inspired a statue by Chantrey in Westminster Abbey.

Bibliography. Life, T. Campbell, 1834; The Kembles, P. Fitzgerald, 1871; Memoirs, J. Boaden, new ed. 1893; The Incomparable Siddons, Mrs. C. Parsons, 1909; Private Life, N. Royde-Smith, 1933; Mrs. S., Tragic Actress, Y. Ffrench, 1936.

Side Arms. Military term to describe the serviceman's bayonet attached to a frog and suspended from the left of the belt.

Sideboard. In the Middle Ages, a board resting on trestles against the wall, as distinct from the board on trestles on which meals were served. The sideboard was used for the disposal of plates and dishes. At the beginning of the 16th century the buffet or side-table was evolved, and towards the end of the Tudor period the three-tiered buffet or sideboard

superseded by the reaping machine. It consists of a sharply curved blade attached to a short wooden handle, with either a smooth or a saw edge. The hammer and sickle, being symbolical of manual labour, make up the badge of Communism. See Agriculture; Reaping.

Sicyon. City of ancient Greece. It was in the N.E. Peloponnese, between Corinthia and Achaea on the R. Asopus about 2 m. from the sea. It first came into prominence in the 7th and 6th centuries B.C. under the rule of the Orthagoridae, a dynasty of enlightened tyrants, when it became famous for its pottery, wood carving, and bronze work. It was in Sicyon that classical Greek painting originated. In the 4th century its school of painting became famous under Eupompus, while in sculpture it was represented by the great name of Lysippus. After a renewal of prosperity under the guidance of Aratus (c. 250 B.C.) it lapsed into insignificance. During recent times its theatre was excavated.

Sidcup. A locality of Kent, England. It is 12 m. S.E. of London, and has rly. stations. The chief building is S. John's church, with a fine carved oak pulpit. The place, chiefly a residential district for Londoners, is part of the urban dist. of Chislehurst and Sidcup.

Sideboard. A Regency mahogany sideboard (c. 1810) with original brass rail at back; square legs terminate in lion paw feet. Top, Sheraton mahogany sideboard (c. 1785) on square tapered legs
Courtesy of M. Harris and Sons

came into being. These pieces are heavily constructed, the huge bulbous turnings having fully developed by that time. The surfaces are covered with carving in nailing, heraldic, and floral design, the flat surfaces of friezes being inlaid with holly and bog oak worked in the solid.

The sideboard later became less significant, and in the Chippendale period it was rather a side table. Robert Adam introduced pedestal sideboards in the 1760s; these were first carved and later painted.

In the Empire period the pedestal sideboard was once more fashionable; pieces were large, and of rosewood inlaid with brass. During the Victorian period sideboards were made in great diversity of style. From the early 20th century they have been small. Oak has been the favourite wood, often stained and polished, though pains are taken with the truly contemporary piece not to hide the figure of the wood.

Sidebone. Deformation of the feet of horses, particularly the fore-feet. It is due to a hardening of one of the lateral cartilages, through the deposition of lime salts therein. Permanent lameness may be the result. *See* Horse.

Sidereal Time (Lat. *sideræus*, relating to a star). Time as reckoned by the apparent diurnal motion of the stars. A sidereal clock which represents the rotation of the earth on its axis as referred to the stars, would complete 24 sidereal hours between the departure of any meridian from a star and its next return to it. The sidereal clock is one of the most important instruments in an observatory, enabling the right ascension of any object crossing the meridian to be at once stated. The sidereal day is reckoned from the passage over the meridian of the first point in Aries. *See* Calendar.

Siderite. In mineralogy, iron carbonate, FeCO_3 , containing up to 43 p.c. iron, often impure. It is sometimes called chalybite or spathose iron and occurs as rhombohedral crystals with curved faces, also massive and granular; the colour is generally buff. Clay ironstone is an impure iron carbonate found as nodules and bands especially in the coal measures of many countries; these constitute valuable iron ores. Blackband ironstone is a carbonaceous type of clay ironstone. Siderite is formed as precipitates in lakes, etc.; as sedimentary deposits; as metasomatic deposits in limestone; and in mineral

veins. The famous minette ores of Alsace-Lorraine contain siderite, as do the Mesozoic ores of the English Midlands.

Siderostat. Device for reflecting by an automatically moving mirror the rays of light received from a star along the axis of a fixed telescope. In its main features it consists of a plane mirror moved by clockwork to keep pace with the heavenly body under observation. *See* Telescope.

Sidesman. In the Church of England, an official appointed by the parochial church meeting and the incumbent to help the churchwardens in various ways, e.g. taking the offertory.

Sidgwick, ALFRED (1850–1943). British philosopher. Born at Skipton, and a product of Rugby and Lincoln College, Oxford, he was a first cousin of Henry Sidgwick (v.i.). A fellow of Victoria University, Manchester, he was an original logician and became known for his philosophical books, which included *Fallacies*, 1883; *The Process of Argument*, 1893; *The Application of Logic*, 1910; and *Elementary Logic*, 1914. He died Dec. 22, 1943.

His wife, Cecily (1855–1934), was born in London of German parents whose surname was Ullman. She began to write after her marriage in 1883, and as Mrs. Alfred Sidgwick gained a wide public, her best books being about Germany and having Anglo-German settings. Novels of this type included *The Grasshoppers*, 1895; *The Severins*, 1909; *Anthea's Guest*, 1911. Set in the Cornish artists' colony where she herself lived was *None Go By*, 1923. Collaborating with Crosbie Garstin, she wrote *The Black Knight*, a romance based on the latter's adventures in Canada. She died August 10, 1934.

Sidgwick, HENRY (1838–1900). British philosopher. Born at Skipton, May 31, 1838, he went to Rugby and Trinity College, Cambridge, of which he became a fellow and lecturer, and in 1883 was appointed professor of moral philosophy. He died Oct. 28, 1900.

Sidgwick was recognized as the leading ethical philosopher of his day. In his system he endeavoured to combine intuitionism with utilitarianism. The object of

ethics was to determine what individual human beings ought, or what is right for them, to do, and the means of realizing this end. The highest good was the greatest happiness of the greatest possible number. His chief work was *Methods of Ethics*, 1874; he also wrote *Elements of Politics*, 1891.

Sidgwick married in 1876 Eleanor Mildred (1845–1936), sister of A. J. Balfour. She was principal of Newnham College, 1892–1910. She died Feb. 10, 1936.

His younger brother Arthur (1840–1920) went to Oxford in 1882 as fellow and tutor of Corpus, and from 1894 to 1910 was university reader in Greek. This well-known classical scholar died Sept. 25, 1920. Arthur's daughter Ethel (b. Dec. 20, 1877) was a novelist.

Sidi Barrani. Village of Egypt, situated on the Mediterranean coast, 60 m. E. of Bardia. On Sept. 13, 1940, Italian forces under Graziani (*q.v.*) invaded Egypt, occupying Sidi Barrani three days later. British and Free French forces retook the village on Dec. 11, during Gen. Wavell's advance into Cyrenaica. In June, 1942, the Germans and Italians under Rommel compelled the British 8th army to withdraw from the Gazala position, Sidi Barrani being lost on June 24. After the victory at Alamein it was recaptured from the Germans on Nov. 10. *See* North Africa Campaigns, 1940–43; Senussi.

Sidi-bel-Abbès. Town of Algeria. It is situated 35 m. S. of Oran. A centre of the French military organization of N. Africa, it trades in wines and cereals produced in the surrounding countryside. It is connected with the coast by rly. Pop. 65,500.

Sidi Omar. Military post on the Libyan-Egyptian border. Situated 30 m. S.W. of Sollum, it figured prominently in the Western Desert campaigns of the Second Great War, and was captured from the Italians by British forces on Dec. 16, 1940. Retaken by the Germans in Rommel's campaign the following spring, it was again occupied by British troops during the second advance into Libya, and provided the base for the armoured sweep across the desert to Tobruk. After Rommel's offensive in June, 1942, Sidi Omar was evacuated by British troops during the retreat into Egypt, but was recaptured Nov. 11 by the 8th army in their advance from Alamein. *See* North Africa Campaigns, 1940–43.

Henry Sidgwick,
British philosopher

Sidi Rezegh. Village of Libya, 10 m. S.E. of Tobruk. During the first British campaign in N. Africa, Sidi Rezegh was captured from the Italians, Jan. 6, 1941. German and Italian forces retook the place in April, only to lose it on Nov. 19, when the British 8th army attacked. Terrific and confused tank battles raged in the vicinity of Sidi Rezegh for several days, the place changing hands several times, but finally remaining in the possession of the British. On June 17, 1942, the 8th army withdrew, following the evacuation of the Gazala position. The village was recaptured on Nov. 12 during the final advance on Tobruk from Alamein. See North Africa Campaigns, 1940-43.

Sidky, ISMAIL, PASHA (1875-1950). Egyptian statesman. Born at Alexandria, he was educated at the collège des Frères, Cairo, and the Khedivial law school. Minister of agriculture, and later of religious institutions, 1914, next year he joined the Wafd (*q.v.*) and was deported with Zaghlul Pasha and others to Malta. On his return in 1919 he became an opponent of the Wafd. Prime minister, 1930-33, he then devoted himself chiefly to business. He helped in negotiating the Anglo-Egyptian treaty, 1936, and was again premier Feb.-Dec., 1946, when its revision was inaugurated. He died in Paris, July 9, 1950.

Sidlaw Hills. Range of hills in Scotland. It forms the S. boundary of Strathmore and extends N.E. from Kinnoull Hill in Perthshire to Stonehaven in Kincardineshire. The chief summits are Craighowl (1,493 ft.), Auchterhouse Hill (1,399 ft.), and Dunsinane (1,012 ft.), with traces of an ancient fort popularly called Macbeth's Castle.

Sidmouth. Watering-place, tourist centre, and urban dist. of

Devon, England. It stands on Lyme Bay, at the mouth of the Sid, 13 m. E.S.E. of Exeter and 168 m. from London, and is the terminus of a branch rly. line. The parish church of S. Nicholas, dating in part from the 13th century, has a window presented by Queen Victoria, in memory of her father, the duke of Kent, who died here. The duke's residence later became an hotel. Sidmouth has good bathing facilities, recreation grounds, and other attractions for visitors including a theatre and two cinemas. Pop. est. (1948) 10,000.

Sidmouth, HENRY ADDINGTON, VISCOUNT (1757-1844). British politician. Born May 30, 1757, in London, he

Viscount Sidmouth,
British politician
After G. Richmond

was educated at Cheam, Winchester, and Oxford, and entered parliament, 1784. He was elected Speaker, 1789, and was largely occupied for several years with the impeachment proceedings against Warren Hastings (*q.v.*). On Pitt's resignation in 1801, Addington resigned the Speakership and formed a ministry which negotiated the peace of Amiens, but only lasted until the opposition of Pitt and his colleagues forced his retirement in 1804. He was created Viscount Sidmouth, 1805, and entered politics again as Home secretary, 1812-21, when his administration earned him great unpopularity owing to the coercive measures he adopted in the Luddite riots, and other labour troubles. He retired from the cabinet in 1824, and died Feb. 15, 1844. *Consult* Life and Correspondence, G. Pellew (son-in-law), 1847.

Sidney, ALGERNON (1622-83). English politician. He was the second son of the second earl of Leicester, and a grand-nephew of Sir Philip Sidney, and was probably born at Penshurst. In 1632 and 1636 he accompanied his father on embassies to Denmark and France, and in 1642 he was captain in his

brother's regiment of horse against the Irish rebels. He joined the Parliamentary army, and was severely wounded at Marston Moor in 1644. He became governor of Chichester, 1645; M.P. for Cardiff, 1646; and in 1647 lieutenant-general of the horse in Ireland. During 1647-50 he was governor of Dover. Sidney was appointed one of the commissioners for the trial of Charles I, but absented himself, and did not sign the death warrant.

Algernon Sidney,
English politician

In 1652 he was appointed member of the council of state, but in the following year, resenting Cromwell's assumption of power, he retired to Penshurst, where he remained until 1659, when he again became a member of the council. At the Restoration he went abroad, but returned to England in 1677. In 1680 he began the writing of his chief work, *Discourses Concerning Government*. A strong republican and opponent of the Roman Catholics, he was one of the leaders marked down for destruction after the discovery of the Rye House Plot, was tried, and on trivial evidence sentenced to death. He was executed on Tower Hill, Dec. 7, 1683. His *Discourses Concerning Government* was published in 1698, and his *Works* in 1772. *Consult* Memoirs of Algernon Sidney, G. W. Meadley, 1813; *Life and Times of A. S. A. C. Ewald*, 1873.

Sidney, SIR PHILIP (1554-86). English soldier and poet. Born at Penshurst, Kent, Nov. 30, 1554, eldest son of Sir Henry Sidney and Mary Dudley, daughter of the duke of Northumberland, he was educated at Shrewsbury, Oxford, and Cambridge. In Paris he witnessed the marriage of Navarre and Marguerite de Valois, found safety with Walsingham in the English Embassy during the night of S. Bartholomew, and first met Hubert Languet, with whom he went to Poland. He also visited Frankfurt, Strasbourg, Vienna, Venice, Padua, Florence, Genoa, Prague, Dresden, and Heidelberg. On his return he was present at the Kenilworth Revels, and visited Chartley, where he met Penelope Devereux, the Stella of his Sonnets.

In 1577 he was Elizabeth's ambassador to the Emperor Rudolph II at Prague and to the counts Palatine, Louis and Casimir. William the Silent authorised him

Sidmouth, Devon. View overlooking the town from the north-east

to offer Elizabeth the sovereignty of Holland and Zealand, paid a glowing tribute to his abilities, and would have welcomed his marriage with a daughter of the House of Orange. Dismissed from court for opposing the Alençon marriage, Sidney was in 1581 elected M.P. for Kent. In 1583 he was knighted, made master of the horse, and married Frances Walsingham. In 1585 he was made joint master of ordnance, recalled from a secret attempt to join one of Drake's expeditions, and appointed governor of Flushing.

On Sept. 22, 1586, in a charge against the Spanish cavalry at Zutphen, he was shot above the left knee, but proudly rode off the field. On his way he passed a poor soldier who, in Fulke Greville's memorable phrase, "had eaten his last at the same feast," and was casting up his eyes at the bottle brought to assuage Sidney's thirst. Sir Philip "took it from his head before he drank and delivered it to the man with these words, 'Thy necessity is yet greater than mine.' And when he had pledged this poor soldier he was carried to Arnheim," where he died, Oct. 17.

The states of Zealand applied for permission to inter his remains beneath a handsome monument at the expense of their government, but he was buried in S. Paul's cathedral, Feb. 16, 1587. As soldier and statesman Sidney fretted against Elizabeth's vacillating foreign policy, and won golden opinions from the Dutch. As a man he enjoyed the friendship of his most eminent contemporaries at home and abroad. As a writer, he composed all his works within about four years, and they were published after his death. His *Apologie for Poetrie* is the first example of English literary criticism; his pastoral romance, *The Arcadia*, written for his sister Mary, a foundation book in English prose romance, and an example of mental self-portraiture; his *Astrophel* and *Stella* sonnets gave the sonnet sequence its vogue in England. He translated the first two books of Aristotle's *Rhetoric*. See *Arcadia*; *Penshurst*; *Rich*, Penelope.

Sidney Street Affair. Celebrated siege of criminals in Sidney Street, Commercial Road, London, E. Late on Dec. 16, 1910, the

Philip Sidney

tenant of the house next to 119, Houndsditch (occupied by a jeweller), heard strange scrapings and rappings at the back of his own premises. He gave the alarm and the attention of the police was turned upon three houses, 9, 10, and 11, Exchange Buildings, which backed upon the Houndsditch row. A police cordon was at once drawn round the buildings, and Sergeant Bentley knocked at No. 11. The door was opened by Gardstein, one of the criminals, and Bentley put his foot across the threshold. Almost immediately Bentley and Sergeant Tucker were shot dead.

Afterwards Gardstein was accidentally wounded by his own friends, and was found dead in a house in Grove Street the following day, together with a number of papers which threw light on the other criminals. These included the ringleader Peter Straume (known as Peter the Painter), Fritz Svaars, and another man called "Joseph."

At midnight, Jan. 2, 1911, information was brought that the latter two had forced their way into the room of a woman at 100, Sidney Street, and had taken refuge there. At day-break the two fugitives were

called upon to surrender. The only answer was a fusillade, in which Inspector Leeson was mortally wounded. Winston Churchill, as Home secretary, at once gave instructions for an attack on the house, and visited the scene to watch developments. A detachment of Scots Guards was brought up, and began a process of progressive sniping at the windows and roof of the house. The building caught fire, and, later, charred remains, identified as those of Svaars and "Joseph," were found amongst the debris. Beyond these men no other participants in the earlier crime have ever been punished, and it has been averred that Peter the Painter escaped to Australia. Three firemen were injured.

Sidney Sussex. College of Cambridge university. Occupying the site of a Franciscan convent, it was founded in 1596 under the will of Lady Frances Sidney, widow of the 3rd earl of Sussex, by a charter granted in 1594 by Queen Elizabeth to Henry, earl of Kent, and Sir John Harrington, the executors. The statutes provided for a master, 10 fellows, and 20 scholars. The original buildings were largely reconstructed in 1821-32. The chapel, which dates from 1776, was redecorated in 1833, and enlarged in 1916-17. A new court was added in 1893.

Notable benefactors have included Peter Blundell, Sir Francis Clerke, and Sir John Brereton. The members have included Oliver Cromwell (though he never matriculated), Edward Montagu, 2nd earl of Manchester, Thomas May, historian of the Long Parliament, Roger L'Estrange, Thomas Fuller, and George Butler, headmaster of

Sidney Sussex College arms

Sidney Sussex College, Cambridge. Quadrangle of the New Court, added to the college in 1890

Harrow. The present society consists of a master, 16 fellows, and 36 scholars.

Sidon. Ancient city of Phoenicia, now in Palestine. Situated on a cape, 25 m. S. of Beirut, it

Sidon, Syria. The Sea Castle, a 13th century fortress, protecting the bay and harbour

had a double harbour, and was celebrated for its purple dyes and glass manufactures. The first record of the city is c. 1400 B.C.; it was conquered by Sennacherib, 701 B.C., and, as the headquarters of the Phoenician navy, contributed the best ships to the expedition of Xerxes against Greece. It was destroyed by Artaxerxes III in 351 B.C. Under the Romans it was a free city. It became Mahomedan in 637, and frequently changed hands during the crusading epoch. Later it was for two centuries the port of Damascus. The tombs of the ancient city have yielded many sarcophagi, notably the so-called sarcophagus of Alexander now in Istanbul. The W. part of the old site is occupied by the modern town of Saïda, which exports olive oil, oranges, and lemons. It was captured by Australian troops on June 15, 1941, during the campaign against the Vichy French troops from Syria. Pop. est. 10,000. See Phoenicia.

Sidra. In Mahomedan lore, a tree of paradise, in the branches of which sat the angel Gabriel, and from which were made the Tables of the Law given to Moses on Sinai.

Sidra. Gulf of the N. coast of Africa. It forms the principal inlet of the Mediterranean on its S. side. It was known to the ancients as Syrtis Major.

Sieben Gebirge (Ger., seven mts.). Group of peaks in Germany. Seven conical hills of volcanic origin rise in picturesque fashion above the right bank of the Rhine almost opposite Bonn. The chief heights are Ölberg (1,522 ft.), Löwenburg, and Drachenfels.

Siedlce. Town of Poland. It is about 50 m. E. of Warsaw, on two rlys. It played a considerable part in Polish revolutionary history, being taken and retaken by the Russians in 1831. The neighbouring flat and swampy dist. is devoted to agriculture and cattle breeding. Spirits, glass, and leather goods have been manufactured here. It was captured by the Germans in 1915 and changed hands in the campaign between the Poles and Bolsheviks in 1920. The town was virtually

destroyed by German aircraft during the campaign of 1939. It lay in the German-occupied part of Poland after the Russo-German partition of the country and was turned by the Germans into a strongpoint covering Warsaw. Its liberation on July 31, 1944, by the Russians disorganized the whole German system of communications E. of Warsaw. Pop. est. 34,000. Pron. Syaydl-tse.

Siegbahn, KARL MANNE GEORG (b. 1886). Swedish physicist. Born in Örebro, Dec. 3, 1886, he was professor of physics at Lund, 1920-23, at Uppsala until 1937, then at Stockholm. He made advances in the study of X-ray spectroscopy and its influence on our knowledge of atomic structure. For this he was awarded the Nobel prize for physics, 1924, and the Rumford medal of the Royal Society, 1940.

Siegburg. Town of Germany, in the Land of North Rhine-Westphalia. It is 16 m. S.E. of Cologne and in 1945 came into the British zone of occupation. Its buildings include a church of the 13th century. The Benedictine abbey which stood here from the 16th century was damaged in the Second Great War. The industries include making pottery and mining of coal and stone. Pop. 25,000.

Siege (Fr. *siège*, seat). Military operation whereby a fortress or town is cut off from outside help with the object of compelling its surrender through starvation or attrition of the garrison. Until the introduction in the late 19th century of rifled artillery firing shells, the art of siege had altered little since the wars of antiquity. The chief weapon of the besieging army was starvation: it was seldom able

to compel capitulation by destruction of the fortifications.

Military engineers, notably Vauban (1633-1707), so developed siege warfare that they could estimate the number of days necessary to capture a given fortress. The usual procedure, after the defenders had been driven behind defence works, was to establish a trench for the installation of artillery. From this first parallel, zigzag trenches were worked forward and second and third parallels established, the last as close as possible to the enemy's works. Sapping and mining then began. All this work was called circumvallation, while the besiegers protected themselves from the attack of a relieving army by forming a system of field defences called the line of contravallation.

Conditions altered radically in the First Great War. Although the German investment of Belgian fortresses in 1914 followed the classic military pattern, many later so-called sieges were, in effect, major battles in which permanent fortifications formed part of a prolonged front. During the German siege of Verdun in 1916, the fortress had a garrison of 100,000 men while French armies totalling 400,000 men were fighting in front and to the flanks.

In the Second Great War a new factor was aerial bombardment. This allowed defences and local communications to be saturated, so compelling the besieged army to develop defence in depth. Whereas breaching the walls of a fortified place had previously resulted in surrender, now a besieged place had to be fought for street by street and house by house. A notable example was Stalingrad. With the increasing range of artillery and bombing aircraft, the siege is ceasing to be a separate military operation. Strategists are disinclined to besiege a town or fortress when it may be by-passed and then forced to surrender through starvation or obliteration at the victor's leisure.

Notable sieges in the world's history begin with Troy and include those of Syracuse (396 B.C.), Jerusalem (A.D. 70), Acre (1191), Calais (1347), Orléans (1428-29), Constantinople (1453), Haarlem (1572-73), Breda (1625), La Rochelle (1628), Magdeburg (1631), Londonderry (1689), Gibraltar (1731, 1779, 1782), Prague (1741-44), Quebec (1759), Saragossa (1808), Ciudad Rodrigo (1810), New Orleans (1814), Sevastopol (1854-55), Lucknow (1857), Delhi (1857),

Vicksburg (1862), Charleston (1863), Metz (1870), Strasbourg (1870), Paris (1870-71), Plevna (1877), Khartum (1884), Ladysmith (1899-1900), Mafeking (1899-1900), Port Arthur (1904), Adrianople (1912), Maubeuge (1914), Przemyśl (1915), Kut (1916), Madrid (1938-39), Calais (1940), Tobruk (1941), Sevastopol (1941-42), Corregidor (1942), Stalingrad (1942-43), Cassino (1944), St. Nazaire (1944-45), Budapest (1944-45), Berlin (1945). *See* Fortification.

Siegen. Tn. of N. Rhine-Westphalia, Germany, 40 m. E. of Cologne, and the centre of the only valuable iron ore fields in Germany. A road and rly. junction, the town has two churches, S. Martin and S. Nicolas, dating respectively from 1200 and 1220, and two palaces which were begun in 1224 and 1695. It was the birthplace of Rubens. Siegen belonged from 1255 to the Nassau dukes; fell in 1806 to the duchy of Berg established by Napoleon; and again in 1813 to the duke of Nassau-Orange who ceded it to Prussia in 1815. During the Second Great War Siegen was captured by the U.S. 1st army, April 3, 1945; here were found, stored for safety in a hillside, paintings by Rembrandt, Rubens, Holbein, Van Dyck, Renoir, and others; Beethoven MSS. from Bonn; and treasures from Cologne and Aachen (Aix-la-Chapelle) chapels, including the crown, sceptre, and gold cups of Charlemagne. F.-M. Model attempted unsuccessfully to fight his way through Siegen out of the Ruhr during its investment by the U.S. 9th and 1st armies, April, 1945. (*See* Ruhr.) After the surrender of Germany, Siegen lay in the British zone of occupation. Pop. (1950) 33,350.

Siegen, LUDWIG VON (1609-c. 1680). German artist, the reputed inventor of mezzotint. Born at Utrecht, of German parents, he became an officer in the service of the landgrave of Hesse. He is said to have discovered the mezzotint process in 1642, and communicated it to Prince Rupert, 1654, who after the Restoration introduced it into England. Several of Siegen's own mezzotint portraits are in the British Museum.

Siegfried or **SIGURD.** Hero of the most famous of Teutonic legends, which arose among the heathen Franks of the Rhine, spread through Germany and Scandinavia, and is alluded to in the English Beowulf. In the Volsunga Saga, Sigurd is son of Sig-

mund the Volsung. He slays the dragon Fafnir and his treacherous master the smith Regin, plights his troth with the Valkyrie, Brunhild, but afterwards wins for her Gunnar, whose sister, Gudrun, he marries. Brunhild avenges herself by inciting Gunnar's brother Guthorm to murder Sigurd, but slays herself on his funeral pyre.

In the Nibelungenlied Siegfried makes himself invulnerable by bathing in the dragon's blood, save for one spot, and wins the hoard of the Nibelungs and the hood of invisibility, by means of which he helps Gunther (Gunnar) to win Brunhild in Iceland. It is Kriemhild (Gudrun) who provokes the murder of Siegfried. *See* Brunhild; Nibelungenlied; Volsunga Saga; Wagner, R.

In *Der Ring des Nibelungen*, the sequence of four music-dramas by Wagner, Siegfried is the title of the third, which is in three acts. It was written between 1854 and 1871, and first produced at Baireuth, Aug. 17, 1876, under Richter. The first performance in England was at Her Majesty's, London, May 8, 1882, and in English by the Carl Rosa Opera co. at Manchester, 1901.

Siegfried Line. German defence zone of the Second Great War. Begun in 1938 as a counter to the French Maginot line (*q.v.*), it extended along the German frontier from a point 15 m. E. of Basel to Karlsruhe, thence W. to the Luxembourg border, thence along the Belgian and Dutch frontiers to a point where the Rhine enters the Netherlands. Built by the Todt labour organization, the main part of the line had steel and concrete fortifications nearly two miles in depth. All communications were underground, as were the main artillery emplacements, which were mounted in cupolas that could be raised for firing. Surmounting the line were 12,000 concrete forts mounting anti-tank artillery. In front of the main defences was an elaborate system of obstacles, giving the zone a depth of up to 30 m. Incomplete when Germany invaded France in 1940, it was neglected from 1943 in favour of the so-called west wall. On Sept. 12, 1944, the U.S. 1st army made a limited penetration of the line near Trier, and on Oct. 2 broke through near Geilenkirchen.

In the First Great War, when the Germans built fortifications in the rear of the Hindenburg Line, each zone had a Wagnerian name: there were Siegfried, Wotan, Brunhild, and Hunding lines.

Siemens, ALEXANDER (1847-1928). British engineer. Born at Hanover, Jan. 22, 1847, and educated at Hanover and Berlin, he entered the workshops of the firm of Siemens at Woolwich in 1867. The following year he assisted in building the Indo-European telegraph line, in 1869 the cable in the Black Sea, and other cables; as well as erecting regenerative gas furnaces in N. America. He was naturalised as a British subject, 1878, and was president of the Institution of Civil Engineers, 1910-11. He was responsible for lighting the British Museum and Albert Hall. He died Feb. 19, 1928.

Alexander Siemens,
British engineer

Siemens, ERNST WERNER VON (1816-92). German engineer. Born at Lenthe, Hanover, Dec. 13, 1816, a brother of Sir William Siemens, he was educated at Lübeck and Berlin. In 1841 he invented a process of electro-plating, but afterwards he specialised in the construction of telegraph lines, laying many of the earlier lines in Europe, and inventing many improvements in transmission. He was the first to use gutta-percha as an insulating material; suggested the unit of electrical resistance known by his name; and was a pioneer in Germany in developing electricity for commercial uses. He died Dec. 6, 1892.

Siemens, SIR WILLIAM (1823-83). British engineer and metallurgist. Born at Lenthe, Hanover, April 4, 1823, and educated at Magdeburg and Göttingen, Karl Wilhelm Siemens first visited England in 1843 with a new process of electro-plating invented by himself and his brother. Here he turned his attention to the regenerative steam engine, an ingenious but unsuccessful invention; a new type of water meter which was superior to any then in use;

E. W. von Siemens,
German engineer

Sir William Siemens,
British engineer

and finally the regenerative furnace, an invention which made him world-famous, and was one of the landmarks in the progress of steel and iron manufacture.

In 1866 he established with his brothers electric works in England, and many important telegraph lines were laid under their direction, including the Atlantic cable in 1874, while the firm were largely concerned in the first applications of electricity to lighting and power. A man of remarkable inventive faculty, Siemens brought out many electrical devices, including an electric thermometer and electric furnace. He became a British subject, 1859, and was president of the British Association, 1882. He was knighted a few months before his death on Nov. 18, 1883. *See Iron; Regenerator; Steel; consult also Life, W. Pole, 1888.*

Siemens. German electrical engineering combine, formerly the largest of its kind in Europe. Founded by the four brothers Werner, William, Carl, and Friedrich Siemens, it branched into many fields and countries, comprising the firms of Siemens and Halske, Berlin; Siemens-Schuckert, Nuremberg; and originally Siemen's Bros., London. The Berlin branch, occupying a whole N.W. suburb of the city, known as Siemensstadt, and the subsidiary German firms employed 150,000 workers. The main plant was heavily damaged by Allied bombing in the Second Great War.

Siemens Process. Method of producing steel, suggested by Sir W. Siemens, in which his regenerative open hearth furnace is used. It is also termed the acid open hearth process. Pig iron and steel scrap, both of low sulphur and phosphorus contents, are introduced into the acid-lined furnace and melted. Elimination of the impurities, which begins during the melting stage, and continues after the charge has become molten, is by means of oxidation. The oxygen is supplied by the furnace atmosphere during the melting stage, and later by feeds of iron ore to the molten bath. The first impurities to be oxidised are silicon and manganese, which then help to form a slag on top of the molten metal. Subsequently carbon is oxidised to carbon monoxide. When the silicon, manganese, and carbon contents of the metal have been sufficiently reduced, the feeds of ore are stopped, and deoxidisers, usually ferro-silicon and ferromanganese, are added to remove

Siena, Italy. 1. Church of S. Domenico, from the south. 2. Palazzo Pubblico and Torre del Mangia, built in 1338-45. 3. The Cathedral, from the south, showing the fine triple portal and the 14th century campanile

excessive oxygen. The steel should then be ready for casting. Steel produced by this process is usually excellent, but good quality pig iron and scrap must be used for the charge because neither the sulphur nor the phosphorus content is reduced. The basic open hearth process, however, can utilise inferior pig and scrap. *See Open Hearth Furnace; Regenerator.*

Siena. Prov. of Italy in Tuscany. Hilly and scantily peopled, it is drained by the upper waters of the Ombrone and its tribs. and by the Elsa, a trib. of the Arno. Wheat, olive oil, Chianti wine, and silk are the principal products. Its area is 1,471 sq. m. Pop. 270,347.

Siena (Anc. *Sena Julia*). City of central Italy, capital of the prov. of the same name. It is 30 m. direct, but 60 m. by rly., S. of Florence, and is picturesquely situated on three undulating hills (c. 1,200 ft.). Surrounded by its

ancient walls, which embrace 2½ sq. m., the crooked, steep, and narrow streets assist in preserving its medieval aspect. On the principal square are many palaces, of which the most notable are the Palazzo Pubblico (1289-1305), with the fine slender tower, the del Mangia, and rich frescoes of the Sienese school, and the Palazzo del Governo (1469-1500), which houses the city archives and has also a library.

The Gothic cathedral, dating from 1243, overlooks the city; its façade of black, white, and red marble is profusely decorated; it contains Donatello's bronze statue of John the Baptist. Under the choir is the early 14th century church of San Giovanni; adjacent is the 15th century cathedral library. Its windows were smashed during the Second Great War. The university was founded in 1300. Straw plaiting and weaving

are industries; there is considerable trade in oil and wine.

A Roman colony in the time of Augustus, Siena was an important medieval city republic and a stronghold of the Ghibellines. In 1557 it was annexed to Florence. During the Second Great War it was entered by French troops of the Allied 5th army July 3, 1944. There was heavy fighting in the approaches to Siena, but the Germans, threatened on their left by the advancing 8th army, withdrew without fighting in the city which, however, they had mined. The plan of the mines was found and they were removed before they could explode. In consequence Siena suffered only minor damage. Pop. (1936) 48,664.

Sienkiewicz, HENRYK (1846-1916). Polish novelist. Born at Wola Okrzejska, in the prov. of

Henryk Sienkiewicz,
Polish novelist

Siedlce, Russian Poland, he was educated at Warsaw. His first work was a humorous story published in 1872, and called *No-body* is a Prophet in His Own Country; but he made his name by some letters which he contributed to the *Polish Gazette*, describing his experiences in California in 1876. In 1880 he brought out the historical novel, *The Tatar Bondage*, and later wrote a remarkable trilogy of tales—*Fire and Sword*, 1884; *The Deluge*, 1886; *Pan Michael*, 1887—describing 17th century society in Poland. This series was translated into English by J. Curtin, 1895-98.

In 1895 he published *Quo Vadis*, a romance of Nero's times, which, translated into some 30 languages, dramatised in England, France, Germany, and the U.S.A., and several times filmed, first in 1913 by Carl Laemmle, made him world-famous. Sienkiewicz received the Nobel prize for literature in 1905. His later works included *Knights of the Cross*, 1904, *On the Field of Glory*, 1906, and *In Life's Whirlpool*, 1910. He died Nov. 14, 1916. Pron. Syenk-yayvitch.

Sierra (Lat. *serra*, saw). Spanish name for a mountain chain or ridge whose edges are jagged or saw-like, e.g. Sierra Nevada in Spain, Sierra Madre in Mexico.

Sierra Leone. British colony and protectorate. The whole territory has an area of 27,940 sq. m. It lies between 6°55' and

10° N. lat. and 10°16' and 13°18' W. long. It is bounded N.W., N., and N.E. by French Guinea, S.E.

Sierra Leone
arms

by Liberia, S.W. by the Atlantic. It has a sea coast of 210 m. The colony proper consists of the Sierra Leone pen., about 28 m. long and 9 m. broad, and formed by a mt. ridge running parallel with the sea; Tasso I., lying N.E. of Freetown, Banana I., Bonthe on Sherbro I., and York I., to the E. of Bonthe, having a total area of c. 271 sq. m.

The protectorate has an area of 27,669 sq. m. It is flat, low-lying, and swampy near the coast, rising gradually inland to 6,000 ft. in the Tingi range. The principal rivers, the Great and Little Scarries, the Sierra Leone, and the Sherbro are navigable by small craft for various distances.

Sierra Leone used to be called the white man's grave, but a determined fight against the mosquito, the clearing of swamps, and greatly improved drainage have made it much less unhealthy.

Both colony and protectorate are administered by a governor who is also c.-in.-c. and president of the legislative council, which consists of 12 official members (heads of the principal govt. depts.), three elected and seven nominated unofficial members, of whom three are paramount chiefs of the protectorate. The protectorate is divided into 13 administrative dists., each in charge of a district commissioner. These districts form three provs., each administered by a provincial commissioner answerable to a chief commissioner who is responsible to the governor. An assembly representing the whole protectorate was convened for the first time in 1946.

The population in 1945 was estimated at 2,087,000, of whom c. 150,000 lived in the colony. The white pop. is less than 2,000. As Sierra Leone

was originally peopled by liberated slaves from all parts of Africa, there are many tribes in the area. But 13 of the tribes, each speaking a different language, are indigenous. The Mende and Temne tribes form a majority of the people, and their languages are widely spoken.

The principal imports are coal, wearing apparel, silk, wines, flour, petrol, electrical apparatus, medicines and drugs, machinery, and vehicles. The most valuable export in 1946 was palm kernels, totalling 46,773 tons, valued at £688,840. Other exports were iron ore, diamonds, piassava, nuts and beans, rubber, cocoa, coffee, gold, platinum, hides, and rice. There are 420,000 acres under rice cultivation, rice being a staple food of the people. Other crops raised for internal consumption include sweet potatoes, fundi, and ground nuts.

There is a main line of rly. from Freetown to Pendembu, 227 m., with a branch line from Baiya Junction to Bumban. Another line connects Pepel, opposite Freetown, with Port Lokko and Marampa. Roads are for the most part primitive, direct road communication between the protectorate and the colony being completed only in 1941.

Freetown (pop. 86,000), chief town of Sierra Leone, is one of the most important sea and air ports in Africa.

The colony of Sierra Leone began with the cession of a strip of land to Captain John Taylor on Aug. 22, 1788, to provide a home for liberated slaves. Periodically additions were made to the colony,

Sierra Leone. Map of the British colony and protectorate on the coast of West Africa

and in 1807 the pen. of Sierra Leone was ceded by its native ruler. In 1896 a protectorate was established over the hinterland, after its boundaries had been fixed by agreement between Great Britain and France on Jan. 21, 1895. In 1928 slavery was abolished in the protectorate, and 215,000 slaves were freed.

Sierra Madre. Name given to the mts. of Mexico. There are two ranges, the Sierra Madre Occidental and the Sierra Madre Oriental, extending almost parallel with the W. and E. coasts, and converging as they approach the S. The loftier summits, some of them more than 10,000 ft., are in the W. range.

Sierra Morena (Span., brown range). Mountain ridge of S. Spain. It rises as a steep scarp from the valley of the Guadalquivir to a height of 1,000 to 1,200 ft. above the level of the Spanish plateau, the Meseta, of which it is really the S. face. The mean elevation is 3,500 ft., and the culminating point is the Cerro de Almenara, 5,920 ft. The Rio Tinto copper mines are in the W.; silver-lead and mercury are also mined.

Sierra Nevada (Span., snowy range). Mountains of S. Spain. The range, of which the crest is less than 30 m. from the Mediterranean Sea, belongs, like the Atlas, Apennines, and Alps, to the great E.-W. system of fold mountains which terminates in the Himalayas. It lies between the valley of the Guadalquivir and the coast, and is about 25 m. wide and 60 m. long. Many peaks rise above 10,000 ft., the chief of them being Mulhacén, 11,420 ft., and Veleta, 11,385 ft. In one of the numerous cirques, the Corral de Veleta, is the most southerly glacier of Europe.

Sierra Nevada. Mountain range of California, U.S.A. It forms the E. boundary of the vast central valley of the Great Basin, and extends N.W. to S.E. for nearly 500 m. The Cascade Range is a N. continuation of the Sierra Nevada, which, in the S., merges with the Coast Range. The slopes are well forested. Sequoias are found only on the W. slope, and gold and silver are found. Several summits exceed 13,000 ft., Mt. Whitney, 14,502 ft., being the highest peak in the U.S.A. See California.

Sierra Nevada de Mérida. Mountain range of S. America. It is a N.E. continuation, for about 250 m., of the E. Cordillera of the Andes from Colombia. It separates the provs. of Mérida and Zamora. The chief peaks are Coluna and Concha, each 15,400 ft.

Sieve, SCREEN, OR RIDDLE. Agricultural implement used for sorting potatoes. The sieve is usually mounted on a stick and shaken by hand, the smaller potatoes falling into a basket below. The modern labour-saving type is called a riddle, and consists of a hopper which feeds potatoes on to two or three tilted oblong graded sieves arranged one above another, through which the potatoes fall into their appropriate baskets. Extra large or imperfect potatoes are lifted off the top sieve by hand.

Sieyès, EMMANUEL JOSEPH (1748-1836). French statesman and political philosopher. Born at Fréjus, May 3, 1748, he entered the Church, and became vicar-general of Chartres, 1784. A member of the provincial assembly of Orléans, 1787, he was deeply concerned with the political situation of France, and his three pamphlets, especially that on the third estate, 1788, attracted wide attention. A member of the states-general and of the national assembly, he produced in 1789 his plan for a new constitution. He sat in the convention, 1792, voted for Louis' execution, entered the committee of public safety, 1795, the council of 500, 1797, and went as ambassador to Berlin, 1798.

He was one of the three consuls with Bonaparte (18 Brumaire), but had little influence. Created count of the empire, 1808, he opposed the return of Napoleon, 1814-15, and lived in exile in Holland, 1815-30. He died in Paris, June 20, 1836. Sieyès was a political thinker of originality, a constitutionalist and enemy of the tyrannies which went before and after the Revolution, but deficient in a talent for practical politics.

Sigerson, GEORGE (1839-1925). Irish historian and poet. Born at Strabane, co. Tyrone, Jan. 11, 1839, he was educated at Queen's College, Cork, and studied medicine in Paris. He wrote many medical books; also numerous historical works. He is, however, best remembered for his translations of Irish poetry; and published two or three volumes of original verse. He became a senator of the national university of Ireland. He died Feb. 17, 1925.

Sigerson, DORA. Maiden name of the Irish poet, Dora Sigerson Shorter, daughter of George Sigerson (v.s.) and wife of C. K. Shorter (q.v.).

Sighisoara. Town of Rumania, in Transylvania, formerly known as Schässburg and Segesvar. It is situated on the river Tarnava

Mare (Nagy Kükküllő), on the rly. between Brassó (Kronstadt) and Sibiu (Hermannstadt). Textiles are manufactured. It was captured by the Russians from the Germans during the Second Great War, Sept. 11, 1944. Pop. 13,000.

Sight. One of the senses. It involves perception of three things, viz. light intensity, colour, and form. See Eye; Sight Testing.

Sights. Devices on a firearm to assist the eye in laying or sighting a correct aim on a target. The simplest principle is to have a fore-sight on the muzzle, to allow the weapon to be pointed in the true direction of the target, and a back-sight fixed to the breech to give the correct range and elevation and ensure that the projectile does not fall beyond or short of the target. The line of sight is an imaginary straight line passing from the firer's eye through both sights to the point aimed at. On rifles the fore-sight is usually a knob or wedge fixed in an upright position, while the back-sight is a U-shaped piece which may be raised vertically or moved laterally.

Until 1942 the back-sight on the British army rifle had a scale allowing sighting over ranges from 200 to 2,000 yds. Then a simplified type of rifle was introduced with two aperture sights at the rear, one for 200 yds., the other for 400 yds. Elaborately sighted rifles to give a variety of ranges are now restricted to snipers. Direct sighting on a target is seldom used except with rifles, machine-guns, and light anti-tank and A.A. artillery. Nearly all field artillery above 40-mm. calibre is indirectly sighted, i.e. the gun is laid for line and elevation according to requirements.

A.A. weapons of .5 calibre and below are directly sighted through ring and aperture or ring and bead sights; the latter method is more accurate but requires a highly trained gunner to hit the target. All other types of A.A. artillery are sighted and fired by predictor. In bad visibility or at night, sighting is by radar direction. Guns mounted on military aircraft have gyroscopic sights fitted in the pilot's cockpit or gunner's turret; these operate efficiently even when the aircraft firing is 'making violent movements while taking evasive action. Similar types of sights, but for indirect firing, are employed for ranging naval artillery, which also uses radar for night firing. See Artillery; Ballistics; Bomb Sight; Predictor; Range-Finder.

Sight Testing. Determination of acuteness of vision. It may be required by a person who complains of imperfect sight, or by one seeking admission to state service. A person's sight is tested, after careful examination with ophthalmoscope and retinoscope, by placing him with his back to the light and showing him in a good light a board containing a series of rows of letters known as test types. Each row is intended to be read at a definite distance, and the letters of each row are smaller than those of the preceding row. The test type is generally designed

Sight Testing. Left, test for astigmatism; with normal sight all the lines should appear equally distinct. Right, card with test type (reduced to $\frac{1}{2}$)

to be placed at a distance of 6 metres from the person who is being examined. If v be the acuteness of vision, d the distance between the eye of the individual and the test type, and D the distance at which the type should be distinguishable, then $v = \frac{d}{D}$. Thus if at 6 metres the type distinguishable at 6 metres can be read, then the vision is $\frac{6}{6} = 1$, or normal. The stereoscopic sense can be tested by placing a red glass before the right eye and rotating a multiple glass rod before the left eye. With normal binocular vision the red spot appears bisected by a white streak.

Sigismund (1368-1437). German king and Roman emperor, 1411-37. Born Feb. 15, 1368, he succeeded his father, the emperor Charles IV, as margrave of Brandenburg in 1378, and nine years later became king of Hungary by right of his wife Maria, daughter of Louis I (q.v.). His utter defeat by Bayazid I at Nikopolis, Sept. 28, 1396, was the signal for the outbreak of serious disturbances. In 1411 he was elected German king. He summoned in 1414 the council of Constance, which by deposing three rival popes ended the Great Schism. His responsibility for the death of Hus (q.v.), who attended

the council under safe conduct, angered the Bohemians, who contested Sigismund's accession to the throne on the death of Wenceslas in 1419; and it was only after 17 years of bitter warfare that Sigismund could enter the Bohemian capital as king. He died at Znaim, Dec. 9, 1437.

Sigismund I (1466-1548). King of Poland. He was the son of Casimir IV, and succeeded his brother Alexander in 1507. The first years of his reign were spent in correcting the abuses of the government and in repulsing the Russians, on whom he imposed a severe peace settlement in 1514, driving them to Moscow. He died at Cracow, April 1, 1548.

Sigismund III (1566-1632). King of Poland. Son of John III of Sweden and the Polish princess Catherine, he was elected king of Poland, Aug. 19, 1587. He persecuted the Protestants with great bitterness. On the death of his father, Oct. 19, 1592, he succeeded to the throne of Sweden, and was crowned Feb. 19, 1594, but was dethroned in 1604. He retained the Polish crown. He died April 30, 1632.

Sigmaringen. Town of Germany, capital of the former duchy of Hohenzollern-Sigmaringen, which was merged with Württemberg in 1935. It lies on the Danube, 54 m. S. by E. of Tübingen. The chief building is the castle, partly reconstructed after a fire in 1893. Its predecessor was long the residence of a branch of the Hohenzollern family. The castle contains a museum with a remarkable collection of antiquities, a picture gallery, library, and armoury, the pictures, books, and manuscripts being valuable. Near by are iron foundries, and there is a trade in wood and cattle. After the Second Great War Sigmaringen came within the French zone of occupation. Pop. 5,000.

Sign. Mark or token, that by which a thing is represented or

known. The term is also used for an omen or portent. Signs, in so far as they may be pictorial symbols, may form specialized languages of their own, as in the examples of road signs, mathematical symbols, heraldic devices, railway and traffic signals; or they may be a mark of individual identity as in flags or trade marks (see Flags; Road Signs; Signaling; Symbol; Trade Mark, etc.).

A particular use of the term refers to such displays of identity as are seen in village signs, inn signs, and shop signs. From the last, which originally gave prominence to the type of shop by means of, e.g., the barber's pole, the tobacconist's Highlander, the grocer's gilded ham, the surgeon's red lamp, the chemist's coloured bottles, and the pawnbroker's three gilded globes, evolved the signboard which publicised the name of the proprietor. At first this was most usually fixed over his shop window or door, the name being painted on wood by a signwriter, sometimes with additional gilding to the letters. But many other methods were soon evolved of obtaining greater publicity, e.g. the hanging or projecting sign, more calculated to catch the eye of the passer-by; the sky sign, with metal letters fixed to a framework above the building, with the sky as a background; various forms of glass sign; the illuminated sign (electric lamps, fluorescent tubes), many of them constantly changing their patterns. When such signs were used apart from shop premises, they entered the field of advertising.

Inn signs in England have aroused the interest of artist and antiquary alike. Innkeepers were compelled to exhibit signs, and their sources of inspiration were

Sigmaringen, Germany. The Hohenzollern Castle, built on a rock rising abruptly from the Danube

innumerable. Family badges and coats of arms suggested all the Red Lions, White Harts, and other heraldic signs. Others displayed portraits of notabilities, real and legendary, rebuses on innkeepers' names, and random combinations of objects of all kinds. Examples of rebus signs include The Brace (kept by two brothers Partridge), The Hat and Tun (kept by a man called Hatton), The Bag o' Nails (The Bacchanals). Among famous artists who painted inn signs is Hogarth. In the 20th century there was some revival of interest and practice in the pictorial side of the art in certain parts of the country, e.g. West Sussex, where a novelty was introduced by the painting of two equally appropriate designs, one each side of a projecting signboard, the one with an old time setting, the other contemporary in its details. See Signpost.

Signac, PAUL (1863-1935). French painter. Born in Paris, Nov. 11, 1863, he studied under Guillaumin, through whom he became acquainted with Impressionist teachings. A friend of Pissarro and Seurat, he developed the theories and technique of the Neo-Impressionist school. His work was dominated by an acute sense of the laws of contrast, and his technique was the logical consequence of Monet's impressionism. Instead of applying dots as in pointillism, he placed pigment in small rectangles, giving his canvases the appearance of mosaics. He published works on Delacroix, 1899, and Jongkind, 1927. He died Aug. 17, 1935.

Signalling. Audible or visual means of transmitting and receiving information between two points on a prearranged system. Except on railways, in the regulation of road traffic, and in ground communication to aircraft, there is little distinction between civil and military signalling.

Man first signalled with his arms; but any fold in the ground soon renders these invisible. Smoke signals, another early form, are still used by primitive peoples; codes have been made possible by covering or uncovering the smoke column with skins or cloth. At night there were beacons. Aeschylus's Agamemnon describes how the watcher on the palace roof at Argos sighted the beacon announcing the fall of Troy. This was for centuries the principal means of signalling in Great Britain. In the 14th century there was a beacon chain along the coast from the

Sign. Signboards exhibited by London tradesmen. 1. Pawnbroker's sign, from an old shop in Drury Lane. 2. Barber-surgeon's pole, with bleeding basin, 18th century. 3. Gilded ham, used by provision merchants. 4. Hatter's sign. 5. Highlander, formerly placed outside tobacconists' shops

1. Guildhall Museum, London. 2. Wellcome Historical Medical Museum, London

Humber to Cornwall to give warning of enemies from the Continent, and a most efficient system was set up when the Spanish Armada was threatening England. A message could be transmitted to London from the coast in 15 minutes by this means.

In 1684 Robert Hooke introduced a signalling device consisting of a black board on a frame. By means of pulleys, 24 white stencils representing letters of the alphabet (omitting I and V) were brought into position in front of the board. The next step was the semaphore (*q.v.*), which remained in use on land until the introduction of the electric telegraph. Military field telegraphs were first used in the Crimean War. From 1866 field telegraph companies of the Royal Engineers provided the principal long-distance communication in land warfare until largely superseded by radio communication in the Second Great War.

Heliograph and Lamp

The earliest recorded use of the heliograph principle was in 490 B.C., when the Persian "fifth column" in Athens signalled to the Persian fleet by reflecting the sun from a polished shield. The same system was used by both sides in the battle of Marathon, and by Alexander the Great. Heliographs were not again used until

1870, when John Mance introduced the mirror-reflector type. By covering or uncovering the mirror, messages can be transmitted in Morse. Mance's heliograph was first used in the Afghan War of 1879.

Two forms of lamp signal will convey messages in Morse. One, mounted on a tripod, consists of a 12-volt lamp taking current from dry cells; it has a range of 2-4 m. by day and 6-12 m. by night. The Aldis lamp has the same power and range, but is held in the hand. A trigger attachment alters the angle of a mirror reflector behind the bulb, so cutting off or restoring the light to produce Morse flashes.

All forms of visual signalling are becoming obsolete in land warfare, as transmission is easily detected from aircraft. Radio transmitters enable coded messages to be sent over greater distances with less chance of error. When battles were fought at short range, orders in the field were sent by bugle, whistle, or drum. Bugle and whistle survived into the First Great War. Signalling by bells originated in China, and in the 14th century was accepted in England as a warning of invasion—as again in 1940, when no church might ring its bells except to raise the alarm.

Naval signalling developed from the Phoenician practice of hoisting

shields in various parts of a ship's rigging and displaying multi-coloured pennants. In 1543 the French introduced the first sea signalling manual. In 1660 they started coloured flags for letters of the alphabet. After the Restoration, the duke of York tried unsuccessfully to have the French system adopted by the Royal Navy, and British signalling at sea remained inefficient until 1800, when the Admiralty adopted Popham's telegraphic signals of nine numbered flags, which could express 999 combinations, 26 letters of the alphabet, and 973 words or phrases. This code remained in use throughout the navy and merchant service until 1817, when Marryat, the novelist, introduced his code for the merchant service. This used 18 flags only, and ignored vowels. In 1857 Marryat's system was adopted, with slight variations, as the commercial code of flag signalling, and in 1887 was developed into the International Signal Code.

International Signal Code

After revision in 1934, the present International Signal Code, with a flag for each letter, was universally adopted. Every merchantman and warship carries a complete set of flags: 26 square alphabetical flags, ten numeral pennants, three triangular substitute flags, and an answering pennant. The first substitute repeats the first flag in the group hoisted. Each alphabetical flag may also signify a standard order or phrase. When flown from a ship in harbour, the letter P means "All aboard, I am proceeding to sea"; but at sea it means "Your lights are out." The letter A alone indicates that the vessel is on speed trials. Q, a plain yellow flag, indicates that the ship is liable to quarantine, but, having no sickness on board, desires a free pratique. L (Yellow Jack), divided into yellow and black quarters, formerly denoting contagious disease on board, means "You should stop; I have something important to communicate." Other single-letter signals are: C. Yes; D. Keep clear of me; F. I am disabled; G. I want a pilot; K. Stop your ship; N. No; O. Man overboard; S. I am going full speed astern; U. You are running into danger; V. I require assistance. T, followed by figures, represents time (24-hour system); P followed by four numerals indicates latitude and longitude. There are two-letter, three-letter, and four-letter groups.

Only five colours, black, white, red, blue, and yellow, are needed

in the whole range of 40 flags. Crosses, bars, stripes, and other marks are so arranged that should bad visibility prevent the colours being distinguished the flags are instantly recognizable. In normal visibility, a signal can be read by glass from 5 m. Flags are never hoisted more than four at a time, and usually in combinations of letters and numerals that represent whole messages. The merchant navy usually spells out the words letter by letter, except standard phrases.

To acknowledge a signal, the answering pennant is hoisted close up the truck; when it is lowered to the dip, the next hoist is made by the answering ship. In the event of the receiving ship being unable to read a signal, she keeps her pennant at the dip and herself hoists U W—"I cannot distinguish your flags." The three substitute flags avoid repetition of a letter in a single hoist.

For reaching beyond the visibility of colour, an alphabet is formed from combinations of black flags, pennants, and bells. Visual weather-signalling from shore to ship is by black cones or lamps. Underwater signalling, as between submarines, is by sound waves on the principle of the hydrophone (*q.v.*), while aircraft rely on light signals or radio telegraphy and telephony. Visual ground-to-air signalling is used (*see* Colour Plate).

Railway Signalling

Before telegraphy was developed, trains were controlled by a time limit, and one was not allowed to leave a station until some minutes had elapsed after the departure of the preceding train. With the advent of telegraphy came the block system which, controlled by pivoted arms from a signal box, prevented two trains being on a section of line at the same time. Next came the lock and block, which interlocks the signals and telegraphic instruments, so forcing the signalman to maintain the section unoccupied. On many lines in Great Britain, multiple-colour light signalling is replacing semaphore equipment. Red, yellow, or green beams of light of high intensity can be read in all but thick fog. One system uses a single coloured lens, a lamp being provided for each aspect. The searchlight type has one lens and one lamp; a moving "spectacle" carrying red, yellow, and green filters is placed between them and electrically actuated to interpose whichever filter is required. Other colour signals are used for shunt-

ing, etc. (*see* Colour Plate). Where lines carry exceptionally heavy traffic, track circuit signals are installed, allowing the trains automatically to set the signals behind.

Road traffic is regulated either by hand signals or by traffic lights; these latter either work on automatic time phases or are actuated by the traffic passing over strips in the road in electrical contact with the signal post.

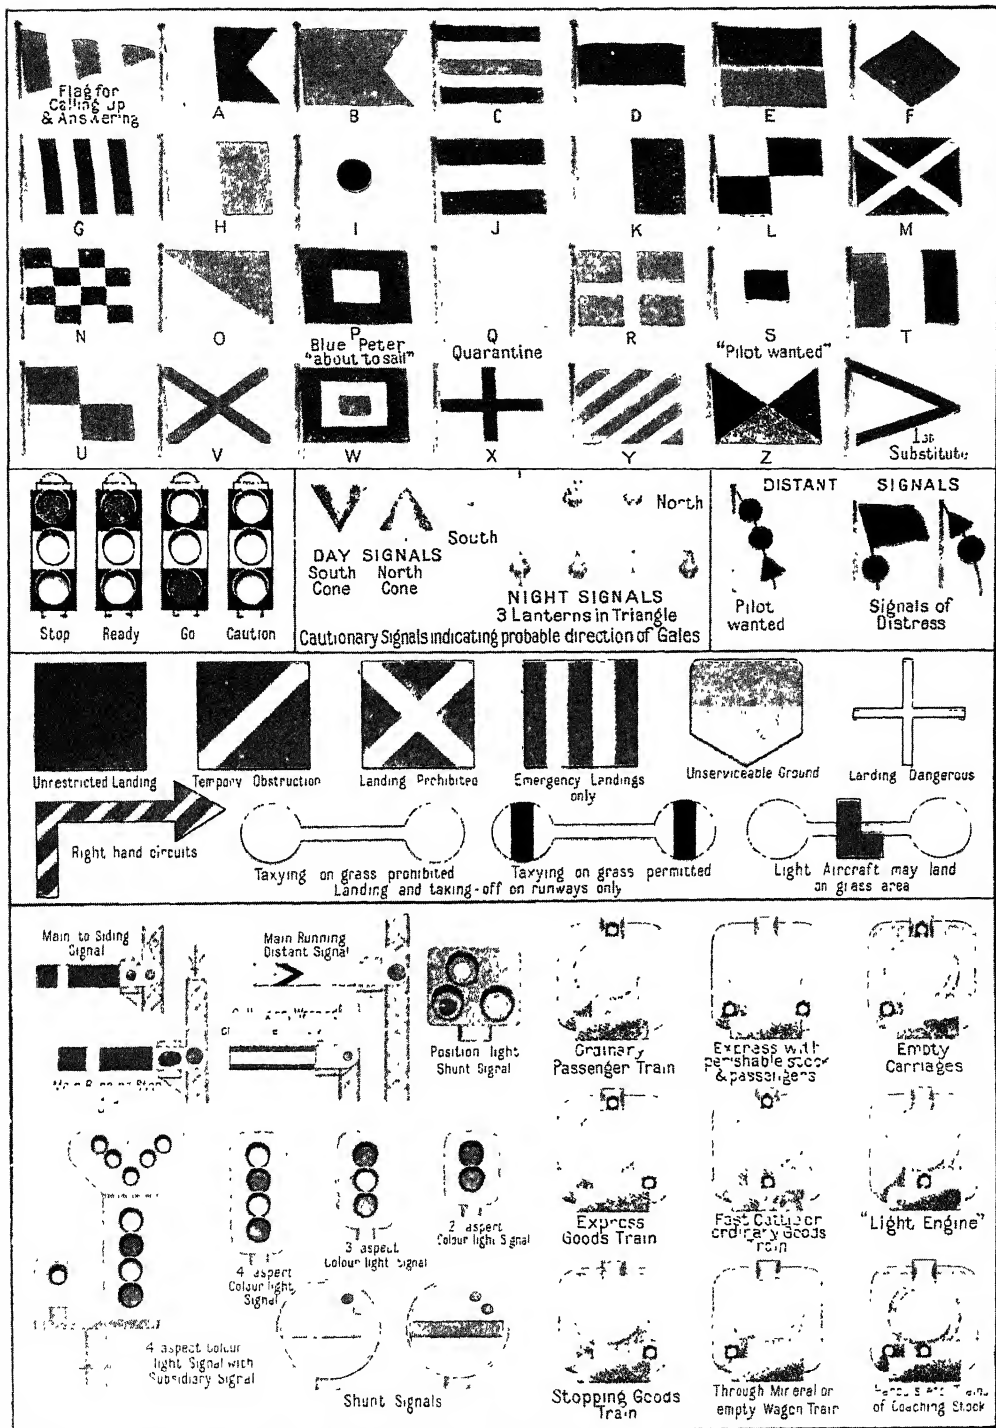

Signature (Lat. *signum*, a mark). Literally, the name of a person written by himself or herself. In printing, it means the letters or figures printed at the foot of the first page of a sheet or section of a book or magazine as a guide to the binder. Artists' signatures are a comparatively modern device, those of old masters usually consisting of monograms which vary in different works.

Episcopal signatures consist of the chief Christian name followed by an abbrev. of the name of the province or see, the latter sometimes in Latin, *e.g.* Archbishop of Canterbury, Geoffrey Cantuar; Archbishop of York, Cyril Ebor.

Signature. In music, a sign or signs placed on the stave indicating (1) pitch, (2) time. As to (1) the clef (*q.v.*) is one signature, but the European system of tonality necessitates another, in order to show what notes are permanently inflected for a given key, the requisite sharps or flats being placed on each stave. The minor key uses the same signature as the major key three semitones higher, its normal seventh note being raised by an accidental ♯, ♮, or x. Naturals are shown in a signature only when it is desired to contradict previous signs.

(2) The time signature is put at the beginning, or when a change is wanted. It consists of two figures, one above the other, the lower showing how the semibreve is divided, and the upper stating how many of these divisions are included in the bar.

When the beat is an undotted value (simple time), the top figure indicates the number of beats; but not when it is a dotted value (compound time), as the semibreve is indivisible into an aliquot number of dotted values. Therefore the number of notes next less in value is shown. Thus $\frac{2}{4}$ stands for two plain crochets, and $\frac{6}{8}$ for two dotted crochets in the bar. Generally the beat is a crochet, plain or dotted, but occasionally other values are used. Four crotchets in a bar is sometimes

SIGNALLING: EXAMPLES OF FLAGS AND OTHER SIGNALS IN DAILY USE

shown by C , which is a survival from the medieval period when a circle meant triple or perfect time, and a half circle, imperfect time (duple or quadruple).

With a stroke through it, C stands for two minims, and with two strokes C for four minims (alla breve). See Key Signature.

Signature Tune. Particular tune adopted by a popular musical entertainer, e.g. dance band leader or theatre organist, to introduce or conclude his programme, especially when broadcasting. It was first popularised by the band leader Jack Payne, who began about 1930 to open and close all his radio programmes with the tune Say It With Music. The practice was widely followed in Great Britain, the U.S.A., and elsewhere.

Signet (Lat. *signum*, sign). Word meaning something signed or sealed. A signet-ring is a ring which contains the private seal of the wearer. See Ring; Seals.

Signet, WRITER TO THE. In Scotland, a member of a society of solicitors; though a solicitor need not belong to the society. The society of writers to the signet probably originated among the clerks of the secretary of state, who had keeping of the Scottish king's seal. The writers were recognized as members of the college of justice in 1532, and certain classes of writs, etc., which had to be signetted, were drawn by the writers to the signet. The chief officer bearer is the keeper of the signet, and is appointed by the crown, and members use the initials W.S. after their names.

Sign Manual. Autograph signature of the sovereign. Certain executive documents are so signed by the king in place of using the great seal. It may also be an authority for fixing the great seal to a document, and in either case the king's signature is counter-signed by a minister. See Seals.

Sign of the Cross, THE. Religious melodrama by Wilson Barrett. It was produced, Jan. 4, 1896, at the Lyric Theatre, London, where it ran for 435 continuous performances, and thereafter toured the world. The plot hinges on the persecution of the early Christians by Nero. Wilson Barrett played the hero. A film version was seen 1933.

Signorelli, LUCA (c. 1441-1523). Italian painter. Born at Cortona, he studied under Piero della Francesca, and was influenced by Antonio Pollaiuolo and Donatello. His greatest extant work is the series of frescoes of the Last Judge-

ment in Orvieto Cathedral (1499-1504). Other notable paintings are at Cortona and Rome (Vatican).

Signpost. Vertical post with one or more horizontal boards at its summit to indicate direction.

Signpost of the type erected and maintained by county councils, bearing name of parish on ring above the arms

The boards carry the names of one or more places, with their mileage from the position of the post, and point in the direction of the places indicated. The post also bears the name of the parish and county in which it stands. British signposts are generally set up at cross roads and junctions, and their erection and maintenance is the responsibility of the county council under direction of the ministry of Transport. Others are maintained by the R.A.C. and A.A. The latter body has fixed circular sheets of metal at the entrances and exits of villages and towns; painted yellow with black lettering, they give the name of the place and its distance from London. Under defence regulations (*q.v.*) of the Second Great War, it became obligatory in 1940 to remove signposts likely to assist an invading enemy.

Sigüenza. City and episcopal see of Spain. It is in the prov. of Guadalajara, on the Henares river and the Madrid-Saragossa rly., 87 m. N.E. of Madrid. The ancient Sagontia of the Celtiberians, it is built on the slopes of a hill, 3,500 ft. high, crowned with a castle. The cathedral, dating from the 12th century, has its front flanked by two lofty rectangular towers. The modern part of the town, in the N., with wide boulevards and gardens, contrasts with the winding streets of the old Moorish quarter. Pop. 4,500.

Sigurd. English form of the Old Norse name Sigurdhr, under which name Siegfried, the legendary hero of German epic, especially of the Nibelungenlied, appears in Icelandic literature, notably in the older Edda, and in the Völsunga Saga. The name was borne by two kings of Norway, Sigurd I, the Crusader (d. 1130), and Sigurd II, called Mund (d. 1155). See Nibelungenlied; Siegfried; Völsunga Saga.

Sigurðsson, JON (1811-79). Icelandic scholar and politician. Born June 17, 1811, the son of a country pastor, he graduated in Copenhagen in 1833, and for some years was secretary to Bishop Jonsson. He was the first president of the Icelandic Society, and edited the learned collection *Diplomatarium Islandicum*, with contributions on Icelandic law, history, and politics. Chief champion of his country in her fight for freedom, he was elected member, and afterwards Speaker, of the Althing, and in 1874 his struggles for home rule for Iceland were successful. Before his death on Dec. 7, 1879, he was a national hero. Sigurðsson's valuable library is now the property of the state.

Sikandarabad. Town of India, in the Uttar union, in Bulandshahr div. It is situated N.W. of Bulandshahr town, and manufactures fine muslin. Pop. 21,000.

Sikandra Rao. Town of the Uttar union, India, in Aligarh dist., almost midway between the Ganges and the Jumna. Founded in the 15th century, it was a centre of rebellion during the Mutiny of 1857. Pop. 13,000.

Sikang. Province in W. China bordering Tibet. It contains 46 counties and two administrative bureaux, with Kangting as its capital. Other cities are Yaan and Sichang. Sikang forms part of the E. Tibetan plateau, the whole of its W. region being mountainous. There is no rly., and only two highways link it with the provs. of Szechwan and Chinghai. Its main products are livestock, gold, and wheat. The giant panda inhabits the high mts. bordering Sikang and Szechwan. Area 164,991 sq. m. Pop. 1,756,000, including Tibetans and Lolos.

Sikes, BILL. Character in Dickens's *Oliver Twist*. He is a brutal burglar, whom Oliver is forced to accompany on an expedition. Sikes murders his unhappy mistress, the pathetic Nancy. In a film version of the story (1948) the part was memorably played by Robert Newton.

Sikh (Hind., disciple). Indian religious community. Numbering some 3,000,000, they formed one-tenth of the pop of the British

Punjab, and one-fifth of that of the Punjab states, especially Patiala, Jind, and Nabha. The dividing line

Sikh. A Sikh soldier of the Second Great War. Top: civilian

between India and the dominion of Pakistan in the Punjab runs through the area in which the Sikhs lived, and following partition in 1947 those of the W. Punjab migrated to the E. Punjab, becoming involved in the riots and sufferings of the mass E. to W. and W. to E. migrations of that time. Predominantly of Jat stock, they are hardy, tall, and bearded. The true Sikhs or Singhs wear the five k's: kes, uncut hair; kacch, short drawers; khara, iron bangle; kripan, sword; khanga, comb. In the conical turban, pag, were formerly worn several sharp-edged quoits, chakra, used as rotary missiles in war. They do not use tobacco; they observe the prohibition of wine loosely. They reverence the cow, but reject other Hindu customs, including pilgrimages, girl infanticide, and purdah seclusion. Their non-Hindu marriage rite was regularised by the Anand Marriage Act, 1909. They maintain a Khalsa college at Amritsar, girls' schools, and orphanages.

Sikhism was founded by Nanak (1469-1539) as a monotheistic reform, designed to embrace Hindu and Mahomedan in one brotherhood. Retaining the doctrine of transmigration, Nanak deprecated image worship, priestcraft, and caste, and laid great stress on the ethical side of his teaching, especially the virtues of honesty,

loyalty, justice, and benevolence. Regarded as the first guru, or religious teacher, he was succeeded by nine others—Angad, Amar Das, Ram Das, Arjan, Har Govind, Har Rai, Har Krishan, Tegh Bahadur, and Govind Singh (1666-1708). Ram Das founded the Sikh sacred city Amritsar. Arjan compiled the original scriptures, Adi Granth, a composite work in metrical form.

The supplementary Dasam Granth made by Govind is accepted by some extreme sections only. Govind, who appointed no successor, declared that the Granth is the true guru. The temple copies of it now receive idolatrous worship, and are carried in procession on Nanak's birthday.

Sikh membership is not hereditary, but secured by individual initiation at the khanda pahul. This rite, inaugurated by Govind, is preceded by ceremonial ablution, whence it is sometimes called baptism. The candidate drinks in ritual communion with five initiated Sikhs amrit or nectar stirred with a dagger, being henceforth called Singh, lion. These warrior Singhs, the long-haired Kesdharis, or wearers of the five k's, are distinguished from the Sahijdharis, mostly cultivators and mechanics, who follow the Nanak rule.

After Har Govind, the fraternal spirit of the earlier gurus gave way before militant aspirations. Under Govind Singh the community was called Khalsa, the property of God. After him confederacies, misls, were formed, and the hereditary chief of one, Ranjit Singh (1780-1839), combined all into a formidable power, with which a British treaty was made in 1809. The anarchy following his death led to the Sikh wars of 1845-46 and 1848-49, resulting in the annexation of the Punjab. During the Indian Mutiny the Sikhs were enrolled and did good service in the relief force which marched from the Punjab to Delhi.

In the Two Great Wars

In the First Great War they distinguished themselves on many fronts. Because of political differences with the British, the number of Sikh regiments was later reduced; at the start of the Second Great War only one remained, and Sikhs generally fought in companies side by side with Punjabi Muslims, Dogras, or Rajputs. In both Great Wars several Sikhs won the V.C. See Amritsar; Army colour plate; India. Consult Sikh Ceremonies, Sirdar J. Singh, 1941; The Sikhs, J. Archer, 1946; Rise of Sikh Power, N. K. Sinha, 1947.

Sikh Wars. Two campaigns preceding the annexation of the Punjab by the British, 1845-46 and 1848-49. The death of Ranjit Singh in 1839 left the Sikh army which he had created leaderless, but confident of its invincibility. Towards the end of 1845, this army, 60,000 strong, crossed the Sutlej, and marched on Ferozepore. At news of the invasion Lord Gough (*q.v.*) hastened thither, and after a sharp engagement at Moodkee, Dec. 18, defeated the Sikhs at Ferozeshah (*q.v.*), Dec. 21, driving them across the Sutlej.

The following month they reformed, crossed the river again, repulsed Sir Harry Smith's force at Buddowal, Jan. 20, 1846, but were totally defeated by Smith eight days later at Aliwal (*q.v.*). Gough's victory at Sobraon, Feb. 10, proved the final blow, and the British immediately invaded the Punjab. Rajah Dhuleep Singh submitted in person, and Lahore was occupied.

The continued unrest and plotting of the Sikh rulers led to another outbreak in the autumn of 1848, when Shere Singh collected an army of 15,000, and declared war. Gough opened the campaign by an advance across the Ravi, and after severe repulses at Ramnagar and Sadulapore, defeated the Sikhs at Chillianwalla (*q.v.*), Jan. 13, 1849, although the battle was indecisive. The capture of Mooltan and the battle of Gujarat closed the war, and the Punjab was annexed to British India, March 29, 1849. Consult The Sikhs and the Sikh Wars, C. J. S. Gough and A. D. Innes, 1897.

Si-kiang or WEST RIVER. River in S. China. It rises in the E. of Yunnan and flows through Kwangsi and Kwangtung. Including the Hungshui, which comes down from Kweichow prov. and joins it at Sunchow, the course is 1,250 m. The river is navigable for steamers for over 200 m. to Wuchow, and for smaller craft another 100 m. At Samshui the Si-kiang divides into several branches, forming the Canton delta. The Hungshui is sometimes regarded as a tributary, the name Si-kiang being given to the river below Nanning, where the Yukiang and Likiang meet.

Sikkim. State in the Himalaya Mts., a protectorate of the government of India. Sikkim lies between Nepal on the W. and Bhutan and Tibet, with which it has trade communications, on the E., with Kunchinlunga on the N. border, and is crossed by the trade route through the Chumbi valley

to Gyantse in Tibet. There are extensive forests and state fruit gardens, and the chief products are rice, Indian corn, and millet, woolen cloth, and oranges. Most of the people are Nepalese, the others are Lepchas and Bhutias; most are Hindus, though the official religion is Buddhism. Gangtok is the capital. Area, state, 2,818 sq. m. Pop. 121,520. Consult Himalayan Village, G. Gorer, 1939.

Sikorski, Wladyslaw (1881-1943). Polish statesman and soldier. Born in Galicia (then

Wladyslaw Sikorski,
Polish soldier

Austrian), May 30, 1881, he studied engineering at Cracow and Lwow universities, and became a leader of the movement for the liberation of Poland from tsarist Russia. Sikorski served in the First Great War and in the Polish-Russian conflict of 1919-20, becoming chief of staff, and in 1922 premier. Minister of war 1924-25, he retired to France for ten years, 1928-38, because he disapproved of Pilsudski's methods of govt. Sikorski was in Poland when it was attacked by Germany in 1939 but, after his services had been refused by Smigly-Rydz, he escaped to France, where he at once started to build up an army of 60,000 exiled Poles, and was chosen prime minister and c.-in.-c. in the exiled govt. He visited Canada and the U.S.A. in 1941 and in 1942 to secure aid for Poland; and in 1941 also visited Moscow, where he signed, July 30, a treaty with Russia which annulled the Russo-German partition of Poland and restored diplomatic relations between the Polish govt. and Russia. But the good will he thus

promoted did not last, and when Sikorski was killed in an aeroplane accident at Gibraltar on July 4, 1943, as he was returning from a visit to Polish troops in the Middle East, Russia had already broken off diplomatic relations again.

Sikorsky, Igor I. (b. 1889). American aircraft designer of Russian birth. In 1913 he built and flew the first multi-engined aeroplane, and during the First Great War designed Russian Army bombers. In the U.S.A., where he was naturalised, 1928, he designed the Sikorsky amphibian and helicopter, the latter adopted for military use 1942 and for civil 1946.

Silage (Gr. *siros*, pit for corn). Succulent fodder produced by Ensilage (*q.v.*)

Silas Marner. A short novel by George Eliot. It was published in 1861, with the sub-title, *The Weaver of Raveloe*, and is generally regarded as the most artistic of her masterpieces. In it, as in her earlier novels, she drew upon her recollections of life in the English Midlands. Silas Marner, the solitary weaver suffering under unjust suspicion, finds a dead woman and a living infant near his door and adopts the child, who becomes his regenerator.

Silbury Hill. Prehistoric mound in the Kennet valley, Wilts. Built of chalk rubble, flat-topped, 552 ft. across, 135 ft. high, its pre-Roman origin is shown by its being skirted by a Roman road. It is probably a Neolithic or Bronze-age barrow (*q.v.*), although excavations have revealed no interment.

Silchester. Village in N. Hampshire, the site of the Romano-British town of Calleva Atrebatum. Its systematic excavation from 1890 onwards revealed walls, streets, and house-foundations, besides an invaluable assemblage of objects, now in the Reading Museum. Within an area 820 yds. by 803 yds. were a basilica, forum, residences of opulent merchants, dyers', millers', silversmiths', and other establishments. A church, 42 ft. by 27 ft., probably 4th century, was the first undisputed Christian edifice in Britain. Apparently built upon a late-Celtic earthwork, Silchester's population, with no military element, never exceeded

3,000. The amphitheatre, accommodating 10,000 spectators, was second only to Maumbury Rings.

Silencer. Component of an internal combustion engine, designed to silence emission of exhaust gases. If the gases escape direct into the atmosphere they make a considerable noise, being still under appreciable pressure. They are therefore led by an exhaust pipe into an expansion chamber; on leaving the chamber the noise is much reduced owing to the reduction in pressure which has occurred through expansion. In its simplest form the silencer is a sheet-steel cylinder containing one or more baffle plates to prevent the exhaust gases from rushing straight through. The exhaust pipe is connected to one end plate and a tail pipe to the other.

Silene (Gr. *stalon*, saliva). Genus of annual and perennial herbs. Of the family Caryophyllaceae, they are natives of the N. temperate regions, especially the Mediterranean. Commonly known as catchflies andampions, 8 species are found wild in Britain. They have smooth round stems, with thickened joints. The paired leaves vary from a broad lance-shape to slender awl-shape; and in many species the leaves or the whole plant is covered with a sticky

Silenus. An ancient
statuette at Naples

Silenus. In Greek mythology, the companion of Dionysus (Bacchus), son of Hermes, or, according to other accounts, of Pan. He is generally represented as an old man, stout and of cheerful demeanour, bearing a wine-bag and always intoxicated. He possessed prophetic powers. See Midas.

Silchester, Hampshire. Foundations of the first Christian church in Britain

Silesia (Pol. Slask; Czech, Sllesko). Area of E. Europe, c. 17,000 sq. m. in extent. Here a Celtic pop. lived until c. 100 B.C., it was subdued by the Teutonic Vandals, who, in turn, were dispossessed by Slav, Polish, and Wendish tribes, c. A.D. 400, but remained in parts of the area. Bohemians conquered the land in the 10th century and, from about 1100, fostered German immigration, especially from Bavaria and Thuringia. Most of the towns and industries, and Silesia's civilization, date from that time.

Through the intervention of the German Emperor Frederick I in 1163, the three sons of a Polish ruler were granted separate duchies in Silesia; the rule of these Piast dynasties, with many subdivisions, lasted until the 16th century, under at different times Polish, Bohemian, and Austrian suzerainty. Under an agreement of 1537, Frederick II of Prussia claimed Silesia from Austria and, in his wars against Maria Theresa, 1740-42 and 1744-45, conquered it. It was enlarged in 1815 by the transfer to Prussia of the Saxon dist. of Upper Lusatia. After the First Great War the Hultschin dist., 1,707 sq. m., went to Czechoslovakia (pop. 1935, 738,000); while about 1,630 sq. m. (pop. 1,315,000), including the Teschen area, went to Poland by decision of the League of Nations, Oct. 20, 1921, after a plebiscite of the previous March. The rest, two provs., Upper Silesia, 3,750 sq. m., pop. 1,482,000, and Lower Silesia, 10,270 sq. m., pop. 2,301,000, remained part of Germany.

The mineral wealth of the area was the reason for these changes. Of the rich Silesian coalfields, the bulk of which had previously been German, Poland secured two-thirds: in 1913, Silesia produced 43 million tons; in 1935, German Upper Silesia produced 14 million tons, Polish Silesia 30 million tons. Poland also received the great Königshutte and Katowice steel industry, the huge smelting houses of Tarnowice, and nearly the whole zinc and lead industry, the famous chemical (nitrogen) works of Chorzow, and several spas. Lower Silesia also (still German) had important coal and lignite mines, engineering works, a huge glass and ceramic industry, and, most important, linen and cotton manufactures. It was, moreover, a main supply region for the rest of Germany of grain, sugar beet, potatoes, fruit, vegetables, cattle, cattle products, poultry, and eggs.

Numerous spas and health resorts in the Sudeten range contributed to the economic welfare of a population which, through centuries of war—an attack by the Mongols in 1241, the Thirty Years' War in the 17th cent., the Seven Years War in the 18th—had been prevented from accumulating wealth. Silesia, however, was rich in thinkers and poets, e.g. the mystics Jacob Boehme and Angelus Silesius, the poet Martin Opitz and, in the 20th cent., Gerhart Hauptmann. Silesians clung to their old traditions, costumes, and myths. All of German Silesia E. of the Oder passed under Polish administration after the Second Great War under the Potsdam agreement, 1945, and the bulk of its German inhabitants were expelled without compensation. The people of German origin in Sllesko, Czechoslovak Silesia, were also expelled, some 3½ million Silesians thus becoming refugees in W. Germany.

Silhouette, ÉTIENNE DE (1709-67). French financier. Born at Limoges, July 5, 1709, he studied

Silhouette, depicting Garriek, the actor (right), conversing with Tobias Smollett, the novelist

finance, and held several civil appointments before being appointed, in 1759, controller-general of France, through the influence of Madame de Pompadour. He at once attacked the privileges of the nobles, and his crude plans of spoliation raised a storm of protest and ridicule, his name becoming a synonym for any figure reduced to its simplest form. In this sense it was later applied to a shadow portrait in profile cut from black paper. Silhouette was compelled to retire, after holding office less than a year, and died at Briarsur-Marne, Jan. 20, 1767.

Silica. Name popularly applied to silicon dioxide, SiO_2 . It is one of the commonest substances in the crust of the earth, being known in various forms, e.g. quartz, sandstone, feldspar, and

other rocks. When coloured by the presence of minute traces of impurities it forms amethyst, chalcedony, flint, and opal. In the pure state, as rock crystal, it is clear and colourless. Kieselguhr, or diatomaceous earth, is a form of silica which is used as a basis for dynamite and as an insulating packing for steam-pipes. Rock crystal has been extensively used for making lenses, and agate for making small grinding mortars. Traces of silica are also found in the vegetable kingdom, giving strength to the stems of many plants, e.g. the bamboo.

Siliceous Sinter. Deposits of hydrous or anhydrous silica, with a loose porous texture, which is deposited from waters of hot springs. It occurs in great masses in New Zealand. Geyserite is a similar deposit found associated with geysers in Iceland, U.S.A., and elsewhere.

Silicon. One of the non-metallic chemical elements. Its symbol is Si, atomic number 14, atomic weight 28.06. First prepared by Berzelius in the beginning of the 19th century, it does not occur in the free state in nature, although as silica the element is, next to oxygen, the most abundant, being a chief constituent of the earth's crust.

Silicon, also formerly known as silicium, exists in two forms, amorphous and crystalline. An easy way of preparing small quantities of silicon, not, however, chemically pure, is to heat cautiously a mixture of 40 grains of dry powdered white sand with 10 grams of powdered magnesium. A vigorous reaction takes place, leaving a dark-brown amorphous powder behind. This form of silicon takes fire when heated in the air. The crystalline form is obtained by heating strongly, in an iron crucible, metallic aluminium with from 20 to 30 times its weight of potassium silico-fluoride. Silicon in some of its properties resembles carbon. Like carbon, it forms, with metals, compounds resembling alloys, and one atom of both carbon and silicon combines with four atoms of hydrogen. The most widely distributed compound of silicon is the dioxide, or silica (*q.v.*).

Silicon carbide is known as carborundum, and is made by fusing a mixture of coke, sand, and salt in an electric furnace fitted with a carbon terminal. Carborundum is a very hard material, and when finely powdered is used as an abrasive, and in the manufacture of steel in place of ferrosilicon.

With hydrogen and oxygen silicon forms four acids, the chief being metasilicic acid or silica monohydrate (H_2SiO_3 or $\text{SiO}_2\cdot\text{H}_2\text{O}$) and orthosilicic acid or silica dihydrate (H_4SiO_4 or $\text{SiO}_2\cdot 2\text{H}_2\text{O}$). Orthosilicic acid is prepared by adding hydrochloric acid to an alkaline silicate and submitting the result to dialysis, when the sodium chloride and excess of hydrochloric acid are removed, leaving a clear solution of silicic acid in the dialyser. Thus prepared silicic acid is colourless and tasteless, but on keeping for a few days gelatinises to a transparent jelly.

The salts of silicic acid are known as silicates. They occur naturally in large numbers in many mineral forms.

Silicones. Group of substances used for many purposes. Chemically they consist essentially of silicon-oxygen chain molecules having organic side-groups, which are chiefly CH_3 . The silicones have lost their glass-like character by reason of the small mutual secondary coherence of the side-groups as compared with the silicon-oxygen bonds. The liquid silicones have a low vapour pressure which makes them useful vacuum pump oils; they have also good electrical properties. The thicker types of silicones are used as greases which have a characteristic advantage in the retention of their properties over a wide temperature range. Solid silicones in solution are used as varnishes, possessing the property of being water-repelling.

Silicosis. A disease of the lungs due to the inhalation of mineral dust. Miners, stonemasons, and potters are particularly susceptible. The functional activity of the lungs is impaired and a liability to contract tuberculosis created. Inhalation of coal dust does not predispose to tuberculosis. The risk of silicosis is lessened by good ventilation, the use of exhaust fans, by spraying the air and the substance creating the dust, and by the use of respirators. In the bronchial stage the disease can be arrested by a change of occupation. See Pneumokoniosis.

Siliqua. In botany, a dry, generally elongated, pericarp or pod. It consists of two valves held together by a common replum. Familiar examples are the fruit of wallflowers, stocks, and other cruciferous plants. Another example is honesty (*Lunaria*), the siliquae of which are of a broad oval form, often distinguished as a silicula. See Fruit.

Silistria. Town of the Dobruja, on the S. side of the Danube, it is about 75 m. S.E. of Bukarest and 70 m. N.W. of Varna. It is strategically important and has frequently changed hands between Turkey, Rumania, and Bulgaria, being allotted to Bulgaria by the 1947 peace treaty with Rumania. During the First Great War it was captured by the Germans and Bulgarians under Mackensen, Sept. 9, 1916. During the Second, the Russians took it Sept. 8, 1944. Pop. est. 17,000. See Dobruja.

Silius, Gaius. Roman soldier. He lived during the reigns of Augustus and Tiberius, was consul, A.D. 13, and held a command in Germany under 20, taking part in the campaigns of Germanicus. In 21 he gained a decisive victory at Angustodunum (Autun) over the Aedui, who had revolted under Julius Sacrovir. By his relations with Germanicus he incurred the suspicion of Tiberius. Accused of extortion, and feeling that his conviction was certain if he stood his trial, he committed suicide.

Silius Italicus, Gaius (A.D. c. 25–c. 101). Roman poet. He cultivated oratory, modelling his style on that of Cicero, and became a leading advocate. Consul in 68, he went as proconsul to Asia. He was a friend of Vitellius and a patron of Martial. Silius Italicus was the author of an epic poem in 17 books dealing with the Punic War. The poem is derivative and conventional and devoid of genius.

Siljan. Lake of Sweden, in Kopparberg. Situated 25 m. N.W. of Falun, it is an expansion of the Dal river. It is 25 m. long, 7 m. wide, 400 ft. deep, and lies at an elevation of 530 ft.

Silk. Fibre derived from the cocoon of several insects, notably the silkworm. The silkworm, in its larval stage, discharges from an opening in its under lip a fluid secretion which solidifies on contact with air and forms the silk of its cocoon. In silk culture the eggs of *Bombyx mori* are hatched by warmth on paper-covered trays, and the larvae are fed with young mulberry leaves, and after three or four weeks the spinning of the cocoon begins. The intermediate layers of the cocoon are those which are reeled to form raw silk. The cocoons are softened in a basin of heated water, and the ends from several cocoons are wound into a hank around a hexagonal frame.

Raw silk is woven in Japan into the cheap goods (*habutae*) for

which the country is famous, but in Europe the raws are further treated in the process of throwing. The silk is carefully sorted and reeled, and different ends of raw silk are combined and twisted together. Silk thrown and hard twisted for warp is called organzine; the softer twist used for wefts is called tram; and ends combined with no appreciable twist, used for electrical wire insulation, are called no-throws.

Unreelable silk is saved and sold as waste silk for making silk spun yarn. This waste silk is cut into short lengths (dressed) and then spun in a manner somewhat similar to cotton. Spun silk has a more subdued lustre than thrown "nett" silk.

Japan and France

Natural silk consists of two portions, the fibroin or insoluble fibre, and the sericin or soluble gum, removable by boiling in soap and water. Before the Second Great War Japan provided nearly half the commercial crop of raw silk, and China, Italy, and the Levant were the next most productive regions. Silk is grown in France with the aid of bounties, and in several European countries, but cannot profitably be raised in the U.K. The cultivated silks are whitish to yellow in colour, and are finer, smoother, and more lustrous than the brown wild silk, such as is produced from worms feeding upon oak leaves, and is used for tussore and shantung.

In Europe silk is manufactured principally in France (Lyons and St. Étienne), Italy (Milan and Turin), and Switzerland (Zurich and Basel). Silk imported from the Far East was formerly extensively manufactured in the U.S.A., but with the improvement in artificial silk (*v.i.*) thread and the difficulty of securing the raw material owing to the prolonged war conditions in Asia, silk manufacture in the U.S.A. became less important. The silk industry in the U.K. is relatively small, the largest section being that for spinning waste to be woven into mixed goods. The chief centres of spinning are Bradford and Brighouse (Yorks), and of throwing and weaving, Macclesfield. Leek (Staffs) makes silk ribbons and sewing threads. Coventry, Derby, Norwich (crêpe fabrics), Braintree (brocades and damasks), Tiverton (nets), Dublin (poplin), are other centres of note.

The non-smouldering character of real silk lends it a special value for making containers for propulsive explo-

sives for artillery, and silk voiles, the by-products of waste silk dressing, are used for such cloths. Its toughness and elasticity also make silk an admirable material for parachutes. The lustre, softness, and high elasticity of silk make it a valuable luxury article. It readily takes dyes of bright shades.

Bibliography. Silk Throwing and Waste Silk Spinning, E. Rayner, 2nd ed. 1921; Silk Industry of the U.K., F. Warner, 1921; Silk and the Silk Industry, Schober, Eng. trans. Cuthill, 1930; Bibliography of Technical Literature on Silk, F. O. Howitt, 1947.

ARTIFICIAL SILK. This dates from 1853 when a French inventor, Hilaire de Chardonnet, described a new method of producing thread by drawing a solution of nitrocellulose through fine orifices; the process was launched commercially at Besançon during the 1890s. At the same time, the viscose process, invented by Cross and Bevan, was being developed in the U.K. A third method, the cuprammonium process, was developed during the 1900s, and accounted for a large part of the world total of 9,000 tons of artificial silk produced annually during 1910-12. All these processes are described under Rayon. Between the two Great Wars other types of synthetic silk-like fibres were produced, in particular those based on polyamides (see Nylon), and various vinyl based fibres.

In the early stages of production of synthetic fibres, it was logical to experiment with naturally occurring protein-containing materials, fundamentally similar to natural silk (and wool), but after Ferrette had shown in 1935 that satisfactory fibres could be produced from casein, this branch of the industry was much extended. Fibres have also been produced from a variety of proteins, notably from soya beans, ground nuts, and fish. One synthetic artificial silk of British invention, produced in 1946, is a polyester derived from terephthalic acid and ethylene glycol. By varying the conditions of spinning, it is possible to vary the properties of the fibre from a yarn of low extensibility and strength up to 8 gm. per denier, to one of low strength but high extensibility. It is highly resistant to micro-organisms and bacteria, and its general chemical resistance is good, particularly to acids, organic solvents, and bleaching agents. It has low water absorption and does not swell in water. See Wool: Artificial.

Silkeborg. Town of Denmark, in Central Jutland. It is on the rly. to Skanderborg, 25 m. W. of Aarhus, at the head of Lake Jul, and has a hydropathic establishment and paper mills. It was founded in 1844. Pop. est. 20,955.

Silkin, Lewis SILKIN, 1st BARON (b. 1889). British politician. Educated at London

elementary and secondary schools and London university, he became a solicitor. Member of the L.C.C. from 1925, he was chairman of its town

planning committee 1940-45. Labour M.P. for Peckham 1936-50, he was minister of town and country planning, 1945-50, responsible for towns planned during 1946-47. Created baron 1950.

Silkworm. Name given to the caterpillar of the moth *Bombyx mori*, probably native to China but unknown in the wild state. It has a brown head, cream-white body with a few dark marks, and is 3 ins. long. It feeds on mulberry leaves but will also eat lettuce. The chrysalis is enclosed in a dense cocoon of white or yellow silk which yields most of the silk of commerce. The moth itself is greyish-white and about 2 ins. across the wings, the female being the larger. Neither sex can fly. Various other moths have caterpillars that yield commercial silk. They mostly inhabit India, China, and Japan. Tasar, muga, eri, tussore, and other wild silks are derived from these insects. Consult Silkworm Rearers' Handbook, D. A. Cooper, 1942.

Silkworm Gut. Material used in part of a fishing line. Prepared from the viscid secretion of silkworms which is used in the making of the

Lewis Silkin, British politician

Silkworm. Caterpillar of the moth *Bombyx mori* on a mulberry leaf; left, cocoon, spun among twigs

cocoon, silkworm gut is extremely strong and difficult to see when immersed in water. For that reason it has been largely used for attaching the hook on fishing lines. Most silkworm gut is obtained from Spain, Italy, and Greece.

Silky Oak OR TUGGAN-TUGGAN (*Grevillea robusta*). Tall slender tree of the family Proteaceae. A native of Australia, it has large, broad leaves, much divided into numerous small leaflets, the complete leaf resembling a fern-frond. The flowers are orange in clustered sprays. The close-grained wood is pale pink in colour and prettily marked; it is used for cabinet work.

Sill. Block of timber or stone at the foot of a door or window. Also, in a timber building, a long horizontal timber upon which the walls, etc., rest. In fortification it is the inner edge of the bottom of an embrasure. The word is also used for the timber or other material against which the gates of a canal lock close. In mining a sill is the floor of a coal seam; in geology it is an intrusive mass of igneous rock in the form of a sheet beneath the surface. See Canal; Lock.

Sill. In geology, sheet-like intrusion of igneous rock which has been injected along the bedding planes of the country sedimentary rocks. Sills are usually intruded in areas of more or less flat-lying beds, and may be involved in later folding of strata. Sil's may be of almost any dimension, from an inch or two in thickness to hundreds of feet. The great whin sill of N. England, up to 200 ft. thick locally, occurs over an area of some 1,500 sq. m., mainly in Northumberland and Durham. A sill is distinct from a dyke (q.v.).

Sillanpää, FRANS EEMIL (b. 1888). Finnish novelist. He was born near Hameenkyrö, Nov. 16, 1888, and had only an elementary education. He soon developed a strong natural talent as a storyteller, and became recognized as Finland's foremost novelist of peasant life. His best novels were *Holy Misery* (1919), *Silja, the Servant-Girl* (1931), *Man's Way* (1932); his short stories, collected in nine volumes, were also notable. He was awarded the Nobel prize for literature, 1929.

Sillimanite. In mineralogy, the name of a silicate of aluminium. Named after Benjamin Silliman, an American scientist, the mineral is grey or brown, and is found in crystalline rocks, notably metamorphic rocks, such as gneiss and mica schist, in the form of long needle-like crystals.

Silloth. Seaport and holiday resort of Cumberland, England. It is on Solway Firth, 22½ m. W.S.W. of Carlisle, with a rly. station. Formerly a fishing village, Silloth was made in 1855 the port of Carlisle. A rly. was constructed and docks built. Chief industries are flour milling and the making of fertilisers, textiles, and plastic goods. For visitors there are good golf links and the usual seaside attractions. Pop. 3,500.

Silo (Gr. *siros*, pit). Hole in the ground in which green crops are stored to be preserved for forage. The term is also applied to above-ground containers, made of wood, concrete, etc., used to preserve green fodder on farms, or for grain storage on a large scale. The process of preserving green crops in silo is called ensilage (*q.v.*).

Siloam or **SILOAM**. Rock-hewn reservoir outside the wall of Jerusalem (See John 9). A conduit,

Siloam. The pool or reservoir outside the walls of Jerusalem

hewn by Hezekiah, c. 700 B.C. (2 Kings 20; Neh. 3), conveyed the Gihon waters from their source in what is now known as the Virgin's fountain to the Siloam pool. In a wall-niche 25 ft. within the lower end, Schick discovered in 1880 a six-line inscription in primitive Hebrew script. It narrates that, when the tunnelling parties, operating from each end, were three cubits apart, their voices guided them in completing the excavation. Conder, who penetrated

the tunnel throughout, made it 1,706 ft. long, 2 ft. wide, and 14½ ft. high, sinking to 1½ ft. in the middle.

Silt. In geology, material intermediate in grain size between sand and mud, i.e. with particles varying in diam. from 0.1 mm. to 0.005 mm. Such material is easily carried by rivers and is often deposited where the velocity of the current is checked, e.g. at the river mouth, where salt water mingling with the fresh helps the silt to settle; hence the term silting up. When the river is in flood and flows out over its floodplain, silt is also commonly deposited and helps to build up the plain, such an area being therefore commonly very fertile. In the Nile the annual flooding of the valley leaves a thin layer of rich silt behind which does away with the necessity for manure. See Alluvium; Delta; Dredging; River.

Silures. Celtic tribe once inhabiting a large part of S. Wales. They offered a stubborn resistance to the Roman occupation of Britain, and were only subdued by the Romans about A.D. 80. Their chief town, Venta Silurum, the modern Caerwent, not far from Chepstow, was made a centre of Roman civilization, with walls, baths, and stately houses. Isca Silurum, now Caerleon-on-Usk, was an important Roman fortress. See Britain.

Silurian. In geology, term proposed by Sir R. Murchison for a series of Palaeozoic rocks. The term is used now for those rocks which lie above the Ordovician and below the Devonian, though Upper Silurian and Lower Silurian were formerly used by geologists for the Silurian and Ordovician periods respectively.

The Silurian period is subdivided into the following series, beginning at the top: (iv) Downtonian, which is transitional into the old Red Sandstone; (iii) Ludlow series; (ii) Wenlock series; (i) Llandovery or Valentian series. Most of these names are taken from localities in the Welsh borderland, where the rocks of this period are well displayed, particularly in Shropshire from Church Stretton to beyond Wenlock Edge, which latter is an escarpment of limestone particularly rich in fossils. In Great Britain the Silurian strata are of two main types or facies: the Welsh borderland rocks are limestones, shales, and sandstones containing fossils of animals which lived in warm, clear, shallow sea waters; the

Silurian rocks of N. Wales, Lake District, and S. Scotland are muddier and were deposited in the more central parts of an elongated N.E.-S.W. trough, the strata in which were later folded at the end of the period by the Caledonian mountain building movements. Intrusions of igneous rocks occurred at the close of the Silurian period in Scotland. Sediments of Silurian age are common in all continents, and have often been folded and rendered slaty by one or more periods of compression. Seaweeds, lycopods, and ferns were common plants of the Silurian period; graptolites, trilobites, corals, etc., were the most common marine organisms; and sharks, which are almost the only vertebrates, occur. See Rock.

Silvanus. In Roman mythology, a benevolent god of gardens, forests, and boundaries, and guardian deity of homesteads. He is represented as a cheerful old man.

Silver. One of the metallic elements, of wide use in the engineering and chemical industries and intrinsically of great value. The chemical symbol is Ag, and the element falls in the first group of the periodic table, its neighbours being copper and gold, to both of which it bears a strong resemblance. It has an atomic number of 47; atomic wt., 107.880; density, 10.5 gm. per c.c.; melting point, 960.5° C., forming one of the fixed points on the International Temperature Scale; boiling point, 2,152° C.; electrical resistivity, 1.66 ohm cm. The crystal form is face-centred cubic, with lattice constant $a=4.0779$, and an interatomic distance of 2.8835 Ångström units.

Ores and Sources

Silver occurs chiefly in nature as the sulphide Ag_2S , argentite, which is sometimes found alone in siliceous rocks, but is more commonly associated with the sulphides of the base metals, lead, copper, zinc, more rarely with tin and nickel, and with gold. It also occurs with arsenic and antimony in complex sulphides and as proustite and pyrrargite, and more rarely as the telluride, hessite. The most important source of high-grade silver ores, which account for only about 20 p.c. of the world's production, is Mexico; and even there complex ores are of increasing importance. Lead-zinc ores are the most important source, providing 45 p.c. of the world's output and occurring in many parts of the world, including Mexico, the U.S.A. (Utah

and Idaho), Peru (Cerro de Pasco), Bolivia, Canada (Cobalt dist., Ontario), and Australia (Broken Hill, N.S.W.). Copper and copper-nickel ores provide nearly 20 p.c. of the world's supply.

Methods of preliminary extraction vary widely and depend upon the composition of the ore deposit. Straight silver ores are commonly treated by direct cyanidation, the coarsely crushed ore being further ground wet in cyanide solution. After transfer to large agitators or tanks, further cyanide solution is added and agitation with air is carried out for several days. After filtering, the silver is precipitated with zinc dust, filtered off, and smelted to give crude silver.

Methods of Extraction

Many lead ores contain appreciable amounts of silver, and when these are smelted the lead acts as a collector for the silver. Smelting is often preceded by concentration of the lead-silver minerals by selective flotation, and then smelting in blast furnaces gives an argentiferous lead, from which the silver may be removed by one of three processes.

The first, the Parkes process, depends upon the fact that silver has a greater affinity for zinc than for lead and thus, when zinc is added to the molten argentiferous lead in a large kettle, a zinc-silver crust is formed. This crust is scraped off and further zinc is added, the process being repeated until nearly all the silver has been removed from the lead. The kettle is then cooled until the lead is just above its freezing point, when the remaining zinc-silver compound floats to the surface, leaving silver-free lead. The skimmings are then pressed into blocks, placed in retorts, and the zinc is distilled off and collected for use again, the residue being cupelled to recover the silver. This process has been improved on in certain plants by making it continuous, a bottle-shaped kettle being used. The incoming argentiferous lead is poured through a thick zinc crust, which collects the silver as the lead falls through it. The zinc is removed and renewed periodically and the purified lead is removed continuously from the bottom by a siphon pipe.

The Pattinson process, which involves cooling the silver-rich lead until the higher-melting pure lead crystallises, leaving a silver-rich liquid alloy and scraping these crystals from the bottom of the furnace, is still used.

The third method, the Betts process, is the electrolytic refining process for lead, the silver and other precious metals being collected in the anode slimes. The electrolysis is carried out in asphalt-lined vats with a solution of lead fluosilicate and free hydrofluosilicic acid. The slimes are removed periodically, dried and cupelled, to give a crude silver bullion. Silver is removed from copper and copper-nickel ores in similar fashion, as it accompanies the copper throughout concentration and smelting operations, finally finishing in the crude copper or nickel. Fire refining does not remove the silver, but if it is there in appreciable amounts its recovery will more than pay for the cost of electrolytic refining of the copper and nickel, silver and the precious metals being concentrated in the anode slimes as in the Betts process.

The impure metal may contain anything between 50 and 95 p.c. of silver; and secondary scrap silver, obtained from either industry, jewelry, or coinage, may be treated in the same way. Preliminary purification is effected by cupellation, which involves melting down the bullion with lead and blowing air through the melt, so that the base metals become fully oxidised and dissolve in the low-melting lead oxide formed, which is removed from the top of the bath. This may give sufficient refining for some purposes, but gold and the precious metals remain with the silver and the product is usually treated electrolytically. The partially refined silver is cast into anodes, which are electrolysed in an aqueous solution of silver nitrate, containing free nitric acid. Careful control is needed to avoid co-deposition of the copper usually present in crude silver.

In the Moebius cell, the cathode is either stainless steel or a thin sheet of pure silver and the crude silver anodes are enclosed in linen bags. The silver is deposited on the cathode as crystals, which are continuously scraped off by wooden scrapers. The crystals fall to the bottom of the cell, whence they are collected, washed, melted, and cast into ingots of more than 99.95 p.c. purity. In the Balbach type of cell the anodes are held horizontal in trays with a bottom of supported filter cloth. The bottom of the tank is made of graphite, which acts as a cathode, from which the loose silver crystals are removed periodically. In both

processes the anode slimes, collected in the bags or trays, are treated for recovery of gold and the platinum metals.

Pure silver is a white and ductile metal, capable of taking a very high polish and the annealed metal is the best conductor of electricity known. It may be readily fabricated and worked, cold work slightly lowering its conductivity. Mechanically, silver and its principal alloys do not show exceptional strength or hardness, but its high electrical and thermal conductivity, optical reflectivity, and resistance to oxidation and corrosion by many chemicals commonly used in industry, give it wide, if specialised, application in the chemical and engineering industries. It has an ultimate tensile strength of 9 tons per sq. in. in the annealed state, but this may be raised to about 20 tons per sq. in. by cold work; and in the same way the Vickers hardness may be increased from 26 to nearly 100. It is not attacked by solutions of the alkalis, nor by fused alkalis up to fairly high temperatures, and it resists attack by most organic acids. Hot, strong sulphuric acid and nitric acid of any strength will dissolve it readily, but dilute sulphuric or phosphoric acids do not affect it. Hydrochloric and the other halogen acids form a protective film, which is dissolved away only by the strong acid, so that dilute acids do not dissolve it. Oxygen will not affect it even at high temperatures, though silver dissolves appreciable quantities of oxygen in the molten state. Sulphur and its compounds attack it readily, causing yellow or black stains of sulphide.

Uses of Silver

Apart from its well-known use for the manufacture of silver ornaments and tableware and for silver plate, silver has so many engineering applications that it is impossible to detail them here. In the electrical industry its high conductivity causes silver and silver-copper alloys to be used for numerous contacts, switches, commutators, fuses, and various small parts in electronic apparatus. There are instances of hundreds of tons of pure silver being used as bus-bars in aluminium reduction works. For chemical engineering plant it is used chiefly for constructing or lining stills, pans, and vessels where its high thermal conductivity and resistance to corrosion are assets. Silver alloys are commonly used for low temperature brazing, and aluminium

alloys, containing up to 10 p.c. of silver, have been used for scientific instruments. Silver-lined bearings are used for aircraft engines and various other rapidly moving parts. Gold, copper, and palladium are sometimes added to silver to make industrial alloys with greater strength and hardness. The most common use of silver compounds is in the photographic industry, where large amounts of silver chloride and bromide are used in the manufacture of all light-sensitive materials, films, plates, etc.

Its history goes back a very long way, but it is not certain when silver was first extracted metallurgically from its ores, although it was probably after gold and copper. It is thought that silver was extracted by cupellation before 1500 B.C. from lead-silver ores in Babylonia, while references in literature and relics show that the Mycenaeans first and later the Phoenicians and Greeks were well versed in silver metallurgy and commonly worked with silver for ornaments. In the Old Testament Jeremiah refers to the extraction of silver before 600 B.C. and the Romans extracted silver from various localities in Great Britain, notable the Mendips, Derbyshire, and Shropshire. Silver has always been much coveted and, as with gold, its history is rather clouded by international politics, particularly in the Middle Ages. See Bimetallism; Coinage; Cupola; Cyaniding; Electro-Plating; Photography; Silversmith.

Silver, LONG JOHN. Character in Stevenson's Treasure Island. A plausible, but black-hearted and murderous old pirate, with only one leg, he secures an engagement as cook to the search expedition in order to lead a mutiny at the fitting opportunity and secure the treasure. On the stage the part was memorably played by Arthur Bourchier and on the screen by Wallace Beery and Robert Newton.

Silver Fir (*Abies pectinata*). Tall evergreen tree of the family Pinaceae. A native of Central and Southern Europe, it attains a height of 150 ft. or more, and a trunk diameter of upwards of six feet. During its youth, say up to 50-100 years old, its bark remains smooth, but later it breaks into small, thin scales. The needles are not in pairs as in the pines, but solitary, arranged in spirals. These are clearly seen on upright shoots, but on the lateral shoots the needles appear as in two ranks only. They are bright green and polished on

the upper side, but beneath there is a stripe of white wax on each side of the mid-rib, which gives the tree

Silver Fir. Male flowers of the evergreen tree

its popular name. Each leaf endures for eight or more years. The cones are cylindrical, erect, and about 6 ins. long. Between the scales are long bracts whose points protrude and turn down, giving the cone a prickly appearance. Fertile seeds are produced when the tree is about 40 years old. The timber, though soft, is strong. It is enduring for interior work, but does not stand exposure to the weather. It yields Strasbourg turpentine.

Silver Fish (*Lepisma saccharina*). Wingless insect of the order Thysanura. About $\frac{1}{4}$ inch long, it has a silvery sheen from its covering of glistening scales. It is found in domestic kitchens and cupboards where, owing to its fondness for sugars and starchy material, it may cause some harm if abundant. The closely related fire brat (*Thermobia domestica*) is found in bakehouses, etc.

Silver Jubilee. Name given to the celebration of a 25th anniversary. It was particularly applied to the celebrations in connexion with the completion by George V of 25 years on the British throne, May 6, 1935. The chief official event of the day was the morning processional drive of the king and queen to St. Paul's cathedral for a thanksgiving service. In the evening the king broadcast to all his peoples, and on many days following he and the queen made tours of London, being received everywhere with great enthusiasm. The day, which was made a public holiday, was marked by the customary signs of jubilation, decorations and illuminations, fireworks and feasting. But more impressive was the spontaneous demonstration from British people everywhere of sincere affection for the king and queen.

Silver King, THE. Melodrama by Henry Arthur Jones and Henry Herman. Produced, Nov. 16, 1882, at the Princess's Theatre, London, it had a run of 289 performances. The hero, Wilfrid Denver, thinking he has killed a man, flies to America. Having made a fortune in silver mines there, he returns to England and discovers the murderers. Wilson Barrett toured the world as Denver.

Silver Leaf. Fungus disease of plum trees, especially Victoria plum, recognized by the silver-grey colour it imparts to the leaves. It is believed to be due to ill-drained soil. The law demands that any branches affected must at once be cut off and burnt, as the spores spread rapidly.

Silversmith. One who works in silver. Vessels and ornaments of silver were common in ancient Egypt, and are frequently mentioned in Homer; the Bible contains many references throughout the O.T. to the use of silver for cups, bowls, candlesticks, images, etc., while the craft of the silversmiths of Ephesus is noticed in the story of Demetrius (Acts 19).

In western Europe the Renaissance period produced many fine craftsmen in gold and silver, among whom Benvenuto Cellini (*q.v.*) was conspicuous. In England, silver early came into domestic use among the wealthy classes, its place in the lower social scale being taken by pewter. Since 1300 the quality of English silver plate has been guaranteed by assay. This right was then granted by Edward I to the Guild of Goldsmiths of London, under condition that "no vessels of gold or silver should leave the maker's hands until they had been tested by the wardens and stamped with the leopard's head." This mark was known as the king's mark; it is now known as the town mark for London. Thus began the compulsory marking of gold and silver wares.

The standard of silver has from time immemorial been "sterling," first mentioned in the enactment of 1300. The alloy consists of 11 ozs. 2 dwts. of fine silver to 18 dwts. of base metal in 1 lb. troy.

In 1697, however, a higher standard known as the new sterling was substituted to prevent the melting of coins of the realm restored by Queen Elizabeth to sterling standard. Silver of the new standard was marked with the lion's head erased and the figure of Britannia. The alloy consisted of 10 dwts. only of base metal in

every pound troy. In 1720 the old sterling standard was restored, but the new sterling standard is still authorised and indicated by the marks prescribed in 1697.

In the provinces local assay offices were established at Bristol, Exeter, Newcastle, Norwich, and York, but these have all ceased to exist. Six assay offices now operate at the present time (town marks shown in brackets): London (leopard's head), Chester (three wheat sheaves and sword), Birmingham (anchor), Sheffield (crown), Edinburgh (three-towered castle), and Glasgow (tree, bird, bell, fish, and ring).

Modern wares of gold and silver are varied in character, and include domestic and ecclesiastical plate, jewelry, mounts for two non-metallic articles, etc.

There are three methods of manufacture: (1) hammering by hand from sheet metal; (2) spinning on a lathe from sheet metal; (3) casting by pouring molten metal into a mould. The first method produces "wrought plate" which includes most of the finest work by artist craftsmen; but some fine pieces have been produced by casting. See Goldsmith; Hall Mark; Plate; Sheffield Plate; consult also The Silver and Sheffield Plate Collector, W. A. Young, 1919; English Domestic Silver, C. C. Oman, 2nd edn. 1947.

Silverstone. British motor racing track, near Towcester, Northants. Adapted from a war time airfield, it was opened 1948, and here were run the first British Grand Prix (300 m.), 1949, and the 1950 Grand Prix d'Europe (210 m.), the first to be held in the U.K. The length of the circuit is varied by including all or part of the former airfield's perimeter and runways. The Grands Prix laps are about 3 m. in length. There is also an annual race of approx. 50 m. for 500 c.c. cars. The full course is a right-hand (clockwise) circuit, with five corners and three curves.

Silvertown. Dist. of Greater London, within the borough of West Ham. It lies to the W. of N. Woolwich, S. of the Royal

Silver Tree. Silvery-leaved tree, native of the Cape of Good Hope

Albert Dock, 8 m. E. of Liverpool Street by rly. By a fire and explosion at a munitions factory here, Jan. 19, 1917, 69 persons were killed and 400 injured.

Silver Tree or **WITTEBOOM** (Du., white tree) (*Leucadendron argenteum*). Small tree of the family Proteaceae. It is a native of the Cape of Good Hope. The long, slender, lance-shaped, leathery leaves are covered with silvery white hairs and are exported in quantity for wreath-making with "everlasting" flowers, for which their durability

makes them suitable.

Silver Wedding. The 25th anniversary of a wedding. For other wedding anniversaries, see under Golden Wedding.

Silvia. Character in Shakespeare's *The Two Gentlemen of Verona* (q.v.). She is beloved by both Valentine and his friend Proteus, but is given in marriage by her father, the duke of Milan, to Valentine. A song occurring in the play, *Who is Silvia?* is well known in a setting by Schubert.

Simancas (Lat. *Septimanca*). Town of Spain. It stands on the Pisuerga river, in the prov., and 7 m. by road S.W., of Valladolid. The surrounding plain yields cereals, fruits, and wine. It was formerly enclosed by a wall, parts of which remain. The fine bridge was a Roman structure. Here, in 934, a battle was fought between the Christians and the Moors.

Simancas is chiefly known for its rich store of documents dealing with the history of Spain. Its Moorish citadel was selected by the emperor Charles V as a storehouse for these, and others were added by Philip II and other sovereigns. It is estimated that the collection consists now of 33,000,000 documents. Pop. 1,200.

Simarubaceae. Small family of trees and shrubs. They are natives of the tropics and warm regions, and include the *Quassia* genus. They have, mostly, alternate leaves and small regular flowers in spikes. The bark of many species is very bitter and, as that of bitterwood (*Simaruba*), yields drugs. In *Quassia* (q.v.) and

Picraena the wood is also used. Other genera are *Brucea*, *Ailanthus*, and *Simaba*.

Simcoe. Lake and town of Ontario, Canada. The lake lies in the S. part of the prov. in the narrow strip between Lakes Erie and Huron, the Severn taking its waters into Georgian Bay. Its area is 271 sq. m. The surrounding dist. was the scene of an Indian war, during which the Iroquois almost exterminated the Hurons. The town is 24 m. from Brantford, is the capital of Norfolk co., and is served by the Canadian National and Wabash rlys. Pop. 6,037.

Simcoe, JOHN GRAVES (1752-1806). British soldier and administrator. Born at Cotterstock, in Northumberland, Feb. 25, 1752, he was educated at Eton and Merton College, Oxford. For about six years (1775-81) he served in the American War of Independence. In 1790 he became M.P. for St. Mawes and almost at once was chosen as governor of the new province of Upper Canada. He remained there for four years, but quarrelled with the governor-general, Lord Dorchester. After returning to England, Simcoe commanded the troops at Plymouth, and had just been appointed commander-in-chief in India when he died at Exeter, Oct. 26, 1806. See Life, D. C. Scott, 1905.

Simenon, GEORGES (b. 1903). Belgian novelist. Born at Liège, he became known by a series of novels which although written with ease and rapidity show unusual insight into the minds of abnormal and criminal personalities, as well as into the atmosphere of various countries and districts. His stories introducing the detective Maigret were translated into many languages. He emigrated to the U.S.A. shortly before the Second Great War.

Simeon. Name of one of the tribes of Israel, and of its traditional ancestor, the second son of Jacob and Leah. He was born at Haran in Mesopotamia, and with Levi took part in the slaughter of the Shechemites for the wrong done to his sister Dinah. This may represent an early feud with Shechem, resulting in the dispersion of the two tribes. The remnant of Simeon settled in the S. part of Judah, and seems to have been a pastoral people which was soon absorbed by Judah.

Another Biblical Simeon was the "just and devout" man to whom the promise had been made that he should not die until he had seen the Christ (Luke 2).

After seeing the infant Christ in the temple, he spoke what is called Nunc Dimittis (Lord, now lettest thou thy servant depart in peace, etc.), familiar as one of the ancient hymns of the Christian Church.

Simeon II (b. 1937). Last tsar of Bulgaria. Born June 16, 1937, he succeeded to the throne at the age of 6, on the death of his father Boris III, Aug. 28, 1943, the proclamation of his accession referring to him as "the darling and hope of our country." But his reign was short. The regency council appointed to act for him fell within a year. Bulgaria became a republic Sept. 15, 1946, and Simeon left with his mother, Joanna, daughter of Victor Emmanuel of Italy, to join the latter in Egypt.

Simeon, CHARLES (1759-1836). British divine. Born at Reading, Sept. 24, 1759, he was educated at

Eton and King's College, Cambridge. Elected fellow of King's, he was ordained, and in 1783 became perpetual curate of Holy Trinity, Cambridge, where

he remained until his death. Simeon exercised an enormous influence in the university, and was one of the leaders of the evangelical party in the Church of England. He helped to found the Church Missionary Society and established the Simeon Trust to secure livings in the Church of England for men holding evangelical opinions. He died Nov. 13, 1836.

Simeon OF DURHAM. English historian. A monk of Jarrow, he lived from about 1070 to 1130. He is known for two works which are authorities for the history of England in the 11th and 12th centuries. The first is a history of the church of Durham, valuable for its account of affairs in the north of England; and the second a History of England, the earlier parts of which are copied from other writers. An English translation appears in Church Historians of England, J. Stevenson, 1855.

Simeon Stylites (350-459). Pillar-saint. Son of a shepherd in Cilicia, he entered a local monastery at the age of 13, and two years later removed to another monastery under the abbot Heliodorus, where he practised extraordinary austerities. Later he lived as a

hermit on Mt. Thelaniisa, near Antioch, where in 423 he built a series of pillars, on which he spent over 30 years of his life. He was visited by great crowds, to whom he preached. He was buried at Antioch. See Anchorite; Monasticism; Pillar. *Pron.* Sty-li-teez.

Simferopol. Town of the R.S.F.S.R., in the Crimea, and the capital of that region. It is about 50 m. N.E. of Sevastopol, on the river Salghir and the Kursk-Sevastopol rly. Notable edifices are the Alexander Nevski cathedral and the Zemstvo building. There are soap, candle, and tobacco factories, and much fruit is exported. Simferopol was formerly a Tartar village. German forces captured Simferopol Nov. 1, 1941, during their advance on Sevastopol. The town was liberated April 13, 1944, by troops of the 4th Ukrainian army. Pop. 142,678.

Simile (Lat., like). Figure of speech by which a thing, scene, or event is compared with another which in some way resembles it. In poetry and rhetorical prose, the simile aims at the imaginative suggestion of a quality by a not too obvious analogy. It may be expanded to considerable length, details being introduced for the sake of ornament which are not relevant to the comparison. Elaborate similes of this kind are frequent in Homer, and in the epic tradition derived from him. They are very rare in the old English and other Teutonic literatures. See Metaphor. *Pron.* simmy-lee.

Simla. District of Punjab state, India, in the Ambala division. It is situated among the hills, and comprises the great hill station of Simla and many detached areas. The chief crop is wheat. Its area is 180 sq. m. Pop. 38,576. See Simla Hill States.

Simla. Town of Punjab state, India. It stands on a ridge 7,500 ft. above sea level in the Himalayas, 170 m. N. of Delhi, with which it is connected by rly. through Ambala and Kalka, whence (2,100 ft.) a 60 m. hill rly. including 107 tunnels, opened 1903, runs to Simla at a point 7,000 ft. high. The cart road from Kalka to Simla has been converted into a motor road.

Known locally as Shumlah, Simla originally belonged to the maharaja of Patiala and the rana Keonthal, but was acquired by the British govt. in 1830 as a summer resort. It was made the summer capital of India in 1864, and of the Punjab in 1876. Although plans were made for laying out the town in worthy fashion, including the building of a town hall and the construction of circular motor roads, they were never carried out and the town grew haphazardly as a mixture of government buildings, bazaar tenements, and picturesque bungalows, along with more handsome edifices, such as Christ Church, the telegraph office, and the legislative buildings. Motor-cars were prohibited except for those of the viceroy, the commander-in-chief, and the governor of the Punjab. An exception was made in favour of Gandhi, during Lord Irwin's viceroyalty. The drabness of the town is mitigated by the glory of deodars, the rhododendrons, dahlias, and cosmos on the mountain roadsides, and the splendour of the distant snows. The highest hill in Simla is Jakko (8,048 ft.), on the summit of which is the temple to Hanuman (the monkey-god), brown monkeys living there in great number. Pop. (winter) 25,000, (summer) 92,000.

Simla Hill States. Group of small states in the Punjab, India.

Charles Simeon,
British divine

Simla, Punjab. General view of the summer capital of India

In 1948 they were merged, with other Punjab Hill states, in the Punjab Hill states union, known as the Himachal union, administered by the govt. of India through a chief commissioner. The major states were Jubbhal, Bashahr, Keonthal, and Baghal; the minor states numbered 17, varying in area from the smallest, Bija, 4 sq. m., to Bhajji, 96 sq. m. Wheat and pulses are the chief crops of the region. The chiefs of these states were Rajputs. Area, 5,937 sq. m. Pop. 460,000.

Simnel, Lambert (c. 1475-1535). English impostor. Said to be the son of an Oxford joiner, he was a handsome youth with a certain natural dignity. An ambitious priest, Richard Simon, trained him to play his part as the figure-head in a Yorkist plot against Henry VII (*q.v.*). The opportunity was provided in 1486 by a report that the earl of Warwick, son of the deceased duke of Clarence, and Yorkist claimant to the throne, had escaped from the Tower. Although the government produced Warwick, Simnel was taken to Ireland and crowned as Edward VI in Dublin cathedral. With the support of Margaret of Burgundy, the earl of Lincoln, other powerful Yorkist nobles, and an army of Irishmen and German mercenaries, the rebellion was carried over to England. Simnel landed near Furness, and marched through Yorkshire, but was overthrown by Henry VII at the battle of Stoke, near Newark, June 16, 1487. The earl of Lincoln was killed, and Lambert Simnel was relegated to service in the royal kitchens.

Simnel Cake (Lat. *simila*, wheat flour). Rich cake, formerly made to celebrate Mothering Sunday, the 4th Sunday in Lent. The ingredients are those of a rich plum pudding, enclosed in a crust coloured with saffron. The cake is boiled for several hours, then brushed with egg and baked. The making of simnel cakes, formerly common in W. England, is still observed when circumstances permit in a few localities of Gloucestershire and Monmouthshire, and in Lancashire, where the rich plum cake is surmounted by a layer of almond paste.

Simois. Small river of the Troad, Asia Minor. Often mentioned in the Iliad, it was a tributary of the Scamander. It has been identified with the Dumbrek Chai, but this insignificant stream does not bear out the description in Homer. It may be another name

for the Scamander, or an invention of the poet. Simois was also personified as a river god, the son of Oceanus and Tethys.

Simon, John Allsebrook SIMON, 1ST VISCOUNT (b. 1873). British politician and lawyer.

1st Viscount Simon,
British politician

Born Feb. 28, 1873, the son of a Congregational minister, he was educated at Fettes and Wadham College, Oxford, and was called to the bar in 1899. He represented the British govt. on the arbitration over the boundary of Alaska, 1903, and became a K.C. 1908. As leading counsel, by his great grasp of principle and detail, and the deadly efficiency of his cross-examination, he became the outstanding figure in numerous civil and arbitration cases. From 1906 to 1918 he was Liberal M.P. for Walthamstow, being appointed solicitor-gen. in 1910 and receiving a knighthood. In 1913 he was promoted to attorney-gen., with a seat in the cabinet. In the Asquith coalition govt. of 1915 he became Home secretary, but resigned office in 1916 in disagreement with the principle of compulsory military service. Losing his seat in 1918, he did not return to parliament until elected in 1922 as Independent (Asquithian) Liberal for Spen Valley, Yorks, a seat he retained until he was elevated to the peerage in 1940.

In the General Strike of 1926 his speech defining the legal position of the strikers was held to have been an important contribution to the collapse of the strike. In 1927-28 he was in India acting as chairman of the statutory commission to inquire into the Indian constitution. In MacDonald's national govt. of 1931 Simon returned to office as foreign secretary. Over the issue of free trade and the Ottawa agreements the Liberal party was split into two factions, the Lib. Nationals, led by Sir H. Samuel, who broke away from the govt., and the National Libs. led by Simon, who supported it. Simon thus remained at the foreign office as leader of the Liberal remnant in the govt., being transferred to the Home office in 1935, and to the chancellorship of the exchequer in 1937. From 1935 to 1940 he was deputy leader of the commons. In the Churchill

govt. of 1940 he became lord chancellor, and was created 1st Viscount Simon of Stackpole Elidor. Continuing as lord chancellor in the Churchill "caretaker" govt. of 1945, to which he gave full support, he went out of office with the defeat of that govt. the same year.

As foreign secretary Simon endeavoured, with varying success, to steer a middle course in European politics. In the public mind his name became identified first with his support, while acting as British council member of the League of Nations assembly, 1933-34, of the Lytton report on Japanese aggression in Manchuria; secondly with his consistent support of Chamberlain's policy of appeasement towards the Italian and German dictators.

Among Lord Simon's publications is a very moving Portrait of My Mother, published 1936.

Simon of Wythenshawe, ERNEST DARWIN SIMON, 1ST BARON (b. 1879). British politician

Lord Simon of
Wythenshawe,
British administrator

and was a member of the Manchester city council 1911-25, acting as lord mayor 1921-22, and as chairman of the housing committee 1919-23. During 1923-24 and again during 1929-31, he was Liberal M.P. for Withington, Manchester, being appointed parl. sec. to the ministry of Health in 1931. He was knighted 1932, and became chairman of the council of Manchester university. Joining the Labour party in 1946, he was appointed in June, 1947, chairman of the board of governors of the B.B.C. In the same year he was raised to the peerage. Lord Simon published many books on housing problems.

Simon, Sir John (1816-1904). British surgeon. Born Oct. 10, 1816, and trained at S. Thomas's Hospital, where he became surgeon and lecturer on pathology, 1847, he early devoted himself to surgical questions and sanitary reform. Simon was appointed medical officer to the local government board, 1855-76. During these years he developed his theories of sanitary science, and saw them

successfully put into practice and widely copied in other countries. Created K.C.B. in 1887, he died July 23, 1904. He wrote many books, including *General Pathology*, 1852; *Reports relating to the Sanitary Condition of the City of London*, 1854; *Fifth Diseases and their Prevention*, 1876; and *Public Health report*, 1887.

Simon, RICHARD (1638–1712). French Biblical critic. He was born at Dieppe, May 13, 1638, became a priest of the Oratory in 1670, and was mainly employed with library work in Paris. The publication of his *Critical History of the O.T.* in 1678, which has been called the birth of the Higher Criticism, ended his career as an Oratorian, and he retired to parish work in Belleville. He also wrote a *Critical History of the Text of the N.T.* Simon died at Dieppe, April 11, 1712.

Simonides or **SEMONIDES** (c. 650–600 B.C.). Greek iambic poet. A native of Samos, he led a colony to the island of Amorgos, one of the Cyclades. His work on the antiquities of Samos is lost, but among the fragments of his iambs is the satire on women, in which he attributes their characteristics to the animals from which they are supposed to be descended, e.g. the crafty woman from the fox, and the industrious housewife from the bee. Simonides did not, like Archilochus (q.v.), attack individuals, but whole classes. *Pron.* Sy-monny-deez.

Simonides (c. 556–468 B.C.). Greek lyric poet. He was born in the Ionian island of Ceos, but spent most of his life at Athens, in Thessaly, and at the court of the tyrant Hiero in Sicily, where he died. He wrote both in the Doric and Ionic dialects and was the author of hymns to the gods, odes, elegies, dirges, epitaphs, and epigrams. His first efforts were the elegiac epitaphs which he composed in honour of the Athenians who fell in the Persian wars; in 489 B.C. he beat Aeschylus in competition for the best elegy on those who fell at Marathon. His poetry survives only in fragments. One is a piece of exquisite beauty and tenderness describing Danaë with the baby Perseus when her father had sent them adrift on the stormy sea. Simonides shares with Pindar the distinction of being the greatest lyric poet of Greece. He was the first Greek poet to write for money.

Simon Magus (fl. c. A.D. 37). Samaritan magician (Gr. *magos*) and religious leader. Acts 8, vv. 9–24 relates that his followers regarded

him as “that Power of God which is called Great.” Baptized by the deacon Philip, he desired to acquire the miraculous gifts of the Holy Spirit possessed by SS. Peter and John, and offered them money, but was sternly rebuked by S. Peter (see *Simony*). Justin, himself a Samaritan, states that Simon of Gitta, in Samaria, whose identity with Simon Magus is disputed by some, founded a numerous sect which worshipped him as “the first God,” and that after his visit to Rome divine honours were paid him there. Justin appears to have confused him with the old Sabine god, Semo Sancus. In later legends marvellous tales are told about Simon Magus. The Simonite sect blended pagan and Christian doctrines with a form of Gnosticism.

Simonstown. Naval port of S. Africa. It is situated on an arm of False Bay, on the E. side of

sirocco wind originating in Arabia, chiefly during the late spring and autumn months, and penetrating into Palestine and Syria as a S.E. or E. wind. In the Sahara the name is also applied to a whirlwind which advances and raises great volumes of sand, sometimes overwhelming caravans and suffocating both men and camels; it resembles the haboob of the Sudan.

Simplicissimus. Former German satirical weekly periodical, published in Munich. Founded 1896, it soon became internationally famous for the caricatures of T. T. Heine and Otto Gulbransson, and for its constant ridicule of authority, a ridicule that was long maintained in the face of many prosecutions. It was suppressed by the Nazis in 1942. The name was taken from that of the hero of a 17th cent. German

Simonstown, S. Africa. Simon's Bay and the Admiralty harbour with enlarged docks, opened in 1910, capable of berthing the largest warships

the Cape peninsula, 22 m. by rail from Cape Town. It was founded in 1814, although first occupied by the British in 1795. It is the southern hemisphere's most important strategic naval base. New docks and other extensive harbour works date from 1900. The town is the h.q. of the S. African training ship, the *General Botha*. The southern end of the town has become a popular seaside resort, with golf links and good bathing. The church of S. Francis, 1834, is the oldest English church in S. Africa. The resident European pop. numbers 1,999.

Simony. Term of ecclesiastical law. It takes its name from Simon Magus. By ecclesiastical law it was simony to agree corruptly to present anyone to any ecclesiastical preferment for reward. By the law of England a simoniacal contract is void; but a patron may present a clerk to a living and make a stipulation that he resigns in favour of one of the patron's relations if requested to do so. *See* Benefice.

Simoom (Arab. *samum*, from *samma*, be poisoned). Stifling hot, dry and often dust laden

story by Grimmelshausen, dealing with the Thirty Years War. A similar paper was pub. from 1946 under the name of *Simpl.*

Simplon. Alpine pass in Switzerland. It leads from Brieg in canton Valais to Domodossola in Piedmont, Italy, at an alt. of 6,582 ft. The Simplon Road was begun under Napoleon in 1800, and finished in 1805. It is 42 m. long, 25 to 30 ft. broad, and has 611 bridges, as well as numerous galleries and tunnels. A hospice founded by Napoleon and a summer hotel mark the summit. Below the pass, at its highest only 2,312 ft. alt., is the 12½ m. rly. tunnel which joins Brieg and Isella on the route to Milan. This was opened May 19, 1906. A second tunnel was completed in 1921. *See* illus. p. 7574.

Simpson, SIR GEORGE CLARKE (b. 1878). British meteorologist. Born in Derby, Sept. 2, 1878, he was educated at Victoria university, Manchester, and Göttingen. As an 1851 exhibition scholar he was the first to study the electrical state of the atmosphere within the polar circle (Lapland). In 1906 he was appointed to the

Simplon. Swiss entrance, at Brieg, to the 12½ mile railway tunnel leading into Italy. See page 7573

India meteorological dept. and, in 1910, joined Scott's second expedition to the Antarctic, later publishing the meteorological results of the expedition. He was attached to the B.E.F. in Mesopotamia, 1916, acted as asst. secretary of the India munitions board, 1917-19, and served on the Nile projects commission, 1920, in which year he was appointed director of the British meteorological office, retiring in 1938. He became F.R.S., 1915, and was corresponding member of the academies of science of Prussia and Vienna. He was created K.C.B. in 1935. During the Second Great War he acted as superintendent of Kew observatory and, 1940-41, as president of the Royal Meteorological Society. Renowned for his pioneer work in atmospheric electricity, having first advanced his breaking-drop theory of the origin of electricity in thunderstorms in 1909, he also reached important conclusions about terrestrial radiation, ice ages, and the causes of climatic change.

Simpson, Sir James Young (1811-70). Scottish physician. Born in Linlithgow, June 7, 1811, the son of a baker, he was educated at

Sir James Simpson,
Scottish physician

Edinburgh university, where, having taken his medical degree, he became a lecturer. In 1840 he was chosen professor of medicine there. Simp-

son's chief title to fame is the work he did in forwarding the use of anaesthetics, of which he may be regarded as the founder. He was made a baronet in 1866, and died May 6, 1870.

His son, Sir Walter Grindlay Simpson (d. 1898), who succeeded to the baronetcy, is Stevenson's companion in *An Inland Voyage* (q.v.). See *Anaesthesia*; consult also *Life*, E. B. Simpson, 1896; Simpson and Chloroform, H. L. Gordon, 1897.

Simpson, Sir John William (1858-1933). British architect. Born at Brighton, Aug. 9, 1858, he was already an architect of repute when in 1910 he went into partnership with Maxwell Ayrton. Responsible for the schools at Haileybury, Lancing, and Roedean, the Glasgow art galleries and many other public buildings, he achieved his most notable work as chief architect, with his partner, of the British Empire Exhibition at Wembley, 1924.

Simpson, Patrick Carnegie (1865-1947). British divine. Educated at George Watson's school, Edinburgh, and at Edinburgh university, he was minister of the U.F.C. of Scotland at Renfield, then of the English Presbyterian church at Egremont, Ches, before being appointed professor of Church history at Westminster theological college in 1914. He retired in 1938. In both 1926 and 1927 he was elected moderator of the federal council of the English free churches, and in 1928 served as moderator of the general assembly of the Presbyterian Church of England. He published many books on Church principles, as well as devotional works. His *Recollections* were pub. 1943. He died Dec. 22, 1947. Dr. Simpson wrote for this work the article on Protestantism and many shorter entries dealing with Church history.

Simpson, Bessie Wallis. Name of the duchess of Windsor while wife to Ernest Simpson, before her marriage in 1937 to the duke of Windsor (q.v.). It was as Mrs. Simpson that she first became acquainted with the duke (then prince of Wales) and that the British public generally became aware of her existence, during the duke's brief reign as Edward VIII.

Simrock, Karl Joseph (1802-76). German poet and scholar. Born at Bonn, August 28, 1802,

Karl Simrock,
German poet

and educated there and in Berlin, he entered the Prussian civil service in 1826, but was dismissed in 1830 for having written a poem in praise of freedom.

He issued a succession of modernised works of ancient writers, among them the *Nibelungenlied*, 1827; *Walther von der Vogelweide's Poems*, 1833; *Reineke Fuchs*, 1845; also the *Eddas*, 1851; and *Beowulf*, 1859. He collected old German hero-legends in the *Heldenbuch*, 1843-49; published a volume of his own poems, 1844; and made translations from Shakespeare and the early Italian novelists. His translation of the *Nibelungenlied* is recognized as a classic. He died July 18, 1876.

Sims, George Robert (1847-1922). British journalist and playwright. Born Sept. 2, 1847, and educated at Eastbourne, Hanwell College, and Bonn, Germany, he was widely known by his pen-name of Dagonet, over which he contributed the *Mustard and Cress* columns to *The Referee*. In addition to an anonymous translation of Balzac's *Contes Drôlatiques*, and a volume of reminiscences, *My Life*, 1916, he was the author of *How the Poor Live*, *The Dagonet Ballads*, *Ballads of Babylon*, *Three Brass Balls*, *Among My Autographs*, *Without the Limelight*, *Watches of the Night*.

Sims was also author or part author of innumerable melodramas, farces, comedies, burlesques, and other stage productions, including *Lights o' London*, *In the Ranks*, *The Harbour Lights*, *Faust Up-to-Date*, *Little Christopher Columbus*, *Two Little Vagabonds*. He died Sept. 4, 1922.

Sims, James Marion (1813-83). American gynaecologist. Born in South Carolina, and educated at Jefferson Medical College, Philadelphia, he took up the

George Robert Sims

Russell

study of gynaecology, establishing a private women's hospital, and was the first doctor to carry out successfully the operation of closing vesicovaginal fistulae, till then supposed incurable. Sims was undoubtedly one of the great surgeons of his generation, and brought new and successful methods into surgical science. He wrote a number of books, including *Silver Sutures in Surgery*, 1858; *The Discovery of Anaesthesia*, 1877.

Sims, WILLIAM SOWDEN (1858-1936). An American sailor. Born at Port Hope, Canada, Oct. 15, 1858, he entered the U.S. navy in 1879. After a distinguished naval career he became president of the U.S. naval war college, Newport, R.I. When the U.S.A. entered the First Great War in 1917 he was put in charge of all U.S. vessels in European waters, and in 1918 was made vice-admiral. Reappointed president of the college at Newport, he was more than once censured for outspoken criticisms of U.S. naval affairs. His book *The Victory at Sea*, 1920, won the Pulitzer prize as the best book of its year on American history.

Sims, WINFIELD SCOTT (1844-1918). American inventor. Born in New York, he became an electrical engineer, and was one of the first to use electricity for driving and directing torpedoes. He carried out a series of experiments on the use of wireless for directing purposes, especially in connexion with torpedoes. He died Jan. 7, 1918.

Simson, SIR HENRY JOHN FORBES (1872-1932). British obstetrician. Born in India, Dec. 12, 1872, he came to England as a boy and held important posts in Edinburgh and London, establishing a reputation as a brilliant obstetrician. Among his patients were Princess Mary, countess of Harewood, and Queen Elizabeth when duchess of York. He played a prime part in the founding of the British college of obstetrics and gynaecology. In 1925 he was knighted. His wife was the actress Lena Ashwell (*q.v.*). Simson died Sept. 13, 1932.

Sin. Theological term signifying an offence against God, or a breach of Divine law. What is known as vice in the realm of ethics, and as crime in the social organism, becomes sin when it is viewed in relationship to God.

Some conception of sin is found in every type of religion. In its lower phases, where religion is

mainly non-ethical, sin consists of some breach of ritual, or the doing of some action that is taboo. When religion becomes ethicised, sin is identified with transgression of the moral law which is held to embody the will of God.

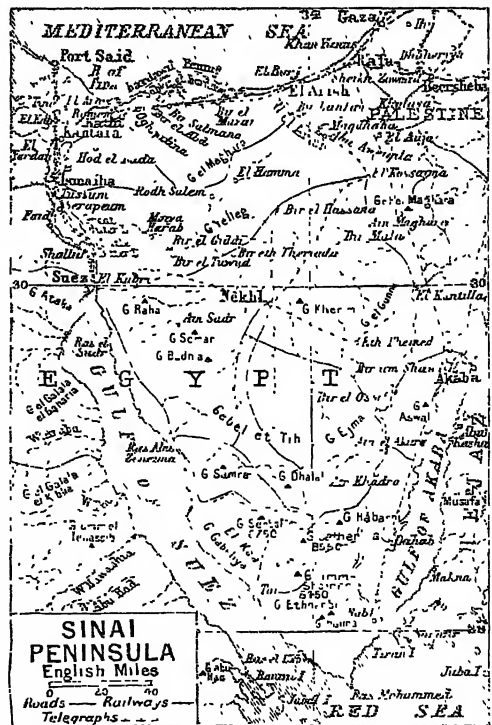

There has been much speculation among philosophers and theologians on the nature and origin of sin in man. Dualism in all its forms—especially in Parseeism and Manichaeism, and to a less extent in the Platonic and Neo-Platonic types of Greek philosophy—maintains that sin arises from the fleshly or material side of human nature; others, *e.g.* Origen in ancient times, and Spinoza in modern, hold that sin is of a purely negative character, and is simply the failure to attain to goodness. Leibniz argued that the presence of sin in man is due to "the imperfection necessarily inherent in finite things as such." "We must consider," he says, "that there is an original imperfection in the creature anterior to sin, because the creature is essentially limited; whence it comes that the creature cannot know everything, and can be mistaken and commit other faults." Kant, in his explanation, laid the stress on the will, and regards sin as the failure of the will to respond to the dictates of conscience.

Orthodox Christian theology has always found the origin of sin in the fall of Adam, though it has no clear explanation to offer of the cause of that fall. The sin of Adam involved the whole race in guilt, and made it impossible for any man to attain to the perfect life. This theory was elaborated first of all by Augustine, who was the first theologian to formulate the doctrine of original sin. Augustine was opposed by Pelagius, who argued that the

fall of Adam affected only himself, and that in the case of his descendants "every man was the Adam of his own soul." Another interesting theory finds the explanation of sin in a fall which took place in a state of pre-existence. Modern Christian thought is turning more and more to evolution, and to the facts of psychology in order to discover the nature and find the origin of sin. See Calvinism; Incarnation.

Sin OR NANNAR. Babylonian and Assyrian moon god. As parent of Shamash and Ishtar, his earlier supremacy was displaced by the sun god. His oldest seats were Ur and Harran. He was portrayed upon seal-cylinders about 2450 B.C., with flowing beard and crescent symbol.

Sinai. Egyptian peninsula at the head of the Red Sea. Between the Gulfs of Suez and Akaba, it is about 140 m. in length, and gradually tapers to a point at the S. end. It is largely a treeless region of wild and barren mountains, shut in on the N. by desert country. In the mountain-pass that forms the peninsula there are three principal peaks of considerable elevation—Gebel Catherina, 8,550 ft., Gebel-

Sinai. Map of the peninsula between the Gulf of Suez and the Gulf of Akaba

umm-Shomer, 8,450 ft., and Gebel Serbal, 6,750 ft. The Mount Sinai of the Old Testament has not definitely been identified, but is generally regarded as identical with Gebel Catherina, which has two separate peaks, Mount Horeb and Gebel Musa, or the Mountain of Moses, the latter usually regarded as the scene of the Hebrew law-giving. Politically, Sinai forms part of Egypt, and it is inhabited by scattered tribes of Beduins.

In the First Great War the British occupation of Sinai was a necessary preliminary to the attack on Palestine. At the beginning of 1916 the opposing Turks were in occupation of the whole peninsula, except for some stations on the Gulf of Suez. The British forces, under Sir A. Murray, gradually pushed rly. and pipe lines across the desert. There were battles at Katia and Romani (*q.v.*). In Nov., 1916, the British began systematic bombing from the air of Turkish lines of communication. The battle of Magdhaba (*q.v.*), Dec. 23, the occupation of El Arish (*q.v.*), and the final victory at Rafa, Jan. 9, 1917, were the chief incidents in the expulsion of Turkish forces from the peninsula.

Sinaia or **SINAJA**. Town of Rumania. Its monastery sheltered travellers across the Transylvanian Alps to and from Brasov (Kronstadt) before the rly. was built. On the Prahova, in N.W. Wallachia, Sinaia stands at the foot of the Tömös Pass, 70 m. N.N.W. of Bukarest. King Charles built a palace here in 1880, and later the town became a summer resort. It was occupied by the Austro-Germans in Dec., 1916. Pop. 3,906.

Sinaloa. Maritime state of Mexico. Bounded W. by the Pacific Ocean, it is traversed in the E. by the Sierra Madre Oriental range, and covers an area of 33,700 sq. m. Mining is the chief occupation, gold, silver, lead, iron, and copper being worked; other industries are agriculture and cattle rearing. The principal products are cotton, grain, sugar cane, rubber, and tobacco. Culiacan is the capital. Pop. 560,000.

Sinatra, **FRANK** (b. 1917). American singer. Born Dec. 13, 1917, at Hoboken, N.J., of Italian parentage, he rose from delivery boy to sports reporter on a N.Y. newspaper, then, in emulation of Bing Crosby, turned to singing. Having appeared at roadhouses and with dance bands, he became a noted broadcaster, known as The Voice, and entered films 1943. Anchors Aweigh (1946), The

Miracle of the Bells (1948), and On the Town (1950) were among later films. Hysterical adulation by adolescent girls greeted his stage appearances—even in London, which he first visited in 1950. One of the most highly paid artists of his time, Sinatra was an ardent campaigner for racial tolerance.

Sinclair, **SIR ARCHIBALD HENRY MACDONALD** (b. 1890). British politician. Born Oct. 2, 1890, he was educated at Eton and Sandhurst, and entered the army in 1910. In 1912 he succeeded to the baronetcy of which his grandfather had been 3rd holder. He entered parliament as Liberal member for Caithness and Sutherland, 1922, and held the seat continuously until 1945. Sinclair was chief Liberal whip, 1930-31, and leader of the Liberal parl. party, 1935-45. In 1931 he was appointed secretary for Scotland, in the first national govt., becoming a privy councillor, but

Sir Archibald Sinclair,
British politician

resigned office the next year with other "Samuelite" Liberal ministers, in protest against the Ottawa agreement. He was constant in his criticism of the Chamberlain govt. during events leading to the Second Great War. In 1940, when Churchill formed his all-party government, Sinclair was appointed air minister, an office he held until 1945. He was lord rector of Glasgow university, 1938-45. The C.M.G. was conferred on him in 1922.

Sinclair, **SIR JOHN** (1754-1835). British politician. Born at Thurso, May 10, 1754, and educated at Edinburgh, Glasgow, and Oxford, he was called to the bar at Lincoln's Inn in 1782. He became M.P. for Caithness, 1780, for Lostwithiel in 1784, and a baronet two years later. An outspoken critic of Pitt and his policy, his study of agricultural economy and the ability he had shown in furthering improvements in the Highlands, pointed him out as first president of the newly-formed board of agriculture, 1793; and, with an interval of eight years, he held the post until 1813, when he retired. He died in Edinburgh, Dec. 21, 1835. Sinclair published much on Scottish agricultural affairs, and also wrote a Statistical Account of Scotland, with details of every parish.

Sinclair, **MAY** (d. 1946). British novelist. She was born at Rock Ferry, nr. Birkenhead, and educated at Cheltenham Ladies' College. Her earliest literary publications were two books of verse, 1887 and 1890, and some reviewing for philosophical journals; Audrey Craven, 1897, and The Divine Fire, 1904, established her reputation as a novelist. At first a realist whose novels were characterised by subtle character drawing and a fine style, as evinced in The Creators, 1910, and The Combined Maze, 1913, she later adopted an impressionistic technique in which she displayed acute psychological insight. Mary Olivier, 1919, Anne Severn and the Fieldings, 1922, A Cure of Souls, 1923, The

May Sinclair,
British novelist

Allinghams, 1927, are among the best known of the later novels. In middle age she wrote The Defence of Idealism, 1917, and The New Idealism, 1922, fruit of her philosophical studies. A biography, The Three Brontës, appeared 1912. In the First Great War she served with a field ambulance corps, which provided the material not only for her Journal of Impressions in Belgium, 1915, but for a novel about the war, The Romantic, 1920. She died Nov. 14, 1946.

Sinclair, **UPTON BEALL** (b. 1878). American writer. Born at Baltimore, Sept. 20, 1878, and educated at Columbia university, he was for long known most widely as the author of The Jungle, 1906, a novel which made so scathing an attack on the American meat-packing industry that President T. Roosevelt appointed a committee to investigate conditions in the Chicago stockyards. The report they issued revealed serious abuses, and led to reforms. Earlier novels by Sinclair had included King Midas, 1901; The Journal of Arthur Stirling, 1903; and Manassas, 1904. Later came many other publications, novels, plays, and political and personal pamphlets, revealing a socialistic view of contemporary life, e.g. King Coal, 1917 (based on the 1913

Upton Sinclair,
American writer

Colorado coal strike); The Brass Check (journalism), 1920; The Goslings (education), 1924; Oil!, 1927. He was a Socialist candidate for congress in 1906 and 1920, for the senate in 1922, and for governor of California, 1926 and 1930; and Democratic candidate for the last in 1934. Dragon's Teeth, 1942, awarded a Pulitzer prize, was one of a sequence of 12 novels with the same central figure (Lanny Budd), forming a dramatized study of the contemporary social and political scene.

Sind, SINDH, OR SCINDE. Prov. of Pakistan. In the area of British rule it was first an independent prov., then a sub-prov. of Bombay presidency, then (1937-47) again a prov. On the transfer of power in Aug., 1947, its capital, Karachi, became the h.q. of the governor-general of Pakistan. It comprises mainly an extensive alluvial plain, of which a large portion is occupied by the delta of the Indus, is mountainous on the W., on the Baluchistan border, has the Runn of Cutch on the S., and the Thar desert on the E. The rainfall is scanty, and agriculture is only successful in the area flooded by or irrigated from the Indus. Karachi is a great wheat port. The prov. was annexed in 1843 after the victory of Napier which was reported by him in a telegram saying simply *Peccavi* (Lat., I have sinned). Area, 47,000 sq. m. Pop. 4,535,008. See Bombay.

Sindbad. Name of two characters in the Arabian Nights entertainments. Sindbad the Porter is a poor man who, on making pious ejaculations outside a Bagdad merchant's sumptuous house, is called within. The master of the house declares himself to be Sindbad the Sailor, and proceeds to narrate the marvellous adventures that befell him in his seven voyages. See Arabian Nights.

Sindhi. Language spoken in Sind (v.s.). It is immediately derived from the Apabramsa Prakrit and contains three chief dialects, Lari (lower Sind), Siraiki (upper Sind), Thareli (desert). The Mahomedan population, which has introduced many Arabic and Persian words, uses the Arabic alphabet, modified to express certain peculiar Sindhi sounds. The Hindus have different alphabets, varying according to locality, all derived from an old Sanskrit alphabet. Sindhi is more purely Sanskritic and contains fewer foreign elements than the other dialects used in the N. of the Indian sub-continent.

Sindia. Name of a family of Mahratta rulers. Ranoji Sindia, the founder of the family, was a feudal chief of the peshwa of Gwalior in 1743, and his son Madhava Rao (fl. 1750-94) became the most important Mahratta prince in 1767. His exploits against the Sikhs, 1771, as antagonist to Britain in the war of 1778-82, and as conqueror of Gwalior, 1784, made him one of the most prominent characters in the Indian history of his time. He was an astute politician, a gallant if ferocious warrior, and an able ruler. His grand-nephew, Daulat Rao Sindia (reigned 1794-1827), was engaged in the second Mahratta war of 1803. Defeated at Assaye and Argaum, his realms were reduced to the territory of Gwalior, where he died without issue. Janakji Rao (1827-43), his adopted son, died childless, but his widow adopted Bagherat Rao Sindia (1835-86), during whose minority the country was reduced to anarchy. With the British intervention of 1843 the power of the Sindias was curtailed. See Mahratta.

Sinding, CHRISTIAN (1856-1941). Norwegian composer. Born at Kongsberg, Norway, Jan.

Christian Sinding, Norwegian composer

11, 1856, he studied at Leipzig, Munich, and Berlin. He then settled in Christiania (Oslo), where he taught and composed. His work is characterized by facility of construction, and by tuneful charm. In Norway he is ranked next to Grieg as a national composer. In 1890 the government granted him a yearly stipend, which later became a pension, to enable him to devote himself to composition. Best known for his piano music (e.g. the famous Rustle of Spring), he also wrote for

phonies, two violin concertos, a piano concerto, much chamber music, caprices, burlesques, many songs and arrangements of folk-songs, and his opera Det Hellige Bjerg (The Holy Mount), produced at Dessau in 1914 and in London the same year. He died at Oslo, Dec. 3, 1941.

Sine. Term used in trigonometry. The sine of an acute angle may be defined as the perpendicular, i.e. the side opposite the angle, divided by the hypotenuse. The value of the sine never exceeds unity. See Trigonometry.

Sin-eating. Primitive custom formerly prevalent in Wales and adjacent English shires. Some villages had an appointed sine-eater, who repaired to the house of death, receiving over the dead body a loaf, bowl of ale or milk, and a small coin, thereby taking over its sins (Hosea 4, v. 8).

Sinecure (Lat. *sine*, without; *cura*, charge). In ecclesiastical terminology, a benefice without cure of souls. Sinecure rectories, i.e. livings given by a patron to a rector expressly without cure of souls, were abolished in 1840. By extension, the term has come to be applied to any office which has pay, but no work, attached to it.

Sine Curve. The curve produced when the sine of an angle is plotted against the magnitude of the angle. In the figure the sine (varying from +1 to -1) is plotted vertically, the magnitude (in degrees from 0 to 360) horizontally. Since the function $\sin \theta$ is periodic, the curve repeats itself indefinitely, to the right for angles over 360°, to the left for negative angles. The cosine curve would be of the same form, but displaced 90° to the left.

The sine curve provides the graphic representation of (simple) harmonic motion (*q.v.*) when displacement is plotted against time, and hence of the fundamental forms of wave motion. Thus the vertical profile of an uncomplicated system of ripples on deep water is a sine curve. In sound waves, the graph of pressure against time during the passage of a steady pure tone is a sine curve. In radio the unmodulated carrier waves are represented by sine curves or portions of them. In electricity the voltage gener-

other instruments. His principal works include his Rondo Infinito for orchestra, op. 42, three sym-

Singapore. 1. Government House. 2. Part of the waterfront from the air. 3. The Victoria Memorial Hall in the foreground, behind which, to the right, is the Supreme Court with its green dome, and the tower of the Cathay building in the background. 4. Anglican cathedral of S. Andrew, built 1861-70. 5. A scene on the river

ated by a conductor rotating in a magnetic field follows a sine law. If point C represents a conductor, and the poles producing the magnetic field are disposed as shown, the maximum voltage is generated when the conductor is moving directly across the field, and is zero when it is moving parallel to the field (at 0° and 180°). Its instantaneous value at any position will, in fact, be its maximum value multiplied by the sine of the angle at the given instant. See Electro-magnetic Machine.

Singapore (Malay *Singapura*, city of the lion). Island off the S. of the Malay pen.; name also of the chief city of the island, and of the British crown colony which includes Singapore I., the Cocos (Keeling) Is., and Christmas I. Singapore Island is about 26 m. by 14 m. and has an area of 220 sq. m. It is joined to the mainland by a causeway carrying rail and road traffic across the strait of Johore, which is about $\frac{1}{2}$ m. wide.

The East India co. took a lease of the island in 1819 on the advice of Stamford Raffles (*q.v.*). It was then jungle and swamp, but Raffles saw its possibilities and was responsible for its initial development as a port and trading centre. In 1824 the island was ceded in perpetuity to the co., and

six years later was, with Penang and Malacca, incorporated in the presidency of Bengal. Control of Singapore, as of the other Straits Settlements, passed from the govt. of India to the secretary for the colonies in 1867. Christmas I. was incorporated with Singapore in 1900, Cocos Is. in 1903, Labuan in 1907. When the Straits Settlements was dissolved April, 1946, Labuan passed to British North Borneo, Singapore with Cocos and Christmas Is. (*qq.v.*) becoming a separate crown colony. The est. pop. of the island (1947) was 940,756, of whom 728,523 were Chinese, 116,583 Malays, 71,300 Indians, and 9,012 Europeans. Christmas I. had a pop. of about 11,500, Cocos Is. about 1,200.

The city of Singapore, on the S. coast of the island, began as a few primitive mud huts, but became one of the greatest and most pros-

perous ports in the world with some 7,000 ships calling annually, until its occupation by the Japanese during the Second Great War (*v.i.*); but in 1947 already the port was recovering, more than 2,500,000 tons of cargo being handled. Singapore's docks include the Empire, the Victoria, the Albert, and several dry docks. Among its many impressive buildings are Anglican and R.C. cathedrals, the Raffles museum, a

Singapore. Map of the island off the south of the Malay peninsula with its naval and air bases

library and college, and imposing govt. offices. It is the seat of govt. of the colony.

The decision to build Singapore naval base, which lies on the N. of the island, was taken at a meeting of the British cabinet June 16, 1921. Construction, which cost more than £11 m., started in 1923, but was held up by Labour govts. in 1924 and 1930. Work began on it again in 1934, and with the opening, Feb. 14, 1938, of the King George VI graving dock it was completed. That dock, the biggest to that date, could take the largest warship afloat, and made Singapore the most considerable British naval base E. of Malta.

SECOND GREAT WAR. British Empire forces retreating before the Japanese in Malaya withdrew from the peninsula to Singapore I. during the night of Jan. 30-31, 1942, and cut the causeway across Johore strait. An artillery duel across the strait followed; the naval base and three airfields, all within artillery range of the mainland, were out of use by Feb. 1. Further demolition of the causeway was carried out. An air raid on the city of Singapore on Feb. 4 killed 31 and injured 132, and others followed. Japanese troops under the command of Lt.-Gen. Yamashita made a first landing on the N.W. of the island in the Kranji area on Feb. 8; more landings were made next day in the W. and N.W., and the defenders were compelled to withdraw before the steady reinforcements poured across the strait by the Japanese, who had absolute superiority in the air. By the 12th the defenders had been driven back to a line running S.W. from Seletar to the city's reservoirs and the sea at Pasir Panjang. The loss of the reservoirs led Lt.-Gen. A. E. Percival to decide to agree to unconditional surrender on Feb. 15, 1942. (*Consult The War in Malaya*, A. E. Percival, 1949). From then until the surrender of Japan in 1945 Singapore, renamed by the occupiers Shonan, light of the earth, remained in Japanese occupation. It was the object of numerous Allied attacks from the air; in one, on Feb. 1, 1945, the 5,000-ton floating dock, scuttled in 1942 before the fall of the island and raised by the Japanese, was sunk again. British, Indian, and Gurkha troops took over control of the island without incident, on Sept. 5, 1945; and at Singapore on Sept. 12 Admiral Mountbatten accepted the surrender by Gen. Itagaki of all Japanese forces in S.E. Asia. Ex-

cept in the dock area, the city was undamaged.

From Sept., 1948, Singapore was once more the h.q. of the British Pacific fleet.

Singer, CHARLES (b. 1876). British scientific historian. Born in London, Nov. 2, 1876, and educated at the City of London School, at University College, London, at Magdalen College, Oxford, and at Heidelberg, he became professor in the history of medicine in London university, and acquired an international reputation by his many books on that subject and on the history of science, e.g. *A Short History of Science*, 1941; *Alum*, the First Chemical Industry, 1948.

Singer, ISAAC MERRITT (1811-75). American inventor. Born in Oswego, New York, Oct. 27, 1811,

I. M. Singer,
American inventor

he became a mechanical engineer, and set himself to the improvement of the early forms of the sewing-machine. He patented a single-thread and chain-stitch machine,

and exploited his invention with success. Singer lived latterly in Paris and England, dying at Torquay, July 23, 1875.

SINGING: ITS THEORY AND PRACTICE

F. G. Shinn, Mus. Doc., Professor, Royal Academy of Music

See the articles on the various musical terms, e.g. Alto; Bass Clef; Soprano; also the biographies of Patti and other great singers.

See also Harmony; Music; Opera; Oratorio; Voice

Singing is the production of musical sounds by means of the voice. Vocal or singing tone is produced by the breath being expelled from the lungs, through the wind-pipe, against the vocal cords so as to set these into sufficiently rapid vibration to produce a sound of definite pitch. The sound when it reaches the listener is, however, very different from that produced simply by the vibration of the vocal cords. This original sound is modified by various means, and its ultimate power and quality depend to a very large extent upon the employment of the chest, the cavity of the mouth, and the nasal and other cavities of the head as resonance chambers.

Voices may be divided into three classes—adult male voices, adult female voices, and children's voices. Adult males have the lowest voices, the names and normal compass of which are: bass (F below bass clef to D above it), baritone (A of bass clef to F above it), tenor (two octaves either side of middle C), alto (artificial extension of tenor).

Music for the baritone voice is now written in the bass clef, but previous to 1700 the baritone clef was used both in solo and choral music. Music for the tenor voice when written upon a separate staff is written in the treble (G) clef, an octave higher than it is sung, but the proper clef and the one used in old music is the C clef on the fourth line.

The male alto voice is sometimes a very high tenor voice—called a counter-tenor, but far more fre-

quently it is a development of the falsetto, or head voice of a bass or baritone. The alto part is now written in the treble clef, but in former times the proper alto clef was used.

Adult females have the highest voices, the names and normal compass of which are: contralto (A flat to E flat one octave higher), mezzo-soprano (B flat to A one octave higher), soprano (B flat below middle C to C two octaves higher). The parts for all these voices are written in the treble clef, but in old music each had its proper clef.

Children's voices, both male and female, are generally treble voices, but a few children have alto voices. The average compass of children's voices is rather less than that of adults.

Method of Breathing

In singing, one of the most important matters is breathing. This consists of two acts, inspiration and expiration. Inspiration is the taking in of breath, that is, the filling of the lungs. This, when done in a proper manner, results in the expansion of the chest and ribs, and in males of the abdomen also. Expiration is the letting out of breath, which, in singing, is the prime cause of the production of vocal tone. For the perfect regulation of the breath, full control over the muscles of the chest, the ribs, and the abdomen is required. The ideal of the singer is that his breathing should be imperceptible and inaudible to the listener, and that he should employ his breath in the most economical and effective manner in the production of sound.

The directing of the breath against the vocal cords, thereby setting these into vibration, produces vocal tone, which is largely reinforced and modified by means of resonance. The action of the vocal cords themselves and also the employment of particular cavities as resonance chambers vary to some extent with the pitch of the sound produced, and as a result, different parts of the vocal compass exhibit differences of quality. It is in this connexion that the word "register" is employed.

Notes are said to be in the same "register" when they are produced in the same manner, *i.e.* by similar action of the vocal cords and by the employment of the same resonance chambers. It is usual to refer to three registers, called the chest, the medium, and the head. The terms, chest and head, indicate the positions of the resonance chambers employed for the two registers so described, while the cavity of the mouth is the resonance chamber for the medium. Female singers generally have some notes in all three registers, but in male voices the greater part of their compass is in the chest register. In some voices there is a marked difference in quality between the registers, especially at the place described as the "break," where one register joins another. It is the aim of the singer, when changing from one register to another, so to assimilate the quality of the notes that the change is imperceptible. The usual method of obtaining this result is to train the higher registers downwards, and for this purpose the singing of scales down from the highest note forms a useful exercise.

Pronunciation and Articulation

Of hardly less importance than correct breathing and good production with proper resonance, is a clear pronunciation of the words sung. To pronounce well requires the employment of correct vowel sounds and clear articulation of the consonants. All vocal tone, and, therefore, all sustained tone, must be upon one of the vowel sounds. The articulation of consonants involves the interruption of vocal tone. The different vowel sounds are produced by modifying the shape of the mouth. When double vowels or diphthongs are employed upon a sustained note, as for instance *i* (in the word "light"), which is made up of *ah* and *ee*, the first vowel sound is sustained and the second is sounded quite shortly at the end of the note. Consonants are produced by the employment

of the lips, tongue, teeth, and other parts of the mouth in certain combinations. Among the more obvious faults in the pronunciation of singers may be included the employment of incorrect or modified vowel sounds owing to the unconscious adoption of vowel sounds which are easier of production, or upon which better vocal tone may be produced, and also the inadequate attention frequently given to the clear articulation of initial and final consonants.

Foundation of all Music

The earliest form of vocal music was purely melodic and unrhythmic, but the combination of singing with some form of dancing, or the repetition of some regular series of bodily movements or gestures, necessitated the introduction of the element of rhythm, *i.e.* the recurrence of strong and weak notes in some regular order which should coincide with the order of the various movements, and in this manner time and rhythm gradually entered into music. The earliest development of music is thus seen to be most intimately connected with singing, and when the materials of music began to be systematised, the first forms of scales—called "the modes"—were based upon the character and limitations of vocal music. The minstrels, troubadours, and minnesingers were important bodies of mediæval singers.

Early in the 17th century the rise of opera, with its recitative and arias requiring dramatic and expressive rendering, led to the development of singing as an art, and the first schools of singing were established in some of the principal cities of Italy. While in the first instance the rise of the opera exercised an influence upon singing, before long singing and singers began to exercise a powerful influence upon the form and character of the opera. The remarkable proficiency which singers rapidly began to acquire in the vocal art induced composers of opera to write music which should specially exhibit this skill, and in time an opera became little more than a series of vocal solos of different styles, loosely connected with one another by their relation to some story, but designed primarily to display the special powers of different singers. These conventional operas largely prevailed from the latter part of the 17th to the end of the 18th century, during which period the development of the art of singing reached a very high state of perfection, and many

singers appeared who possessed remarkable voices, over which they exercised wonderful control.

It was during this period that the Italians established that pre-eminence in the vocal art which they held unchallenged for so many years. Italy was the home of oratorio and of opera, in both of which the then most important parts were those taken by solo singers. In connexion with opera, Italian composers had created a distinctive type of work which had been almost universally adopted, and composers of other nationalities, like Handel, composed operas not merely upon the Italian model, but in which the Italian language was employed.

The very nature of the Italian language also was favourable to Italian pre-eminence. The purity of its vowel sounds, and the large proportion which were employed in it, made it specially favourable to the production of pure vocal tone, and it is possible that the large number of Italians who possessed, exceptionally fine voices was in some degree the result of this. All these circumstances combined to give Italian singers and teachers of singing a unique position in the world of music, and for a very long period enabled them to play the chief part in the development of the art of singing.

Influence of Opera

Since the end of the 18th century, the character of opera has been gradually changed, and it is no longer dominated by the solo singer. The demands which modern music makes upon the singer differ from those of earlier times, and in some directions are very much in advance of those. The size of the modern orchestra and the fuller and more elaborate character of the accompaniments have greatly increased the demands upon the physical capacities of singers. This has not infrequently led to the forcing of voices, much to their detriment and sometimes to their ultimate loss. But apart from this, the musical, intellectual, and physical powers which are required adequately to sustain a leading rôle in a Wagner opera are far in advance of those required by the opera singer of earlier times.

The development of choral singing has been due to quite other influences. One of the chief purposes of its early employment was to give vocal expression to the feelings of the body of worshippers in religious ceremonies. The singing of the choir and also of the whole congregation has formed an im-

portant part of religious services from the time of the Jewish worship in the Temple at Jerusalem, until the present day. During the Middle Ages secular choral singing was practised by the use of rounds and canons, and later on by madrigals, while sacred choral music was heard in the cathedrals and abbeys. The finest choral singing was probably that of the Sistine choir at Rome.

In Great Britain choral singing has always exercised a very great attraction for all classes of people, and there is no doubt that the choral singing which Handel heard in England greatly influenced him when he turned his attention from opera to oratorio. In the middle of the 19th century John Hullah showed to what a high standard choral singing might attain. In more recent times, owing to the excellent teaching of singing in many elementary schools and to other causes, choral singing and choral technique, in connexion with both secular and sacred music, have reached a remarkable pitch of excellence. A powerful incentive to this has been the development all over the country of the competition festival movement. Many towns both small and large organize an annual musical festival, and in most of these, choral competitions form an important part. Choirs of all kinds consisting of children's voices, male or female voices, and mixed choirs compete in the performance of music of every variety and of every grade of difficulty. Usually the standard reached is high. The choral technique required for the adequate interpretation of contemporary works is far in advance of the requirements of the early part of the 20th century. The overcoming of the difficulties of interval and melodic outline, of intonation and choral effect, of control over every degree of tone and every variety of tone colour, which is involved in the performance of many contemporary choral compositions, has raised to great heights the standard of choral technique.

Bibliography. Singing, A. Randegger, n.d.; The Psychology of Singing, David C. Taylor, 1908; The Interpretation of Song, H. Plunket Greene, 1912; Choral Technique and Interpretation, H. Coward, 1914; The History of Singing, W. J. Henderson, 1921; and the article on Singing in Grove's Dictionary of Music, new edn. 1940.

Singlestick. Weapon consisting of a thin, round ash stick, about 34 ins. in length, with a basketwork

hilt for the protection of the hand. The old style of cudgel play is now obsolete, the singlestick being

Singlesticks with basketwork hilts

employed in modern times as a medium for acquiring skill in the use of the light sabre. There are six cuts: two diagonally downwards at the head or shoulders, two in the same manner delivered upwards at the legs, and two at the ribs or stomach, given horizontally. See Fencing.

Single Tax. Idea popularised by the American economist Henry George (q.v.), whose Progress and Poverty, 1880, attributed the prevalence of poverty, in spite of material progress, to private ownership of land, and urged that the land must be common property. He argued that if the state took to itself all the economic rent of land and all the unearned increment which then accrued to the owners of urban sites, all other taxes could be dispensed with. See Land Value.

Sing Sing. Name of the state prison of the U.S.A. Situated 30 m. N. of New York City, just S. of a village, formerly called Sing Sing, but changed to Ossining in 1901, it dates from 1825 when the first building was opened. It took its name from the Sin Sink Indians.

Sing Spiel (Ger., sing-play). Form of opera having spoken dialogue as well as musical numbers. It is thus different from opera seria, in which the libretto is set throughout, and from opera buffa, in that it need not be of a comic character. Taking its rise in Germany, it became very popular there, and eventually developed into lyrical opera, as evidenced in Mozart's *Il Seraglio* and *The Magic Flute*. In France it is represented by *opéra comique*, while as examples in England may be mentioned the Savoy operas of Gilbert and Sullivan.

Singular Points. In mathematics, points of a curve or surface which present a non-metrical peculiarity. Such, for example, are nodes and cusps and conjugate or outlying points not adjacent to any other real point.

Sinhalese OR **CINGALESE.** Dominant native stock in Ceylon. Numbering some 2,500,000, two-thirds of them occupy the low country, one-third the Kandyan highlands. The aboriginal Vedda

population was dominated by a Dravidian stock and culture, and these were overlain by an Aryo-Indian immigration which introduced Buddhism. The modern Sinhalese speak an Indo-Aryan language enshrined in a rich literature of high antiquity. The traditional Buddhism is allied with much animistic spirit-worship, and with ritual devil-dancing for exorcising disease-demons. There are 246,000 Christian Sinhalese. See Ceylon.

Sinibuldi, GUITTONCINO DE. Italian poet generally known as Cino da Pistoia (q.v.).

Sining-fu. Town of China, in the prov. of Kansu. It is on the Sining-ho, 118 m. W.N.W. of Lanchow, and has an important caravan trade with Lhasa.

Sinis OR **SINNIS.** In Greek legend, a robber who preyed upon travellers on the isthmus of Corinth. He was in the habit of tying his victims to two trees bent towards each other and tied together, and then releasing the trees, so that their bodies were torn asunder. Sinis suffered the same fate at the hands of Theseus.

Sinister (Lat., left). In heraldry, the left side of the shield, as carried by its bearer. It is therefore the right side to those in front of him. The word is used for anything unlucky and therefore evil, this being due to the fact that left-handed persons were formerly regarded with suspicion. See Heraldry colour plate.

Sinjerli OR **ZINJIRLI.** Village in the Kara-Su valley on the E. Amanus slope, N. Syria. The ancient Shamal, it marks a prehistoric pastoral settlement whereon a post-Hittite walled citadel arose. Excavations, 1888-94, revealed a palace with sculptured reliefs dated 11th-9th century B.C. See Esharhaddon.

Sinkiang. Westernmost prov. of China, formerly known as Chinese Turkestan. It borders Tibet and Turkestan, and contains 59 counties and 11 administrative bureaux. The capital is Tihwa, and other important cities are Hami and Ining. There are no rlys., but highways connect the prov. with other parts of China and with the U.S.S.R. Chief products are wheat, cotton, livestock, and fruits. The inhabitants are Chinese, Mongols, Muslims, Kazakis, and other tribes. The prov. has been called China's "back door." In ancient times, and again during the China-Japan conflict of 1937-45, when it was well outside the areas of fighting,

it provided one of the two routes by which China maintained touch with the outside world. See N.Y.

Sinking Fund. In finance, an arrangement by which a sum of money is set aside at regular intervals either to repay a debt or to provide a fund sufficient to renew a wasting asset, e.g. a lease. The term amortisation (fund) is sometimes used as a synonym. Thus, if a company has bought a seven-year lease for £10,000 it should charge against profits each year as part of the cost of the premises both interest on the initial outlay and such a sum as will with compound interest provide enough seven years hence to renew the lease.

Again, a company may have borrowed £100,000 by means of 5 p.c. debentures repayable in 20 years. The company should provide each year, in addition to £5,000 interest, a sinking fund instalment towards the amount of £100,000 cash necessary to repay the debenture holders.

There are two principal methods of redeeming such loans: (1) to invest the periodical instalments and allow them to accumulate at compound interest until the expiration of the period (sometimes the instalments are invested in an insurance policy to provide the capital sum required); (2) to use the instalments year by year to pay back part of the loan, the parts to be repaid being decided by "annual drawings," i.e. by lot.

Sinking funds are created when local authorities borrow either from the public direct or from the public works loan board. The charge against the rates for such loans includes interest on the principal, plus an annual instalment sufficient to redeem the loan during the stipulated period, which is related to the probable duration of usefulness of the things (libraries, baths, tramways, etc.) acquired through the loan, and may be as long as 80 years for housing loans. On March 31, 1941, loans outstanding by local authorities in England and Wales amounted to £1,626 m.; against them there were sinking funds amounting to £61 m.

In 1786 William Pitt established a sinking fund, appropriating each year £1,000,000 to be paid to specially appointed commissioners for the reduction of the national debt. In 1792 it was provided that a fund of 1 p.c. of the capital of every loan should be raised by taxation, in

addition to what was required to pay interest. Successive governments, however, raided these funds in order to meet current expenditure. It was eventually seen that no sinking fund arrangement, however ingenious, can diminish debt unless its instalments represent real excess of revenue over expenditure. In 1829 it was decided to devote any surplus of revenue towards the reduction of debt. This arrangement is known as the old sinking fund.

A new sinking fund was introduced in 1875, when parliament enacted that a fixed annual sum should be set aside each year for the service of the national debt, and that any part of this fixed sum not required for interest should be used to reduce the debt. The sum was originally fixed at £27,400,000. This was reduced to £24,500,000 in 1910. The First Great War greatly increased the debt; but the idea of the new sinking fund was revived in 1928, when a new fixed annual charge of £338 m. was agreed upon. The Second Great War caused an increase in the national debt from £7,247 m. in 1939 to £23,773 m. in 1946, and an increase in the interest charge to £496.4 m.; an appropriate change in the total charge had not yet been agreed upon by 1950.

Debt reduction is also effected by (1) the sale by the national debt commissioners of terminable annuities; (2) the acceptance of Victory bonds and 4 p.c. funding loan in payment of death duties; (3) specific sinking funds, such as those for 3 p.c. funding loan, 4 p.c. funding loan, and 4 p.c. Victory bonds; (4) conversion operations, by which one security is substituted for another.

Sinn Féin. Irish nationalist movement of approx. 1905-22. The name may be translated as "Ourselves alone," and its adoption implied a belief that an attitude of self-reliance in matters political, economic, and cultural was the only means of safeguarding the distinctive national life of Ireland. Originally Sinn Féin looked only to the preservation of the Irish language and culture. But it also looked forward to an Ireland politically united in spite of differing creeds, and was soon dissatisfied with the policy of the Nationalist party. In *The United Irishman*, a weekly journal which he had founded in 1898, Arthur Griffith (q.v.) set forth in 1902 his so-called Hungarian policy, by

which all M.P.s elected for Ireland should abstain from attending the U.K. parliament and remain in Ireland to form a nucleus for a national government (as in Hungary in 1861).

By 1905 the Sinn Féin organization had become established as a political body. Many younger members of the Gaelic League, a non-political body founded by Douglas Hyde (q.v.), came under its influence. When the Irish Volunteers were formed in opposition to the Ulster Volunteers they rejected the control of the Nationalist leader, John Redmond, and allied themselves to Sinn Féin. In the First Great War, after first assuming an attitude of neutrality, Sinn Féin soon adopted a policy as inimical to the British as possible. Under James Connolly (q.v.) a policy of ambush, assassination, and covert murder was adopted by many.

The party broke into open rebellion in Dublin on April 26, 1916. This became known as the Easter rising. It was quashed, Connolly and 13 other leaders were shot, and more were imprisoned. From this dates the rapid growth of Sinn Féin among the general public.

De Valera (q.v.) was elected president of the movement in Nov., 1917, in succession to Griffith. A "republican" policy was inaugurated and the convocation of a constituent assembly decided upon. In the general elections of 1918, Sinn Féiners won 73 of the 105 Irish seats. Those elected never sat in Westminster, but constituted themselves as *Dáil Éireann*, and began to prepare for the establishment of an Irish republic. Republican courts of justice were set up, though suppressed as illegal, and the I.R.A. was organized to maintain guerrilla warfare against crown forces, military and police. There followed an era of murder and reprisals on both sides, throughout 1920-21, accompanied by a world-wide campaign against British rule. This period ended with the negotiations between Sinn Féin and the British govt., leading to the settlement of Dec. 6, 1921, which brought the Irish Free State into being. The Sinn Féin party was immediately split between those who supported the settlement and the followers of De Valera who opposed it. The treaty was passed by a narrow majority and De Valera resigned the presidency of the party. The split led to civil war, and to the virtual end of

Sinn Féin. See Eire; Ireland: History.

Sino-Japanese War. Details of the undeclared war between China and Japan, 1937-45, as well as of the wars of 1894-95 and 1931-33 will be found under China-Japan Conflict.

Sinon. In Greek mythology, a relative of Odysseus, whom he accompanied to the Trojan War. Distinguished for his cunning, he allowed himself to be taken prisoner by the Trojans at the siege of Troy. He persuaded the Trojans to drag the wooden horse into the city, and in the dead of night he opened the side of the horse and let out the band of armed men concealed within. See Trojan War.

Sinôpë or ΣΙΝΟΠ. Town of Asiatic Turkey. Situated on the S. side of the Black Sea, it is a considerable port. One of the colonies founded from Miletus, it passed in 183 B.C. into the possession of Pontus (*q.v.*). Diogenes and Mithradates the Great were born here. In the Middle Ages it was one of the ports of the empire of Trebizond. The Turks took it in 1470.

Sinter. In geology, chemical deposits of siliceous material surrounding hot springs or geysers. As it cools and evaporates the boiling water deposits the sinter, which is often beautifully coloured. The sinter terraces of Rotomahama in New Zealand (destroyed by eruption in 1886) and in Yellowstone Park, U.S.A., were and are extensively visited by tourists.

Sintering. Processes in metallurgy in which a number of fine particles are caused to agglomerate by the action of heat. The essential difference between sintering and other metallurgical operations is that the heat applied is never sufficient to cause melting of the particles, but at the most the merest beginnings of fusion or softening. There are two common applications of the process. First, many ores are sintered before smelting either in reverberatory or blast furnaces, because otherwise the very fine particles of ore would not stay in the furnace long enough to be smelted, but would be caught up by the furnace gases and driven up the chimney. The particles usually stick together because of the presence of sulphides or other compounds which soften at fairly low temps., and act as a pasty matrix. Secondly, in powder metallurgy, sintering is the essential stage following the formation of a compact and causing the close bonding of the

metal powders at temperatures well below their melting points. See Metallurgy; Powder Metallurgy; Roasting.

Sinuessa (mod. Mandragone). Town of ancient Italy. Situated on the Tyrrhenian Sea, at the mouth of the Voltumnus, 90 m. S.E. of Rome, and originally belonging to Campania, it afterwards formed part of Latium. It became a Roman colony 296 B.C., and was destroyed in the 10th century by the Saracens.

Sinus. In physiology, any hollow in an organ or anatomical structure, *e.g.* in a vein or bone. It is most frequently used for the complicated air-filled hollows in the head bones, which communicate with the nose. These cavities are lined with mucous membrane, and can be the site of acute and violent inflammation (*sinusitis*), demanding immediate surgical attention.

It is increasingly evident, however, that the contagious fevers, influenza, and the common cold, can cause a mild chronic inflammation giving rise to much discomfort by headache, a change in

fluid balance of the body tissues on which weight depends. Mental and emotional disturbances arise from the proximity of the infection to the brain.

Treatment of these sub-acute cases of sinus infection implies the opening of the entrance to the sinuses by the inhalation of medicated steam and by using sprays of a synthetic adrenalin which does not (like true adrenalin) reconvert a surface after decongesting it. A method has been devised of washing the mucous membrane of the sinuses with normal saline, thus stimulating it to recovery.

Sinusoidal. In electrical engineering, term applied to wave or current having sine form. See Sine Curve.

Sion or SITTEN. City of Switzerland, capital of Canton Valais. It is on the Sionne just above its junction with the Rhône, midway between Martigny and Brieg, 25 m. by rly. E. of St. Maurice. The castles of Tourbillon and Valeria are in ruins. Notable buildings are the Gothic town hall, the 15th century cathedral, the 13th century church of S. Catherine, and a cantonal museum. The Roman Sedunum, it became the seat of a bishop in the 6th century, and in 999 its bishop became count of Valais. Pop. est. 6,500.

Sion College. London institution. It was founded in 1632 by the will of Dr. Thomas White (*c.* 1550-1624), in London Wall, as a college and almshouse, a library being added by Dr. John Simson, one of his executors. In 1884 pensions were substituted for the almshouses, and the new building on the Victoria Embankment, E.C.4, designed by Sir A. Blomfield, was opened Dec. 15, 1886. It exists for the benefit of clergy of the Churches of England and Wales. In addition to the valuable library and reading room, the college contains portraits of Laud and other bishops.

Sioux. North American Indian tribe who call themselves Dakotas. Sioux is the termination of the French form of their Ojibwa name (enemies). It is used for the Siouan family, comprising many tribes in the Mississippi and Missouri basins, and including the Assiniboins. They number some 10,000, of whom under 2,000 are in Canada. See American Indians and colour plate; Assiniboins; Dakota. *Pron.* Soo.

Sioux City. City of Iowa, U.S.A. Situated on the Missouri, near its junction with the Big Sioux and

Sion College, London. The building on the Victoria Embankment

weight which has no relation to diet or exercise, and vague mental symptoms, such as poor concentration. The headache is caused by inflammation blocking the narrow opening to the sinus. The air in the sinus is in time absorbed, and the resulting vacuum causes pain. The headache tends to recur regularly at the same hour of day. The fluctuation in weight originates in the surrounding by septic material of the all-important pituitary gland, which controls all its fellows besides directing the

Floyd rivers, and served by several rlys., it is a leading livestock centre, cattle pens covering 10 sq. m. The trade area, through which pass the city's dairy products and bricks, lies between Colorado in the W. and Minnesota in the N. Sioux City was founded in 1849, and became a city in 1857. Pop. 79,183.

Sioux Falls. City of South Dakota, U.S.A. It stands on the Big Sioux river, in the S.E. corner of the state. Largest city in the state, it is named after nearby falls dropping 100 ft., which supply water-power to some 97 industries. The city is a major livestock market, and has a million dollar high school building, and 536 acres of public parks. Pop. 40,832.

Siphnos or **SIFANTO.** Greek island in the Aegean Sea. It is one of the Cyclades and has an area of 30 sq. m. The lowland is fertile and yields cereals, figs, wax, and honey; silk and pottery are produced. Pop. 5,000.

Siphon (Gr., tube). Bent tube, with limbs of different length, used for transferring or drawing

liquids from one vessel to another. The shorter leg of the tube is immersed in the liquid and the latter drawn over the bend by suction or other means. A constant flow of liquid takes place, due to the differences in pressure at the extremities of the two limbs. The flow ceases when the levels of the liquids in the two vessels are equal, or the extremity of the shorter limb no longer comes below the surface of the liquid.

Siphon Recorder. Electrical instrument receiving messages sent through submarine cables, and recording them in Morse code on a paper strip. Invented by Lord Kelvin, it consists of a fine glass tube, bent into a U form, attached, inverted, to a light coil suspended between the poles of a permanent magnet, and connected with the line and with earth. The signals received cause the coil and siphon tube to move to the right or left, according to the direction in which the current is sent for individual signals. The shorter limb of the siphon dips into a small ink vessel, by which it is

kept supplied. The longer almost touches a paper ribbon, which is moved mechanically at right angles to the swing direction of the siphon.

Sipontum. Port and commercial town of ancient Italy. On the Adriatic at the foot of Mt. Garganus, it was colonised by the Romans in 194 B.C. Manfred (1231-66), king of Sicily, transferred the inhabitants to a site about 2 m. to the N., where he built a new town, called after him Manfredonia. Remains of the old town have been discovered at Santa Maria di Siponto near by.

Sippara. Akkadian city at Abu Habba. On the left bank of the Euphrates, it is 40 m. N. of Babylon. Commonly identified with the biblical Sepharvaim, the two

Sippars dedicated to the sun-god Shamash and the goddess Anunit (Ishtar), its capture by Assyria resulted in Sepharvite colonists being settled in Samaria (2 Kings 17).

Sir (Fr. *sire*; from Lat. *senior*, an elder). Title of

honour. In the U.K. it is applied to baronets and knights. When James I instituted the order of baronets it was stipulated that the honour should carry the title "sir." The sovereign and princes of the blood royal are addressed as "sir."

Sirajganj. Town of E. Bengal, Pakistan, in the Pabna dist. It is situated on the Jamuna section of the Brahmaputra, is an important centre for the jute and rice trade, and has rly. connexions with Calcutta and Dacca. Pop. 32,000.

Sirdar (Hind. *sar-dar*). Title used in the East for military chiefs.

Siren (Gr. *Seirēn*). In classical mythology, a sea nymph who, by the power of song, lured to their ruin those who listened to her. According to the Odyssey the Sirens lived on an island near the Strait of Messina. As Odysseus's

ship approached the island he had the ears of his sailors filled with wax, and himself bound to the mast, and gave instructions that no matter what he said or did, the ship must not stop. When the spell of the Sirens' voices fell upon him he signed to his men to stop rowing, but they rowed on until the island and its dangers were passed. Encountered by the Argonauts, the Sirens were surpassed in singing by Orpheus, threw themselves into the sea, and were changed into rocks. In art they are often portrayed as birds with women's faces. Sirens are frequently represented on Attic tombstones.

Siren (*Siren lacertina*). Species of amphibian, known as the mud eel. It is found in swamps of the S. dists. of the U.S.A. In colour

Siren. Two-legged amphibian, showing the external gills that persist throughout its life

black, sometimes spotted with white, it is about two feet long, and resembles an eel except that it has two very small fore-limbs and external gills.

Siren. Device for generating sound. Its simplest form is a disk with holes, driven on the turbine principle between two fixed plates with inclined holes. When the air passing through the holes on the stationary plate is cut by the revolving disk, a sound wave is generated, the frequency of which is governed by the speed of rotation and the number of holes in the disks. Electrically-driven sirens of this type were used in Great Britain in the Second Great War to sound the alert and all-clear signals before and after air raids. A warbling, or rising and falling, note indicated the alert; a note of constant pitch, the all-clear. As the frequencies of sounds emitted by siren can be determined in

Siren. Diagram of the instrument. See text

Siren. As used for warnings of air raids during the Second Great War

absolute terms, the device was once used in acoustic laboratories to establish sound intensity and pitch, but has now been generally replaced by electronic vibrators.

On ships' sirens there is only one revolving disk, as shown in the illustration. When the lever D is pulled, steam is admitted through the valve A, and passes through oblique holes, *a, a'*, in the fixed disk B and others, *b, b'*, in the rotating disk C; thus causing the latter to revolve at high speed, so that the steam passes in a series of rapid and regular puffs. This sets the air in vibration and creates a loud and penetrating note. Sirens on electric locomotives and on lighthouses use compressed air instead of steam. Some have horns, operated by gearing (as at E in illus.), to concentrate and direct the sound. Lighthouse sirens have a range up to 20 m. in favourable circumstances. A diaphone has a moving element which vibrates to and fro instead of revolving. See Fog Signals, p. 3440.

Sirenia. Order of the Mammalia, including only the dugong (*q.v.*) and the manatee (*q.v.*). They are specially adapted for an aquatic life, and have no hind limbs. There are flipper-like fore-limbs, and a horizontal tail fin. They are found off the coasts of the Atlantic and Indian oceans, and in estuaries, feeding on seaweeds.

Sirhind. Small town in Patiala state, India. It was formerly the name of a large tract which is thought to have included the states of Patiala, Jind, and Nabha, also the districts of Ambala, Ludhiana, and Jullundur, now in E. Punjab. The 16th century historian Ferishta calls it the most eastern possession of the Brahman kings of Kabul; later it became the frontier town (*sar-i-hind*, frontier of Hind) of the Muslims. Under the Moguls it was one of the most flourishing cities. In 1709 came its downfall when the Sikh leader Banda plundered it. Regarded as accursed by the Sikhs, it was totally destroyed by them in 1763, but relics of its former greatness remain in fine tombs and domestic architecture. Now used by the Patiala government as an assembly hall is the great Serai of the Moguls. The Sirhind irrigation canal takes off from the Sutlej at Rupa, the terminus of a branch rly., 33 m. to the N. Pop. 8,200.

Sirius (Gr. *seirios*, scorching). Brightest star in the sky, with a magnitude of 1.6. Also known as Alpha Canis Majoris or dog star, it has a large parallax, measured

by Gill and Elkan at 0.37 secs., giving it a distance from the sun of approximately 8.8 light-years. It is a double star with a much fainter companion, discovered in 1862, and of about half its mass. Sirius is itself about two and a half times the mass of the sun; and the great intensity of its light, which, allowing for its great distance, must be 26 times that of the sun, accords with theoretical predictions. The star was venerated by the Egyptians, and to the Greeks was one of Orion's hounds, the other being Procyon. See Dog Days.

Sirius. British steamship. She was of 700 tons burthen and had engines of 320 h.p. Under command of Lieut. Roberts, R.N., she left Cork, April 4, 1838, and reached New York April 23, having been delayed a day by grounding off Sandy Hook. This meant an average of 5½ knots. She was in competition with the Great Western, which displaced 1,340 tons and had engines of 440 h.p. The latter left Bristol, under command of Capt. Hoskins, R.N., April 8, and reached New York the same day as the Sirius. Both ships met with very bad weather.

Sirmium. Capital of the province of Pannonia in the Roman Empire. It stood on the river Savus, and in the fourfold division of the empire instituted by Diocletian in 292 became the seat of government of Valerius, one of the four rulers. It is the modern Mitrovitza, Yugoslavia.

Sirmoor or **NAHAN.** Former Indian state, now in the Himachal union; also the capital town. The ruling family was descended from the Jaisalmir house in Rajputana. It is a mountainous area of 1,046 sq. m. to the N. of Ambala district, the Chor rising to 11,982 ft. There are forests of deodar and sal. The town is situated on the Siwauk Hills, 3,207 ft. alt., and has an iron foundry. Pop., state, 156,054; town, 7,136.

Sisal Hemp. Leaves and roots of *Agave rigida*; inset, flower spray

Sirocco. Term applied to any warm southerly wind by inhabitants of the N. shores of the Mediterranean Sea. Such winds may be dry or moist, dust-laden or clear. They occur in front of a depression, moving E. over the sea. The typical wind is hot and very dry, is probably frequently due to Föhn (*q.v.*) conditions, and is harmful to vegetation. The term has been extended to include similar warm, southerly winds experienced in the east of the U.S.A. See Wind.

Sirovy, JAN (b. 1885). Czech soldier and politician. Born in Bohemia, he practised as an architect in Warsaw before the First Great War. He lost his eye while fighting in the Czech brigade in the Russian army. After the Russian revolution he was commander of the Czech legionaries in the retreat through Siberia, and received a letter of thanks from King George V. From 1935 he was inspector-general of Czech forces, and became prime minister in 1938 during the German-Czech crisis, when he was forced to come to terms with the Germans and remodel the country on National Socialist lines. During the Second Great War Sirovy cooperated with the German forces, and after the liberation was sentenced to 20 years' imprisonment for treason.

Sirsa. Town of Punjab state, India, in Hissar district. It is situated on the rly. 50 m. N.W. of Hissar, and gives its name to a branch of the Western Jumna canal. The old town, founded as a fortress in the 6th century, was depopulated in the great famine of 1726. The new town N.E. of the old site was founded in 1837 as a centre for local trade, wheat and sugar being exchanged for salt and millet. Coarse cloth and pottery are manufactured. A cattle fair is held in late summer. Pop. 20,718.

Sis. Town of the vilayet of Seyhan, Asiatic Turkey, in the region anciently called Cilicia. It lies in the foothills of the E. side of the Taurus, about 45 m. N.E. of Adana, and has long been the religious capital of the Armenians in Turkey. Here, on the summit of a hill, they have an immense monastery. Once a considerable place, Sis has now a pop. of only about 4,000. Built on the site of the ancient Flaviopolis, it was the residence of the kings of Lesser Armenia from the 12th to the 14th centuries. In 1374 it was destroyed by the sultan of Egypt.

Sisal Hemp. Rope fibre obtained from the large leaves of *Agave rigida*, var. *sisalana*, a

perennial plant of the family Amaryllidaceae. It is a native of S. America. Several other species of agave yield valuable fibres, used for cordage, string, etc.

Siskin (*Carduelis spinus*). Species of finch. Distributed over Europe and parts of Asia, it nests in a few localities in the British Isles, but is better known as a winter visitant. The plumage is variegated with brown and grey, with a greenish yellow bar across

Siskin. Small species of finch that visits the British Isles in the winter

the wings. The nest is made of grass and moss, and is usually built high up in a pine or fir tree.

Sisley, ALFRED (1839-99). A French artist. Born in Paris, of English parents, Oct. 30, 1839, he studied at Gleyre's atelier, where he became acquainted with Claude Monet and other Impressionist painters. He painted river scenery, snow effects, and views of towns, generally in sunlight. His life was passed almost wholly in France. He died Jan. 29, 1899.

Sismondi, JEAN CHARLES LÉONARD DE (1773-1842). Swiss historian and writer on economics.

Of Italian descent, he was born at Geneva, May 9, 1773, and spent some of his early years in England and Tuscany. He held an administrative post at Geneva

J. C. L. Sismondi, Swiss historian

under the French Empire. Sismondi expounded economic theory closely akin to that of Adam Smith in his *Traité de la Richesse Commerciale*, 1803, and published his famous *History of the Italian Republics*, 1807-18. Other economic and historical studies, notably his renunciation of the English economic doctrines, *Nouveaux*

Sistine Chapel, Rome. Papal private chapel in the Vatican palace, built by Sixtus IV in 1480, and richly adorned with frescoes by Michelangelo

Principes d'Économie Politique, 1819, were followed by his *Histoire des Français*, 1821-43. He died at Geneva, June 25, 1842.

Sissek (Yugoslav Sisak). Town of Yugoslavia, in Croatia. It is 31 m. by rly. S.E. of Zagreb, at the head of navigation on the Save at its confluence with the Kulpa. Here was the ancient Siscia, where numerous Roman relics have been found. Pop. 6,000.

Sisterhood. Communities of R.C. or Anglican women living together under religious rule, but not enclosed in convents, and devoting themselves to active work for the good of the poor. Sisterhoods were first established by S. Vincent de Paul, in Paris, in 1633, under the name of Daughters of Charity.

In the 19th century arose a vast multiplication of active sisterhoods, some being little more than groups of pious women who agreed to live together for religious work. Dr. Pusey, in 1845, established a community at Regent's Park, London, which developed into the Society of the Holy Trinity, now established at Ascot Priory. In 1851 the All Saints Sisters of the Poor were founded by Harriet Byron; and about the same date the Sisters of S. John the Baptist, at Clewer, were established. Other congregations have been the Sisters of S. Margaret, East Grinstead, of S. Mary, at Wantage, of the Holy Cross, at Hayward's Heath. The sisters take the threefold vow of lifelong poverty, chastity, and obedience. See Deaconess; Monasticism.

Sistine Chapel. Private chapel of the popes in the Vatican, built by Pope Sixtus IV in 1480. Its chief glory is the magnificent series of frescoes by Michelangelo, illustrating the Creation and other O.T. themes, on the vault, and that of the Last Judgement on the altar-wall; there are also wall frescoes by Botticelli, Ghirlandaio, Roselli, Pinturicchio, and others. See Michelangelo; Rome; Vatican.

Sistova, SUSTOV, or SVISHTOV. Town of Bulgaria. It lies on the S. side of the Danube, about 45 m. N.E. of Plevna, and has a considerable grain trade. Here in 1791 the Austrians signed a peace with the Turks. Pop. 15,000.

Sistrum (Gr. *seistron*, rattle). Ancient Egyptian metal rattle, usually a bronze horse-shoe-shaped frame, pierced for three or four looserods, sometimes bearing jinglingrings. The handle was often Hathor-headed. It was held by women worshippers, especially in the later Isis ritual. It is also used in Africa, for instance among the people of the Benin dist. of Nigeria.

Sistrum used in Benin, Nigeria

Sisyphus. In Greek legend, a king of Corinth who was an able ruler, but noted for his deceitfulness and rapacity. For his many iniquities, or according to other stories, because he betrayed the secrets of the gods, Sisyphus was condemned after death perpetually to push up a hill an immense stone, which as soon as it reached the top always rolled down to the bottom.

Sittingbourne, Kent. Parish church of S. Michael

Sitapur. District and town of the Uttar union, India, in the Lucknow division. The dist. is situated between the Gumti and the Gogra rivers to the N. of the Lucknow dist. Wheat, barley, and millet are the chief crops. There is a large sugar industry with three model mills. Area, 2,250 sq. m. Pop., dist., 1,293,554; town, 25,530.

Sitka. Town of Alaska, U.S.A. Formerly the capital of the territory, and originally called New Archangel, it stands on the W. coast of Baranov Island, opposite Sitka Sound. U.S. govt. stations include an agricultural experiment outpost, a magnetic observatory, and a wireless telegraph station. The Russian Orthodox cathedral, with a spired dome, still stands; beside it, a Russian foundry once cast bells for mission churches in California. Sitka was the Russian capital down to 1867, and then the U.S. capital until 1906, when it was superseded by Juneau. Pop. 2,000, of whom two-thirds are Eskimos. See Alaska.

Sittang. River of Burma. It flows almost due S. for 350 m. between Pegu Yoma and Panglaung ranges to the Gulf of Martaban. Its valley is followed by the main rly. line from Rangoon to Mandalay.

During the Second Great War the Japanese drove the British W. of the Sittang by Feb. 28, 1942, and crossed it in strength early in March, which led to the evacuation of Rangoon to the W. on March 7. In April, 1945, troops of the British 14th army advanced rapidly down the Sittang valley to take Pegu on April 30. Fighting flared

up again along the Sittang N.E. of Pegu in early July and continued until the general surrender of Japan in Aug., Japanese forces isolated W. of the river seeking to escape across it towards Siam.

Sittingbourne and Milton. Urban dist. and market town of Kent, England, 10 m. E. of Chatham by rly. It has large paper mills, a brick-making industry, and is a centre of a cherry-growing district. It stands on Milton Creek, an arm of the Swale. It has some shipping, as the Swale connects it with both the Thames and the Medway. Milton was famous for its oysters. Near Sittingbourne are the remains of Tong Castle.

Sittingbourne was made a chartered town in the 16th century. It was on Watling Street and was a halting-place for pilgrims to Canterbury. S. Michael's church has a Norman tower, but generally dates from the 13th century. In 1921 a leaden font, in splendid preservation, was discovered in S. Margaret's church, Lower Halstow, near Sittingbourne. Market days, Wed. and Fri. Pop. 20,175.

Sitting Bull (c. 1837-90). American Indian chief, Tatanka Yotanka. He was born in N.

Sitting Bull, American Indian chief

Dakota, and was the son of Jumping Bull. The warlike chief of the Sioux of Dakota, he was ordered to return to his reservation. In the campaign that followed his refusal, Gen. G. A. Custer and his force were surprised and massacred. Sitting Bull escaped into Canada in 1879, but returned in 1881 under an amnesty. Following another rising, he was arrested, Dec. 15, 1890, and was shot during an attempt at rescue.

Situla (Lat.). Term used in archaeology for a bucket or pail, especially of the early metallic ages. At Hallstatt (*q.v.*) cylindrical or conical flat-bottomed vessels, of riveted bronze plates, often bear on sides and lids embossed geometrical and animal designs, showing Oriental contact. Specimens from Ireland exhibit Celtic ornament.

Sitwell, EDITH LOUISE (b.1887). English poet and critic. Eldest child of Sir George Sitwell and sister to Osbert and Sacheverell (*v.i.*), she was born in Scarborough Sept. 17, 1887, and educated privately. She and her brothers were among the most discussed writers

Edith Sitwell, English poet

of their time as much for their deliberate personal eccentricity and flouting of accepted standards as for their innovations. During 1914-16 she edited *Wheels*, an annual anthology of current verse. Though her own work was not popular, owing to its difficulty, she made a real contribution to poetry by the freshness of her diction and the flexibility of her rhythms. Her obscurity came from her unusual use of words. In 1923 she gave a poetry recital (to music by William Walton), speaking behind a curtain painted with a female figure with closed eyes and mouth open, to demonstrate her theory that spoken poetry should emphasise musical cadence and dissociate itself from the poet's personality. Her works included *Selected Poems*, 1936; *Green Song*, 1944; *A Song of the Cold*, 1945; *The Canticle of the Rose*, 1949; studies of Alexander Pope, 1930, of Bath, 1932, of the English Eccentrics, 1933, of Victoria of England, 1936; and an anthology *The Pleasure of Poetry*, 3 vols., 1930-32.

Sitwell, SIR OSBERT (b. 1892). English author. Francis Osbert Sacheverell, elder son of Sir George Sitwell, 4th bart., whom he succeeded in 1943, was born in London, Dec. 6, 1892. He was educated at Eton (in his own words, during the holidays from Eton), and was an officer in the Grenadier Guards, 1912-19, serving in France 1914-16. The satirist among the Sitwells (*v.s.* and *v.i.*), he published in 1916, in collaboration with his sister Edith, *Twentieth Century Harlequinade*, which included his first bitter verse.

Argonaut and Juggernaut, 1919, *The Winstonburg Line*, 1919; *Out of the Flame*, 1923, and *England Reclaimed*, 1927, continued this

Sir Osbert Sitwell, English author

satirical vein; a collected edition of his poems and satires appeared in 1931. A more creative impulse is apparent in his humanly discerning fiction, *e.g.* Before the Bombardment, 1926; Triple Fugue (short stories), 1934; and flowered in his volumes of autobiography: Left Hand, Right Hand, 1945; The Scarlet Tree, 1946; Great Morning, 1948; Laughter in the Next Room, 1949; Noble Essences, 1950. Other books included Escape with Me, 1939, a book of travel in the Far East; Sing High, Sing Low, 1944 (essays). Selected Poems appeared 1943.

Sitwell, SACHEVERELL (b. 1897). English poet and writer. He was born in Scarborough Nov. 15, 1897,

Sacheverell Sitwell,
English poet and
writer

the younger son of Sir George Sitwell and brother of Edith and Osbert (*v.s.*). Educated at Eton and Oxford, he was in the Grenadier Guards 1916-18. His poetry was more lyrical and less artificial than his sister's, but, like her, he delighted in sustained imagery that produced the effect of a brittle, unreal world. His best known verse included Hortus Conclusus, The People's Palace, The Hundred and One Harlequins, The Thirteenth Caesar, The Cider Feast. Nurtured in a gentle family having close association with the land, and oppressed by the vulgarity of the contemporary world, he sought the unusual in scene and custom, recording it in books of evocative description, such as Southern Baroque Art, 1924; German Baroque Art, 1927; The Gothick North, 1929; Poltergeists, 1940; Primitive Scenes and Festivals, 1942; The Netherlands, 1948. He also published biographies of Mozart, 1932, and Liszt, 1936; and the autobiographical All Summer in a Day, 1926.

Siut. Town and prov. of Upper Egypt, also known as Assiut (*q.v.*).

SIVA or **SHIVA** (Skt. *śiva*, propitious). In Hindu religion, one of the chief triad of gods. By his worshippers, the Sivaites (*v.s.*), is called Mahādeva, the great god, properly he is the principle of destruction and reproduction. In the latter capacity his symbol is the linga or phallus. He is represented with four hands and three eyes, with a garland of skulls round his neck, generally seated and absorbed in

thought. His weapons are the trident, bow, thunderbolt, and axe. His wife is Durgā, Kālī, or Devī (*q.v.*). See Hinduism; Lingayat; Rudra.

Sivaites. Followers of one of the two main sects of Hinduism, the other being the Vishnuites. They worship Siva (*v.s.*) as the chief deity. The sect is particularly strong in the extreme N. of India, and in the S. and is subdivided into Saktas and Thugites. See Hinduism.

Sivaji (1627-80). Mahratta raja. The son of a soldier, he was born in Bijapur, and early showed himself ambitious and eager to expel the Mahomedans from the Deccan and Western India. By incessant conspiracies and rebellions he welded the Mahratta tribes into unity. He died April 5, 1680.

Sivan. Third month in the Jewish sacred and ninth in the civil year. Corresponding approximately to the month of June, it is mentioned in Esther, and the feast of weeks is observed on its sixth day.

Sivas. Town of Turkey, the ancient Sebastea. The capital of the vilayet of the same name, it is situated on the Kizil Irmak, about 160 m. S.W. of Trebizond. A great centre of trade, it exports grain and wine. Samsun is its port. In Roman times it was the second city in Asia Minor. Pop. 45,419, including many Muslims. The vilayet of Sivas contains silver, lead, copper, iron, and coal. It was the scene of Armenian massacres in 1895. The area of this fertile vilayet is about 24,000 sq. m., and its pop. 494,373.

Siwa. Oasis in the Egyptian desert, near the Libyan border. About 150 m. S. of the Gulf of Sollum, its length is about 30 m. and its breadth from four to five m. Olives and dates are grown. The oasis contains two towns, Siwa and Aghourmi. The Siwans are of Berber origin, and are divided into two religious sects—the Senussi and Madani. The temple of Jupiter Ammon, 1½ m. E. of Siwa, was visited by Alexander, Lysander, and Croesus. Siwa figured in the British campaign against the Senussi in the First Great War, being the scene of their defeat on Feb. 5, 1917. See Senussi.

Siwalik Hills. Section of the sub-Himalayan ranges, abutting on the great plain of N. India. They stretch W. from the point where the Ganges debouches from the mountains, and give rise to the Jumna. Their average height is 2,000 ft. and they are heavily wooded. See Himalayas.

Siward (d. 1055). Earl of Northumbria. A Danish follower of Canute, he was made earl of Deira, and in 1041 acquired Northumbria by murdering his wife's uncle. After supporting Edward the Confessor against Godwin, he was sent to oppose the usurper Macbeth in Scotland, defeating him on July 27, 1054. He died at York. Siward figures in Shakespeare's Macbeth.

Six, LES. Group of French composers. It was formed in Paris in 1917, under the leadership of Erik Satie (*q.v.*) and the dramatist Jean Cocteau (*q.v.*), and was intended to assist the development of music. The six composers who gave the group its name were Georges Auric (b. Feb. 15, 1899), Louis Durey (b. May 27, 1888), Arthur Honegger (b. March 10, 1892), Darius Milhaud (b. Sept. 4, 1892), Francis Poulenc (b. Jan. 7, 1899), and Germaine Tailleferre (b. April 19, 1892). Among the performers attached to the group was Andrée Vaurabourg, who married Honegger. The group gradually broke up during the 1920s. See Honegger; Milhaud; Poulenc.

Six Acts, THE. Measures passed by the British parliament in 1819, at the instance chiefly of Castle-reagh and Sidmouth. Prompted by the disturbed state of the country, due to the industrial depression which followed the Napoleonic Wars, and to discontent with the reactionary policy of the government of Lord Liverpool, they provided especially for the suppression of illegal drilling and arming, of riotous assemblies, and of seditious publications. See Industrial Revolution; United Kingdom.

Six Articles, STATUTE OF. Law passed by the English parliament in 1539. The statute affirmed the doctrine of transubstantiation, communion in one kind only for the laity, celibacy for the priesthood, auricular confession, and prayers for the dead. So severe were the penalties prescribed that the statute was called by Protestants "the whip with six strings." It was repealed in 1547.

Six Nations. Name given in the 18th century to the Indian nation of the Iroquois. Originally comprising five tribes, and called the Five Nations, in 1715 these were joined by the Tuscaroras, and the name was changed accordingly.

Sixth. In music, an interval comprising six degrees of the scale. It is of three qualities:

The chord of the sixth is the first inversion of a triad, and is so called because the bass is figured 6. See *Thorough-bass*.

Sixtus. Name of five popes, of whom IV and V are noticed separately. Sixtus I (or Xystus) was the 7th bishop of Rome from about 115 to 125. Sixtus II was martyred under Valerian, 258, and his festival is kept on Aug. 6. Sixtus III was pope 432-440.

Sixtus IV (1414-84). Pope 1471-84. Born near Albissola, July 21, 1414, his name was Francesco della Rovere. He entered the Franciscan order in early youth, in 1467 was created cardinal, and in 1471 was elected pope. Plunging into Italian politics, and placing a large number of his relatives in high office, he made war against Florence, 1478. A patron of art and letters, he built the Sistine chapel and the Sistine bridge in Rome, and refounded the Vatican library. He died Aug. 12, 1484. *Consult* History of the Papacy, M. Creighton, new ed. 1897.

Sixtus V (1521-90). Pope 1585-90. Born near Montalto, Dec. 13, 1521, the son of a gardener, his name was Felice Peretti. He entered the Franciscan order at 12, rose to high office in his order, was created cardinal 1570, and elected pope 1585. He exterminated brigandage in the papal states and accumulated vast wealth for the papal exchequer. His only expenditure was on many public buildings in Rome. Sixtus recognized and reformed the papal curia by the establishment of 15 congregations (or committees) for the management of ecclesiastical affairs. On the execution of Mary Queen of Scots, 1587, he proclaimed a crusade against England. He died Aug. 27, 1590.

Sixtus V.
Pope during 1585-90

Sizar. In Cambridge university, term applied to an undergraduate holding a junior emolument called a sizarship. The word *size* was formerly given to an allowance of food and drink. Originally the sizar earned his board by distributing victuals to the pensioners and scholars. See *Scholarship*: University.

Size. Agglutinant used in many industrial processes. In weaving textile fabrics the warp-thread is sized to prevent the fraying out of its fibres, and hence to strengthen

the thread against breakage under tension in the loom. For this purpose a size is favoured composed of starch or of flour-paste, with tallow or oil added to prevent stiffening, and an antiseptic like zinc chloride to kill mildew. The sizing of cloth may include loading with minerals. To make wheat-flour size, the flour is steeped in water for weeks or even months, then boiled and mixed with other ingredients.

Less commonly used for sizing various fabrics are the starches derived respectively from potatoes (*farina*), sago, maize, tapioca, and rice. Other materials used are dextrin, gum tragacanth, gum tragacanth, Iceland moss and Irish moss, gelatine (glue, and bone size).

Size, as used by house painters and paperhangers, may be generally described as a weakened glue, and is obtained by boiling under pressure the residue of the process of making gelatine. Occasionally the paperhanger makes his own size from parchment clippings, which are placed in a saucepan to simmer for two hours or so, the resultant size being strained through muslin. It settles as a thin jelly, and is applied with a brush or a sponge.

Vegetable size is free from the objectionable odour of animal size, is but little subject to decay in storage, and, being colourless, does not stain or darken the materials with which it comes in contact. Size is applied to various surfaces to fill the pores or to prevent suction, technical expressions for its function of checking the absorption of paste or varnish. Mixed with various pigments, it makes a binding material for colour washes or distempers.

Gold size is an oil varnish preparation containing a high proportion of resin with a minimum of thinner. It dries to a hard, tenacious coating which can be rubbed clean when dry, thus providing a firm, uniform surface for subsequent coats of paint and varnish. It is also an adhesive for gold leaf.

Sjambok. Whip made of rhinoceros hide

Sjambok. Rhinoceros-hide whip used in S. Africa. The Afrikaans word is derived from Malay *chabok*, which comes from the Persian *chabuk*, meaning a whip, or, adjectively, alert. *Pron.* zhambock.

Skagen or **THE SKAW.** Cape and port of Denmark. The cape, the N. extremity of the peninsula of Jutland, is a narrow spit of sand with a high lighthouse. The

adjacent port is 24 m. by rly. N. of Frederikshavn. New Skagen is a seaside resort on the Kattégat. Pop. 6,446.

Skagerrak. Strait between Norway and Jutland, connecting the North Sea by the Kattégat and the Sound with the Baltic Sea. With a mean breadth of 80 m. its length is about 150 m. Near Jutland are dangerous shoals and sandbanks; towards the coast of Norway lies the E. end of the Norwegian deep, a steep valley in the floor of the North Sea, where the depth is 2,000 ft. Violent N.W. storms interfere with navigation. The Germans call the naval engagement of Jutland (*q.v.*) the battle of Skagerrak.

During the Second Great War the Skagerrak was heavily mined by the Germans; but because the U.K. needed Swedish products, in particular ball-bearings, in greater quantity than could be carried by air, five small, very fast, easily handled vessels, the Master Standfast, the Gay Corsair, the Gay Viking, the Hopewell, and the Non-such, with fair cargo space for their size, were designed and built to run the Skagerrak blockade to the port of Lysekil as unarmed merchantmen. They were in service during the winter of 1943-44; only the Master Standfast was lost, captured in Swedish waters by German warships.

Skagway. Sea port of Alaska. It is situated on Chilhoot Inlet, Lynn Canal, and is the terminus of the rly. to the Yukon and the steamer service to Seattle. It was settled in 1898 as a port of entry for the men taking part in the Klondike gold rush in that year, and was the main channel for the settlement of Alaska. It has a public library, a U.S. govt. building, and three hospitals. Pop. 492.

Skald or **SCALD.** Ancient Scandinavian, and more especially Icelandic, poet, corresponding to the bard of the early Britons and Celts. They sang or recited their compositions concerning the deeds of heroes at feasts and other public gatherings. Apart from one or two poems, such as the Song of Lodbrok, the poetry of the skalds is represented mainly by fragments in the sagas and the Eddas (*q.v.*).

Skara. City of Sweden. Situated 75 m. direct N.E. of Gothenburg, between Lakes Wener and Wetter, it has a valuable library and an important veterinary school. Its Gothic cathedral, 1151, destroyed by fire in 1947, belonged to the oldest episcopal see in the country. Pop. 4,500.

Skaraborg. Län or county of Sweden. It is situated between Lakes Wener and Wetter, and is crossed by the Göta Canal, which connects them. Dairy farming is important, especially in connexion with the manufacture of cheese. Munitions are made at Karlsborg. Area 3,273 sq. m. Pop. 241,466.

Skargard. Term applied to the islets which fringe the fjord coast of Norway. It means wall or fence of skerries or rocky islets. The waters between the skerries and the mainland are in general smooth, and largely navigable.

Skarn (Swedish). In geology, a type of metamorphic rock formed from limestone by the incoming of hot solutions carrying silica and various metals. It is commonly associated with iron and sulphide ores.

Skate. Edible fish, showing the flattened body, broad fins, and whip-like tail

W. S. Berridge, F.Z.S.

Skat. Card game played by three players, with a pack of 32 cards, the 6 to 2 inclusive of each suit being discarded. The three players are termed Vorhand, Mittelhand, and Hinterhand, with sometimes a dealer and even another player, who take no active part in every round, but change places alternately with the others, though whichever two players are standing out pay or receive, according to the result of the round.

The dealer gives three cards to each player, then two to the table for skat, and afterwards deals two more rounds to each player, first four cards and then three. Thus each of the players holds ten cards, and two cards are in skat.

The four jacks are always trumps, ranking in the order of their suit: clubs, spades, hearts, and diamonds. After these, the cards of the trump suit follow in the order of ace, 10, king, queen, 9 to 7. When no trumps is declared the cards bear their usual sequence.

The object of the game is to acquire a certain quantity of points in the tricks won. The ace counts 11, the ten 10, king 4,

queen 3, jack 2. The nine, eight, and seven score nothing. There being four suits with 30 points in each, a pack contains 120 points; the caller must score at least 61 to win. Or a player may elect to play to lose so many points. The following are the principal declarations: When one of the skat cards is turned to decide trumps, it is a *tournee*; a solo is when a player names a suit from his own hand. A trump suit is called a club solo, spade solo, etc. Jacks being the only trumps is termed a *grand*. If a jack is turned up from skat, the player may make whatever suit it may be trumps, or declare jacks only, at discretion. This is called a *turned grand*. Nullo is a declaration of no trumps. The cards in the skat always count to the caller, whether or not he may have previously taken them into his hand in exchange for cards of his own.

Skate. British food fish, of the Elasmobranch (plate-gilled) group. The skeleton is cartilaginous and the body greatly flattened, with broad pectoral fins and a whiplike tail. The common skate (*Raja batis*) varies from two to four ft. in length, and is greyish on the upper parts, with small black spots. It belongs to the ray family. There are twelve British species, all edible.

Skating. Locomotion on ice by the aid of mechanical attachments to the feet. Skates, runners as they were once termed, were originally made of metacarpal bones of animals and bound on to the foot. Later, runners were shod with iron, and so came the iron blade fitted into a wooden holder attachment to the sole of the boot by screws and straps. To these succeeded steel skates which can be clamped to the sole of an ordinary walking boot. The speed and artistry of modern

skating demands the use of skate and boot combined. For figure skating the blade should project only slightly at the toe and heel, whereas for speed skating a long blade achieves the best results.

The fen country can be regarded as the English skating nursery, although today the greater part of British skating is performed on indoor ice. There are 28 ice skating rinks in Great Britain (1948). When an exhibition to illustrate the history of fen skating was staged at the Cambridge and County Folk Museum, the earliest skates shown were those with blacksmith-made iron blades. A later pair with leather backs at the heel had a semi-obliterated trade mark, which read: *Ichens Improved Skate Registd April 22, 1842*. Among the trophies was a silver cup inscribed: *Jas. May. A prize won by skating at Upwell, Jany. 5, 1821*.

Figure skating has been developed into a fine art, and diagrams of great delicacy and complexity are cut on the ice by experts. The backbone of all these intricacies, however, consists of two turns at a given point, the turn towards the centre and the turn away from the centre. These are known as *rockers*, *counters*, *brackets*, *threes*, etc., according to the change of edge or direction.

Skating is controlled in the U.K. by the National Skating Association of Great Britain, under whose auspices grading tests are held for skaters. In figure skating there are six tests: preliminary; third class; intermediate second class; second class; intermediate first class; and first class. In free skating a competitor performs his, or her, own interpretation of chosen music, for a period of four

Skating. Left, A. Seyffarth, ice speed champion in action at St. Moritz; right, a competitor in the British amateur figure-skating championships, 1943

minutes. The American trend in free skating is to include high jumps in this programme.

The British, European, and World championships are held annually, and the Olympics once in four years. The 1948 Olympic skating results were: men's figure skating, R. Button (U.S.A.); women's figure skating, Barbara Ann Scott (Canada); pairs skating, Micheline Lannoy and Paul Baugniet (Belgium); speed skating, 500 metres, F. Helgesen (Norway), 43.1 secs., an Olympic record; 1,500 metres, S. Farstad (Norway), 2 min. 17.6 secs., an Olympic record; 5,000 metres, R. Liakley (Norway), 8 min. 29.4 secs.; 10,000 metres, A. Seyffarth (Sweden), 17 min. 26.3 secs.

Fuchs 1926; Modern Figure Skating, T. D. Richardson, 1930 (2nd ed. 1938); Skating for Beginners, E. Jones, 1935; Ice Rink Skating, T. D. Richardson, 1938 (new edn., 1948); The Complete Figure Skater, T. D. Richardson, 1948.

Skean-dhu (Gael, black knife). Dirk or small dagger carried by Scottish Highlanders in the stocking. A skean was an old Irish dagger or short sword. *See* Dirk; Highlands. *Pron.* skeen.

Skeat, WALTER WILLIAM (1835-1912). British philologist. He was born Nov. 21, 1835, educated

W. W. Skeat,
British philologist

at Highgate and Christ's College, Cambridge, and appointed professor of Anglo-Saxon in that university in 1878. He died Oct. 7, 1912. One of the greatest of English scholars, Skeat edited Lanceland's *Piers Plowman*, Chaucer, and Chatterton; *Etymological Dictionary of the English Language*; *Early English Proverbs*; *The Science of Etymology*. A *Student's Pastime* is a collection of 30 years' contributions to *Notes and Queries*, with an autobiographical introduction.

Skeffington, SIR WILLIAM (d. 1535). English politician. The eldest son of Thomas Skeffington of Leicestershire, he became known to Henry VII and was made master of the ordnance. In 1529 he became an M.P. and deputy for the lord-lieutenant of Ireland,

but his first stay there was brief. In 1534 he returned, and for nearly two years was responsible for the conduct of affairs, warring against Kildare until the Irish earl was compelled to submit. Skeffington's capture of Maynooth was a notable event. He died at Kilmainham, Dec. 3, 1535.

Skegness. Seaside resort and urban dist. of Lincolnshire, England. It is on the E. coast, 24 m. N.E. of Boston, with which it has rly. connexion. The town has been developed since the opening

Skegness. A section of the very extensive sands with the bathing pool and amusement park

of the rly. in 1873, and owed popularity to John Hassall's poster of a dancing fisherman with the words "Skegness is so bracing." Attractions are fine sands, a pier, and golf links. Part of the town is called Seacroft. At Skegness William Butlin (*q.v.*) opened his first holiday camp; during the Second Great War this became a principal R.N. training centre. An earlier Skegness was a seaport, destroyed by the sea in the 15th century. Pop. 11,000.

Skeleton (Gr., dried up). The hard framework of a body, formed mainly of bones, but completed in places by cartilage. The term *exoskeleton* is applied to hard parts on the exterior of the body, such as the carapace of a tortoise, the bones in the interior forming the *endoskeleton*. Among the mammalia there is little trace of an exoskeleton, except the horns of some species. In man the cartilaginous parts of the skeleton are the disks between the vertebrae of the spinal column or back-bone, and the costal cartilages which connect the ends of the ribs with the breast-bone. The ends of the long bones and the sockets or surfaces with which they articulate are also covered with cartilage to

facilitate movement and provide some degree of elasticity. The human skeleton consists of some 200 bones. *See* Anatomy; Archaeology; Burial Customs; Plesiosaurus; Pterodactyl; Reptile.

Skelligs. Three small rocks off the S.W. coast of Kerry, Eire. They are known as Great and Little Skellig and Lemon Rock, and abound in sea-fowl. Great Skellig, alt. 710 ft., has the remains of a monastery, formerly resorted to by pilgrims. There is a lighthouse on one of the rocks.

Skelmersdale. Urban dist. of Lancashire, England. It is 8 m. by rly. N.N.W. of St. Helens. The chief industries are the manufacture of shors and straw rope and the dehydration of potatoes. The chief building is S. Paul's church. Until the industrial developments of the 19th century, the place was a village, and long the property of the old family of Skelmersdale. Pop. 7,000.

Skelton. Village of Yorkshire (N.R.), England. It is 11 m. E. of Middlesbrough and forms part of the urban dist. of Skelton and Brotton, which has rly. stations. Skelton Castle occupies the site of a Norman stronghold. The chief occupation of the village, which once was a market town, is in the extensive ironstone mines. Pop., urban dist., 13,654.

Skelton, JOHN (d. 1529). English poet. Born probably about 1440, he is claimed as an alumnus by both Oxford and Cambridge. He took orders, became tutor to Prince Henry, afterwards Henry VIII, and for a time was rector of Diss in Norfolk. His earlier poems, such as the interlude, *Magnificence*, were of a scholarly character, but latterly he developed a humorous and satiric vein, attacking the

clergy in Colin Clout, and Wolsey in *Why Come Ye Not to Court?* This last effort brought the wrath

John Skelton,
English poet

of Wolsey upon him, but Skelton took refuge in the sanctuary at Westminster, where he remained till his death, June 21, 1529.

His other poems include

The Tunning of Elinor Rummung, full of Rabelaisian humour, The Death of Philip Sparrow, and The Bowge of Court, an allegorical satire. In English literature Skelton stands midway between the Chaucerian school and the Italian influences inaugurated by Wyatt and Surrey. *Consult Poetical Works*, 2 vols., ed. A. Dyce, 1843; Lives, L. J. Lloyd, 1938; N. Nelson, 1939; J. A. Gordon, 1944; H. L. R. Edwards, 1949.

Skerries. Watering-place and seaport of co. Dublin, Eire. It is 18 m. N. of Dublin, with a station on the Eire State rlys. The chief industries are fishing and quarrying, stone being found in the neighbourhood. Pop. 2,306. The Skerries are four small islands off the coast of co. Dublin. The name is also that of a reef about 3 m. off the S. coast of Devon and about 2 m. from Start Point.

Skerriyvore. Rock extremity of a dangerous reef of the Inner Hebrides, Scotland. The reef extends for 8 m. in the W.S.W. direction and is about 10 m. S.W. of Tiree Island. It was the cause of numerous wrecks until 1844, in which year a lighthouse, 150 ft. above high water, was completed. This was built by the brothers Alan and Thomas Stevenson, and after it the latter's son, R. L. Stevenson, named his house at Bournemouth.

Sketch, THE. London weekly illustrated paper. Issued from the office of The Illustrated London News, and started Feb. 1, 1893, it was the first paper of its kind to be illustrated throughout by process blocks. Reflecting the lighter side of life, with special attention to theatres and variety houses, social gossip, etc., its first editor, 1893-1900, was Clement Shorter (*q.v.*).

Sketches by Boz, ILLUSTRATIVE OF EVERYDAY LIFE AND EVERYDAY PEOPLE. The title given by Charles Dickens to selections from his contributions to The Monthly Magazine, The Evening Chronicle, Bell's Life in London, and Chapman and Hall's Library

of Fiction, when, with additions and Cruikshank's illustrations, they were published by Macrone in 1836. A third edition was followed in 1837 by a new series. The Sketches were then issued in monthly parts by Chapman and Hall, who, with the author and John Forster, had acquired the copyright. The pathos and humour of Dickens were as yet far from maturity, but the Sketches were an earnest of his unrivalled descriptive power.

Skewback. In building, a part of an arch abutment with an inclined face. It receives the thrust of an arch projecting beyond the vertical line of the opening.

Skibbereen. Market town, urban dist., and seaport of co. Cork, Eire. It stands on the Ilan, 54 m. S.W. of Cork, with a station on the Eire State rlys. It is also the terminus of a line from Skull. Small vessels can reach the town, but larger ones unload at Old Court, 3 m. away. In addition to the shipping, there is some fishing and a trade in corn, cattle, etc. The district suffered dramatically in the potato famine of 1847: pilgrimages are still made to the graves of the victims, in a graveyard adjoining a ruined Cistercian cell on the outskirts of the town. Market day, Sat. Pop. est. 3,000.

Skiddaw. Mountain of Cumberland, England. It is 3 m. from Keswick and rises to 3,054 ft. On the E. side of the mountain is an extensive and wild tract of moorland called Skiddaw Forest. The ascent of the mountain is easy.

Skiddaw Slates. In geology, a group of sedimentary rocks, mainly slates and sandstones, which occur on the northern edge of the English Lake District, and take their name from Skiddaw, which is composed chiefly of them. They are partly Upper Cambrian and partly Lower Ordovician in age. The Skiddavian Series is the lowest subdivision of the Ordovician. See Cambrian; Geology; Ordovician.

Skien. Seaport of Norway. It is situated on the Skienelv, an arm of Oslo Fjord, 62 m. in a direct line S.W. of Oslo. Founded in the 14th century, it has been frequently rebuilt of timber after destruction by fires. It has rly. connexion with Oslo. There are

paper, saw, flour, and cotton mills, wood-pulp, chemical, and furniture factories. Copper and iron ore are mined in the locality and exported. Ibsen was a native. Pop. 16,300.

Ski-ing (Norw. *ski*, snow shoe). Art of forward movement on ski (*pron. skee* or *shee*). The ski are a form of snow shoe, consisting of boards strapped to the feet, some 90 ins. long, 5 ins. broad in the widest part, and 1½ ins. thick just under the foot. The boards are usually made of hickory. There are many kinds of binding used by means of which the ski is attached to the boot. Tight bindings are most used, because the modern swing turn is quite impossible unless the heels are firmly held.

Ski as a means of progression over snow date back centuries. The earliest mention of ski-ing on record occurs in Procopius (A.D. 526-599), who mentions a race of Skridfinner—that is, gliding Finns—apparently in contrast to other Finns who did not glide. The use of ski was mainly as a method of getting from one snowbound valley to another, and it was not until 1870 that first reference is made to ski-ing as a sport. In 1877 the Christiania ski club was formed, and the Norwegian ski association was founded 1883. The first mention of Continental ski-ing is found in a book published 1689. In England ski were used in Cumberland

Skiddaw. The 3,054-ft. mountain in the Lake District, Cumberland

early in the 19th century, and possibly even before that.

There are three different types of ski-ing: 1, cross-country or *Langlauf*; 2, downhill or *Slalom*; 3, jumping. As well as a sport, ski-ing is practised for pleasure by many holidaymakers. The practice of downhill ski-ing is of comparatively recent date.

The first ski-ing Olympic games were held in Chamonix, 1924. In the same year the Parsenn Derby, the first international downhill race, was run over a course from Parsenn Furka to Kublis, with a vertical descent of 5,500 ft. and 7 m. long. The course was

changed in 1931 and is now run from the Weissfluh to Kublis, a drop of 7,000 ft. and 10 m. long.

For turning at high speed, both ski should be parallel, flat on the snow, very close together, and should rise slightly before the turn.

The body should be swung from the shoulders, keeping the hips rigid, towards the direction in which the skier is turning, and at the same time dropping to a crouch with the knees and body as far forward as possible.

Leading British competitions are the Duke of Kent's cup, the Roberts of Kandahar challenge cup, the British ski championship. The Arlberg-Kandahar and the Parsenn Derby are the two most important Continental events. Ski-ing in Great Britain is controlled by the Ski Club of Great Britain, which was formed in 1903 and has approximately 8,000 members.

Ski-ing, A. Lunn, 1927; High Speed Ski-ing, P. Lunn, 1935; Ski Français, E. Allais, 1947; Ski (Technique, Competition, Mountaineering), J. Couttet, 1947.

Skimmia Japonica. Evergreen shrub of the family Rutaceae, native of Japan. It is about 4 ft. in height, with alternate lance-shaped, leathery leaves and fragrant white flowers in large clusters. These are succeeded by bright red berries.

Skimpole, HAROLD. Character in Dickens's novel Bleak House. He is an indolent dilettante and poseur, who allows an affectation of irresponsibility and a flow of charming chatter to mask a nature utterly selfish and a persistent habit of sponging on his friends. Dickens originally called him Leonard Skimpole, and in formulating his peculiar conversational

Skimmia Japonica. Clustered berries and leaves of the Japanese shrub. Inset, flowers

deeper layers consisting of protoplasmic cells. The dermis is composed of dense fibrous tissue, which becomes looser in the deeper part and passes into the subcutaneous tissues. It contains the blood-vessels of the skin. The nails are thickenings of one of the layers of the epidermis.

The deeper layers of the skin contain the hair follicles, from the base of each of which a hair grows, passing through the epidermis. Sebaceous glands are small sacs in the dermis, the ducts of which open into the upper parts of hair follicles. They secrete a fatty substance called sebum, which acts as a lubricant to the hairs. Sweat glands consist of coiled tubes in the deepest part of the dermis, ducts from which pass up through the skin to the surface. They are most numerous on the palms and soles. The dermis also contains the minute end-organs of nerves, by which sensations of touch, pain, heat, and cold are excited.

The functions of the skin are to act as a protective covering to the underlying tissues, to assist in regulating the temperature of the body, and to secrete sebum and sweat, so excreting a certain amount of waste material from the body. See Anatomy; Man.

Skink (*Scincus officinalis*). One of a tribe of lizards, which includes about 400 species. Some of them are limbless, but in most genera short limbs are present. The body is bulky and, as a rule, rather smooth, while the tail is short and conical. The true skinks are found in Africa and S. Asia, in sandy districts. See Lizard colour plate.

Skinner, JOHN (1744-1816). Scottish prelate. He was born at Longside, May 17, 1744, and educated at Aberdeen university. After ordination in 1763 he was a parish clergyman at Ellon and Longacre, Aberdeen, becoming co-

Ski-ing. A German woman champion demonstrates a turning movement. Top picture shows a ski jump

style openly had Leigh Hunt in mind. To his surprise this gave Hunt some pain, and the alteration of the name to Harold was part of the author's amends.

Skin. Tissue covering the surface of the body. It consists of two layers, the epidermis or cuticle and the dermis or true skin. The epidermis is composed of stratified epithelium, the surface layers being hard and horny, and the

Skin. Diagram of section of the human skin, showing the epidermis and the corium (dermis) or true skin, and indicating the arrangement of the sweat glands and the position of a hair follicle

adjutor to the bishop of Aberdeen in 1782, bishop 1787, and primus of Scotland in 1788. He did important work in promoting the Relief Act of 1792, which removed the disabilities under which the Scottish Episcopalians suffered. He published *A Course of Lectures*, 1786; *A Layman's Account of His Faith*, 1801; *Primitive Truth and Order Vindicated*, 1803. He died July 13, 1816.

John Skinner,
Scottish prelate

Skinner, William (1778-1857). Scottish prelate. Born at Aberdeen Oct. 24, 1778, he was educated at Marischal College and Wadham College, Oxford. He was ordained in 1802 and succeeded his father, John Skinner, as bishop of Aberdeen in 1816, being elected in 1841 primus of Scotland. Skinner exercised great influence in the Episcopal Church, and Glenalmond College was founded during his primacy. He died April 15, 1857. His elder brother, John Skinner (1769-1841), wrote *Annals of Scottish Episcopacy*, 1818.

William Skinner,
Scottish prelate

Skinner's Company. London city livery company. Incorporated in 1327, and arising from a guild interested in the trade in skins cured with the fur upon them, it has had many illustrious members. In its charge are Tonbridge school, founded by Sir Andrew Judd in 1553; a secondary school for boys at Tunbridge Wells, 1887; another at Tonbridge, 1888; a secondary school for girls at Stamford Hill, 1886; and almshouses at Palmer's Green, 1894.

The Skinner's company has done much to promote technical education and its charitable work has been considerable. The hall, 8, Dowgate Hill, E.C.4, once called Copped Hall, rebuilt after the Great Fire of 1666 and since renovated, contains some valuable 16th century plate, and historical paintings by Sir Frank

Brangwyn. See *City Companies*. Consult *Some Account of the Company of Skinners of London*, J. F. Wadmore, 1902.

Skipper (Du., *schipper*). Title of the master of a fishing vessel or small trading ship. The term is sometimes applied to the captains of larger vessels, except in the R.N., where it is used only for a wartime rank of the commander of a drifter or trawler engaged in minesweeping.

Skipper (Hesperiidae). Family of butterflies of primitive structure approaching moths, and coloured

Skipper. Small British butterfly, the grizzled skipper, *Hesperia malvae*

mostly various shades of brown. The eight British species have a rapid short darting flight—whence their English name. The caterpillars mostly feed on grasses and spin leaves together as shelters. The pupae are enclosed in cocoons of silk and grass. See *Butterfly*.

Skipton (A.S. *scepton*, sheep town). Mkt. town and urban dist., giving its name to a co. constituency, of Yorks (W.R.), England. On a tributary of the Aire, 26 m. N.W. of Leeds, it has a rly. station. The town has cotton and woolen factories and a cattle market. It has a grammar school of the 15th century, and a parish church, Holy Trinity, in Perpendicular style. Skipton grew up around a Norman castle; this was a stronghold in the Civil War, and the damage it suffered, together with that to the parish church, was repaired. In the grounds of the castle, part of which is still used as a residence, are the ruins of the church of S. John. Skipton was the birthplace of some of the Sidgwick family of philosophers. Market days, Mon. and Sat. Pop. est. 13,430.

Skipton, Yorkshire. Gateway of ruined castle

Skittles. Game of great antiquity and wide distribution. Four large pins or skittles are set up in the form of a diamond at one end of a green or alley; a bowl shaped like a cheese and about 10 lb. in weight is thrown at them from a distance of 21 ft. Another pin in the centre of the diamond is called the king pin. The object is to strike the skittles so that all of them shall be knocked over in one or two throws. The cheese is flung on to the skittles, not rolled towards them, a certain amount of physical strength being required. In another form of the game a ball is bowled at nine pins set up in the same manner. A variety played upon a table in public houses is known as bar skittles. See *Nine Pins*.

Skjaeggedals Foss. Norwegian waterfall. It is 9 m. N.E. of Odde on the Tyssaa river in the Hardanger Fjeld, and 525 ft. high, and is much visited.

Skobelev, MIKHAIL DMITRIEVICH (1843-82). Russian soldier. Born Sept. 17, 1843, at St. Petersburg (Leningrad), he saw his first service during the Polish insurrection of 1863, and from 1868 was stationed in what is now Soviet Central Asia, where he also did good work as an explorer. He had a share in the capture of Khiva and a still greater one in the ex-

Skoda Works. The famous Czecho-Slovakian armament works near Pilsen after Allied bombing during the Second Great War. Top, the advanced stage of rebuilding reached in 1946

Germans invaded Czecho-Slovakia in 1939 they immediately seized the Skoda works for their own armament production. Forced labour was extensively used. The works were bombed from Great Britain and the Mediterranean area, the last attack being made by American aircraft in 1945. Thereafter Skoda production was largely directed to supplying

the Russian armed forces.

Skopin. Town of the R.S.F.S.R. It is in the region and 50 m. S. of Ryazan, on the Verda. There is considerable trade in grain, cattle, pottery, and iron wares. The dist. is chiefly agricultural.

Skoplje. Capital of S. Serbia, Yugoslavia. It is 130 m. N.W. of Salonika, is on the Vardar, and is a rly. junction. The Turkish name is Uskub. It is a centre of administration for Muslim activities. The principal buildings are a citadel, the palace of the former Turkish governor, churches and mosques, a Roman aqueduct, a school of agriculture, an institute of tropical diseases, and a university. Agricultural produce consists of maize, oats, barley, and opium, and silkworm culture is carried on. Chrome, antimony, saltpetre, and magnesite are mined in the dis-

trict. The name is derived from Scupi, an ancient town overwhelmed by an earthquake in the 5th century. In the 13th century Skoplje was captured by the Serbian king, Milutin, who made it his capital. It was taken by the Turks in 1912, fell to the Bulgarians in 1915, and was regained by the French in 1918. During the Second Great War it was taken by the Germans, April 9, 1941, and liberated by a combined force of Bulgarians and Yugoslav patriots, Nov. 15, 1944. Pop. 68,334.

Skua (*Stercorarius*). Genus of gulls, of which four species occur in Great Britain. They have brownish plumage. The common or great skua (*S. skua*) is 25 ins. long and is mottled brown. It breeds in the Shetlands, but is rather rare. Richardson's skua is somewhat smaller and has dusky plumage, except on the neck and under parts, which are yellowish white. The Arctic skua (*S. parasiticus*) breeds in the Orkneys, Shetlands, and Hebrides. The

petition against Khokand, but made his great reputation during the Russo-Turkish War of 1877. He showed great courage and strategic skill at Plevna, Lovtcha, and especially at Senova in the Shipka Pass. Afterwards he returned to Turkistan, where in 1881 he led the assault on the fortress of Geok Tepe and subdued the country. He died July 7, 1882.

Skoda Works. Manufacturing concern situated at Pilsen, Czecho-Slovakia. Up to the end of 1918 it was one of the world's greatest arsenals and the largest steel works in Central Europe. It was in Austrian territory, and bore the same relation to the Austro-Hungarian govt. as Krupp's (*q.v.*) to the German. By the treaty of 1919 the works passed under control of Czecho-Slovakia.

The Skoda works were started as a small factory in 1859. In 1913 their area, excluding coal mines and proving range for guns, was 360 acres, and employment was given to 7,500 men. The principal departments were the ordnance factory with a shell-filling plant and proof-range, forges for light and heavy work, rly. material plant, steel works, iron and metal foundries, boiler-building shops, bridge-building plant, and general engineering works.

Although the 40,000 workers of 1918 were reduced to a few thousands in 1921, production of armaments was increased after 1930 to supply many weapons used by Germany and France. When the

pressed on the sides, broader behind than in front, and is supported by the spinal column or back-bone. The bones composing the cranium are the occipital, the frontal, the sphenoid, the ethmoid, two temporal, and two parietal bones.

The bones of the cranium are formed of two compact layers known as the inner and outer tables, supported by a layer of cancellate bony tissue. The external surface is smooth, but shows lines formed of small irregular bony processes or sutures where the component bones are united. Internally, the cranium exhibits depressions corresponding to the large convolutions of the brain, shallow grooves along which large veins run, and smaller grooves marking the site of the arteries.

The base of the skull presents a large aperture known as the foramen magnum, through which the brain passes to the spinal cord, and smaller apertures for the passage of nerves and blood-vessels. The bones of the cranium are developed from cartilage, and at birth this process is not complete. Hence soft spots are to be felt. These are known as fontanelles, the largest being on the vertex of the skull. They should be completely closed by not later than the end of the second year. The form of the skull varies widely in different races, skulls relatively wide being termed brachycephalic, whilst the long, narrow type is termed dolichocephalic. See Anthropology, plate; Bone; Brain; Facial Angle; Head; Man; Phrenology; Piltown Skull.

Skunk (*Mephitis*). Carnivorous mammal. Belonging to the weasel tribe, it is found in N. and Central America. It is rather smaller than a domestic cat, and has a handsome black coat with two white stripes running along the back. The tail is long and bushy, measuring 18 ins. when the body is about 24 ins. long. Skunks are commonly found in the open country and near farms, where the hen-roost is a great attraction. Their chief foods are mice, frogs, and

Skunk of Canada, *M. mephitis*
W. S. Berridge, F.Z.S.

Skye Terrier. A champion of this popular breed of dog

birds' eggs, and to a certain extent insects. Their fur is of considerable value. The animal, which can emit an offensive odour from the secretion of a pair of glands near the tail, has been reared in captivity for its fur.

Sky. Apparent arch or vault of heaven, which extends from horizon to horizon. The chief cause of the blue colour of the sky is the scattering of sunlight by the molecules of the air. When light of different wavelengths passes through such a medium containing minute particles the proportion scattered is greater the shorter the wavelength of the light; the short waves at the blue-violet end of the spectrum are thus scattered more than the longer yellow-red waves. If large particles of smoke or dust are present in the atmosphere the scattered light does not contain so high a proportion of blue, and the sky appears whiter in colour. From high mountains the sky assumes a pure deep blue because of the absence of smoke, etc., in the upper regions. See Clouds, colour plate.

Skye. Island of the Inner Hebrides, Scotland. Part of the county of Inverness, it is separated from the mainland by Kyle Rhea, a channel $\frac{1}{2}$ m. wide. From N. to S. it measures 47 m., and its breadth varies from three to 26 m. Its area is 643 sq. m. The coast is deeply indented, and the surface mountainous. The highest hills are the Cuillin range, several being over 3,000 ft. high. The scenery is magnificent, especially in the N. Notable spots are Loch Coruisk, mentioned in Scott's *Lord of the Isles*, and Glen Sligachan, at the head of a loch of the same name.

The chief industries are fishing, the rearing of cattle and sheep, and distilling. Portree, the chief village, has steamer communication with Glasgow, Oban, and elsewhere. Skye was the stronghold of the Macleods and the Macdonalds. Dunvegan Castle was the headquarters of the former. The inhabitants are mainly crofters. Off the coast are a number of small

islands. A Highland gathering for Skye is held every year near Portree. Pop. est. 11,000.

Skye Terrier. Breed of small dog. Formerly kept in the Isle of Skye for destroying vermin, it is now regarded largely as a pet. It has a long low body, with very short legs, and the hair almost touching the ground. Very often the hair on the head is so long and profuse as to obscure the vision. Its height is usually 10 ins., and the length of the body rather more than 30 ins. Two types of Skye terrier are recognized by fanciers. The drop-eared breed should be very long in the body, almost resembling the dachshund, and have long, straight hair. The prick-eared type is shorter in the body, rounder in the head, and should have a rather rough coat. The Skye terrier is extremely alert and intelligent; is docile in disposition; and makes a capital house dog. See Dog, colour plate.

Skylark (*Alauda arvensis*). Bird of the order Passeriformes. It is a native of Europe (including Great

Skylark. British song-bird which nests in the fields and downs
W. S. Berridge, F.Z.S.

Britain) and Central and N. Asia. Its general colour is brown, streaked with black on the upper parts, and buffy white beneath. It measures about 7 ins. in total length, of which a little over 2 ins. is tail. The first primary quill of the wing is exceedingly small, and the hind claw is very long and straight; two points which distinguish the skylarks from other larks. The open nest, constructed of dry grass, is placed in a depression in the ground, and contains 3-5 blotched grey and brown eggs. The food consists chiefly of seeds and insects. The bird is famous for its song in flight. Vast numbers of skylarks from the Continent visit Great Britain in the autumn and stay during the winter. See Bird; Eggs colour plate.

Skymaster. Transport aeroplane designed and manufactured by the Douglas aircraft co. of the U.S.A. First known as the DC-4

airliner, the Skymaster became in the Second Great War the standard four-engined transport of the U.S.A.A.F., in which it bore the designation C-54. The wing span was 117 ft. 6 ins., the fuselage length 93 ft. 11 ins.; it was one of the first large aeroplanes with a nosewheel undercarriage. It was powered by four 1,350 h.p. Pratt & Whitney Twin Wasp radial engines, giving a top speed of 274 m.p.h. The extreme range with normal load of 26 passengers was 3,900 m. In 1947 an automatically controlled Skymaster crossed the Atlantic without a pilot.

Skyro. Alternative name for the Aegean island of Seyros (*q.v.*).

Skyscraper. Building of many storeys. Two pre-requisites of its invention in the U.S.A. were the devices of the hydraulic lift and the steel building framework. These were first utilised to the full in the construction of the Home Insurance building in Chicago (1884) to designs by W. Le B. Jenney (1832-1907). The basic principle was a method of skeleton construction in which each storey was carried independently on columns. The pattern was soon followed elsewhere, especially in New York, where this type of building was especially suitable because of the island site of this great and growing city in which 32 skyscrapers rise to more than 500 ft. The tallest is the Empire State building, with 102 storeys reaching to 1,250 ft.

The advantages of the skyscraper are that it utilises to the full the costly land of crowded cities, and it is convenient since restaurants, shops, etc., may be found in the same building with many offices. On the other hand it is the chief reason for congestion of street traffic at rush hours, since it concentrates several thousands of persons under one roof; also when, as often happens, skyscrapers are built on both sides of a street, they convert it into a canyon, perpetually darkened and stiflingly oppressive through the closeness of the atmosphere when not swept by fierce gusts; and it gravely increases fire hazards. While the individual skyscraper is often aesthetically a disfigurement, a certain combination of skyscrapers may produce a unique artistic effect, especially when lit up at night, as in the skyline of lower New York when approached from the sea. The inconvenience caused by the exclusion of light and air has led many U.S. cities to impose varying height limits.

Slade, Felix (1790-1868). British art collector. Born in Lambeth, London, he became a collector of ancient and modern glass, pottery, old MSS., and engravings. He bequeathed a great part of these to the British Museum, and left £35,000 for the endowment of the Slade professorship of fine arts at Oxford, Cambridge, and University College, London, where also six scholarships and the Slade school (*q.v.*) were established. The Oxford professorship, together with that of poetry, was discontinued from 1914. Slade died in London, March 29, 1868.

Felix Slade, British art collector

Sladen, Douglas Brooke Wheelton (1856-1947). British writer. Born in London, Feb. 5, 1856, he was educated at Cheltenham and Trinity College, Oxford. Professor of history in Sydney university, 1882-84, he travelled extensively, and became an authority on Japan. He planned *Who's Who* in its new form in 1897, and edited it until 1899. In 1938 he was chairman of the Modern Girl club. He died Feb. 12, 1947. More than 60 books by Sladen included *Frithjof and Ingebjorg*, 1882; *Austrian Ballads and Rhymes*, 1888; *A Japanese Marriage*, 1895; *In Sicily*, 1901; *The Secrets of the Vatican*, 1907; *The Douglas Romance*, 1916; *Eve, an Artist's Model*, 1932; *My Long Life*, 1939.

Slade School. School of fine arts, a branch of University College, London. Founded by the bequest of Felix Slade (1790-1868), it was opened in 1871, with Sir E. Poynter as its first professor, and has professors of painting and sculpture, and lecturers in the history of art, anatomy, ornamental design, and perspective. Other principals have included Henry Tonks and Randolph Schwabe (the latter died in 1948). The many famous painters who studied at the Slade include Augustus John, Orpen, Wyndham Lewis, and Paul Nash. *Consult* The Slade, J. Fothergill, 1907.

Slag. Non-metallic metallurgical material. It is produced during almost all operations involving the handling of molten metals. Composition varies with the impurities present, refractories in the furnace, etc. In smelting, the function of slag is to collect the unwanted gangue constituents of

the ore, so as to leave the metal or matte as pure as possible. As silica is the most abundant impurity in ores, the majority of slags are silicates. A desirable slag will melt readily to form a fluid, easily handled mass; be lighter than the molten metal; not attack the refractory linings of the furnace; and protect the metal from the furnace atmosphere. This is effected by the addition of suitable fluxes. Slag often has value as a by-product; e.g. basic slag from steel making is a common fertiliser.

Slagelse. Town of Denmark. It is in Zealand, 58 m. S.W. of Copenhagen, and has rly. connexion with the capital and with Korsør. The church is an ancient foundation, and there is a ruined monastery. Hans Andersen attended the high school. Pop. est. 18,073.

Slaitwaite. Former urban dist. and market town of the W. Riding of Yorks, England, since 1937 forming part of the Colne valley urban district. It stands on the river Colne, and is served by rlys. and by the Huddersfield canal, Huddersfield being 4 m. N.E. There are manufactures of woollen and cotton goods, and the place is visited for its baths, the waters being efficacious for skin diseases. Market day, Mon. (alternate). Pop. 5,000. The name of the town is locally pron. Slah-wit.

Slander (Lat. *scandalum*, scandal). Malicious defamation of a person in his character, business, or profession by spoken words as distinct from written words, which is libel (*q.v.*). It is a less serious offence than libel as being less permanent and far-reaching, and exposes the offender only to civil proceedings. Action will lie if the words impute a criminal offence, if they allege misconduct in a public office, if they reflect upon another's trade or profession, or if they cause special damage. Any imputations on a woman's chastity are actionable without special damage under the Slander of Women Act, 1891.

Slaney. River of Eire, in the prov. of Leinster. It rises on the slopes of Lugnaquilla, co. Wicklow, and flows 60 m. S.W. and S. through counties Carlow and Wexford to Wexford Harbour. It receives the waters of the Bann, Derry, and other rivers. The town of Wexford, at its mouth, has a salmon fishery and river traffic between itself and Enniscorthy.

Slang (*cf.* Norwegian *slengja*, to sling, cast). Vulgar or colloquial form of speech not recognized in

the literary language of the period. The earliest sense of the word, which held its ground till the middle of the 17th century, is the cant or jargon peculiar to rogues and vagabonds and intelligible only to themselves. Subsequently the respectable trades and professions adopted a jargon of their own, also known as slang, made up of colloquialisms and characterised by unauthorised or humorous metaphorical applications of legitimate expressions. When these expressions meet with general acceptance in their altered sense, their original eccentricity is forgotten, they cease to be slang, and take their place in the storehouse of the literary language. Cant or pedlars' French appears to have assumed definite shape soon after the arrival of the gypsies in England early in the 16th century.

Sources of Slang Words

This language was naturally of mixed origin. Irish and Gaelic words made their way into it through shelta, tinkers' slang; Romany, which in the main consists of Hindi and Persian, contributed a number of words, though not so many as might have been expected; in the time of Elizabeth many additions were made from Italian. Later slang was also considerably indebted to Dutch, the result of the great influx into England from the time of William III. After the time of Charles II the new kind of professional slang developed, in consequence of the great advance of the arts and sciences. In more recent times slang has been increased by Yiddish (Hebrew-German), extensively spoken in the East End of London; Anglo-Indian, pidgin-English (*q.v.*), and Americanisms have played their part.

All countries possess a slang of their own; such are the French argot or langue verte, the German Rotwelsch (beggars' lingo), the Italian gerga, the Spanish germania, the American gangster idiom. Minor kinds are back, rhyming, university, and public school slang. To illustrate the extent to which slang has affected different classes of society, a dictionary of the subject arranges slang under various headings—fashionable, parliamentary, military, religious, legal, literary, theatrical, civic, money, shopkeepers', workmen's, oaths.

A fruitful source of slang is metaphor, the use of a name or descriptive term in reference to something to which it is not really applicable—*e.g.* "mug" for "face," perhaps

originating in the 18th century habit of making drinking mugs to represent a human face with distorted features. Metaphor is responsible for phrases like a "blooming" error, which is regarded as slang, whereas no objection is taken to a "glaring" error. Other sources are neologisms, new words of native or foreign origin, and the use of old words with different meanings; euphemism, the substitution of a less disagreeable phrase for one that is offensive to the susceptibilities of others, as "to go west," in the sense of "die." In both Great Wars hundreds of new slang words were invented by the British fighting services; some were common to all, while others were peculiar to one service. Much service slang, especially from the R.A.F., passed into civilian speech. See Rhyming Slang. Consult Dictionary of Slang and Colloquial English, J. S. Farmer and W. E. Henley, 7 vols., 1905; Words, Words, Words, E. Partridge, 1933.

Slapton. Village in Devon, England, 7 m. S.S.W. of Dartmouth. It has a 14th century tower and a church dating from the 15th century. For nearly 20 years it was the home of Sir John Hawkins. During the Second Great War, Slapton Sands in Start Bay were used by American land and sea forces as a training ground for the invasion of the Continent. On July 7, 1945, the American authorities unveiled a monument expressing gratitude to people who evacuated their homes during the training.

Slate. Fine-grained rock, possessing exceptionally good cleavage, and produced by the metamorphism (*q.v.*) of pre-existing rocks. Most slates are formed by pressure at the end of a period of folding. The pressure influences the development of new minerals so that they grow normal to the direction of compression; flat and flaky minerals such as chlorite and sericitic mica tend to develop, and a direction of cleavage appears. Shales and mudstones are the rocks most readily converted into slate, but volcanic ashes and lavas can also take on a perfectly good cleavage, as in the Lake District. This cleavage is usually at an angle to the bedding planes of the strata, and is commonly parallel to the axial planes of the folds into which the beds have been thrown. Slates are found in all geological epochs to the Tertiary and many contain fossils.

Good slates are hard and durable, compact, do not split easily from

exposure to changes of temperature or to moisture, and are usually grey-black to blue-black in colour, though green, red, and mottled varieties are found. Its lightness, the ease with which it is split into thin sheets, and its weathering properties make slate an excellent roofing material.

Slates come from N. Wales, the Lake District, Delabole in Cornwall, Scotland, parts of Ireland, many parts of Europe, and N. America. When quarried the slates are cut up into sizes known as princesses, duchesses, countesses, and ladies, varying from 24 ins. by 14 ins. to 9 ins. by 6 ins. In addition to their use for roofing purposes slates are wanted for billiard tables, cisterns, mantelpieces, slate pencils, writing slates, blackboards, etc. See Shale.

Slate Club. Association of persons who pay weekly contributions into a common fund, from which they can draw limited sums to meet emergency demands. At the end of the year, usually just before Christmas, the balance of the fund is distributed among the members. Slate clubs are so called because originally the sums were chalked up on a slate.

Slater, OSCAR. German Jew convicted at Edinburgh, May, 1909, of the murder of Miss Gilchrist, an octogenarian living in Glasgow, who kept £3,000 worth of jewels in her bedroom. On Dec. 21, 1908, Miss Gilchrist was found lying on the dining-room floor, murdered. A girl named Barrowman saw a man escaping from Miss Gilchrist's residence, and afterwards identified Slater as the man she had seen.

Oscar Slater fled to New York a few days after the murder and was arrested there. The identification of Slater aroused a conflict of evidence. Sir Arthur Conan Doyle maintained his innocence, but in June, 1914, an inquiry reported that there was no evidence of a miscarriage of justice. Meanwhile, in 1909, he had been condemned to death, but the sentence had been commuted to penal servitude for life.

In 1927 Slater was released; in 1928 the Scottish court of criminal appeal, set up two years before, set aside his conviction, and the govt. accorded him an *ex gratia* payment of £6,000. A special Act of parliament had been passed in order that the case could be reviewed. Slater died, at the age of 75, Jan. 31, 1948. Consult Oscar Slater, ed. W. Roughhead, 1910; The Case of Oscar Slater, Sir A. Conan Doyle, 3rd ed. 1914.

Slatin, SIR RUDOLPH KARL VON (1857-1932). Austrian soldier. Born near Vienna, June 27, 1857, he served in the Austrian army until 1878, when he went to Egypt and joined the forces there. In 1884 Gordon made him governor of Darfur, but almost at once he was taken prisoner by the Mahdists and remained a captive for eleven years. In 1895 he escaped and rejoined the Egyptian army, with which he served in the Dongola and Omdurman campaigns. During 1900-14 he was inspector-general in the Sudan under the British, but on the outbreak of the First Great War he joined the Austrian Red Cross. He was a member of the Austrian peace delegation in Paris, 1919. He was created a Baron of the Austrian Empire, 1906, having been made K.C.M.G. in 1898. He wrote *Fire and Sword in the Sudan*, 1896. He died Oct. 4, 1932.

Slatting. Roofing of buildings with slates. The commonest way of slating is to nail the slates to laths which in turn are fixed to the rafters of the roof. This form of slating cannot be relied upon to keep out snow, however, and a better method is first to cover the rafters with felt or three-ply Willesden paper. The slates are then laid directly on this, or to laths. An air space keeps the roof at a more uniform temperature, and the laths are often placed over battens nailed on to the felt. *See* Roof; Slate.

Slaughter House. Place designed for the killing of cattle and other animals. *See* Abattoir.

Slav. Name of a group of peoples, mostly in E. Europe. It is applied primarily to people speaking dialects of the Slavonic sub-family of Indo-European languages. There is no homogeneous Slav ethnographical group. The name is by some writers derived from a native word meaning speech.

The first definite reference to the name dates from the 6th century A.D. Some Slav peoples, such as the Venedae and Serbs, were known to classical geographers at the beginning of our era, and Slav elements emerge still earlier in certain tribal groups of the Scythian region described by Herodotus. Their protohistoric cradle-land, wherein they established their most typical characteristics, lay N. of the Carpathians.

They eked out their indifferent crops by fishing, and hunted animals, with whose pelts they were clad. They brewed mead. There

being no dry grasslands, they lacked cattle and milk food. Their social organization was based on a primitive patriarchal rule, with chiefs elected by the local assembly. In warfare they fought afoot, with javelins and shields.

The W. and S. migrations of the Germanic populations in the 3rd-4th centuries conduced to, if they were not actually occasioned by, the expansion of their Slavonic-speaking neighbours. By the 6th century Slav communities occupied Poland, the Elbe basin to the Baltic coast, the region between Saale and Oder, and the Bohemian uplands. Berlin, Breslau, Dresden, Pomerania, and numerous other Slavonic place-names attest the extent of their dispersion. Towards the S. they crossed the Danube and overran the Balkan plains. Although driven back by the Avars, their settlements imparted to the peninsula that Slav predominance it still retains.

The Slav populations, political rather than ethnic communities, number: Poles, including Kashubs, 20,000,000; Czechs, Slovaks, and Wends, 10,000,000; S. or Yugo-Slavs and Bulgars, 20,000,000. There are about 8,000,000 in America.

Slavonic languages pertain to the E. or Aryan branch of the Indo-European family. As such they use sibilants where gutturals occur in the languages of the W. branch. Some of their inflexions have outlived the Teutonic and Celtic; nouns have three numbers and seven cases, and the numerals are declined. The "aspects" of the verb express subtle distinctions. Russians, Bulgarians, and Serbs use a modified form of the Cyrillic alphabet. *See* Cyril and Methodius; Pan-slavism; Russia.

Slave. River of Canada. It forms part of the Mackenzie river system and is the connecting link between Lake Athabaska and the Great Slave Lake, receiving the Peace river 20 m. N. of Lake Athabaska. At Grahame Landing the river drops over a series of rapids to Fort Smith, the head of navigation from the Arctic Ocean. Below this the river flows for 190 m. over a lowland to the Great Slave Lake. Its length is 306 m.

Slave Coast. Name applied to a portion of the coast of W. Africa between the Gold Coast and the river Benue. The littoral is divided between Togoland, Dahomé and Nigeria. *See* Africa.

Slave Labour. Term used during the Second Great War for the millions of Jews. Poles,

Russians, French, Dutch, Norwegians and others, who were removed by the Germans, usually forcibly, from their homes and put to work under conditions of slavery in the factories, mines, and underground workshops of Germany. Hundreds of thousands of these people, their usefulness as workers exhausted by bad conditions, long hours, and poor food, were sent to the death camps of Poland; from those who survived came the majority of the Displaced Persons (*q.v.*) whose resettlement constituted a major international problem after the end of hostilities.

Slavery (Med. Latin *sclavus*, a Slavonic captive). Economic institution under which forced labour is used without pay. Though supported by his owner, the slave is often a chattel. Slavery is not always distinguished from serfdom, a term which should strictly be applied to the house slaves of Africa, who are members of the owners' families, and cannot, as a rule, be sold.

Slaves fall broadly into the two classes of domestic and industrial slaves. In the lower civilizations—those of agricultural and pastoral tribes—slavery is a widespread institution. It is rare with hunters and nomads.

As regards origin, slaves may be divided into four classes: (1) captives of war, with whom may be grouped kidnapped persons; (2) debtors and criminals; (3) those who have sold their own persons, or have been sold as children by their parents; (4) the offspring of slaves. A great slave-owning area is necessarily either itself warlike or in communication with warrior tribes whose captives come into the market.

In negro Africa most classes of slaves are found. A male slave must work for his owner on certain days, at other times he cultivates his own farm. Any surplus he may convert into currency. A slave may become his master's heir, or guardian of his sons.

In ancient India slaves were inherited, captured in war, purchased, or condemned criminals. Hebrew slaves, if native, were set free in the seventh year, but might be redeemed by their relatives.

In ancient Greece and Rome the economic importance of slavery was enormous. In the 5th century B.C. half the population in Attica was unfree, and a much larger proportion has been given for the Roman empire under Claudius. Slaves in Greece were

employed on domestic duties, in farms, mines, and factories. There were also temple slaves. In general, their condition was good; custom recognized their marriages, permitted them to save money, purchase their freedom, and exercise religious rights. Even the law provided redress against cruel owners who had no power of life and death; escaping slaves had a right of asylum. Domestic slaves, often on terms of friendship with their masters, were better treated than industrial slaves. A slave might purchase his liberty or be set free, and became a client as regards his master, a "metic" or resident alien as regards the state, or by vote receive full citizenship.

Roman Slaves

In Rome slaves were employed in the house, on estates, where they afterwards became *coloni* or serfs, as gladiators, actors, teachers, and in the law courts, etc. Their lot was hard, especially on farms, where the *villicus*, or overseer, was himself a slave. The owner had power of life and death, the slave had no civil rights, could hold no property, and his marriage was not recognized. But by hard work and economy he could purchase his freedom in six years, and in many respects custom mitigated the law. The expansion of the empire increased the number of slaves. When wars of conquest ceased in the 2nd century A.D., the supply of slaves was subjected to many limitations, and in time slaves became serfs.

The civilization of the ancient world was based on the institution of slavery, and without this economic foundation neither Athenian culture nor the Roman imperial system could have existed. It was, however, a chief cause of social and moral decay. Christianity did not forbid slavery, but commended manumission. It supplied the spiritual solvent which gradually destroyed the institution. The manumission of slaves profoundly modified the population of S. Europe. By the 12th century the enslavement of Europeans in Europe had almost disappeared, becoming only a legal penalty for particular offences, generally for a limited period, e.g. penal servitude in galleys.

Among Mahomedans a slave is either a captive infidel or the child of a female slave. Oriental rulers often raised slaves to high positions of confidence, and formed regiments or armies of slaves, e.g. the mamelukes and janissaries.

Powerful dynasties were established by slave captives.

After the discovery of the New World, negro slavery was introduced into all the tropical and semi-tropical colonies. English criminals and political prisoners were sent as slaves to the plantations in the 17th century, and the kidnapping of English children for sale there did not cease until 1744. From about 1650 the European conscience was gradually roused to a sense of the injustice and moral evils of slavery, the Quakers being among the first to protest. The suppression of the slave trade (v.t.) 1807, was followed by that of the whole system throughout the British Empire in 1834. Slavery is now nominally extinct in all civilized countries, although in several parts of the world there exist systems of indentured labour which are scarcely distinguishable from it. See Anti-Slavery Movement; Negro; Peonage; Serf; United States.

Bibliography. History of European Morals from Augustus to Charlemagne, W. E. Lecky, 1890; A History of Slavery and Serfdom, J. K. Ingram, 1895; Slavery as an Industrial System, H. J. Nieboer, 1900; The Roman Law of Slavery, W. W. Buckland, 1909; Slavery, Lady Simon, 1929.

Slave Trade. Traffic in human beings for the purpose of forced labour. In most countries where slavery prevailed the demand was not fully supplied by the small natural increase of the slave population. Where the slave-owning state could not rely on a steady supply of prisoners of war, other warlike tribes enriched themselves by organizing raids, and trading in their captives. The Arabs were for centuries active slave-dealers, and supplied the markets of W. Asia from tropical Africa. The corsairs of N. Africa carried on an extensive trade in slaves, even raiding Ireland and Iceland in the 17th century.

The modern European traffic in negroes was begun by the Portuguese in 1442, but was developed only after the discovery of America. As Spain had no tropical African possessions, the trade was in the hands of the English, French, and Dutch. By the treaty of Utrecht, 1713, Spain concluded an exclusive contract, called the *Asiento*, with the English traders to supply her colonies with slaves. During the 18th century the trade attained great dimensions, and brought rich profits to the traders, in spite of the enormous mortality, two or more slaves being

embarked for one who became an effective labourer. The native chiefs on the Slave Coast, in the Cameroons, Angola, etc., waged constant wars in the hinterland to supply the markets at the ports, the result being the rapid demoralization and ruin of large areas.

In Great Britain, after a long struggle, Lord Grenville's Act for the abolition of the slave trade was passed in 1807. The corsairs of Algiers were suppressed in 1816. The Sudan remained a great source of supply for the Turkish, Egyptian, and Persian markets, but in 1869 the Egyptian government employed Sir H. Baker and afterwards C. G. Gordon to put down the traffic in the Egyptian Sudan carried on by Arab slave dealers, who were devastating that region. The partition of Africa between the powers virtually ended the trade by the close of the century. See Anti-Slavery Movement; Anti-Slavery Society; Slavery.

Bibliography. History of the Rise, Progress and Accomplishment of the Abolition of the African Slave Trade, T. Clarkson, 1808; The African Slave Trade, 1838, and The Remedy, a Sequel, 1840, T. F. Buxton; Suppression of the African Slave Trade, 1863-1870, W. E. B. Du Bois, 1896.

Slaviansk, OR SLAVYANSK. Town of Ukraine S.S.R. It is 110 m. S.E. of Kharkov, in the valley of the Donetz. In the neighbourhood there are numerous salt lakes, the place being famous for its saline baths and salt-works. In German hands from the end of Oct., 1941, Slaviansk was liberated Sept. 6, 1943, during a rapid but hard-fought Russian advance in the Donetz basin. Pop. 75,542.

Slavin, FRANK PATRICK (1862-1929). British pugilist. Born in New South Wales, Jan. 5, 1862, he became a professional boxer, and between 1885 and 1891 beat Tom Burke, Mic Dooley, "Chesterfield" Goode, Jim Young, Joe McAuliffe, and Jake Kilrain. On Dec. 23, 1889, he fought a draw, under prize ring rules, with Jem Smith, at Bruges. At the National Sporting Club, on May 31, 1892, Slavin was knocked out by the negro Peter Jackson in the tenth round after a game display. Slavin subsequently won several contests in the U.S.A. and also in the Klondike. He died Oct. 18, 1929.

Slavonia. Dist. of Yugoslavia. Formerly in Hungary, it was the area between the Drave and Save rivers mainly inhabited by Serbs,

and formed part of the semi-autonomous Hungarian prov. of Croatia-Slavonia (q.v.). In the reorganization of the South Slav state the dist. became the autonomous prov. of Syrmia (q.v.).

Sleaford. Market town and urban dist. of Lincs, England, the administrative capital of Kesteven.

Sleaford, Lincolnshire. West front of the parish church of St. Denis

It stands on the Lea, 112 m. from London and 21 m. from Lincoln, and is a rly. junction.

The chief buildings are the church of St. Denis, and Carre's grammar school founded in 1624. The former has a beautiful nave, a Perpendicular rood-screen, and a strikingly decorated font. Sleaford is an agricultural centre; the chief industries are malting and seed production. Sleaford was originally a Roman station, afterwards passing to the bishop of Lincoln. One of the bishops built a castle here, which was pulled down in the 17th century. In the Middle Ages the town had fairs, markets, and trade guilds. Market day, Monday. Pop. 7,610.

Sledge. Carriage with runners made for sliding upon snow. It is more usually spelled sleigh. A sledge-hammer is a heavy hammer. See Hammer; Sleigh.

Sleep. Recurring period of mental and physical rest of an organism during which consciousness is abolished except for partial interruptions while dreaming. During sleep the volume of blood in the brain is diminished, the pupils are contracted, the pulse rate is reduced, the respiratory movements are slower and deeper, and the temperature falls slightly. The cause of the phenomenon is, however, not fully understood, though its duration can be, in some people, controlled at will.

Sleeper. Device for strengthening and preserving the permanent way of a rly. line. Sleepers, which rest on the ballast and carry the rails, are in Great Britain usually of wood, 9 ft. long, 10 ins. wide, and 5 ins. deep. See Railways.

Sleeping Sickness. Disease due to infection by an organism of the genus *Trypanosoma*, prevalent along the W. coast of Africa, the Congo, Uganda, Rhodesia, and other parts of Africa. The parasite occurs in antelopes and other animals, and in domestic dogs. From these it is conveyed to man, and from man to man by the bite of certain tsetse flies.

The symptoms begin usually within two or three weeks with an attack of fever and rash on the skin. The lymphatic glands become enlarged. The fever lasts for about a week, but recurs at intervals. After some weeks or months the patient becomes dull and apathetic. He neglects his work, may be dirty in his habits, and has some difficulty in walking. He prefers to lie quiet instead of exerting himself. Sleep may be excessive, but the condition is more one of lethargy from which the patient can be aroused. Tremors of the limbs occur, there may be shaking of the whole body, and the patient shuffles in his walk. Gradually the muscles become rigid, the patient loses flesh, and the legs may be drawn up against the abdomen. Extreme emaciation occurs, and ultimately death follows from exhaustion.

Preparations containing arsenic have been found of some value in treatment. Preventive measures consist in segregating the sick, where possible, in districts away from the tsetse fly or unfavourable

by painting the part affected with tincture of iodine. For the disease popularly called *sleepy sickness*, see Encephalitis.

Sleet. Falling rain and snow or partially melted snow. It occurs, probably, when falling snow passes through air warmer than 32° F., and reaches the ground in a half-liquid state. See Snow.

Sleeve. Covering for the arm. Sleeves vary greatly in different periods, and few parts of dress so precisely indicate the time to which costume belongs. The Normans wore long, loose sleeves reaching far beyond the hand, and the 15th century was also remarkable for great length of sleeve. Some fell loose from the shoulders, or had a slit at the elbow through which the arm was thrust, and sometimes the ends were so long that they had to be knotted or tied together behind to prevent inconvenience. See Costume; Cuff.

Sleeve Valve. The earliest type of this valve, invented by C. Y. Knight about 1905, consisted of two concentric sleeves sliding axially in the bore of a petrol engine cylinder. Each sleeve was driven by a separate eccentric, the relative angular positions of these eccentrics being arranged so that openings in the sleeve communicated alternately with induction and exhaust ports in the cylinder. Fitted to Daimler engines in 1909, the device gave good results, but disadvantages became apparent as revolution speeds and mean effective pressures increased.

The single-sleeve valve (Figs. 1 and 2)

Sleeve Valve. Fig. 1, the valve developed by the Bristol Aeroplane co. Right, fig. 2, sectional diagram. See text

for the development of the trypanosoma in the fly, clearing the bush near villages and along the water's edge at landing places and fords, avoiding bites by wearing appropriate clothing, and immediate disinfecting of a bite

was invented in 1909 by Burt and McCallum, working independently. It consists of a sleeve S, making both sliding and rotary oscillations in the cylinder C. The combined motion puts ports in the sleeve in communication with induction and exhaust ports in the cylinder at the correct positions of the engine crank. The sleeve is actuated by a pin P fixed to a wheel K which is driven at half crank speed through gearing. In the latest type, developed by

the Bristol Aeroplane co. in conjunction with (Sir H.) Ricardo and (Sir Roy) Fedden, a spherical bush B, fitted to a lug on the sleeve S, permits of free sliding and rotary motion of the pin P. Substitution of single-sleeve valves for poppet valves has the following advantages: (1) more silent operation; (2) fewer working parts; (3) all working parts enclosed; (4) higher mean effective pressures practicable, with consequent reduction of weight per h.p.; (5) cooler exhaust; (6) little maintenance required; (7) wear involves replacement of sleeve only; (8) higher revolution speeds practicable, combined with high volumetric efficiency.

Sleigh or **SLEDGE** (Mid. Eng. *sledé*, akin to slide). Wheelless vehicle used on ice or snow. Built on runners, sleighs vary in size and shape according to their use. In countries which are snow-

Sleigh. A team of dogs drawing a sleigh in N. Saskatchewan, Canada. Top, a motor tractor converted into a sleigh in readiness for an American Arctic expedition

bound during the winter sleighs drawn by man-power, horses, reindeer, or dogs are the only means of transport, and are adapted for heavy draught purposes, or built on light and graceful lines for use as private conveyances, as in Russia and Scandinavia, or for racing, as in Switzerland, etc. See Bobsleigh; Reindeer; Tobogganing; Troika.

Slessor, **SIR HENRY** (b. 1883). British judge. He was educated at Oundle, St. Paul's, and London university, and in 1906 became a barrister, specialising in trade union law. In 1924 he was knighted, took silk, and was appointed solicitor-gen. in the first Labour govt., being Labour M.P. for S.E. Leeds, 1924-29. He was a lord justice of appeal 1929-40 and, a strong Anglo-Catholic, vice-president of the Church Union Himself a J.P., he favoured a professional, instead of a lay, magistracy. In addition to a legal work on Trade Union Law, 1922, he published *Religio Laici*, 1929; *The Pastured Shire and Other Verses*, 1935; *Judgement Re-*

served (autobiography), 1941; *History of the Liberal Party*, 1944; *Order and Disorder*, 1945.

Slessor, **MARY MITCHELL** (1848-1915). Scottish missionary. Born at Aberdeen, Dec. 2, 1848, she worked as a mill-girl in Dundee, and later was trained for mission work. In 1876 she was sent as a missionary of the Free (later United Free) Church of Scotland to South Nigeria. Her

the university. Attached to the territory are several islands in the Baltic and the North Sea. Both duchies, Slesvig (Ger. Schleswig) and Holstein, came under the Danish crown in 1386, and in 1460 were decreed inseparable. Frequent breaches of this promise led to fighting through the centuries, especially in 1848 and 1864. From 1866 the duchies were united with Germany; but after the First

Great War a plebiscite gave N. Slesvig again to Denmark. The country is flat, with mostly rich soil, whereon horse and cattle breeding have reached the highest standard in Germany. There is fishing in both seas and the numerous inland lakes; grain

and sugar beet are grown; textile, leather, engineering, shipbuilding, and tobacco industries are normally prosperous. Of a pop. (1950) of 3,000,000, 42 p.c. were refugees. See Holstein; Kiel.

Slesvig-Holstein Question.

European difficulty which largely caused the Seven Weeks' War of 1866 between Austria and Prussia. Both duchies, Slesvig and Holstein, were ruled by the king of Denmark, although not part of the Danish kingdom proper. In each, but especially Holstein, there was a numerous German population, and Holstein was a member of the German confederation set up in 1815. Moreover, the two duchies had been in 1460 declared inseparable.

Frederick VII, who became king of Denmark in 1847, was without sons, and in the duchies, unlike Denmark, the Salic law was recognized. Frederick claimed that his domains should pass together on his death, whereupon the Holsteiners revolted, and a Prussian army entered the duchies in their support. The Great Powers interfered, and the Prussians withdrew.

knowledge of native dialects was recognized by her appointment as British consul for the Okoyong prov. She died in Old Calabar, Jan 15, 1915. *Consul's Life*, W. P. Livingstone, 1916.

Slesvig. District in Jutland, Denmark. The treaty of Versailles specified that a plebiscite should be taken to determine the frontier of Germany and Denmark after the First Great War. The people in the N. portion of the Prussian prov. of Slesvig-Holstein (*v.i.*) voted for incorporation in Denmark, and this took effect from July 9, 1920, their territory being organized as the S. Jutland provinces. See Denmark map, p. 2650.

Slesvig-Holstein. Until 1945, a Prussian province; later the northernmost German Land, in the British zone, bordering Denmark. Area 6,047 sq. m. Kiel is the capital, biggest city, and seat of

Slide Rule. The instrument which enables arithmetical computations to be made rapidly by mechanical means and logarithmic methods. The slide rule incorporates four principal scales, A and D on the rule, and B and C on the slide. In the illustration in this and facing p.—

The difficulty over the Danish succession was soon adjusted, and Christian, afterwards Christian IX, was recognized as the future king. His succession was guaranteed, as was the integrity of Denmark, by the treaty of London of 1852. But in 1855 a new constitution created alarm in the duchies. With the associated duchy of Lauenburg they had been promised self-government, but instead of this privilege the authority of Denmark over them was emphasised.

The two tendencies, Danish and German, still clashed. In 1863 Frederick VII denounced the treaty of London, and declared his intention of incorporating Slesvig with Denmark. A little later he died and Christian became king, but a rival appeared in Frederick of Augustenburg, who was supported by the Holsteiners. Prussia then interfered, declaring for the right of the duchies to self-government under Christian. Austria consented to act with her. A conference was called to London, but it failed to end the dispute, and the war began in 1864. The Danes were beaten, and the duchies ceded to Austria and Prussia. They quarrelled over the spoil, and with the victory of Prussia in 1866 Slesvig-Holstein became part of that kingdom. See Europe; Seven Weeks' War.

Slide. In photography, device for holding cut film or plates in a camera. After focusing, the focusing screen is removed and the dark slide, with the sensitive material, inserted in its place. Slides usually hold two films or plates, arranged back to back; some are in two hinged leaves which open like a book. A shutter at the front of the slide temporarily excludes light while it is being inserted.

Slide Fastener. Device for closing a garment or bag. Several metal members are clamped to a length of cord, and the latter is sewn on to a fabric tape. Two lengths of tape are stitched one on either side of the aperture to be closed. Each metal member has

on one side a concave recess and on the other a rounded projection; on either side of the opening a projection is opposite a recess. At the end of the lengths of metal members is a slider, the edges of which are lipped and lap over nicks on the outer sides of the metal members. When the slider is drawn the length of the aperture to be closed, the tapes are brought together, causing the projection on one metal member to engage in the recess on that opposite, and vice versa; the members are thus interlocked. For opening there is a heart-shaped piece of metal loosely fixed in the centre of the slider. When the latter is pulled backwards, the pointed end of the heart-shaped piece engages slightly below the locked projections and recesses, disengaging them.

The first practical slide fastener was introduced in 1893 by an Alsatian mechanic, Henri Aronson. His invention was developed by an American firm, but not until 1920 was machinery devised for mass production of the components. The fastener was introduced in Great Britain in 1925 as a fastener for tobacco pouches. There are different types of slide fasteners, one being commercially marketed as the "Zip," but basically their principle is the same.

Slide Rule. Instrument for performing mechanically multiplications and divisions and other mathematical operations by logarithmic methods. In the use of logarithms the multiplication of two quantities is effected by adding their logarithms, the division by subtracting them. This principle is employed in the slide rule, which in effect adds or subtracts logarithmic distances on the scales marked on the rule and on its slide. The principle of the rule is due to Gunter (1620); the slide was added by Wingate, 1626, and the cursor by Mannheim, 1851. The latter is a sliding glass or other transparent member having a datum line engraved upon it; it can be slid along to indicate any

Slide Fastener. 1. Open. 2. Tab. 3. Slide to hold tab. 4. Outer casing of fastener. 5. Wedge that causes teeth to disengage. 6. Teeth disengaged. 7. Teeth about to be disengaged. 8. Teeth engaged. 9. Channel or sides of fastener causing teeth to engage. 10. Fabric. 11. Closed

point desired on the scale, enabling results to be read more quickly.

The normal slide rule has a scale 10 in. long; others with 5-in. and 20-in. scales are made. The Fuller calculator works on the same principle, but is cylindrical in form (length 17 in. and diam. $3\frac{1}{4}$ in.); it is equivalent, on account of the spiral nature of its scale, to a straight rule 500 in. long.

Sliding Scale. Arrangement by which a scale of variations of one quantity is linked with and made dependent on the variations in another set of quantities. A famous sliding scale was that of the import duties on wheat introduced in 1828. These duties were linked with the home price of wheat; when that was 50s. a quarter, the duty on imported wheat was 36s. 8d.; at 52s., the duty was 34s. 8d.; and so on, until when the home price was 73s. a quarter, the duty was only a shilling.

For many years rates of wages in the British iron and steel industry have been increased and diminished according to changes in the selling prices of the basic iron and steel products.

—(reproduced by courtesy of Dargue Bros., Ltd., Halifax) log-log scales (LU and LL) are also shown on top and lower edges respectively. Scales A, B, C, and D are, in effect, tables of logarithms plotted out to scale on the rule. A and B are alike. Besides the simpler multiplication and division and other mathematical problems solved by the slide rule, squares, square roots, cubes, and cube roots can also be determined

During the First Great War most trade unions negotiated agreements with employers by which wages were to be augmented by a cost-of-living bonus, the amount of which changed a stated amount for every 5 or 10 p.c. alteration in the cost-of-living index. In the Second Great War it again became a practice to tie rates of remuneration to the official cost-of-living figure.

Sliding scales underlie much current economic planning, *e.g.* import quotas, licensing, the payment of subsidies under Agricultural Marketing Acts, and grants-in-aid to local authorities. See Cost of Living.

Slieve Bloom. Mt. range of Eire. Trending S.W. to N.E., it forms part of the boundary between Offaly and Laoighis, and attains an alt. of 1,733 ft.

Slieve Donard. Mountain of N. Ireland, in the S. of Co. Down. It is the loftiest summit of the Mourne Mts., and is 2,796 ft. high.

Sligo. Co. of Connacht, Eire. In the N.W. of the country, its land area is 694 sq. m. It has a low coast-line on the Atlantic, broken by Sligo, Killala, and other bays. The surface is fairly hilly. There are mts. in the N.E., and elsewhere are the Ox Mts. and the Curlew Mts. Rivers include the Moy, Easky, Owenmore, and Owenboy, and loughs the Arrow, Gara, and Gill. The principal industries are grazing cattle, fishing, and growing potatoes and oats. Much of Eire's scanty mineral wealth comes from this co.—coal, lead, copper, iron ore. The Eire state rlys. afford transport facilities. Sligo is the co. town; other places are Tobercurry, Ballymote, and Collooney. Inishmurray and other islands belong to the co. Its place-names figure in the poetry of Yeats, long a resident. Three members are sent to the Dáil. Pop. 62,331.

Sligo. Seaport, market town, and co. town of Sligo, Eire. It stands at the mouth of the Garroogue, where it falls into Sligo Bay, 134 m. N.W. of Dublin by rly. One of the principal seaports on the W. coast, Sligo has a good harbour with ample docks, etc. It exports dairy produce. Other industries are concerned with flour mills, sawmills, and fishing. There is a regular steamer service with Liverpool and Glasgow. The chief building is the R.C. cathedral of the diocese of Elphin, built 1870. About 1252 a Dominican abbey was founded; there are extensive

ruins. Market days, Tues. and Sat. Pop. 12,906.

Slim, SIR WILLIAM JOSEPH (b. 1891). British soldier. Born Aug. 6, 1891, he was educated at King Edward's school, Birmingham, and after serving with distinction in the First Great War, joined the Indian army. Instructor at Camberley staff college, 1934-36, he commanded the 10th infantry brigade in the Sudan at the outbreak of the Second Great War, and took part in the Eritrea campaign, being promoted major-general. Service in the Middle East brought the D.S.O., and Slim led the British 14th army in Burma through a brilliantly executed campaign. In 1945 he was appointed c.-in-c. of Allied Land Forces, S.E. Asia, but in 1946 returned to be put at the head of the Imperial Defence College for a year. In 1948 he was chairman of the rly. executive. Knighted 1944, he was A.D.C. to the king 1947. In 1948 he succeeded Montgomery as C.I.G.S., being promoted field-marshal 1949. See Burma Campaign.

Sir William Slim,
British soldier

Slime. Metallurgical term applied to that portion of crushed ore which, owing to its minutely divided state and the presence of colloidal substances, settles very slowly from water. Generally, that portion of ore which passes through a 200-mesh screen with a 0.003-in. aperture is treated as slime.

Sling. Primitive projectile weapon. The sling is a short piece of leather to each end of which cords are attached; a stone is placed in the pocket formed by the leather, and, gripping both cords, the slinger whirls it; when he lets one cord free the stone is shot out by the momentum. It is frequently referred to in Biblical history, and in classical times Balearic Islanders were renowned slingers. See Armour; First Aid.

Slip. Word used in several senses in engineering. In screw motion the difference between the actual forward travel per revolution of a propeller and the distance which it would move if acting on a solid medium is known as the slip. In a driving-wheel or belt-pulley, the loss of drive owing to insufficient adhesion is referred to as slip.

Slipstream. Stream of air produced by an airscrew when driving an aircraft forward. In contrast to the smooth flow of air over the rest of the aircraft, it is eddying and pulsating, and causes noise, vibration, and strain in the materials over which it passes.

Sloan, JOHN TODHUNTER (1874-1933). American jockey. He first visited England towards the end of the racing season of 1897. "Tod" Sloan attracted attention by the peculiar seat he adopted, perched in a crouched fashion on the horse's withers. At Newmarket on Sept. 30, 1898, he rode five consecutive winners; on April 18, 1899, he won on four successive mounts. His career ended in 1900 when he was accused of betting on his own mount. He died at Los Angeles, Dec. 22, 1933.

Sloane, SIR HANS (1660-1753). British physician, naturalist, and collector. Of Scottish descent, he

Hans Sloane

was born at Killyleagh, co. Down, April 16, 1660, and studied in Paris and Montpellier. He was physician to the governor of Jamaica, 1687-89; secretary of the Royal Society, 1693-1712; president, 1727-41; and president of the Royal College of Physicians, 1719-35. Made a baronet, 1716, he became first physician to the king, 1727, and lived until Jan. 11, 1753, being buried in the churchyard of Chelsea old church. After purchasing the manor of Chelsea, 1712, he presented the freehold of the Chelsea Physic Garden to the Society of Apothecaries, 1721, and his collection of natural history specimens, books, MSS., pictures, coins, prints, etc., formed the nucleus of the British Museum (*q.v.*). Sloane Square, Hans Place, etc., are named after him. He compiled a catalogue of Jamaican plants, 1696, and wrote *A Voyage to Jamaica, etc.*, 1707-25. See Chelsea.

Sloane, WILLIAM MILLIGAN (1850-1928). American historian. Born at Richmond, Ohio, Nov. 12, 1850, he was educated at Columbia College, N.Y., afterwards studying in Germany. He was a teacher in Pittsburgh, then acted as secretary to the historian, George Bancroft, U.S. minister in Berlin. In 1876 Sloane returned to America, and

became professor of history at Princeton, where he remained for twenty years, editing for part of the time *The Princeton Review*. In 1896 he was appointed Seth Low professor of history at Columbia. Sloane's most popular work is his *Napoleon Bonaparte*, 1896, enlarged ed. 1911. He wrote also *The French War and the Revolution*, 1893; *Party Government in the U.S.A.*, 1914; and *The Powers and Aims of Western Democracy*, 1918. He died Sept. 12, 1928.

Slocum, HENRY WARNER (1827-94). American soldier. Born at Delphi, New York, Sept. 24, 1827, he was educated at the military academy of West Point. He left the army in 1856, and practised as a lawyer, but rejoined on the outbreak of the Civil War, in the course of which he was present at both battles of Bull Run, Gaines's Mill, Antietam, Chancellorsville, and Gettysburg, and commanded the left wing on Sherman's famous march to the sea. In 1865 he settled in Brooklyn as a practising lawyer, also taking an active part in political and municipal affairs. He died there April 14, 1894.

Sloe. Fruit and leaves of the blackthorn, the British wild plum

Sloe. Name given to the fruit of the blackthorn, or the tree itself. The fruit is about the size of a small damson, and black or very dark purple in colour, with a white bloom. Very sour to the taste, it is of little value commercially, being used only in the making of sloe gin and a few preserves. See Blackthorn.

Sloop (Dutch *sloop*). Fore-and-aft rigged sailing vessel with one mast, a jibstay and a standing bowsprit. In the sailing ship era of the Royal Navy a sloop was a vessel rated between a cutter and a frigate, armed with 18 guns, and commanded by a lieutenant-commander. In the First

Sloth. Two-toed species, *Choloepus*, of the nocturnal animal of the South American forests
W. S. Berridge, F.Z.S.

Great War, the term was revived for a patrol and convoy protection vessel of 1,100 tons armed with four 4-in. guns. The type survived into the Second Great War, but was largely replaced by the frigate.

Sloth. Family of edentate (toothless) mammals, found only in S. America. They include two genera, the three-toed (*Bradypus*) and the two-toed (*Choloepus*) sloths. The body is bulky and heavy, the head comparatively small and rounded, while the limbs end in hook-like feet armed with very long curved claws by which the animal clings back downwards from the boughs of trees. The hair is long and shaggy, brown or greyish in colour, and tinted green on the animal in its natural conditions by an alga lodging and growing upon it. Though

classed with the Edentata, sloths have five pairs of teeth in the upper jaw and four in the lower; and they feed upon leaves, shoots, and fruit. Among the trees they can move with considerable speed; but on the ground they crawl slowly and with some difficulty. They move about at night. See *Megatherium*.

Sloth Bear or **Honey Bear** (*Melursus labiatus*). Bear of the mountainous regions of India and Ceylon. The only

species of the genus *Melursus*, it has a shaggy black coat, and a long muzzle with very mobile lips. Its food is chiefly honey, fruit, and insects. See *Bear*.

Sloth Bear. Long-snouted, shaggy-haired bear, a native of the mountains of India and Ceylon
W. S. Berridge, F.Z.S.

Slough. Industrial and residential borough of Bucks, England. It lies 20 m. W. of London, and is served by Green Line and three rly. stations, being a junction. The borough charter was granted in 1938, and Slough joins with Eton to elect an M.P. The chief public building is a hall erected to the memory of the duke of Albany. The mechanical transport depot established by the government in the First Great War was transformed into a trading estate of 700 acres accommodating more than 200 factories. Engineering is a principal industry of Slough, where the Herschels carried out much of their astronomical research. Pop. est. 64,911.

Slough arms

Sloop under full sail; a type of vessel used in the navy in the 18th century

From *Falconer's Universal Marine Dictionary*

Slovak. Peasants from the remote districts of the Czechoslovakian republic

Slovak. Slav people in Czechoslovakia. Numbering some 3,000,000, mainly on the N. uplands of the old Hungarian kingdom, they occur also in Moravia, with a sprinkling in adjacent states. They are mostly hard-working peasants, practising a somewhat backward husbandry, or itinerant artisans. Pliant in disposition, they suffered for eight centuries under Magyar oppression, but rapidly adapted themselves to their new freedom after the First Great War. Lutheran or R.C., they have preserved in isolation many primitive Slav customs. Their dialects, like Polish and Czech, pertain to the W. Slavonic languages.

Slovakia. Eastern portion of the republic of Czechoslovakia, which before the First Great War was part of Austria-Hungary. It lies between Moravia on the W. and Ruthenia on the E., Poland on the N. and Hungary on the S. By the constitution of 1948 Slovakia was given an elected national council of 100 members and an executive board of commissioners appointed by the govt. of Czechoslovakia. Bratislava is the capital. Area, 18,902 sq. m. Pop. 3,402,300.

Although the country is chiefly mountainous, it comes down towards the plains of the Morava and Tisza (Theiss) at its W. and E. ends respectively. The Carpathians attain their greatest alt. in the High Tatra, where peaks rise over 8,000 ft. In the upland districts forestry and shepherding are the chief occupations; intensive methods of agriculture have been introduced in the valleys, and there are many industries based on local material, e.g. working flax, wool,

wood, and iron, and making glass. Lignite is found, and water power supplements the relatively scarce coal fuel. Though communications throughout S. Slovakia have been greatly extended, the isolated N. region retains many traditions and customs. See Czechoslovakia.

Slovene. Slav people in Yugoslavia. They number rather over a million, mainly in the old Austro-Hungarian lands of Carniola, Gorizia, Styria, S. Carinthia, and the Istrian coastland. Established there since the 7th century, when the Slav immigration into the Balkan peninsula was pressed back by the Avars, they have in recent times acted as a barrier to the Germanic movement towards the Adriatic. In this service they were effectively aided by their economic and racial organizations, including cooperative societies. Tall, round-headed, they developed in their Alpine habitat sturdy independence. They are intelligent, industrious, businesslike, sociable, and highly musical. Mainly Roman Catholics, they include a small Calvinist section in the N. Their dialects, like Serbian and Croat, pertain to the S. group of Slavonic languages.

Slovenia. Northern portion of Yugoslavia. Almost coterminous with the former Austrian province of Carniola, it was incorporated after the First Great War into the Serb, Croat, and Slovene state known as Yugoslavia. Covering an area of 6,266 sq. m., with a pop. of 1,144,298, it is traversed by several mt. ranges. The principal river is the Save, and there are several important lakes. The chief cities include Ljubljana (Laibach), the capital, and Maribor (Marburg). See Carniola; Yugoslavia.

Slow March. Ceremonial march used in the British fighting services at funerals and trooping of the colour. When slow marching without weapons, both arms are held rigidly to the sides and the party steps off with the left foot, the leg being rigid, and the foot slid along the ground toe downwards to make a pace of 30 ins. The step is then completed with the right foot, there being a distinct pause between each leg movement. When slow marching under arms at funerals, rifles are held reversed under the left arm, the butt towards the front and the muzzle to the rear declined at an angle of 45°.

Slow Match. Simple type of fuse which smoulders very slowly. It is prepared by soaking loose hemp cords in a dilute solution of saltpetre and then drying. When

ignited it burns at the rate of about 3-4 ins. an hour. In olden times it was used in matchlock guns as a means of keeping a light ready for use; and later for military and civil blasting, to provide a delay action in various types of projectiles, and in fireworks.

Slow-worm OR **BLIND-WORM** (*Anguis fragilis*). Limbless lizard. It is common throughout Europe, except in the N., and is of a brownish-grey colour, with a streak of black down the back. It is more usually known by its alternative name of blind-worm (*q.v.*). See Regeneration.

Sloy, Loch. Stretch of water in Dumfriesshire, Scotland, 30 m. N.W. of Glasgow and 3 m. W. of Loch Lomond. As part of the Highland Development Scheme (*q.v.*), it was tapped to supply electric power to part of the Highlands and the Glasgow area. The work, begun in 1945, involved building a dam on Loch Sloy to form a reservoir of 1,200 million galls. capacity, tunnelling 1½ m. through Ben Vorlich, and erecting a power station supplying 130,000 kW. on the banks of Loch Lomond.

Slubice. Polish name for Frankfurt-on-Oder (*q.v.*), in Polish occupation after the Second Great War.

Slug. Name given to those land molluscs in which the shell is either internal or absent. In other

Slug. The black slug, *Arion ater*, with tentacles partly retracted. Reduced

respects they do not differ in any essential features of structure from snails. The British Isles have 20 species of slugs, including three of *Testacella*, in which there is a small external shell on the hinder end of the foot. All British slugs have small flattened shells concealed within the mantle cavity, but in one group the shell is reduced to a mere chalky granule, not always to be found in dissection.

Most of the destruction in gardens commonly ascribed to snails is the work of slugs, especially of the field slug (*Agriolimax agrestis*) and the keeled slug (*Limax Sowerbyi*), both of which are abundant. Most other slugs feed upon fungi, lichens, and decaying animal and vegetable matter, and are harmless to garden plants. Slugs are hermaphrodites and deposit their eggs in holes in the ground. In winter they hibernate under stones and often

Slug. The species *Limax rufus*

at some distance under ground. They hide during the day and feed at night. They may be caught in large numbers by placing scalded bran under pieces of tile or slate in the evening. *See* Mollusca; Snail.

Sluice Gate. Solid gate used to control the flow of water in a channel or weir. Made of wood or steel, and usually rectangular, the gate moves vertically in guides and is raised or lowered by hand or machine. If the water level on the discharge side is above the highest point of the sluice, a submerged gate is used. Sluice gates are employed principally for filling irrigation channels, controlling flow into reservoirs, and in some sewage disposal schemes.

Slum. Word meaning a poor street or neighbourhood. It is therefore used for a district where houses are crowded together and are dilapidated and insanitary. The haphazard growth of large towns during the 19th century led to a large increase in the size and number of slum areas in Great Britain, and towards the end of that century much philanthropic effort was being expended towards the alleviation of slum life. The 20th century saw the adoption of a more practical policy, local authorities being more concerned with slum clearance by resettlement of the slum-dwellers either on housing estates amid better conditions elsewhere or in new houses or blocks of flats built on the site of the cleared slums. It is to be noted that even good districts with well-built houses may degenerate into approximate slum conditions by overcrowding or by the uncleanly habits of those who occupy them. *See* Housing; Public Health; Town Planning.

Slur. In music, a curved line, the meaning of which varies according to circumstances. (1) It is often synonymous with Legato (*q.v.*). (2) It indicates the extent of the phrase. (3) As a mark of phrasing, it is properly applied over two notes only, the second of which does not exceed the first in value. In performance, the first note receives special stress, and is closely united to the second note,

which is slightly weakened as well as shortened. (4) In vocal music, it is placed over two or more notes which are to be sung in a single syllable. When used otherwise, it may imply the vocal grace of *Portamento*. (5) If used in combination with dots, it means that the break between the notes should be very slight.

Slutsk. Town of White Russia S.S.R. It is 60 m. S. of Minsk, on the Sluch, a tributary of the Pripiet. A communications centre, captured by the Germans in early July, 1941, it was liberated June 30, 1944. Pop. est. 16,000.

Sluys, BATTLE OF. Naval engagement fought between the English and the French, June 24, 1340. Edward III had declared himself king of France in Jan., 1340, besides being "lord of the sea and of the passage across the sea." Yet the French had ravaged Sandwich, Winchelsea, Rye, Hastings, Southampton, and Portsmouth, and had captured numerous English vessels. Accordingly a fleet comprising about 200 ships was assembled in the Orwell, and on June 20, 1340, Edward embarked in the "cog" Thomas, and the whole armament set sail, being joined off Blankenberghe by the northern fleet of 50 sail. Edward put the strength of the enemy at 190 ships. They had with them a Genoese contingent under Barbanegra.

They lay at anchor in the river Sluys, some 10 m. from Blankenberghe, well armed with knights, men-at-arms, crossbowmen, and stone-throwers. Edward carried his fleet into the river on the flood tide, on the morning of June 24. There was a fatal defect in the French defence, because the English blow struck the end of the line, and ship after ship was carried with terrific slaughter. It is possible that the French ships, or some of them, had got under way before the impact. The tide turned, and Barbanegra's ships slipped their cables and escaped. Of the fleet only 24 got away, and of these several were afterwards taken at sea. *Pron.* Slois.

Sly, CHRISTOPHER. Character in Shakespeare's *Taming of the Shrew*. In the Induction to the play, Christopher Sly, a drunken tinker, is found by a lord who, in jest, takes him home and has him placed in the best chamber of his mansion. When Sly awakes he is treated with every respect, and made to think he is a lord indeed. For his diversion the play of *The Taming of the Shrew* is performed.

Smack (Dutch, *smak*). Name given to fishing vessels that sail, but strictly a decked or half-decked boat used for trawling. *See* Boat.

Smailholm. Parish of N. Roxburghshire, Scotland. On Eden Water, on the Berwickshire border, $5\frac{1}{2}$ m. N. of Kelso, its ivy-clad church is said to date from the middle of the 17th century. Smailholm Tower, about 7 m. E. of Melrose, has been identified as the Avenel Castle of Scott's novel *The Monastery*. A square gabled building with courtyard, it dates from the 15th century. Sandyknowe Crags, $1\frac{1}{2}$ m. to the S.W., is associated with Scott's early life.

Small Arms. General classification which includes those weapons, whether designed for thrusting, stabbing, cutting, or the discharge of missiles, which can be conveniently operated and transported by one man. *See* Ammunition; Bayonet; Revolver; Rifle, etc.; also Musketry, School of.

Small Heath. Suburb and bor. constituency of Birmingham (*q.v.*).

Small Holdings. Portions of land of limited area or rental let to agricultural workers for their own cultivation. In Great Britain the progress of enclosures, and the general tendency of agricultural development towards large-scale farming, gradually caused the disappearance of the small holders or owners of land. By the middle of the 19th century this class only survived in a few isolated districts, *e.g.* the New Forest and the Isle of Axholme, Lincolnshire. A Small Holdings Act of 1897 had assigned to every dwelling built for "persons engaged in husbandry" an area of at least four acres of land, but this was abolished in 1975.

The subsequent rural depopulation and growing discontent among agricultural labourers led to various pieces of small-holding legislation. In 1892 the Small Holdings Act was passed; it was designed to help agricultural labourers to acquire a holding by a system of instalment purchase, and fixed the limits of such holdings, which were to be allotted by county councils, as from one to 50 acres, or up to £50 annual rental. The Act was a failure, however, and was superseded. The Small Holdings Allotments Acts, 1908-31, gave power to local authorities to acquire land for these purposes. The powers may be exercised compulsorily with the consent of the ministry of Agriculture. *See* Agriculture; Allotment; Enclosures; Land Settlement.

Small-pox OR **VARIOLA**. Acute infectious disease, caused by a virus which gains a footing through the respiratory tract. The disease is very contagious, and the infection is conveyed by small scales, which are shed like a dust from the skin at the peak of the eruption and during convalescence. The patient is not free of power to convey the disease until the skin is perfectly clear from eruption and the consequent scaling. The incubation period is from 10 to 14 days. Persons of any age may be attacked, the mortality rate being 25 to 50 p.c. Epidemics vary much in virulence. Native races are much more susceptible to the disease, and show a higher mortality from it, than Europeans.

Several forms of small-pox are recognized. In the ordinary form the symptoms begin with a chill, and a rise of temp. to 103° or 104° F. In children there may be convulsions. Severe headache, pains in the back, and vomiting occur, and sometimes delirium. In some cases, within the first three days an initial rash, which may resemble that of scarlet fever or measles, appears. Usually on the fourth day papules appear on the forehead, face, and scalp, and extend over the whole body. These pass through a series of changes and suppurate about the ninth day. They begin to dry up about the eleventh day, and later scars are formed, producing pitting.

Haemorrhagic small-pox or black small-pox is a form in which haemorrhage occurs into the pustules, and there may be haemorrhage from the mucous membranes. In one form of haemorrhagic small-pox the bleeding occurs early, and death may follow in a few days. In another form, the disease progresses as in the ordinary type, and then in the pustular stage haemorrhages occur. Varioloid is a modified form of small-pox which occurs in people who have been vaccinated, and is milder.

Segregation of the patients in special institutions is essential. No drug has any specific influence on the disease, but a good deal can be done to relieve the symptoms and lessen the risk of disfigurement from pitting of the skin. Signs and symptoms are dealt with as they arise. The diagnosis, as between chicken-pox and small-pox often presents difficulty; but the history of vaccination, the distribution and size of the pustules, and the severity of the prostration decide the question. Small-pox is a notifiable disease. See Vaccination.

Smalt. Blue pigment, mainly cobalt silicate. It dates from the 16th cent., when it replaced the older Egyptian blue, a complex copper silicate. Smalt is made by roasting cobalt-glance or other suitable cobalt ore, and then fusing it with a mixture of quartz-sand and potash. This forms a cobalt glass, which is poured into cold water and then ground to a fine powder. Smalt was formerly used for tinting starch and paper and in artists' colours; it is still used in china and glass painting. See Cobalt; Pigment.

Smaltite. In mineralogy, cobalt arsenide, CoAs_2 . It usually contains nickel arsenide, passing to chloanthite, NiAs_2 . Smaltite is an important source of cobalt, usually occurring in vein deposits of silver, nickel, and copper, the cobalt being extracted as a by-product. See Cobalt.

Smart, CHRISTOPHER (1722-71). British poet. Born at Shipbourne, near Tonbridge, Kent, April 11, 1722, he was educated at Pembroke College, Cambridge, of which he became a fellow in 1745. He early established a reputation as a facile versifier, but through intemperance and improvidence sank into the position of a bookseller's hack in London. After being twice in a madhouse, he died in London in a debtors' prison, May 21, 1771. Smart's translations from the classics have been superseded, his epigrams and satires forgotten, but he lives by his Song to David, a poem of real power, which won the enthusiastic praise of D. G. Rossetti. Consult The Song to David, with Intro. by R. A. Streatfeild, 1901; English Poets, T. H. Ward, 1904.

Smart, SIR GEORGE THOMAS (1776-1867). British musician. Born in London, May 10, 1776, he became a member of the Chapel Royal choir, and in 1791 a church organist in Hampstead Road. He played in various orchestras, and in 1811 conducted a successful series of concerts in Dublin, where he was knighted by the lord-

Sir George Smart,
British musician

Christopher Smart,
British poet

lieutenant. An original member of the Philharmonic Society, he conducted many of its concerts, 1813-44, and also musical festivals all over the country. He also taught, Jenny Lind being among his pupils. He died Feb. 23, 1867.

Smart, HENRY THOMAS (1813-79). British composer and organist. Nephew of Sir G. T. Smart, he

H. T. Smart,
British composer

was born in London, Oct. 26, 1813, and studied for the army and the law before turning finally to music, and was organist at Blackburn, Lancashire, 1831-36. From that year he was organist to several London churches, and had a high reputation, but his failing sight from 1864 hampered his later years, and he died in London, July 6, 1879. His compositions include an opera, Bertha, or the Gnome of the Hartzberg, 1855; the cantatas, King René's Daughter, 1871, and Jacob, 1873; much sacred music, part-songs, and organ music.

Smartweed OR **WATER PEPPER** (*Polygonum hydropiper*). Annual herb of the natural order Poly-

Smartweed. Leaves and flower
sprays of the Water Pepper. Inset,
single flower

gonaceae. A native of the N. temperate hemisphere, it has a creeping, much-branched stem with swollen joints and lance-shaped leaves. The small greenish-rosy flowers are in short terminal sprays. The juices are very acrid, from which it has received its popular name, and it has been used for medicinal purposes as a diuretic.

Smeaton, JOHN (1724-92). British engineer. Born at Austhorpe, near Leeds, England, June 8, 1724, he early showed remarkable mechanical ability. Though edu-

cated for the bar he turned his attention to the manufacture of scientific instruments and wrote many engineering papers for the Royal Society, the gold medal of which he received in 1759 for his paper on wind and water mills. He made a special study of canal and harbour construction, and in 1755 he was called upon to replace the second Eddystone lighthouse, a work he completed in 1759. He built a number of bridges, including those at Perth, Banff, and Coldstream, and constructed the Forth and Clyde canal. In 1771 he founded the club which became the Institution of Civil Engineers. He died Oct. 28, 1792. *Consult* Lives of the Engineers, S. Smiles, 1861.

John Smeaton,
British engineer
After Mortimer

Smedley, FRANCIS EDWARD (1818-64). British novelist. Born at Great Marlow, Buckinghamshire, Oct. 4, 1818, Smedley received a private education. His novels include Frank Fairleigh, 1850, his best book, notable for its telling pictures of education under a private tutor; Lewis Arundel,

Francis Smedley,
British novelist

1852; and Harry Coverdale's Courtship, 1854. He edited Sharpe's Magazine for a time, and also the short-lived George Cruikshank's Magazine. Smedley died May 1, 1864.

Smell. Sense common to many animals. The word is also frequently used, not strictly correctly, for that which excites the sense of smell. The organs of smell consist of the olfactory region in the nose, which is a part of the mucous membrane covering the upper turbinal bone and the adjacent part of the nasal septum, and containing special olfactory nerve cells. The olfactory nerves pass up through minute holes in the cribriform plate of the ethmoid bone, and enter a complicated structure, the olfactory bulb, which is a continuation of the olfactory tract in the brain. Certain animals, e.g. the porpoise, appear to have no sense of smell. In others, the sense of smell is much more acute than in the human species. Even in man,

however, it has been calculated that a three hundred-millionth part of a grain of musk is distinctly appreciable. *See* Nose.

Smellie, WILLIAM (1740-95). Scottish printer and scientist. Born in Edinburgh, he served an apprenticeship with a printing firm, 1752-59, attending also classes at Edinburgh university, winning a gold medal for an able botanical essay in 1765. In that year he started a printing business on his own account, gained an important university connexion, and printed the first edition, in three volumes, of The Encyclopaedia Britannica, 1771. An active student of natural history, Smellie published his successful Philosophy of Natural History, 1790-99, and a translation of Buffon's Natural History, 1781. He was an original member of the Society of Antiquaries of Scotland, becoming secretary in 1793, and was a well-known figure in the intellectual Edinburgh society of his day. He died June 24, 1795.

W. Smellie, Scottish
printer and scientist

Smelling Salts. Preparation of ammonium carbonate and a perfume. It is used as a stimulant, as a restorative in faintness, and to give relief in nasal catarrh.

Smelt (*Osmerus*). Genus of small marine fishes closely related to the Salmon family. Of the three

Smelt. Small fish that inhabits the waters round the British coasts

W. S. Berridge, F.Z.S.

species, the common smelt (*O. eperlanus*) is the only one occurring in European waters; and it is numerous about the British coasts. It is fond of brackish waters, and is often found in the Thames above London. It grows to a length of seven or eight inches, though it is usually less, and has a silvery grey hue, with greenish back.

Smelting. In metallurgy, those operations in which the ores of metals are melted or fused. Hence the process of smelting is necessarily carried out in some form of furnace, and calls for some form of fuel or source of heat, while in many cases it requires fluxes. *See* Furnace; Metallurgy, and the articles on the various metals

Smerwick. Bay of co. Kerry, Eire. An opening of Dingle Bay, it is 5 m. from Dingle. At the harbour here 600 Spanish and Italian soldiers landed in July, 1579, to help the Irish against the English. They entrenched themselves in two forts and held out until Nov., 1580, when the English leaders, now in a position to act on the offensive, forced them to surrender. As Philip II of Spain had not formally sanctioned the expedition, the troops were put to death as pirates by the troops under Lord Grey de Wilton and Sir Walter Raleigh.

Smetana, BEDRICH (1824-84). Czech composer. Born at Litomysl, Bohemia, March 2, 1824, the boy

who was to be acclaimed as the founder of a national school of music, was a prodigy at the piano. After teaching music in Prague, he went to Gothenburg, 1856-61, to conduct for its philharmonic society. Then he helped to start what became the Czech philharmonic society, and conducted at the Prague opera house from 1866 until deafness overtook him in 1874. On May 12, 1884, he died in a mental home. This intensely nationalist composer is chiefly known by his second opera, The Bartered Bride, first performed 1870. Other operas, Dalibor, and Libusa, are based on Czech legends. Of the six symphonic poems Ma Vlast (My Country), the most often heard is Vltava, which, brilliantly scored, depicts the river of Prague. He also composed piano music, including polkas, Czech dances and other national pieces; some songs and choral music; and two string quartets and a pianoforte trio.

B. Smetana,
Czech composer

Smethwick. County and mun. borough of Staffordshire, England. It is 3½ m. from Birmingham and is

Smethwick arms

served by rly. The industries include engineering works and the making of glass, chemicals, and hardware. The chief buildings are those used for municipal purposes and several modern churches. There are 10 parks and recreation grounds. A village until the 18th century, Smethwick was made a borough in 1899 and a county

borough in 1907. From 1918 Smethwick has elected one member to parliament. Pop. 76,700.

Smew, *SMEW*, OR *NUN* (*Mergellus albellus*). British sea duck, belonging to the same group as the merganser. The plumage of the male is black and white, and the female is distinguished by a reddish-brown head. It occurs occasionally in winter on the E. coasts. See Merganser.

Smigly-Rydz, **EDWARD** (b. 1886). Polish soldier. He fought with Pilsudski's legions in the First Great War and was created c.-in-c. of the Polish military organization in 1918. An inspector of the army from 1922, he became inspector-general in 1935 and a marshal of Poland next year. When Germany invaded Poland, Sept. 1, 1939, Smigly-Rydz took command of the army, but on its defeat went to Rumania. He was arrested in Oct., 1940, but escaped.

Smike. Character in Dickens's *Nicholas Nickleby*. The drudge at Wackford Squeers's school, Dotheboys Hall, and half-witted through brutal treatment, he develops a dog-like devotion to Nicholas Nickleby, and follows him on his adventures, playing small parts in Mr. Crummles' theatrical troop to which Nicholas belongs. He dies as a result of his former ill-usage, and it is then discovered that he is the son of Ralph Nickleby, and Nicholas's cousin.

Smilax. Genus of shrubby plants belonging to the order Liliaceae. See China-root.

Smiles, **SAMUEL** (1812-1904). British author and social reformer. Born at Haddington, Dec. 23, 1812,

Samuel Smiles,
British author

he was intended for the medical profession, and graduated M.D. at Edinburgh university. Dissatisfied, however, with medical practice, he went to Leeds, where he became editor of *The Leeds Times*, and an active social reformer. Subsequently he became identified with railway management in Leeds, and later in London. His first considerable literary success was his biography of George Stephenson, 1857. In 1859 appeared the book on which his fame mainly rests, *Self Help*, a work designed to show what can be accomplished in life by determination and the will to succeed, and illustrated by copious

examples from the lives of eminent men. The book achieved amazing popularity all over the world. Very popular also were *Character*, 1871; *Thrift*, 1875; and *Duty*, 1880. Other works are *Lives of the Engineers*, 1861; *Industrial Biography*, 1863; *James Nasmyth*, 1883; and *Josiah Wedgwood*, 1894. Smiles died in London, April 16, 1904. Consult *Autobiography*, ed. T. Mackay, 1905.

Smillie, **ROBERT** (1857-1940). British labour leader. Born in Belfast, March 17, 1857, of Scottish

parents, he was early taken to Scotland, where he started work in a factory at the age of 11. Later he worked in a Clyde shipyard, then became a miner in Lanarkshire. He was president of the Scottish miners' federation, 1894-1918, and again from 1921 until his death. As president of the Miners' Federation of Great Britain, an office he held 1912-21, he led the strike of coal miners in 1912 which brought about a national minimum wage. He was a member of the royal commission on mines, 1919, presided over by Sir John Sankey (see Sankey, Viscount), and in 1928 a member of the general council of the T.U.C. He was Labour M.P. for Morpeth 1923-29. His autobiography, *My Life for Labour*, was published 1924. He died Jan. 16, 1940.

Smilodon OR **MACHAERODUS NEOGAEBUS**. Largest of the long-tusked extinct cats, also known as sabre-toothed tigers. The smilodon was the size of a modern tiger, and its tusks projected some seven inches from its jaw. See *Machaerodus*.

Smirke, **SIR ROBERT** (1781-1867). British architect. Born in London, Oct. 1, 1781, he studied at the

Sir Robert Smirke,
British architect

R. A. schools, and was articled to Soane. After travelling in Italy and Greece, he was appointed architect to the board of trade. He was elected A.R.A. in 1808, R.A. in 1811, and was treasurer of the academy 1820-50. In 1859 he removed from London to

Cheltenham, where he died, April 18, 1867. His best-known work is the British Museum, completed 1847; he also designed the old general post office, demolished 1913, and the Royal College of Physicians in Pall Mall East. Smirke's style for the most part was classic and massive.

Smith, **ADAM** (1723-90). British economist. The posthumous son of an official in the customs, he was born at Kirkcaldy, June 5, 1723, and was there educated.

Adam Smith,
British economist

From the university of Glasgow he went in 1740 to Balliol College, Oxford. In 1748 Smith began to lecture in Edinburgh, and in 1751 was chosen professor of logic at Glasgow, where during 1752-63 he was professor of moral philosophy. In 1764 he went abroad with a pupil, the duke of Buccleuch, after which he gave ten years mainly to writing and study. In 1776 the result of this labour appeared in *The Wealth of Nations*. Two years later he was appointed a commissioner of customs, a post he held until his death, July 17, 1790.

Smith enunciated a philosophy of his own, that all our sentiments arise from sympathy, in his *Theory of Moral Sentiments*, 1759. His reputation, however, rests on his *Wealth of Nations*, the most influential and exhaustive work of his kind. Its influence on the study of political economy was enormous, and it was perhaps equally great on practical politics. The book was widely translated, and studied all over the world. Mention should be made of Smith's friendships with Hume and many notable literary figures of his day, in France as well as in Great Britain. See *Political Economy*; *Wealth of Nations*.

Bibliography. Lives, R. B. Hal-dane, 1887; J. Rae, 1895; *The House of Adam Smith*, E. Ginzberg, 1934; A. S. as Student and Professor, W. R. Scott, 1937.

Smith, **ALEXANDER** (1830-67). Scottish poet. Born at Kilmarnock, Dec. 31, 1830, he became a pattern designer in Glasgow, but early began to write verses. His first considerable work was *Life Drama*, 1853. In 1859 he was appointed secretary to Edinburgh university. He died at Wardie, Midlothian, Jan. 5, 1867. His

Alexander Smith,
Scottish poet

Household, 1866. Smith, Dobell, and Bailey were classed together by Aytoun as the Spasmodic School of poetry.

Smith, ALFRED EMANUEL (1873-1944). American politician. Born of poor parents on the east side of New York, Dec. 30, 1873, he worked as a clerk. In 1903 he was elected to the N.Y. assembly as a Democrat, and became majority leader of the party in 1911. In 1915 he was New York sheriff, and in 1918 governor, being re-elected 1922, 1924, and 1926. He fought corruption, introduced much reforming legislation, and was a keen opponent of prohibition. Humour and honesty made "Al" Smith, a Roman Catholic, widely popular. In 1928 he was Democratic candidate for the presidency, but was defeated by Hoover. He died Oct. 4, 1944. See Roosevelt, F. D. Consult also Life, J. Costello, 1928.

Smith, SIR BEN (b. 1879). British politician. A London taxi-driver, he became an organizer of the Transport and General Workers' Union. Alderman for Bermondsey council, he sat as Labour M.P. for Rotherhithe, 1923-31 and 1935-46. He was parl. secretary to the ministry of Aircraft Production, 1942, then a successful minister resident in Washington for supply, 1943-45. Knighted in 1945, he was given the food ministry in C. R. Attlee's govt., but resigned in 1946, becoming chairman of the W. Midlands divisional coal board until 1950.

Smith, SIR CHARLES AUBREY (1863-1948). British actor. Born July 21, 1863, and educated at Charterhouse and Cambridge, he captained Sussex at cricket and led teams to Australia and S. Africa. Although intended for a medical career, he decided to go on the stage instead, making his first appearance in 1892. After

Sir C. Aubrey Smith,
British actor

works include Sonnets on the War, 1855, written in conjunction with Dobell; City Poems, 1857; the epic Edwin of Deira, 1861; and a novel, Alfred Hagart's

1930 he was in films, mainly in America, where he tried to popularise cricket. His usual rôle was that of the English soldier or country gentleman, and he was seen in Lives of a Bengal Lancer, 1935; Little Lord Fauntleroy, 1936; Rebecca, 1940; The White Cliffs of Dover, 1944; and the British film An Ideal Husband, 1948. Knighted 1944, he died at Beverly Hills, Calif., Dec. 20, 1948, his ashes being brought to England for burial at Hove.

Smith, DODIE. Contemporary British playwright. Born at Whitefield, Lancs, she was educated in Manchester and at St. Paul's school, London. After studying at the R.A.D.A. she made her stage début in musical comedy in 1915. Later she joined a London firm as a buyer of pictures. Her first play given professionally, Autumn Crocus, was an immediate success at the Lyric Theatre, 1931; as were Service, 1932; Touch Wood, 1934; Call It a Day, 1935; Bonnet over the Windmill, 1935; and Dear Octopus, 1938. In 1949 she pub. a novel, I Capture the Castle. Until 1935 she wrote as C. L. Anthony.

Smith, EDWARD PERCY (b. 1891). English playwright and politician. Born Jan. 5, 1891, he was educated at Haileybury and in France, and served as a seaman in the R.N.V.R., 1915-17. Under the name Edward Percy he wrote plays outstanding for suspense and powerful plots: If Four Walls Told, 1922; The Rigordans, 1926; The Shop at Sly Corner, 1945; also, with Reginald Denham, Suspect, 1937; Ladies in Retirement, 1939. A director of several milling companies, he was M.P. for Ashford, Kent, 1943-50.

Smith, LADY ELEANOR (1902-45). English novelist. Born in Birkenhead, this elder daughter of the first Lord Birkenhead started her career at 17 as society reporter for The Sphere and The By-stander, but gave up journalism to write novels. She was fascinated by gypsy life from an early age, and her first book, The Red Wagon, 1930, was about gypsies and circuses. To write more realistically she travelled with a circus (on one tour with Laura Knight), and even rode in the ring.

Lady Eleanor Smith,
English novelist

Flamenco, 1931; Tzigane, 1935; and Caravan, 1943, were all romantic stories. Ballerina, 1932, was based on the life of Pavlova; The Man in Grey, 1941, was a Regency romance; and Life's a Circus, 1939, was autobiographical. She died Oct. 20, 1945.

Smith, GEORGE (1840-76). British Assyriologist. Born in London, March 26, 1840, he practised engraving.

George Smith,
British Assyriologist

Some cuneiform plates entrusted to him led him to study the British Museum inscriptions. Observed by Rawlinson, he became museum assistant, 1867; collaborated in his Cuneiform Inscriptions of Western Asia; deciphered the Cypriote script; and wrote a History of Assyrian Discoveries, 1875, and The Chaldean Account of Genesis, 1876. While taking part in another expedition, he died at Aleppo, Aug. 19, 1876.

Smith, SIR GEORGE ADAM (1856-1942). British scholar and divine. Born at Calcutta, Oct. 19, 1856, he was educated at Edinburgh, Tübingen, and Leipzig. After a period of travel and study in Egypt and Assyria, he entered the ministry of the Free Church of Scotland and became assistant minister at Brechin in 1880. He was Hebrew tutor at the Free Church College, Aberdeen, and in 1882 was chosen to be minister of Queen's Cross church in that city.

In 1892 Smith was appointed professor of O.T. language, literature, and theology at the Free (later U.F.) Church College, Glasgow, a position he retained until 1909, when he became principal of Aberdeen university until 1935. He was moderator of the general assembly of the U.F.C., 1916-17, and chaplain to the king in Scotland from 1933 until his death, March 3, 1942. Standard

books by Smith, who was knighted in 1916, are *Historical Geography of the Holy Land*; *Life of Henry Drummond*; *The Book of Isaiah*; *The Twelve Prophets*.

Smith, GEORGE MURRAY (1824-1901). British publisher. He was born in London, March 19, 1824. His father, George Smith (1789-1846), with a fellow Scot, founded in 1816 the London stationers and booksellers, Smith and Elder, first in Fenchurch Street, then in Cornhill. George Smith the younger joined his father in 1838 and became head of the business of Smith, Elder, and co. in 1846, and founded *The Cornhill Magazine*, 1859, and *The Pall Mall Gazette*, 1865.

In 1869 the publishing was removed to Waterloo Place, Pall Mall, where, 1885-1901, under the editorship of Leslie Stephen and Sidney Lee, *The Dictionary of National Biography* was issued. Smith died on April 6, 1901; the business was then carried on by his sons and son-in-law, after whose death it was taken over by the firm of John Murray, the D.N.B., however, passing to the Oxford University Press (*q.v.*). Consult *Memoir*, Sir Sidney Lee, D.N.B., vol. xxii; *Life and Letters of Leslie Stephen*, F. Maitland, 1906.

Smith, GOLDWIN (1823-1910). British publicist and historian. Born at Reading, Aug. 13, 1823, he was educated at Eton and Magdalen College, Oxford. He won several university prizes and became a fellow of University College in 1847, and, though called to the

Goldwin Smith,
British publicist

bar in the same year, never practised. He was closely identified with the reform of university education at Oxford, and became regius professor of history there in 1858. Resigning in 1866, in 1868 he was appointed professor of English and constitutional history at Cornell, U.S.A., and in 1871 he settled in Toronto, where, at The Grange, he lived for the rest of his life, marrying a wealthy Canadian.

A sincere, if somewhat vehement reformer, Smith all his life was

engaged in combating clericalism, militarism, and imperialism. His views were set forth in trenchant style in articles he contributed to the press. In Canada he advocated in the first instance independence from the mother country and subsequently amalgamation with the U.S.A. His best known works include *Three English Statesmen*, 1867; *Canada and the Canadian Question*, 1891; and *Questions of the Day*, 1894. Goldwin Smith died June 7, 1910.

Smith, HENRY JOHN STEPHEN (1826-83). British mathematician. Born in Dublin, Nov. 2, 1826, he was educated privately and at Balliol College, Oxford, of which he became a fellow and mathematical lecturer. Appointed Savilian professor of geometry at Oxford, 1860, he died Feb. 9, 1883. Smith did his best work in connexion with the theory of numbers, a report of which in six parts he presented to the British Association. Consult *Collected Mathematical Papers*, 2 vols., 1894.

Smith, HERBERT (1862-1938). British labour leader. Born in a Yorkshire workhouse, the son of a miner killed before he was born, he began work in the mines when he was ten years old. While still a young man he was chosen as checkweighman, and became vice-president of the Yorkshire miners' association about 1904. Two years later he became president of the association, an office he held for more than 25 years. He was president of the Miners' Federation of Great Britain, 1922-29, in succession to Robert Smillie. Together with A. Cook he led the miners in the coal dispute which led to the General Strike (*q.v.*) of 1926. Though the miners were defeated, their loyalty to and trust in Smith never wavered. In addition to his work as a trade union leader, he took a large part in local govt., first as a member of the Barnsley school board, then as member of the bor. council, alderman, mayor, member of the West Riding county council, and magistrate. He died at Barnsley, June 16, 1938.

Smith, HORATIO OR HORACE (1779-1849). British wit. Born in London, Dec. 31, 1779, he was educated at Chigwell, Essex, and began life in a counting-house in London, but early turned to litera-

ture. After writing three novels and contributing to periodicals, he suddenly, with his brother James (*v.i.*), became famous by their volume, *Rejected Addresses*, in 1812. The occasion was the competition for a prize offered by the managers of Drury Lane Theatre for a poem to be recited at the re-opening of the theatre, which had been rebuilt after the fire of 1809. The brothers very wittily parodied the leading poets of the day, among Horace's best efforts being his imitations of Scott and Byron. Having become wealthy as a stockbroker, he retired in 1820, and died July 12, 1849. Of his novels the historical romance, *Brambletye House, or Cavaliers and Roundheads*, 1826, is the best known, and of his verse, apart from his contributions to *Rejected Addresses*, *An Address to a Mummy* is best remembered.

Horace and James Smith, British
wits and parodists

Smith, JAMES (1775-1839). British wit. Elder brother of Horace Smith, he was born in London, Feb. 10, 1775, was educated at Chigwell, and became solicitor to the board of ordnance, 1812. He joined his brother in the composition of *Rejected Addresses* in 1812, contributing among others the parodies of Wordsworth, Southey, Cobbett, and Crabbe. He also published the volume of verse, *Horace in London*, 1813, and acquired a reputation as a wit. He died in London, Dec. 24, 1839.

Smith, SIR JAMES EDWARD (1759-1828). British botanist. Born at Norwich, Dec. 2, 1759,

Sir James Smith,
British botanist

and educated at Edinburgh university for a medical career, he studied botany under John Hope. He was elected F.R.S. in 1785. In 1788 he founded the Linnean Society on the model of the Royal Society, and became its first president, an office he held until his death, March 17, 1828. Smith's chief publication was the letterpress to what is known as Sowerby's *English Botany*. He published also a *Flora Britannica*, 1800.

Smith, JOHN (1580-1631). English soldier and colonist. Born at

John Smith,
English colonist

Willoughby, Lincolnshire, he went abroad as a young man, saw service in France and Flanders, and, after many wild adventures, entered the Austrian army, fighting the Turks, being taken captive to Constantinople, and escaping thence to England, 1605. The following year he joined an emigrant party to Virginia, arriving at Chesapeake Bay, April 26, 1607. There he proved an able member of the council and a successful captain against the natives. In a fray with the Indians, Smith was captured, but released, according to his own account, at the intercession of Princess Pocahontas (q.v.). In 1608 Smith became president of Virginia. He explored and mapped Chesapeake Bay. Owing to dissensions in the colony, Smith returned to England, but in 1614 crossed to New England and charted the coast as far as Cape Cod. After a further voyage in 1617, he retired from active work, dying in London. He wrote many books and pamphlets (rep. Arber, 1884) relating his own adventures and describing the colony in Virginia. *Consult* Lives, C. D. Warner, 1881; A. G. Bradley, 1905; E. K. Challerton, 1934.

Smith, JOHN RAPHAEL (1752-1812). British mezzotint engraver. Born at Derby, he was brought up to the drapery trade, but in 1769 adopted the engraver's profession. He was closely associated with George Morland, and engraved hundreds of plates after Reynolds, Gainsborough, etc. He died March 2, 1812.

Smith, JOSEPH (1805-44). Founder of Mormonism. Born at Sharon, Vermont, U.S.A., Dec. 23, 1805, he began to announce his visions at the age of 15, and in 1827 alleged that under angelic guidance he had discovered new scriptures, which he professed to translate, and published, 1830, as the Book of Mormon. The church was organized the same year, with Smith as president, and the remainder

Joseph Smith,
Founder of Mormonism, in military uniform

of his history is that of the Mormon church. He governed his followers by a series of "revelations," the last, July 12, 1843, enjoining the practice of polygamy. This doctrine was not published to the world, but it was obeyed by Smith and other leading members of the community. So bitter was the hostility aroused among non-Mormons that Smith and his brother were assassinated near Nauvoo, Ill., when the Mormons were driven from the state, June 27, 1844. *See* Mormons.

Smith, LOGAN PEARSELL (1865-1946). American-born British essayist and critic. Born in Philadelphia, Oct. 18, 1865, he left the U.S.A. in 1888, becoming a naturalised British subject in 1913. He was educated at Haverford College, Harvard university, and Balliol College, Oxford. Noted for the brief exquisite essays and delightful aphorisms collected in *Trivia*, 1918; *More Trivia*, 1921; and *Afterthoughts*, 1931, his work ranged from pamphlets on the English vocabulary to the editing of authors so diverse as Donne and Santayana. The *Youth of Parnassus* (short stories) appeared 1895; a biography of Sir Henry Wotton, 1907; *Songs and Sonnets*, 1909; *On Reading Shakespeare*, 1933; *Reperusals and Recollections*, 1936; and *Milton and his Modern Critics*, 1940. *Unforgotten Years*, 1938, was an autobiography. He died March 2, 1946.

Smith, MADELEINE HAMILTON. Scottish girl tried in Edinburgh, June-July, 1857, for murdering her lover, Pierre Emile L'Angelier. Madeleine Smith and L'Angelier met clandestinely. When the intimacy had lasted two years an eligible suitor appeared, and Madeleine implored L'Angelier to return her letters. His reply was to threaten to hand them to her father. On Feb. 17, 1857, L'Angelier told a friend that he was to see Madeleine on Feb. 19. He left his lodgings that evening in his accustomed health, but early next morning he was found writhing on the floor of his bedroom. He recovered and went to Bridge of Allan to recuperate. On March 23 he had another violent paroxysm and died. The discovery of Madeleine's letters led to a post-mortem, which established that he

had been poisoned by arsenic. Madeleine was proved to have bought arsenic on Feb. 21, March 6, and March 18, her explanation being that she used it for her complexion. A verdict of Not Proven was returned. Madeleine went to the U.S.A., where she was twice married, and died at the age of 93. *Consult* Report of the Trial, A. F. Irvine, 1857; *Splendours and Miseries*, S. Sitwell, 1943.

Smith, RODNEY, commonly known as Gipsy Smith (1860-1947). British evangelist. Born in a tent at Woodford, Essex, March 31, 1860, he was the son of Cornelius Smith, a gipsy. Beginning evangelistic work at the age of 17 under General Booth of the Salvation Army, he successfully toured Australia, Canada, and the U.S.A., as well as Great Britain, after his appointment as missionary of the Free Church Council. He served with the Y.M.C.A. in France during the war of 1914-18, and for his great services as an evangelist with the troops he received the M.B.E. He had a beautiful singing voice and was an eloquent and persuasive speaker, raising thousands of pounds for various good causes. He died on board the liner Queen Mary in Aug., 1947.

Gipsy Smith,
British evangelist

Smith, SYDNEY (1771-1845). British divine, author, and wit. Born at Woodford, Essex, June 3, 1771, he was the son of Robert Smith. Robert Percy Smith, known as Bobus, was one of his three brothers. Educated at Winchester and New College, Oxford, Sydney's intellectual gifts made him prominent at both. In 1794 he was ordained and became curate of Netheravon, Salisbury, and tutor to the sons of Michael Hicks Beach, with whom he went to Edinburgh.

In Edinburgh Smith became acquainted with Jeffrey, Brougham, and others, one result being the foundation of *The Edinburgh Review*, of which he was the first

Sydney Smith

Madeleine Smith
From a contemporary sketch

editor. During 1803-09 he lived in London, and there he made his mark as a preacher and as a lecturer. He was also a prominent figure in Whig circles. In 1809 he accepted the living of Poston-le-Clay near York, where he was farmer and doctor as well as vicar, and in 1829 he removed to Combe Florey, near Taunton. In 1831 he returned to London as canon residentiary of S. Paul's. He died Feb. 22, 1845.

Smith's writings include Peter Plymley's Letters, 1807-08, on Roman Catholic emancipation, many other letters and pamphlets on subjects dear to a Whig reformer, and numerous articles in The Edinburgh Review. He is best known, however, as the author of many witty sayings. His Wit and Wisdom was published in 1861. Consult Memoir, Lady Holland, 1855; Sketch, S. J. Reid, 1884; Life, G. Russell, 1905; The Smiths of Smiths, Hesketh Pearson, 1945.

Smith, Walter Bedell (b. 1895). U.S. soldier and diplomat. Born in Indianapolis, Oct. 5, 1895, he was educated in state schools in that town. He fought in France in the First Great War as an infantry officer, and was later on the staff; then he held various army appointments and passed through several army schools before being appointed assistant secretary to the war dept. gen. staff in 1939. He became full secretary in 1941. During 1942-1944 he served as chief of staff to Eisenhower, remaining at S H A E F until it was disbanded in 1945. He signed the German surrender document for the supreme Allied command at Reims, May 7, 1945. U.S. ambassador to the U.S.S.R. 1946-49 (he pub. Moscow Mission, 1950), he became in 1950 head of U.S. intelligence. He received an hon. K.C.B., 1944, and G.B.E., 1945.

Smith, Walter Chalmers (1824-1908). Scottish poet. Born Dec. 5, 1824, he was educated at

Marischal College, Aberdeen, and New College, Edinburgh, and in 1850 became minister of the Scottish Free Church in Pentonville, London. Later he held ministerial appointments at Milnathort, Kinross-shire, Roxburgh Free Church, Edinburgh, the Free Tron Church, Glasgow, and the Free

High Church, Edinburgh. Moderator of the General Assembly, 1893, he retired in 1894, and died Sept. 20, 1908. As a poet Smith began with The Bishop's Walk, published in 1861 under the pseudonym of Orwell. Later volumes included Oligig Grange, 1872, Hilda among the Broken Gods 1878, Kildrostan, 1884, and A Heretic, 1890. A collected edition of his poems was published in 1902.

Smith, William (1769-1839). British geologist. He was born at Churchill, Oxon. After an elementary village education he taught himself the principles of surveying, and later became a canal engineer and civil engineer. His spare time was spent in collecting fossils and observing the order in which various strata succeeded one another, his method being to identify the strata by means of the fossils they contained. His publication in 1815 of a big geological map of England and Wales was a landmark in the history of geology. In 1831 he was presented with the first Wollaston medal by the Geological Society of London. He died at Northampton, Aug. 28, 1839.

Smith, Sir William (1813-93). British classical scholar and encyclopedist. After studying at

Sir William Smith, British scholar

University College, London, and Gray's Inn, he became a master at University College School and edited works of Plato and Tacitus. His dictionary of Greek and Roman Antiquities, 1840-42, is a great contribution to classical learning. He also edited other standard works, such as A Dictionary of Greek and Roman Biography and Mythology, 1843-49; A Dictionary of the Bible, 1860-63; A Dictionary of Christian Antiquities, in collaboration with Archdeacon Cheetham, 1875-80; and with Dr. Wace A Dictionary of Christian Biography, Literature, etc., 1877-87; besides histories, grammars, and other aids to the student. The extent and variety of the work accomplished were due to his organizing power and capability for selecting suitable assistants. Editor of The Quarterly Review, 1867-93, he was knighted in 1892. He died Oct. 7, 1893.

Smith, William (b. 1886). Professional billiards player. Born at Darlington, Jan. 25, 1886, he was a linotype operator before

William Smith, billiards player

playing his first important money match in 1913, and was runner-up in the Burroughes and Watts professional tournament, which he won in 1915 and again in 1921.

Smith became British billiards champion in 1920, defeating Falkner in the final by 16,000 to 14,500. In 1921 he met Melbourne Inman, who had voluntarily relinquished the championship in 1920, in a match of 16,000 up for £500, and won by 1,861 points. He won a further three contests with Inman, and then retired from competitive billiards.

Smith, Sir William Alexander (1854-1914). Founder of the Boys' Brigade. Born at Thurso, Oct. 27, 1854, he was educated at the academy there. When in Glasgow, he founded the Boys' Brigade (g.v.) in 1883, thereafter devoting his life to organizing the movement, of which he was secretary. He travelled extensively on its behalf, visiting Canada, 1895, and the U.S.A., 1907. He served on the departmental committee on employment of boys and girls from congested districts in the Highlands of Scotland, 1909. Knighted in 1909, he died May 10, 1914.

Smith, William Henry (1825-91). British politician. Born in London, June 24, 1825, the son of

Sir W. A. Smith, founder of the Boys' Brigade

W. H. Smith, British politician

William H. Smith, who established the business of newspaper distributors now known as W. H. Smith & Son, he joined his father when a youth and enormously developed the business. In 1868 he was returned to parliament as a Conservative member for Westminster, afterwards becoming financial

secretary to the Treasury, 1874, first lord of the Admiralty, 1877, and for short periods, 1885-86, secretary for war, and chief secretary for Ireland. In 1886, on the resignation of Lord Randolph Churchill, Smith was made leader of the house of commons and first lord of the Treasury. The appointment was unexpected, but he was admittedly a great success, and he held the post until his death, Oct. 6, 1891. Since the redistribution of seats in 1885 he had represented the Strand division. His widow was created Viscountess Hambleden, and on her death, in 1913, this title descended to their son (1868-1928), who as Hon. W. F. D. Smith was M.P. for the Strand division, London, 1891-1910.

The firm of newsagents, book-sellers, stationers, printers, and binders already mentioned was founded in Duke Street, Grosvenor Square, London, in 1821, by two brothers, William Henry and Henry Edward Smith. The business was controlled entirely by W. H. Smith, 1829-46, when his eldest son was taken into partnership. Its first rly. bookstall was opened at Euston, Nov. 1, 1848; at the end of 1905 more than 200 stalls on the L. & N.W. and G.W. rlys. were given up, and a like number of shops opened in various parts of the country. The head offices are at Strand House, Portugal Street, London, W.C.

Smith, WILLIAM ROBERTSON (1846-94). British scholar. Born at Keig, Aberdeenshire, Nov. 8, 1846,

his father was a minister. Educated at the university of Aberdeen, where his career was unusually brilliant, he then went to the Free Church College at

W. R. Smith,
British scholar

Edinburgh. After serving as assistant to the professor of natural philosophy in Edinburgh and studying in Germany, he became in 1870 professor in the Free Church College, Aberdeen. In consequence of some articles in *The Encyclopaedia Britannica*, he was charged with heresy, and in 1881 was deprived of his position. In 1883 Smith was chosen professor of Arabic at Cambridge, and in 1886 university librarian. He died in Cambridge, March 31, 1894. Smith was the most prominent Biblical critic of his day, being aided by a wide knowledge of Oriental life

and literature. His researches are contained in the *Jewish Church*, 1881; *The Prophets of Israel*, 1882; *Lectures on the Religion of the Semites*, 1889. From 1881 he was editor of *The Encyclopaedia Britannica*; and he was a promoter of *The Encyclopaedia Biblica*, and a reviser of the *O.T. Consult Life*, J. S. Black and G. Chrystal, 1912.

Smith, SIR WILLIAM SIDNEY (1764-1840). British sailor. Born June 21, 1764, in London, he entered the navy at 13 and served on the N. American station. After travelling in France, Morocco, and Sweden, 1785-90, he joined as a volunteer the Swedish expedition against Russia. In 1793 he took part in Hood's action off Toulon, and commanded a frigate in the North Sea until 1796, when he was captured by the French. After two years he escaped, was given a Mediterranean command, and in 1799 undertook the defence of Acre against Napoleon, holding the place successfully for eleven weeks. He prosecuted the war off the coasts of Italy, 1806-07, upholding the rule of the Bourbon tyrants. Retiring in 1814, he died in Paris, May 26, 1840.

Sir Sidney Smith,
British sailor

Smith-Dorrien, SIR HORACE LOCKWOOD (1858-1930). British soldier. Born May 26, 1858, he went to Harrow and Sandhurst before entering the Sherwood Foresters in 1876. Between 1879 and 1898 he saw much service in Zululand, Egypt, and the Sudan. He went to South Africa in 1899 at the head of his battalion, but was soon promoted to a brigade, and later to a division. Adjutant-general in India, 1901-03, he commanded the Quetta division, 1903-07, and, having been knighted in 1904, was c-in-c. at Aldershot, 1907-12, and then held the southern command. At the head of the 2nd corps at Mons and in the retreat,

tative he gave battle at Le Cateau, Aug. 26, 1914, rather than attempt a daylight retreat. Though he

suffered heavy losses, he was able to withdraw almost unmolested in the evening, and also threw the German forces into uncertainty and confusion. The c-in-c., French, at first com-

Sir H. L. Smith-Dorrien,
British soldier

mended Sir Horace's action, but stated later that it had imperilled the safety of the whole army. Later judgements were almost entirely in favour of Smith-Dorrien. He returned home in May, 1915, having just previously been put at the head of the 2nd army. He was c-in-c. in East Africa, 1915-16, and governor of Gibraltar, 1918-23. He died Aug. 12, 1930. He wrote *Memories of Forty-Eight Years' Service*, 1925. See *Le Cateau*.

Smithfield. London district. Known also as West Smithfield, to distinguish it from East Smithfield, near Tower Hill, it lies S. of Farringdon station, between Farringdon Street on the W., and Aldersgate Street on the E. Anciently the scene of jousts, tournaments, fairs, and from 1614 to 1855 of a horse, sheep, and cattle market, it was once a place of execution and burnings of so-called heretics. Wallace was executed here in 1305, and in 1381 Sir William Walworth slew Wat Tyler. The martyrs' stake stood opposite the gate of S. Bartholomew's priory. Human remains were excavated in 1849. A martyrs'

Smithfield, London. The meat market built on the site of an old jousting field

memorial tablet was affixed to the wall of S. Bartholomew's Hospital in 1870, and about the same time the Martyrs' Memorial church was opened in St. John's Street Road. After the Great Fire of 1666 the place was a camping-ground for the homeless.

The cattle market was removed to Copenhagen Fields in 1855, and on part of its old site the City Corporation erected the central meat market, $3\frac{1}{2}$ acres, opened 1868; central poultry and provision market, 1889; and the central market for poultry, provisions, fish, vegetables, etc., in 1892. Throughout the Second Great War the market was occupied by the military authorities; and as the building was also devastated by the explosion of a rocket bomb on Farringdon market close by, March 8, 1945, it was not until the spring of 1946 that London's meat trade returned there. See Bartholomew Fair; Caledonian Market; Copenhagen Fields; S. Bartholomew's Hospital.

Smithfield College OF FOOD AND TECHNOLOGY. British institution for technical education. Founded in 1924, it is administered by the L.C.C., and offers full and part-time instruction in the technology of meat, milk, and allied foods. Students are prepared for diplomas of the Royal Sanitary Institute and the Institute of Meat. The college is at Eagle's Court, St. John's Lane, London, E.C.1.

Smith's Falls. Town of Ontario, Canada. It is situated on the Rideau river and canal, 45 m. S.S.W. of Ottawa, in Lanark co., and is served by C.N.R. and C.P.R. Textiles and agricultural implements are made. Pop. 7,159.

Smithsonian Institution. American educational institution.

It was established by Act of Congress in Washington, 1846, through the bequest of James Macie Smithsonian, F.R.S. (1765-1829), a son of the first duke of Northumberland, who left a large sum of money for a foundation for "the increase and diffusion of knowledge among men." It is concerned mainly with problems of scientific promise, irrespective of their present economic value, which are not being investigated by other agen-

cies. Smithsonian's directions were liberally interpreted by the erection of a main building, while the nucleus of a library, which has since become of importance, and of a museum was formed; in addition, a start was made with research work. The activities of the institution spread rapidly, and it has been largely responsible for the success of the weather bureau, the U.S. national museum, the bureau of American ethnology, the national zoological park formed 1890, near Washington, the Langley aerodynamical laboratory, and the aerophysical laboratory. It has also a national collection of fine arts, which includes the Freer gallery. Research work was extended by a later large gift of funds by T. G. Hodgkins. Consult *The Smithsonian Institution*, 1846-96, ed. G. B. Goode, 1897.

Smithsonite. A zinc mineral, zinc carbonate (ZnCO_3) crystallising in the rhombohedral system. Smithsonite rarely occurs in good crystals, but more commonly in rounded aggregates (botryoidal, stalactitic, etc.) or as crystalline encrustations on other minerals; also in granular masses. It has a perfect cleavage and varies in colour from white to greenish, brownish, and bluish tints with a vitreous to pearly lustre. It may be distinguished from hemimorphite, which it often resembles, by its effervescence in acid. In addition to zinc carbonate, it may contain iron, manganese, cobalt, calcium and magnesium carbonates; rarely cadmium and indium.

Smithsonite is a common associate of galena and sphalerite; also with copper and iron ores. It is probably always of secondary origin and usually occurs in calcareous rocks, such as limestone, which it often replaces. It is one of the minor ore minerals of zinc, but in the upper and oxidized zones of zinc deposits it may occur in large quantity. See *Zinc*.

Smith Sound. Strait in the Arctic Ocean. It connects Baffin Bay with Kane Basin, separates Ellesmere Land from Greenland, and provided a route for Peary and other Arctic explorers to the Arctic ice. It was discovered in 1616 by Baffin and Bylot.

Smithsonian Institution, Washington, U.S.A. Main buildings, containing the library and museum

Smith's Prizes. Distinctions awarded to members of the university of Cambridge. In 1768 Robert Smith, master of Trinity College, left a sum of money to be awarded to the two bachelors of arts most proficient in mathematics and natural philosophy. Before 1883 they were given after examination, but since then have been awarded for essays, two each year.

Smock. Shirt-like overall garment of drill or linen once much favoured by farm labourers, characterised by the honeycomb-stitch or smocking on yoke and sleeves.

Smoke. Visible vapour or volatile matter, one of the products of combustion. The term is more specifically applied to the visible gaseous product of the combustion of coal, wood, and similar substances. Such smoke consists chiefly of carbon or hydrocarbon particles. Smoke is caused by incomplete combustion, and can be virtually eliminated by the use of proper furnaces.

A local authority may take proceedings for the summary abatement of a smoke nuisance (a) where any installation for the combustion of fuel used in any manufacturing or trade process or for working engines by steam does not so far as possible prevent the emission of smoke into the atmosphere; or (b) where any chimney (other than that of a private house) emits smoke in such quantity as to be a nuisance. The National Smoke Abatement Society, with offices in London, exists for the purpose of suggesting means for improvement in smoke abatement in large cities, and holds exhibitions and publishes papers on the subject.

Smokeless Powder. Explosive substance that burns with little or no smoke, used for military and sporting purposes. The first successful smokeless powder was that devised by Schultze, a Prussian artillery officer, about 1865, a type

James Macie Smithsonian, British scientist
From a medallion

which survives today in the Schultze sporting powders. His earliest powders appear to have been composed of grains of wood impregnated with saltpetre, but this was altered to a process comprising purification of the wood and subsequent nitration. The nitro-lignin thus obtained was then impregnated with saltpetre or a mixture of that salt and barium nitrate.

The next successful powder was that made by the Explosives co. at Stowmarket, and known since its invention in 1882 as E.C. powder. The first smokeless propellant really suited to rifled firearms was devised in 1884 by Vieille, an engineer working on behalf of the French government, who produced Poudre B. A somewhat similar powder was introduced in Ger-

a choking smoke. Caesar and Pompey had smoke screens, generated from bales of damp straw.

With the development of firearms, smoke screens were not again used until 1632, when Gustavus Adolphus surprised Tilly by crossing the Lech under cover of smoke created by the firing of wet straw. When the Dutch bombarded Landguard, near Harwich, in 1667, some ships lay to windward and fired special powder charges to create thick smoke which, drifting across the rest of the fleet, prevented the forts opening effective fire. When Charles XII of Sweden crossed the Dvina during his campaign against Saxony in 1770, he concealed his movements under cover of thick smoke issuing from tar barrels on

shell. The phosphorus is melted under hot water and poured into the shell case, which previously has been filled with hot water. As the shell fills with phosphorus, the hot water is displaced, except for a small quantity which remains on top of the filling and prevents the latter catching fire until the shell is sealed up and the air thus excluded. When the shell bursts, the phosphorus emits dense clouds of white fumes. Bombs, or grenades, on the same principle weigh 2 lb., and may be thrown by hand or discharged from mortars.

Smoke projectors release smoke while it is being created, and project it under regulated pressure. In defence they either obscure a target or conceal preparations. Their smoke is made either by burning crude oil or by injecting chlorosulphonic acid across a heated funnel. The former produces a thick black smoke, and the latter a thick white mist which clings to the ground.

Smoke weapons had a limited application in the mobile operations of the Second Great War. Projectors laid smoke screens over industrial targets as a protection against enemy bombers, and during the preparations for the Allied invasion of the Continent in 1944 they shielded from enemy reconnaissance aircraft the troops and shipping assembling around embarkation ports. They were also used preparatory to amphibious landings on enemy-occupied coasts. Dense and continuous clouds of smoke concealed the Allied preparations for crossing the Rhine on March 23-24, 1945. Smoke bombs were dropped by aircraft to mark targets. Smoke shells had a limited use in armoured operations for signalling formations on to targets.

Such screens were essential to naval operations in both wars, particularly for protecting convoys or providing cover for manoeuvres. Smoke was usually laid by destroyers, though all vessels were equipped to make it when necessary. The most common practice was to spray cold unvaporised oil into the furnaces, when, owing to the incomplete combustion of the oil fuel, dense clouds of black smoke came out from the funnels to lie on the surface of the water. Another method of making smoke at sea is to discharge chlorine and ammonia from containers on the stern of the ship: when the chemicals come into contact with the water, thick white vapour is given off and lies on the surface.

David Le Roi

Smoke Weapons. Generating a smoke screen as used in the Second Great War to cover the advance of British troops

many about 1889. In 1888 came Nobel's ballistite, and in the same year the British government introduced cordite.

A most important consideration in all smokeless powders is the question of their durability, as nitrated cotton undergoes slow changes which may lead to spontaneous explosion. In order to prevent this decomposition it is essential that the nitro-cotton be thoroughly washed, and some addition made to the smokeless powder which will arrest the decomposition. Vaseline and diphenylamine are most in demand.

Smoke Weapons. Devices to generate dense smoke for the purpose of obscuring a target or of concealing the movement of troops or ships preparatory to an attack or to cover a withdrawal. Smoke weapons were first used by the Romans, in the form of pots filled with chemicals. When thrown against an enemy, the impact of the pot on the ground caused the chemicals to combine and produce

barges. But the deliberate creation of such screens usually conferred little advantage, as until the general introduction of smokeless propellants both sides in a battle were usually enveloped in the smoke of their guns.

Not until the First Great War did the smoke screen again become an important weapon of defence or offence. In the early stages, screens were laid by lighting smoke candles in trenches anticipating attack, but the usual result was to mark the trench as a target for enemy artillery. After a disastrous incident of that nature at Loos in 1915, it was realized that smoke was a weapon best suited to attack; accordingly the smoke projector and shell were developed.

Smoke shells are fired by artillery and are similar in appearance to ordinary explosive shells. They have a comparatively thin casing and are filled with white phosphorus, a small explosive charge, fused for time or contact detonation, being provided to burst the

Smolensk, R.S.F.S.R. View of the city showing devastation caused by the fighting there during the Second Great War

Smoking. Practice of drawing into the mouth or nose the fumes of a burning vegetable substance with narcotic, sedative, or stimulant properties. The chief substances thus used are tobacco, opium, and bhang or Indian hemp (called marijuana in America). Bhang smoking is practised in central Asia and India, and from Arabia to S. Africa. Smoking, like the analogous practices of incense burning and exorcism by fumigation, may have had a ritual origin. Tobacco was smoked in the Neolithic age by the mound builders of the upper Ohio in connexion with funeral rites. Herodotus relates that the Scythians purified themselves after funerals by inhaling the fumes of burning hemp, which produced intoxication. See Calumet; Cigar; Cigarette; Pipe; Tobacco.

Smolensk. City of the R.S.F.S.R., capital of the region of Smolensk. It is situated on the Dnieper, 250 m. W.S.W. of Moscow, and is a rly. junction for Riga, Warsaw, and Moscow. Remnants of the old walls exist; a celebrated picture of the Virgin adorns the Uspenski cathedral, which is a great place of pilgrimage. Formerly of strategic importance, it was taken by the Russians in 1514, by the Poles in 1611, and regained by Russia in 1668; most of the town was burnt in 1812, when the inhabitants fled to Moscow, leaving the town to the French.

In the Second Great War, the Germans first bombed Smolensk June 30, 1941, and claimed its capture on July 16; but stubborn fighting continued in the area and not until Aug. 13 did the Russians admit the evacuation of the city. Here Hitler established his Eastern G.H.Q.; and Smolensk was made the key point of the German

defence system in Russia and the centre of a far-reaching and complicated network of defences described by the Germans as impregnable. After outflanking Smolensk on the N. and the S., the Russians re-entered it from the N. on Sept. 24, 1943, completing its recapture next day. Pop. 156,677.

Smollett, Tobias George (1731-71). British novelist. Born at Dalquhurn, Dumbartonshire, of a good Scottish family, he was educated at Dumbarton and Glasgow university. He served an apprenticeship to a Glasgow surgeon, but except for a period spent as surgeon in the

T. Smollett

navy, 1739-44, he only practised in a desultory fashion. His first novel, *Roderick Random*, published in 1748, embodies Smollett's own experiences in the navy and elsewhere, and if his picture of life afloat in those times be a faithful one, it is small wonder that Smollett left the service in disgust. His novels generally seem to bear the impress of one who has lived in a brutal and heartless world. *Roderick Random* was a decided success, and so also was *Peregrine Pickle*, 1751, another novel in very similar strain. Both novels abound in rollicking humour, often coarse to modern taste. The characterisation is especially good in *Peregrine Pickle*.

Ferdinand, Count Fathom, 1753, is not of much interest.

During the next few years appeared a number of translations and a *History of England*. Smollett was no historian, but his lively style made his history exceedingly readable, and it enjoyed quite a vogue. His health breaking down, he was ordered abroad and ultimately settled at Leghorn, where he wrote *The Expedition of Humphrey Clinker*, published in 1771. It is in the epistolary style of Richardson, and is undoubtedly the best of his novels, quieter in tone and less brutal in its interpretation of life than his earlier works. Smollett died at Leghorn, Sept. 17, 1771. He was an unequal writer, but in parts he attains a higher level than even his contemporary Fielding, and created a gallery of characters seldom surpassed. See *English Literature*; *Novel. Consult The English Humourists of the 18th Century*, W. M. Thackeray, 1858; *Lives*, R. Chambers, 1867; D. Hannay, 1887; W. H. O. Smeaton, 1897; Fielding and S., H. H. Child, 1913; *The Later Career of T.S.*, L. L. Martz, 1942; T. S., *Traveller-Novelist*, G. M. Kahrl, 1945.

Smooth Snake (*Coronella austriaca*). Reptile common on the Continent. It is rare in Great Britain, occurring only in a few places in the S. of England. The average length of the adult is 24 ins., and the characteristic markings are two series of irregular dark spots on the grey back. It feeds chiefly on lizards and mice. See *Reptile*; *Snake*.

Smuggling. Term applied to the offence of defrauding the revenue by evading the customs duties, or by importing or exporting prohibited goods into or from a country. It is also used to denote the illicit distilling of spirituous liquors. In general the prevalence of smuggling on any organized scale varies in proportion as duties on the goods in question are high or low. The "free-traders" of Kent and Sussex, partially broken

Smooth Snake. Harmless reptile common in Europe, and occasionally found in S. England
W. S. Burridge, F.Z.S.

up by the hanging of three leaders at Tyburn in 1749, terrorised the countryside and had large storehouses for "run" goods. Cornwall and Devon were noted smugglers' counties, e.g. the Carter family at Prussia Cove, Cornwall. The chief smuggling entrepôt for the West of England was Guernsey, until a revision of customs law drove it to Roscoff in Brittany.

Legislation against smuggling in England is frequent from the 14th century. Elizabeth made a stringent enactment in 1558. The increased customs imposed by William III led to a marked increase of organized smuggling, especially in brandy, wines, tobacco, and tea. In 1732 a house of commons committee exposed its enormous spread and the grave corruption of excisemen; during two years 4,738 hogsheads of wine were smuggled into Hampshire, Dorset, and Devon alone. Walpole's reduction of wine and tobacco duties, and the Smugglers' Act of 1736, making the offence a felony, were designed to reduce the smugglers' activities by reducing their potential profits and raising the risks involved; the reduction of the tea tax in 1745 checked tea smuggling for a time, and Sir Henry Parnell's financial recommendations, 1830, included the lowering of spirits and tobacco duties to the same end.

But the general reduction of duties, and the increased dangers to offenders by the spread of rapid communications and improved coastguard services, brought organized smuggling practically to an end.

During and after the Second Great War prohibition of the import and export of certain articles, e.g. currency, and the very high rates of purchase tax led to a great increase in smuggling. Under the Customs Consolidation Act, 1876, the penalty for smuggling is forfeiture of the goods and either treble the value of the goods, £100 fine, or 2 years' imprisonment. The Exchange Control Act, 1947, prohibited the import or export of currency except with permission of the Treasury. *See* Coastguard; Customs; Excise; Preventive Service. *Consult* Memoirs of a Smuggler, from diary of Jack Rattebury, 1837; Smuggling Days and Smuggling Ways, H. N. Shore, 1892; The King's Customs, H. Atton and H. H. Holland, 1908.

Smut (*Ustilago*). Genus of small fungi parasitic upon herbs and grasses. Several are pests upon cultivated cereals, producing conditions which farmers know as

"smut," "black-ball," "chimney-sweeper," etc. The mycelial threads run between the cells of the deeper tissues and break through to the surface, where they produce their masses of microscopic brown spores which appear in the mass like soot. The flowers when attacked produce no grain; where the assault is made upon the seeds these are largely converted into spore-masses. The affected ears should be gathered and burnt as early as possible to prevent the dissemination of the spores. Wild grasses and weeds growing close to the infested crop should be carefully examined for signs of the fungus.

Seed oats suspected of contamination should be treated in one

Smut. A. Ear of diseased wheat. B and C. Single grains affected by fungus

of the following ways: (1) Immersion for five minutes in water heated to a temperature of 127°-133° F. (2) Putting the seed corn in bags and soaking for 10 minutes in diluted formalin, at the rate of 1 pint of 40 p.c. formalin to 36 galls. water for 40 to 50 bushels. (3) Spreading out the grain on a suitable surface the day before sowing, and treating it with a solution of copper sulphate (bluestone); 1 lb. of sulphate dissolved in 1 gall. of water will suffice for 4 bushels. The grain must be turned over several times with a shovel.

Spores that get into the soil retain their germinating power, and may be able to infect the next crop, in spite of care taken to purify the seed.

JAN CHRISTIAN SMUTS

Julian Mockford, Author of *Here are South Africans*, etc.

This article recounts the life of a distinguished statesman, soldier, and philosopher who, having fought the British in his youth, became a great leader of the British Empire and a worker for world peace. See also Botha, Louis; Kruger, Paul; Reitz, Deneys; S. Africa, Union of; S. African War

Jan Christian Smuts was born May 24, 1870, at Bovenplaats farm, Riebeeck West village, Malmesbury district, Cape Colony. His Boer parents were descendants of Dutch immigrants from the Netherlands, though his mother also had French Huguenot blood. After attending the Riebeeck West school, he graduated at Victoria College, Stellenbosch, and then went to Christ's College, Cambridge, where in 1892 he took a double first in the law tripos. In 1895 he began his career as a barrister and journalist, in 1896 going to Johannesburg to practise at the Transvaal bar.

Paul Kruger, president of the Transvaal republic, made Smuts his state attorney in 1898; and when British forces occupied Pretoria, the capital, in 1900, Smuts saved the treasury's gold during the evacuation, and then fought (under General de la Rey) against the British. In 1901 Smuts, as commandant, led a commando from the Transvaal through the allied Boer republic of the Orange Free State and invaded Cape Colony, where he sought to raise a rebellion among the Boers living under British rule. In this larger task he failed; but many rebels joined his commando as it rode right through the colony, through

Namaqualand, as far as the S.W. coast, where his burghers fired their rifles at a British ship, passing within range out at sea. In 1902, while besieging O'Kiep village, among the Namaqualand copper mines, he was given a *laissez passer* by the British in order that he might attend the peace conference at Vereeniging, Transvaal.

Thereafter, Smuts, under the political leadership of Louis Botha, wartime commandant-general of the Transvaal Boers, devoted himself to the task of rehabilitating the Transvaal. After the post-war administration had been organized by Lord Milner, the Transvaal was accorded responsible govt. in 1907, and Smuts was made minister for the interior. Then, in 1910, when the two former Boer republics (the Transvaal and the Orange Free State) and the two British colonies (Natal and the Cape) formed themselves into the Union of South Africa, Smuts, under the premiership of Botha, became minister of the interior, mines, and defence. In 1912 he became minister of finance and defence; and under his hand the Union defence force was established and developed. When the Witwatersrand (Johannesburg) gold-miners struck in 1913 and serious disturbances resulted, Smuts used the armed forces

to restore order; and he not only did so with greater severity in 1914 when they rioted again, but also had nine of their arrested labour leaders deported, without trial, to England.

In 1914, as minister of defence, he played a prominent part, after

Smuts at the age of 30, on the outbreak of the S. African War

the outbreak of the First Great War, in quelling a Boer rebellion which sought to overthrow Botha's Anglo-Boer govt. with its policy of reconciling the two main groups of S. Africa's white population. Then, in 1915, he followed Gen. Botha to the German colony of S.W. Africa, where the Union's invading forces quickly conquered the German forces and occupied the territory. Back in Pretoria, Smuts built up S. African forces for invading the German colony of Tanganyika in E. Africa and for the campaigns in France and Belgium. He himself, in 1916, accepted the supreme command of the British mixed forces in E. Africa, and was promoted to the rank of lt.-gen. In the following year (when he was made a P.C.) he went to London as the S. African representative in the imperial war cabinet, a position he retained until the war ended in 1918.

Smuts, in 1919, attended the peace conference in Paris as plenipotentiary for the Union with Botha, the prime minister. He signed the peace treaty "to close the war," protested that it lacked "the spirit of the new life" that Europe needed for its revival, and set high hope in the League of Nations, then instituted. Resisting the temptation to stay in the U.K. to help in rebuilding Europe, he returned to S. Africa where, three weeks after his arrival in Aug., 1919, his chief and colleague, Botha, died. He succeeded to the position of prime minister and, in 1920, retained that position after

a general election in which Gen. Hertzog (Nationalist) won 44 seats against his 41; but Smuts was given a working majority by the support of 25 Unionists (British). When the Nationalists tended to combine with the Labour members (21), Smuts found his position so difficult that he sought a stronger mandate from the people at a general election in 1921 by combining with the Unionists. Thereafter he commanded 79 votes in the house of assembly against Hertzog's 45, with Labour 9.

The fight for power became more bitter between Smuts (Anglo-Afrikaner) and Hertzog (Afrikaner). The Labour members (then chiefly British) remembered the 1913 and 1914 strikes, and never forgave Smuts for 1922,

Field-Marshal Smuts at Cambridge as chancellor of the University, June, 1948

when he stamped out the Rand revolt (organized by armed gold-miners) with the combined strength of the police, the army, the air force, the militia, and the burgher commandos. Smuts found it increasingly difficult to retain a majority in parliament; and, on his again appealing to the country in a general election in 1924, he secured, with the Unionists, only 53 seats against Hertzog, who won 63, in alliance with the Labour party, which returned 18 members.

While in the political wilderness, Smuts, who at Cambridge had written, but found no publisher for, a long analysis of Walt Whitman's poetry, at last found

time to set down the synthesis of his own philosophy which he published under the title *Holism and Evolution* in 1926. The book was at once accepted as the standard exposition of the philosophy of holism, a philosophy which regards all things in nature as consisting of wholes, each whole representing more than the sum of its component elements. During this same interlude Smuts also gathered together some of his thoughts on Africa and world politics, giving them form in his Rhodes memorial lectures at Oxford in 1929, which were published as *Africa and Some World Problems* in 1930, in which year he became F.R.S.

In 1933, Hertzog had apparently won all his Nationalist objectives; and, forced to quick action by a scheme for a reorientation of parties by a former colleague, Tielman Roos, who laid claim to the prime ministership, Hertzog formed a coalition govt. with Smuts as deputy prime minister. But Dr. F. S. Malan, one of Hertzog's cabinet ministers, refused to take office in this coalition, and chose, instead, to become leader of an opposition made up of those Nationalists who regarded themselves as the guardians of true Afrikanerdom. In 1934 the coalition took firmer shape under the name of fusion.

In 1936 Smuts became chancellor of the university of Cape Town. On the outbreak of the Second Great War in 1939, Smuts and his followers defeated Hertzog's motion for neutrality by 13 votes, and he then formed his own cabinet pledged to prosecute the war against Germany. Malan

J. M. Smuts
Smuts, elder statesman of the British Commonwealth

handed over the opposition leadership to Hertzog, who, however, resigned from parliament in 1940 and died in 1942.

As prime minister Smuts, in 1940, assumed supreme command of the Union defence forces, and in 1941 King George VI conferred on him the rank of field-marshal: he was the first dominion soldier to achieve this rank. S. Africa's whole war effort, in the Union, and in the successive theatres of operations in E. Africa, Madagascar, N. Africa, and Italy, by land, air, and sea, came under his high-level direction. In 1942 he visited London for consultations with Winston Churchill and to deliver a major war propaganda address (the switch-over from the defensive to the offensive phase) before a joint meeting of both houses of parliament. In the same year he published a collection of his speeches, *Plans for a Better World*. He asked the people of S. Africa, in the general election of 1943, to endorse his war policy; and they did so by returning him to power with a majority of 67 over all opposition groups combined; but Malan, after outmanoeuvring rival Nationalist factions, was, at the same time, firmly established as the leader of an amalgamated opposition whose members declared themselves to be the reunited national party—reunited after the divisions caused by Hertzog's coalition and by Smuts's war policy.

Symbol of the Commonwealth

Honours were heaped upon Smuts as the Second Great War ran its course. To the world he symbolised the great partnership, known as the Commonwealth, of the U.K. and the dominions. In addition to receiving high decorations, he was made a freeman of many British cities. In an optimistic mood he helped draft the United Nations charter at San Francisco in 1945, and he represented S. Africa at the victory march through London in 1946. In a less optimistic mood he listened to the wrangling at the Paris peace conference, later the same year. In 1946 also he led the S. African delegation to the United Nations assembly at New York, where he was attacked for his policies *vis à vis* mandated S.W. Africa and the population of Indian origin in the Union.

During the royal visit to S. Africa, 1947, the king conferred on him the Order of Merit. But, meanwhile, Malan was steadily closing the ranks of Afrikaner-

dom; and in the general election of 1948 he triumphed over Smuts on a platform of home politics, just as Hertzog had triumphed over him in 1924. It was a narrow victory—Malan, supported by N. C. Havenga's Afrikaner party, 79; Smuts, supported now by a changed and dwindling Labour party, 75—but it sufficed to put Smuts out of office and back into the position of opposition leader. Immediately after his defeat, he went to Cambridge to be installed as chancellor of his old university. Owing to illness, he retired June 14, 1950, from leadership of his party, the United Party; and he died Sept. 11.

Smyrna, GULF OF. Opening of the Aegean Sea, the ancient Smyrnaeus Sinus. It is situated nearly in the middle of the coast of W. Asia Minor, and has two arms. It is about 40 m. long, and at its mouth is 13 m. wide.

Smyth, CHARLES PIAZZI (1819–1900). British astronomer. Born at Naples, Jan. 3, 1819, he was educated at Bedford grammar school and became assistant at the Royal Observatory at the Cape of Good Hope, 1835. While there he observed the great comets of 1836 and 1843, and in 1845 was appointed astronomer royal for Scotland. Smyth carried out a number of important researches on spectroscopy and introduced the use of the rain band in meteorology. He died Feb. 21, 1900.

Smyth, DAME ETHEL MARY (1858–1944). British composer and

writer. Born at Sidcup, April 23, 1858, daughter of a general, she composed hymns as a child. She received a musical education in Leipzig.

Dame Ethel Smyth,
British composer
Russell

Her *Serenade* for orchestra and overture to Antony and Cleopatra were performed at the Crystal Palace, 1890, and her most famous work, *Mass in D*, at the Albert Hall, 1893. The opera *The Wreckers* was given at Leipzig in 1906; and in 1910 it became the first opera by a woman performed at Covent Garden. Subsequent works were *The Boat-swain's Mate*; *Fête Galante*; a concerto for violin, horn, and orchestra; *The Prison* (cantata). Ethel Smyth became a D.B.E. in 1922. A woman of great energy and independent outlook, a friend of the Empress Eugénie, a supporter of the militant suffragettes (she spent two months in Holloway prison in 1913), she was a brilliant writer and talker, her books including the autobiographical *Impressions that Remained*, 1919; *Female Pippins* in Eden, 1932; *As Time Went On*, 1936; and *What Happened Next*, 1940; as well as *Beecham and Pharaoh*, 1935, and a study of Maurice Baring, 1938. She died at Woking, May 9, 1944.

Snafell. Highest mountain in the Isle of Man. It is 5 m. S.W. of Ramsey, and is 2,034 ft. high. From its summit, which is reached by electric rly. from Laxey, parts of England, Wales, Scotland, and Ireland are visible.

Snaffle (Dutch *snavel*, horse's muzzle). Type of bit. It varies somewhat, but for a riding horse consists of a smooth-jointed mouthpiece of steel, with straight cheekbars. The rings for the reins are fixed in the bars, where they join with the mouthpiece. *See* Bridle.

Snail. Name applied to many gastropodous molluscs that possess an external shell. They are of world-wide distribution, the Polar regions excepted. The number of species recognized by malacologists amounts to many thousands, and fresh ones are constantly being discovered. The British list includes about 127 species, of which 81 are land snails and 46 fresh-water. There are also a great number of marine snails, of which the periwinkle is a familiar example, and a few species accidentally imported from abroad

Snail. The Roman or little snail, *Helix pomatia*; top, the common British species, *H. aspersa*. W. S. Beiridge, F.Z.S.

are found about gardens and hot-houses. The British species range in size from the edible snail (*Helix pomatia*), whose shell attains a height of over two inches, to little *Vertigos*, smaller than the head of a pin; but some of the tropical *Achatinas* have shells 8 ins. long. Snails are found in all parts of the country. One species of water snail occurs only in a little mountain tarn in Killarney.

Snails love damp spots, and are most active after rain. In continued dry weather they retire underground or to sheltered spots, close the orifice of the shell with a film or epiphragm of dried mucus, and aestivate till the damp weather returns. Most snails hibernate.

The great majority of snails are vegetarians. Several British species are more or less carnivorous. Only three or four species do any serious damage to garden plants, others attacking weeds and fungi, and some restricting their attentions to mosses and other low plants. Some snails possess a very remarkable homing instinct, the common snail (*Helix aspersa*) will sleep in the same spot for the whole of its life, if no accident occurs to displace it. With few exceptions, snails are nocturnal in habit and do not roam abroad—except after rain—until it is nearly dark. They glide by wavelike movements of the foot; and their average rate of progress would amount to about a mile in a fortnight. In most cases the duration of life in the British species is about two years; but the common and the edible snails certainly live for five years. Most species are hermaphrodite and are reproduced by means of eggs. The egg of the edible snail is the size of a moderate pea, and has a white, chalky shell; and some S. American species lay eggs as large as those of a pigeon.

All land snails are edible, and many of the larger ones are much consumed on the Continent. Snail farms, on which the large edible snail is cultivated for the market, are common in Burgundy and other parts of France. Snails have long been in repute as a rustic remedy for pulmonary weakness, being either swallowed raw or made into thick broth. See Animal, colour plate; Gastropoda; Mollusca; Slug.

Bibliography. Monograph of the Land and Freshwater Mollusca of the British Isles, J. W. Taylor, 1894; British Snails, A. E. Ellis, 1926; Shell Life, E. Step, 1927.

Snake (A.S. *snaca*) OR SERPENT. Reptiles of the order Ophidia. The upper sides are clothed with small

overlapping scales, and the underside with broad plates, except in the Sea-snakes (*q.v.*), where the body is keeled below and clad with scales. The body is elongated and cylindrical, without any external limbs. There are no external ears and no movable eyelids, but the eye is protected by a fixed transparent cover. Locomotion is effected by movements of the abdominal plates, which are attached to the numerous ribs, by which their edges are raised and depressed.

The union of the several bones of the skull and jaws is so elastic that dislocation takes place readily to allow the swallowing of prey larger than the snake's head. To assist in such operations the slender, pointed teeth are all directed backward, and those of the jaws are supplemented by others on the palate. In numerous snakes certain teeth are developed into fangs, and a fold in the enamel provides a channel for the flow of venom from the poison-gland to the victim's wound. The tongue, whose forward portion divides into two slender branches, can be protruded through a notch without opening the mouth, and is so used constantly to ascertain the nature of near objects. The entire skin is shed at intervals. Separating at the lips, it is worked over the head and the snake glides out.

The embryonic stages of development take place in eggs, which have soft shells and are not incubated; in some species they are retained in the body of the parent and hatch in the oviduct. About a thousand species are known from all parts of the world with the exception of the Polar regions. They are most abundant in the tropics, where also they attain their maximum size. They are all carnivorous, and consume their prey whole. Only three species of snake occur in Britain—the grass snake (*q.v.*), the smooth snake (*Coronella austriaca*), and the adder (*q.v.*); none of them is present in Ireland. The adder is the only venomous British species. In temperate regions snakes hibernate often in company. See Anaconda; Boa; Cobra; Copperhead; Coral Snake; Rattlesnake; Reptile; Smooth Snake; consult also Cambridge Natural History, vol. 8, H. Gadow, 1901; Reptiles of the World, R. L. Ditmars, 1910; Snakes of Europe, G. A. Boulenger, 1913.

Snake, LEWIS OR SHOSHONE. River of the U.S.A. The most considerable affluent of the Columbia river, it rises in the Rocky Mts. in Yellowstone Park, near the W. bor-

der of Wyoming. It flows first S., expanding into Jackson Lake, and traverses a deep cañon in Idaho, forming the famous Shoshone Falls. Turning N., it forms the boundary between Idaho and Oregon, later flowing N.W. and W. to join the Columbia near Pasco. Its length is about 940 m.

Snake Bite. In Great Britain the only snake which inflicts a poisonous bite is the adder or viper. The tissues in the neighbourhood of the bite become swollen and painful, and may be followed by general symptoms such as giddiness, faintness, vomiting and diarrhoea, but a fatal result is very rare.

The viper and cobra families are the most dangerous of snakes, injecting their poison through hollow teeth connected with the poison glands. The cobra in Asia, the rattlesnake in N. America, the fer-de-lance in S. America, the cobra and puff adder in Africa are all names spelling danger. The sea snakes of the great oceans are also nearly all poisonous.

In a general sense snake venom acts in two ways. Either it clots the blood, so stopping the heart and circulation, or it acts on the central nervous system, rather as does the drug curare, bringing the organism to a standstill by paralysis of vital functions. Snakes seldom attack human beings. Nearly all bites are below the knee, and suitable boots and leggings are the best preventive.

Treatment consists in an immediate tight ligature of the part, and suction of the wound. Permanent of potash should be applied and the wound excised. Antidotes known as antivenins are available for intravenous injection. Sometimes these are polyvalent, but more often must be specific for the type of snake. Measures should be taken to combat shock.

Snake-charming. Ancient practice in Oriental lands, still common in Egypt and India. The snake charmer commonly claims that his power of "charming" the reptile, usually a cobra, is an occult gift. But evidence in support of this claim is entirely lacking. The business, often handed down from father to son, is a trick pure and simple, based on an intimate knowledge of the ways of the reptile, whose fangs have usually been removed. Cases are recorded where the charmer has allowed himself to be bitten by the snake, and where this is not an illusion or the reptile a non-poisonous one, it is possible that the charmer has gained a measure of immunity by

Snake-charming. Indian performer with his cobra

frequent inoculations with an attenuated preparation of venom from various serpents.

Snake-root. Popular name for several plants. Black snake-root is *Cimicifuga racemosa*, also N. American species of *Sanicula*. Button snake-root is *Eryngium yuccifolium* and several species of *Liatris*. Sampson's snake-root is *Gemiana villosa*; seneca snake-root is *Polygala seneca*.

Snake's-head (*Fritillaria meleagris*). Bulbous perennial herb of the family Liliaceae, native of Europe and W. Asia. The small bulb consists of only a few swollen scales. The large, drooping flowers are produced singly at the top of

Snake's-head. Flowers and leaves of the white and speckled varieties

the leafy stem, and they are of a dull purple colour spotted with oval patches of a paler tint.

Snake Stone. Name given to a variety of whetstone also known as Water of Ayr stone or Scotch stone. A light grey carboniferous shale, used for polishing marble and copper plates as well as sharpening tools, it is found at Bridge of Stair on the Ayr, Scotland.

Snake Wood or **LETTER WOOD.** The heart-wood of *Brosimum aubletii*. A tree of the family Moraceae, native of S. America, it has wood of a rich brown colour, used for veneering and inlaying.

Snapdragon (*Antirrhinum majus*). This well-known herb of the family Scrophulariaceae is described under Antirrhinum.

Sneek. Town of the Netherlands, in Friesland. It is 17 m. N.E. of Stavoren and 14 m. by rly. S.S.W. of Leeuwarden, with which it has also canal connexion. Industries include distilling and tobacco making, and there is a trade in butter, cheese, etc. The Hoogeindster Waterpoort is a fine water-gate dating from 1613, restored in 1878. Sneek was entered by Canadian infantry, April 16, 1945, in an advance from Leeuwarden to prevent the German forces in the provs. of N. and S. Holland from escaping by the

Snake-root. Flower spike and foliage of black snake-root. Inset, characteristic roots

causeway shutting off the Yssel Meer from the North Sea. To the S.W. lies the large Sneeker Meer, a shallow marshy lake, partly reclaimed by drainage. Pop. 14,860.

Sneeze-wort (*Achillea ptarmica*). Perennial herb of the family Compositae. A native of Europe, Asia Minor, and Siberia, it has a long, creeping root-stock, and narrow, stalkless leaves with toothed edges. The flower-stem branches above, each branch supporting one of the rather simple flower-heads, which have white outer ray-florets and greenish inner tubular florets. The dried and pulverised rootstock is said to afford a substitute for snuff. Yarrow or milfoil (*A. millefolium*), a closely allied plant, has broader, larger leaves deeply cut into threadlike segments, and smaller, more numerous flower-

heads. The ray-florets are more or less tinged with pink or purple, and the tubular florets are yellow.

Sneezing.

Reflex action set up by irritation of the nasal mucous membrane. There is first a deep inspiration, then the glottis is momentarily closed and the abdominal muscles, contracting strongly, press the viscera against the diaphragm, thus raising the pressure in the lungs. The glottis then opens and a strong current of air is directed through the nose, with the intention of expelling the irritating particle. Sneezing is associated with hay fever, with the onset of a common cold, or with infection of the sinuses. See Nose; Smell.

Snell, HENRY SNELL, BARON (1865-1944). British politician. Born at Sutton-on-Trent, Notts, April 1, 1865, he was a farm labourer, groom, ferryman, and potman before going to Nottingham university college, London School of Economics, and Heidelberg university. An ardent Socialist and Rationalist, he became a member of the L.C.C., 1919-1925, and was chairman (when Labour first gained a majority), 1934-38. From 1922 until becoming a peer in 1931 he was M.P. for E. Woolwich. In 1930 he was a member of the imperial economic committee, and parliamentary under-secretary at the India office, 1931. He was made P.C., 1937, and C.H., 1943. From 1940 until his death, April 21, 1944, Snell was deputy leader of the house of lords. He wrote *Daily Life in Parliament*, 1930; and *Men, Movements, and Myself*, 1936.

Lord Snell, British politician

Snell, HANNAH (1723-92). An English woman soldier. Born at Worcester, April 23, 1723, she was abandoned by her husband at 20, and set forth in man's clothes to find him. She enlisted in

Hannah Snell, woman soldier

Sneeze-wort. Heads of blossom of *Achillea ptarmica*

the army, but deserted and joined the navy, saw active service in the East Indies, and fought in the siege of Pondicherry. On her return to England in 1750 she dressed again as a woman, published her adventures, and opened a public-house in Wapping. She died insane, Feb. 8, 1792.

Snell's Law. Law governing the refraction of light when passing from one medium to another. It states that the ratio of the sine of the angle of incidence (i) to the sine of the angle of refraction (r) is a constant for two media and for a given wavelength of light. This ratio is known as the refractive index of the second medium with respect to the first.

Snider, JACOB (d. 1866). Dutch-American inventor. He entered business life as a wine merchant in Philadelphia, but his main interests were in mechanical matters. He made a number of inventions, one being for a breech-loading rifle, which in 1859 he took to England. It was accepted by the British government, but the details of payment had not been settled when Snider died, Oct. 25, 1866. See Rifle.

Snipe (*Capella*). Genus of birds. Belonging to the plover tribe, three species are known in Great

Snipe. *Capella gallinago*, the common species of the British game bird
W. S. Berridge, F.Z.S.

Britain. The common snipe (*C. gallinago*) is found in most marshy districts throughout the British Isles, the majority arriving from Scandinavia in Oct.-Nov. and leaving in March. It has mottled black and brown plumage on the upper parts, white bars on the flanks, and white under parts. It is about 10 ins. in length, and its long beak is characteristic. The snipe feeds upon worms and insects in soft soil, for which it probes with its sensitive bill. It usually crouches at the approach of danger.

The jack snipe (*Lymnecryptes minimus*) is smaller in size and has the plumage mottled with buff, brown, and black, with purple re-

flections. It does not now breed in Great Britain, but occurs as a winter visitor, and is less numerous than the common snipe. The great snipe (*C. media*), often called the solitary snipe, is 12 ins. long and much like the common snipe in plumage. It is found sparsely in the E. and S. counties of England during Sept.

Snipe shooting is carried on in Norfolk and the E. counties. Requiring great skill in judging distance and pace, it is regarded as one of the most difficult forms of shooting. See Bird; Shooting.

Sniper. Military term for a concealed marksman who fires at selected targets. In the static operations of the First Great War, snipers were employed for their nuisance value in compelling troops to keep under cover even in quiet sectors. In the mobile fighting of the Second Great War, the sniper was mainly restricted to a defensive rôle in street fighting. Snipers' rifles are generally fitted with telescopic sights.

Snizort. Sea-loch in the N.W. of the Isle of Skye, Scotland. An arm of the Little Minch, it extends inland for 13 m., and has a breadth varying from 1 to 9 m. The village of Snizort stands at its head.

Snodgrass, AUGUSTUS. Character in Dickens's *The Pickwick Papers*, one of the three who accompany Pickwick on his various adventures and misadventures. Snodgrass is a reputed poet, who has never published any poems. He marries Emily Wardle, and settles at Dingley Dell.

Snoek (*Thyrstites atun*). Fish belonging to the family Gempylidae of the order Percomorphi. The name is derived from the Dutch name for pike. Found around the shores of S. Africa and Angola, it is silvery and bluish-black in colour, weighs up to 16 lb., and is sometimes 4 ft. in length. It is caught mainly by hand-line, and is edible. In 1947 10,000,000 tins of fresh snoek were exported from S. Africa, much of it to Great Britain. Occurring also in Australian waters, the fish is there given the name barracuda or barracouta.

Snoilsky, CARL JOHAN GUSTAF (1841-1903). Swedish poet. Educated at Uppsala, he was in the diplomatic service until 1879, when he began to devote his whole time to literature. He had already made his name as a poet and become a member of the Swedish Academy. His works include *Poems*, 1869, *Sonnets*, 1871, *New Poems*, 1881, and a translation of Goethe's

ballads. His collected poems appeared in 1903-04 in five vols.

Snood (A.S. *snod*). Fillet or ribbon to bind the hair, once worn in Scotland by unmarried girls.

Scott, in *The Lady of the Lake*, gives it a special significance, as declaring maidenhood, a married woman wearing curch, toy, or coif. During the 1930s the fashion of wearing a net or scarf in the same way as a snood came into favour with Englishwomen.

Snood as worn by a war worker

In fishing the word is also applied to the gut or silk cord which fastens the hook to the line, and a snood is one of the short lines attached to a line with many hooks with which cod are caught in Newfoundland waters.

Snooker. Game played on a billiards table. A combination of pool and pyramids, it is played with 15 red balls, six pool balls—black, pink, blue, brown, green, yellow—and one white cue ball which every player uses. It is a game of winning hazards only, cannons being ignored. The scoring value of each red is one, and before a pool ball can be played on, a red ball must have been potted. The values of the coloured balls are: yellow, 2, green 3, brown, 4, blue 5, pink 6, and black 7.

At the beginning of a game the red balls are placed in the form of a triangle, the apex standing as near the pink ball spot as possible, the base being parallel with and nearest to the top cushion. Yellow is on the right hand spot of the D, green on the left, brown in the middle of the baulk line, blue on the centre spot, pink on the pyramid spot, and black on the billiard spot at the top of the table. The opening stroke is made from within the D. A player continues to make strokes as long as he can pot a red and a coloured ball alternately. The coloured balls are replaced, but not the red ones; when all these are gone, the coloured balls must be taken in order of scoring value from yellow upwards. A great part of the game is defensive, the player trying to leave his adversary in such a position that he cannot play a direct stroke in a straight line to the ball next on play. This constitutes a snooker. The minimum penalty for a miss or potting the wrong ball is four points.

Credit for the invention of snooker goes to the British army. Sir Neville Chamberlain is said to have played it in Jubbulpore, India, in 1875. It did not become popular in Great Britain for more than 30 years, but today it outrivals billiards. Joe Davis won the world championship 16 times in succession from its institution in 1927. In 1948 he made a record break of 140, but H. Lindrum beat this by one the same year. Davis equalled Lindrum's 141 in 1949, but on Feb. 3, 1950, G. Chenier (Canada) made a new record break of 144. The Billiards Association is the controlling body for the game. Its h.q. are at 107, Fleet Street, London, E.C.4.

Snoring. Sound produced during sleep by vibration of the soft palate. It is generally due to breathing through the mouth, which, in its turn, most often results from obstruction of the nasal passages. Snoring in children is very often a sign of adenoids.

Snow. Ice crystals, feathery or needle-like in structure, formed in the atmosphere directly without the intermediate liquefaction of the water vapour. A snow-flake comprises many matted or clotted crystals usually broken or deformed in the conglomeration. Snow is one form of aqueous precipitation from the air, and for statistical purposes it is customary to compute a foot of freshly fallen snow as equal to an inch of rain, but this ratio is only approx., as it depends on the total depth and the texture of the snow.

Snowberry. White berries and leaves of this N. American shrub

In Great Britain snow rarely lies for many days after it has fallen; in Canada, the central U.S.A., Russia, and Siberia the winter comes with a fairly heavy fall of snow which covers the ground until the spring; the slight loss by evaporation being made good by subsequent falls.

The period during which snow lies increases with an increase of

latitude, or of elevation, until the permanently snow-covered area is reached. The lower limit in altitude of permanent snow, the snow line, is at sea level in Antarctica and Greenland, about 4,000 ft. in N. Scandinavia, 8,500 ft. in the Alps, 11,000 ft. in Asia Minor, and 15,000 ft. in the Himalayas. Apart from summer temp., however, such factors as amount of winter snow, prevailing winds, exposure and steepness of the mt. slopes exert an influence. There are thus considerable differences in the height of the snow line in a single region.

Above the snow line lie the snow fields, from which consolidated snow forms glaciers, wherein the snow crystals have been arranged to make granular ice crystals. In mountainous countries, the snow supply of valley glaciers is due to direct snowfall within the valley, avalanches or

Snow Crystal. Examples of the delicate symmetrical crystals of which snow-flakes are composed

snow slides down the valley sides, and drifts wind-blown into the valley. The upper part of the valley is the snow-field, and below this is a zone of névé or granular snow, which at a lower level becomes glacier ice. See Rain; Temperature. Consult Snow Structure and Ski Fields, G. Seligman, 1936.

Snowball Tree. Popular name for the guelder rose (*q.v.*).

Snowberry (*Symphoricarpos racemosus*). Shrub of the family Caprifoliaceae, native of N. America. It has slender, upright, branching stems with opposite, oval leaves, and spikes of small, pink, bell-shaped flowers, succeeded by large, opaque, white berries, each containing two seeds.

Snow Blindness. Painful affection of the eyes associated with some dimness of vision. It results from the glare of sunlight reflected from a large extent of snow. The symptoms usually pass off in a few days without leaving any permanent results. See Eye.

Snow Bunting (*Plectrophenax nivalis*). British song-bird, a winter visitor from N. Europe and Siberia. Only a few pairs are known to breed in the Highlands of Scotland. The plumage is black

Snow Bunting. Winter visitant to Great Britain in its summer plumage

and white in the summer, mixed with reddish brown in the winter. It is usually found near the coasts, feeding on seeds in fields and waste places.

Snow Crystal. Tiny ice-crystal which unites with others to form snow-flakes. If the temperature conditions are suitable, water vapour may condense into crystals of ice. As this takes place in

free space high in the air, the frozen molecules of water are able to arrange themselves so that the crystals form innumerable geometrical figures. The characteristic shape of the simplest ice crystal is a small flat triangular or hexagonal plate, but the majority show much more complicated structures. When the temperature is not too low, and the ice-crystals are more or less wet, snow-flakes consist of a very large number of crystals matted or clotted together. See Snow. Consult Snow Crystals, W. A. Bentley and W. J. Humphreys, 1932 (with 2,000 photographs).

Snowden, PHILIP SNOWDEN, Viscount (1864-1937). British politician. Born at Keighley, Yorks, July 18, 1864, he entered the civil service, but left, 1893, to devote himself to political and journalistic work for the socialist movement. A prominent member of the Independent Labour party, of which he was chairman, 1903-06 and 1917-19,

Viscount Snowden, British politician

he was M.P. for Blackburn, 1906-18, and for Colne Valley, Yorks, 1922-31. He became a dominant figure in the house of commons, mainly by reason of his pugnacious and incisive oratory. He served on several important royal commissions, and was chancellor of the exchequer in the first Labour govt., 1924, and again in 1929-31. A sound and orthodox economist, he gained considerable approval beyond the ranks of his own party for his firm insistence, at the Hague conference of 1930, on

B.B.C. from 1927 to 1933, and evinced particular interest in the development of opera in Great Britain. Her interest in the arts was further seen in her connexion with the Royal Academy of Dramatic Art and the Royal Academy of Dancing. An ardent temperance advocate, she served as president of the Band of Hope union. Her publications included *The Feminist Movement*, 1919.

Snowdon (Welsh *Eryri*, eagle top). Mountain of Carnarvonshire, Wales. Situated 10 m. S.E. of Carnarvon, it is the highest mountain S. of the Tweed, with five distinct peaks, the loftiest, Y Wyddfa, attaining 3,560 ft. The ascent is made N. from Llanberis, S. from Beddgelert, E. from Capel Curig, and W. from Snowdon station. It gives its name to the mountainous dist. of Snowdonia, a royal forest in the reign of Edward I, which extends across the country from near the head of Cardigan Bay in the S. to the vicinity of Conway in the N. The Snowdon rly. runs from Llanberis to the summit. Except in the finest weather the mountain top is shrouded in mist. See Railways illus. facing p. 6848.

Snowdrop (*Galanthus nivalis*). Bulbous perennial herb of the large family Amaryllidaceae. It is a native of Europe and W. Asia. The small oval bulb produces two strap-shaped leaves, and a solitary white flower on a long stalk. The three white sepals are larger than the three notched petals, which are each marked on the outside with a yellow-green horseshoe patch, and inside have grooves which contain nectar. See Bulb.

Snowdrop Tree (*Halesia carolina*). Small tree of the family Styracaceae, native of N. America. It has alternate, oval lance-shaped leaves and white bell-shaped flowers in sprays. See Inflorescence illus.

Snowflake (*Leucojum vernum*). Bulbous perennial of the large family Amaryllidaceae, native of

Snowflake. Flower cluster and leaves of the summer snowflake

Europe. It is similar to the snowdrop, but has more numerous, much longer leaves, and there are usually two flowers. These are white with green tips to the sepals. In another and larger species, the summer snowflake (*L. aestivum*), there may be as many as six flowers.

Snow Hill. London street, connecting Holborn Viaduct and Farringdon Street, E.C. It was formerly the highway between Holborn Bridge and Newgate Street, but was reconstructed on a smaller scale in 1867. John Bunyan died in Snow Hill, 1688. Midway down the hill stood the old coaching inn called The Saracen's Head, immortalised by Dickens in Nicholas Nickleby. Offices and the entrance to a police station now occupy the site. The street suffered heavily in the German air-raids of 1940-41, many buildings, especially on the S. side, being totally destroyed.

Snowplough. Machine for clearing snow from roads and rly. tracks. In countries where the snowfall is seldom great, the rly. plough is a vehicle with a sloping front, out of which rises a wedge-

Snowplough. Single-track steel snowplough in action on the Canadian Pacific Railway

Snowdon, Carnarvonshire. Highest mountain in Wales seen from Crib Goch. Llyn Llydaw and Llyn Glaslyn in the foreground

British rights under the Young scheme of reparations. In the economic and political crisis of 1931 he supported Ramsay MacDonald, and remained in the National govt., violently attacking his former colleagues in speeches before the subsequent general election. Created Viscount Snowden of Ickornshaw, 1931, he was

Snowdrop. Leaves and flowers of the familiar British wild flower

lord privy seal until the following year, when his hostility to any form of protection led to his resignation. He died suddenly, May 15, 1937. He published his Autobiography, 1934.

His wife, Ethel, was also an active socialist, internationalist, and public worker. She was one of the original governors of the

shaped box. The slope lifts the snow, and the wedge throws it to the side. The plough is pushed by two or more locomotives. In regions of heavy snowfall clearing is done by the rotary plough, which carries in front a transverse wheel made up of a number of cones resembling pencil-sharpeners on a large scale. The revolving wheel slowly eats its way into the drift. The snow is flung out by centrifugal force through an opening in a hood almost touching the cutters. A plough of this type can penetrate easily snow 15 to 20 ft. deep.

Snow Rollers. Term applied to cylinders of snow formed and rolled along by a strong wind. Snow rollers rarely occur in the British Isles, but they were observed on Jan. 10, 1945, at Full Sutton, Yorks, the largest being 3 ft. in length and 1 ft. 6 in. in diam. They were composed of snow loosely packed in layers.

Snow Shed. Structure to protect rlys. from snow. Where the track runs along a hillside, the roof of the shed is carried into the slope and has a slight inclination outwards, so that any moving snow is thrown clear of the rails. Very stout timber is used throughout, and extra solidity given by anchoring to cribs of logs and stones.

Snow Shoes. Appliances with long, broad, flat surface enabling the wearer to travel over snow.

Snow Shoes. A variety worn in Russia

They have a framework of hickory or some other strong, tough wood, filled up with a webbing of hide. Those of the Eskimos are circular or triangular, some 18 ins. in length, while those of the N. American Indians are longer and narrower, the Crees having hunting shoes as long as 6 ft. Canadian snow shoes run to about 3½ ft. long, and 15 or 18 ins. broad.

Snow White AND THE SEVEN DWARFS. Fairy tale included in the collection made by the

brothers Grimm, 1812-22. It was the basis, under the same title, of the first full-length musical cartoon film, which was made by Walt Disney (*q.v.*) and shown in 1938. The film was memorable for its technical excellence, its humorous characterisation, especially of the dwarfs (who were given the names of Happy, Doc, Sneezy, Bashful, Sleepy, Grumpy, and Dopey), and the tuneful songs composed by Frank Churchill, *e.g.* Whistle While You Work, Some Day my Prince will Come. With a Smile and a Song.

Snowy Range. Name sometimes applied to the Colorado section of the Rocky Mts.

Snowy River. River of Australia. It rises near Kosciusko in the Snowy Mts. in New South Wales, flows for short distances N.E., S.E., and then, in general, S., with a great bend to the left to receive the McLaughlin and Delegete, to enter Victoria, and continues S. to Bass Strait. Settlement began in the valley about 1830. See Australia in N.V.

Snuff. Finely ground tobacco with various salts and flavours added during manufacture, and used for inhalation through the nose. The additions are only such as are allowed by law. Medicated snuffs are sold subject to *ad valorem* duty. They have as a foundation substances other than tobacco.

Snyders, FRANZ (1579-1657). Flemish painter. Born at Antwerp, he studied under H. van Balen and P. Breughel the younger, and painted "still life" and pictures of hunts. Rubens employed him to introduce fruit, etc., into his pictures. Except for visits to Brussels and Madrid, he passed his life at Antwerp, and died there.

Soane, SIR JOHN (1753-1837). British architect. Born at Whitchurch, near Reading, Sept. 10, 1753, he studied under Henry Holland, at the R.A. schools, and in Rome. Returning to England in 1780, he was appointed architect to the Bank of England in 1788, and rebuilt that structure in the Roman Corinthian style, 1800. Other works by Soane include the Dulwich College picture gallery, 1812, and restorations of colleges of both Oxford and Cambridge.

After Lawrence

He became A.R.A. in 1795, R.A. in 1802, professor of architecture in 1806, and was knighted in 1831. After 1833 he devoted himself to extending the museum of antiquities and his own designs, which he had already installed in his house (*v.i.*). He died Jan. 20, 1837.

Soane Museum. The private house, in Lincoln's Inn Fields, London, of Sir John Soane (*v.s.*),

Soane Museum, London. The house on the N. side of Lincoln's Inn Fields

containing his collections of antiquities, works of art, and MSS. Maintained under an Act of parliament secured by Soane in 1833, the museum is an intact example of a private house and museum arranged precisely as it was left by its founder. The house, built 1812, is remarkable for its architectural features. The contents include two important series of paintings by Hogarth, The Rake's Progress and The Election, and there are paintings by Reynolds, Turner, Lawrence, Canaletto, and Watteau. The sarcophagus (*q.v.*) of Seti I (*c.* 1370 B.C.), discovered in 1817, is another feature, while the MSS. include illuminated missals, John Thorpe's book of architectural drawings (*c.* 1590-1630), and large collections of the works of Wren, Chambers, the Adam Brothers, and Soane himself.

Soap. Detergent or cleansing substance produced by the action of caustic soda or caustic potash on animal or vegetable oils or fats. In the first century the ashes of wood were causticised by boiling with lime, and so formed a solution of caustic potash, which, boiled with oils or fats, produced a soft soap, *i.e.* a potash soap, that was then boiled with salt to convert it into a hard soap, *i.e.* a soda soap.

Soap. Processes in its manufacture. 1. Oils and fats in barrels being heated over steam jets to melt out their contents. 2. Pan in which the ingredients are boiled together to form the glycerine and soap mixture. 3. The frame room, in which the liquid soap cools and solidifies in steel frames. 4. Solid blocks of soap cut into slabs by means of a frame strung with piano wires. 5. Bars cut from the slabs being fed into machines which reduce them to tablets, stamped with the maker's name, and finally packed into boxes

By courtesy of Lever Brothers and Unilever, Ltd

It was not possible until after the establishment of the Leblanc soda process in England in 1824 to attempt the manufacture of soap on a large scale. The modern developments of the industry, however, began after solid caustic soda became an important article of commerce in 1850, and the abolition of the taxes on soap in 1853.

Modern soap manufacture involves the same chemical reactions as did the ancient. In the cold process for hard soaps, melted coconut oil at 35° C. is stirred with a 32 p.c. solution of caustic soda in exactly the right proportions; heat is developed by the reaction which is allowed to go on for 24 hours. The soap so produced is quite satisfactory, when the process is properly conducted. It contains all the glycerine produced by the chemical reaction $C_3H_5\bar{A}_3 + 3NaOH = C_3H_5(OH)_3 + 3Na\bar{A}$ (oil) (c. soda) (glycerine) (soap) where \bar{A} stands for the fatty acid radicle. Certain proportions of other oils may be mixed with the coconut oil. These soaps, "marine soaps," can be used for washing with sea-water.

The hot process is applicable to any oils or fats by boiling them with caustic soda for hard soaps or caustic potash for soft soaps, but a little of the more expensive potash is mixed with the soda in making certain toilet soaps, and a little soda is added to stiffen soft soaps in summer time. Most of the best soaps are prepared in this way. Glycerine is obtained as an important by-product. The oils or fats are melted and churned by means of steam in large soap coppers, and a dilute solution of caustic soda gradually run in, until the mixture consists of the sodium salts of the fatty acids, i.e. the soap, and glycerine with water. It is, however, necessary to use more caustic soda than is theoretically required, in order to saponify all the oil, but this is removed in the salting-out process. On adding salt the soap separates from this mixture, and rises to the surface; the watery layer containing salt, glycerine, and the excess of caustic soda forms the lower layer.

The curdy soap granules are boiled with fresh dilute caustic soda to complete the saponification of the

oil and improve the colour, then salted out again. The soap, which retains 30 to 35 p.c. of water, is then brought into condition, perfumed, coloured, medicated, etc., milled, moulded, and packed. The composition of the finished soap is, approximately, fatty acid (anhydrides) 62 p.c., combined soda (as Na_2O) 7½ p.c., water (including a little glycerine, salts, etc.) 30½ p.c.

Soft soaps are made by the hot process, simply by boiling linseed oil with a solution of caustic potash, under proper conditions, with the addition of an excess of alkali in the form of potassium carbonate at the end to render it transparent. The excess of water is removed by boiling. There is no salting out, and consequently all the glycerine produced remains in the soft soap. The average composition is fatty acids (anhydrides) 39 p.c., combined potash (as K_2O) 7 p.c., glycerine, water, etc., 54 p.c.

In chemical nature, soap is usually a mixture of oleate, palmitate, and stearate of sodium, or of potassium in the case of soft soap. The oleate and palmitate predominate when made from vege-

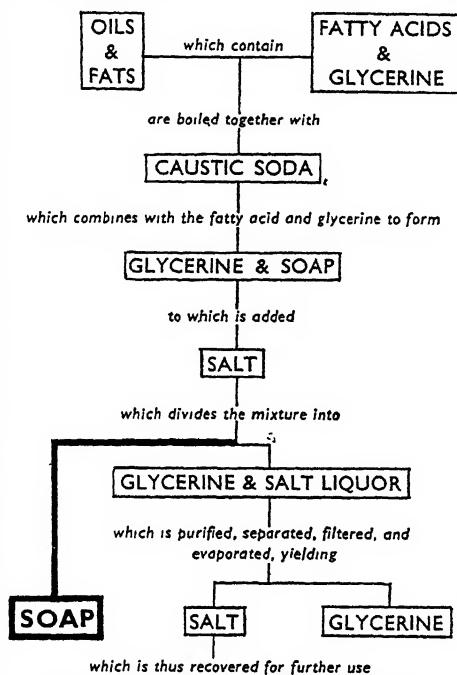

table oils, the stearate when from animal fats, e.g. tallow. The stearate forms the harder soaps, e.g. curd. With the calcium and magnesium salts present in ordinary water, soap reacts to form the oleate, palmitate, and stearate of calcium (calcium soaps), or magnesium, and these compounds, being insoluble, collect as a scum or curd in the water used for washing. These soap-destroying properties constitute the hardness of a water. When an acid is added to an aqueous solution of a soap, it is decomposed with the separation of the free fatty acid of the soap, which floats on the surface. The so-called cereal soap is made by the action of caustic alkali on starchy material in a way similar to the cold process for hard soaps. It possesses good lathering and cleansing properties. The soaps used in medicine are made with olive oil and are neutral.

In addition to the vegetable and animal oils, considerable use is now made of hardened fats, that is soft fats and oils converted to hard fats by hydrogenation. Rosin colophony (*see* Resins) is also an important addition to the raw materials used by the soap maker. Rosin consists almost entirely (90 p.c. at least) of free resin acids which combine with alkali to form soap. Household soap often contains considerable quantities of rosin. Rosin is cheaper than fats and oils but does not yield glycerine. Up to 40 p.c. rosin soap can be incorporated, but such large quantities have an adverse effect upon the physical qualities of the product. During recent years there have been considerable developments in the preparation of resin derivatives, notably hydrogenation products, which appear to be of use in the preparation of soaps.

An important development has been the introduction of a continuous process for soap making. The details of the plant are complicated, but briefly it consists in passing the molten fat and the

aqueous alkali solution through a series of reaction vessels in opposite directions.

The soap is finally separated after the addition of brine by centrifugal force. The advantages of the process are the great reduction in steam consumption, higher recovery of glycerine, and less loss due to impurity, mainly because the reactants are under the influence of heat for a shorter time.

Soap. Summary of the process of manufacture

Developments have also taken place in exploiting the detergent qualities of sulphonated fatty alcohols. The primary alcohols of this type are derived from natural fats, but the secondary alcohols are derived from petroleum and thus constitute a new source of detergents.

For some purposes these possess considerable advantages, e.g. the range over which they are effective and their stability to hard water. In wool scouring they give a soft fluffy result free from stickiness and any tendency to felt.

Soap Berry (*Sapindus saponaria*). Tree of the family Sapindaceae, native of tropical America. With alternate leaves and small greenish-white flowers, it has fleshy fruits containing hard, black, round seeds that have been used as beads and buttons. The outer coverings of the seeds when soaked in water

make a lather, and are used as soap. The root has the same property in a lesser degree.

Soapstone or **STREATITE**. In geology, the name sometimes given to the massive variety of talc. Generally white or blue-grey to green in colour, soft and heat-resisting, it is extensively used in laboratory furniture, electric switchboards, etc. It is rarely found pure. *See* Talc.

Soapwort or **FULLER'S HERB** (*Saponaria officinalis*). Perennial herb of the family Caryophyllaceae. A native of Europe and W. Asia, it has a creeping white rootstock and straight stems with oblong, lance-shaped leaves. The fragrant lilac or white flowers are in clusters. The leaves, bruised in water, produce a lather which may be used in washing.

Soar. River of England. It rises on the E. border of Warwickshire and flows 40 m. N.E. and N.W. to the Trent, about 11 m. S.E. of Derby. It passes through Leicestershire, forms part of the boundary between that county and Nottinghamshire, and is navigable to Leicester.

Sobat. River of the Anglo-Egyptian Sudan. Formed by the junction of the Baro and Pibor, it rises in the S.W. of the Abyssinian highlands and runs N.W. to the Nile, which it enters at Sobat, 525 m. S. of Khartum. The total length from the source of the Baro is about 460 m. The Sobat joins the Bahr el Jebel or Mountain Nile, and its silt deposit gives rise to the name Bahr el Obeid, or White Nile, for the united stream. *See* Nile.

Sobieski. Name of a famous Polish family. James Sobieski, a noble of Cracow, was the father of John Sobieski, who became king of Poland. John's granddaughter, Maria Clementina, became the wife of the Old Pretender. *See* John, king of Poland.

Sobraon. Village on the Sutlej, Punjab, India. Here on Feb. 10, 1846, a battle was fought between the British under Sir Hugh Gough and the Sikhs. The Sikhs, 20,000 strong, were entrenched with the river behind them, and the British guns were unable to damage them seriously. The infantry, however, reached the entrenchments, and, after a stubborn fight, the Sikhs were put to flight, losing about 5,000 men. *See* Sikh Wars.

Socage. Word used for a certain kind of land tenure. Such land was held on the payment of rent or services, and the holder was not a villein but a freeman.

His obligations included the duty of attendance at the court held by the lord of the manor. After the decay of feudalism socage tenure became freehold. *See* Land; Manor; Soke; Villeinage. *Consult* Domesday Book and Beyond, F. W. Maitland, 1897.

Social Contract. THE. Term common in the philosophy of the 17th and 18th centuries, embodying the old theory that civil society originated in a contract. It has been supported by very diverse arguments, and used to support conflicting conceptions. Generally, it assumed an original state of nature in which everyone did as he liked; from which state of miserable anarchy men escaped by making a contract with someone to protect them, thus organizing society. In England this theory was accepted by such opposed thinkers as Hobbes and Locke, and in France Rousseau afterwards gave a new meaning to the term.

In the *Contrat Social*, published in 1762, he discarded the theory of an original state of nature, and sought his arguments from philosophy rather than from history. His state, an ideal conception, is founded on man's universal desire for freedom, which can only be secured by a contract which each makes with all, and in which each surrenders his will to receive it back again as part of the whole. In this state the people themselves are sovereign, and affairs are settled by the general will, of which each man forms part. *See* Rousseau; State.

Social Credit. Economic philosophy first expounded in 1919 by Clifford Hugh Douglas (*q.v.*), in an article in the *English Review*. It is based on the principle that the individual is the all-important unit in society. Accordingly, the only object of production being consumption, the interests of the consumer should be paramount. Douglas maintained that the chief cause of the recurring economic crises in the world was artificial financial restrictions, which limit consumption in ways not easily perceived by the layman. He propounded the Social Credit idea in a twofold manner: (1) by an analysis of costing, which became known as the $A + B$ theorem; (2) by a set of proposals of which the essentials were the establishment of a national credit authority; the financing of the consumer, apart from the employment system, by means of a national dividend based on production; the appli-

cation of a price-adjustment mechanism "at the retail end"; and the issue of new credits for new production.

The idea attracted the attention of A. R. Orage, editor of *The New Age*, who opened his columns to a series of articles by Douglas which came to be accepted as the "bible" of the movement. Many politicians, attracted by the plan, were dubious about its revolutionary financial implications.

In Canada, an Alberta schoolmaster, W. Aberhart, organizing a Social Credit party in 1935, obtained a sweeping electoral majority in the prov., and formed the world's first Social Credit govt., repeating his victory in 1940. After his death his successor, E. Manning, won 51 out of 57 seats in 1944, and again held his position in 1948. But after more than 13 years of popular approval, Social Credit was still not in practice in Alberta, because the British North America Act, 1867, under which Canada became a dominion, imposed federal control over all forms of monetary issue, and the privy council, on appeal, repeatedly maintained the provisions of the Act.

In the U.K. the Social Credit party, though small in numbers, was active, one group of its supporters, uniformed in green shirts, hold occasional public demonstrations.

Socialism. Word introduced by Pierre Lerroux in 1838, and used since then to denote various methods of reorganizing society and the plans, practical measures, and political activities for effecting the changes necessary to bring them into being. In spite of the wide differences of theory, all types of socialism substitute collective for individual ownership and management over a large part of the economic field; consequently socialism has often been called collectivism.

Without exception socialists deny that individual profit-making can be an efficient basis for the economic activity of society, and desire to substitute for it the motive of service to the community. This, it is thought, may be assured through the communal ownership and control of the means of production and distribution, making possible a scientific organization of the productive forces of society and a more equal distribution of the social income.

The principal differences among socialists concern chiefly the measures to be taken and the

speed with which socialism can be attained. The Fabians, who have had a great influence in Great Britain, would "make haste slowly," so that the changes effected in the economic framework through legislative action may reflect changes in men's ideas. But the revolutionary socialists think of socialism as a ready-made economic system to be installed instantly, if need be after a revolution. They believe that socialism is inevitable, and that given the opportunity, men's minds could be changed to attune with the system. This difference of approach represents the gulf separating the western socialism from that of Russia.

Founders of Socialism

As a political doctrine, socialism is linked with many others, *e.g.* Utopianism, radicalism, anarchism; and with isolated writings and events during many centuries. But as an active and organized political force it is a product of the industrial revolution of the 18th-19th century, the concentration of capital, and the aggregation of workers in large factories. The writings of Tom Paine and William Godwin contributed; Ricardo, through his economic writings, stimulated anti-capitalist schools of thought; Robert Owen in Great Britain, and Fourier in France, made plans for ideal communities; Saint-Simon urged the need for transferring power from the old governing classes to the "industrials," so that science could be applied to solve the problems of poverty. All these influences were in various degrees focused by Karl Marx and Friedrich Engels in their Communist manifesto, 1848, "the year of revolution." Marxist ideas spread rapidly on the Continent, but eventually had much less influence than was originally expected. In Germany, the essential principle of Marxism was abandoned in 1875, when the socialists decided to aim at the democratisation of the state instead of at its overthrow and the institution of a new order. In France socialism declined for several years after the failure of the Paris Commune in 1871. In both countries, as elsewhere in western Europe, there remained a gap between the reformist and the revolutionary socialists.

In the U.K., H. M. Hyndman founded in 1881 the Social Democratic Federation, which adopted a full Marxist programme; but it was able to achieve little, partly

because of the rise of the trade union movement, partly because the numerous parl. reforms introduced held promise of reform without revolution. In 1883 the Fabian society was founded. Its members were socialists, men and women who aimed "at the reorganization of society by the emancipation of land and industrial capital from individual and class ownership and the vesting of them in the community for the general benefit. . . . For the attainment of these ends the society looks to the spread of socialist opinions and the social and political changes consequent thereon." Its instruments were education and legislation; and it achieved much in both directions. Fabian socialism became the theoretical basis of British socialism when Keir Hardie and his associates founded the Independent Labour party in 1893; during the 20th century it inspired informally, perhaps, most of the policy of the Labour party, and much of that of the trade union movement. The doctrine of the "inevitability of gradualness" came to be accepted by almost all the British socialist leaders. One social reform was a stepping-stone to another, which in its turn entailed further structural changes in the social and economic organization of the state. Considerable changes in that structure had been made before the accession of the Labour party to power in 1945 by the extensive socialisation that had taken place through municipal government.

Marxian Socialism in Russia

The political and social conditions of tsarist Russia were basically different from those of western Europe. In the revolution of 1917 the removal of one tyranny left a void; it was filled, temporarily at least, by another tyranny: the dictatorship of the proletariat. Thus in one country at least the Marxian dream came true. The Bolsheviks (literally, the majority) called themselves Communists, to recall the Communist manifesto of 1848; and from 1917 the word communism was normally used to mean the policy and programme of the Communist party of the U.S.S.R. and of those groups in other countries which accepted its lead. At first the Russian Communists expected socialist groups elsewhere in the world to follow their example, and the Communist international bureau (Comintern, *q.v.*) was active in many countries, but without signifi-

cant results. In 1943 this bureau was disbanded, but the resurgence of extreme socialism among many who had been active in resisting the Germans in territory occupied by them during the Second Great War led to the establishment of the Cominform, a new international Communist bureau.

For and Against Socialism

Chief arguments advanced by opponents of socialism are: (1) there is no adequate substitute for private profit-making as an economic motive; and if it is suppressed or given inadequate scope for legitimate exercise, either individual initiative and energy will be weakened or men will seek personal profit illegitimately, and society will become corrupt; (2) private ownership and control of business undertakings can alone provide the necessary flexibility and willingness to undertake risks; (3) the socialist state leaves unsolved the problem of who is to do the drudgery of the community, and gives no guarantee that this work will be allocated more fairly than under capitalism; (4) socialism involves a great increase in the number of those whose sole work is to prevent others from doing anything, and the system of planning, licensing, quotas, etc., which it establishes is itself a serious brake on useful economic activity and a serious cause of frustration and waste; (5) socialism necessarily imposes great restrictions on the freedom of the individual, not only by deciding in what economic activities he may engage, but by deciding what he may *not* do; (6) through the extreme centralisation of power, it would be possible for an unscrupulous combination of men to establish a continuous dictatorship; (7) it is unwise to rely on only one motive, service to the state, among the many human motives, others being *e.g.* the urge for good works, the desire for personal gain, the love of praise, the thirst for power.

In reply, socialists contend: (1) profit-making is a strong motive only because of the power that money gives in a capitalist society; (2) private profit-making often leads to the deliberate creation of shortages, and this is anti-social; (3) in large-scale enterprise, ownership is frequently separated from control, and forms of socialised undertaking can be given similar control, but with the added safeguard that the managers will be responsible to parliament; (4) with the large aggre-

gations of capital in contemporary industry, there is a concentration of power that is not accountable to parliament and is a serious challenge to democracy; (5) economic freedom is denied, under capitalism, to the vast majority of the population; (6) in a complex industrial structure there must be planned investment, if miscalculation and unemployment are to be avoided, and this planning, being subject to parl. control, would aim at the general well-being of the population instead of the enrichment of a few. See Capitalism; Communism; Syndicalism.

Bibliography. History of Socialism, T. Kirkup, rev. edn., 1920; History of British Socialism, M. Beer, 1920-21; The Road to Serfdom, F. A. Hayek, 1927; History of Socialist Thought, J. Laidler, 1927; The Intelligent Woman's Guide to Socialism, G. B. Shaw, 1928; Fabian Socialism, G. D. H. Cole, 1943; The Socialist Tradition; from Moses to Lenin, A. Gray, 1946; and such classics as Wm. Morris's News from Nowhere; E. Bellamy's Looking Backward; and Robt. Owen's The Book of the New Moral World.

Social Security. Term used officially in the U.K. in 1944, when it was announced that a ministry of Social Insurance was to be set up to administer the whole field of social security, covering allowances for unemployment, sickness, and accidents, old age and widows' pensions, family allowances, and death and maternity grants. See Beveridge Report; Insurance, National. Consult the White Paper, Cmd. 6550, 1944.

Social Security Act. Act of the U.S. Congress signed Aug. 14, 1935, by Pres. F. D. Roosevelt, who is said to have regarded it as the cornerstone of his administration in domestic affairs. It was amended in 1939 and 1946. It covers old age and survivors' insurance, administered directly by the federal govt., and several other benefits administered through federal grants to the states, *e.g.* unemployment insurance, public assistance, and maternal and child welfare especially in rural areas and those suffering from economic distress. The act was originally administered by a non-partisan social security board of three members, of which John G. Winant was chairman. In 1946 the functions of the board were transferred to a federal security agency.

Social Services. Term used in the U.K. for collective financial provision organized through central

and local govt. agencies primarily to promote the physical and mental health and well-being of the population, and thus indirectly the prosperity of the whole community. Such provision includes expenditure out of taxes and rates on such activities as education, public libraries, public baths and similar amenities, housing, national assistance, social security (*v.s.*), social salvage (reformatories, mental hospitals, etc.); but not expenditure on sanitation, roads, fire service, etc., and probably not food subsidies or other taxational devices for controlling the price-level or redistributing the national money income. The total provision for social services made in the 1947 British budget was £441 million, of which half was used in the form of grants-in-aid to local authorities. The contribution from rates was c. £400 million. Consult National Income and Expenditure of the U.K., 1938 to 1946 (Cmd. 7099); Economic Survey for 1948 (Cmd. 7344).

Society. Association of persons united by common interests in certain subjects, or for the furtherance of particular objects. Innumerable classes of societies are in existence, and the most important are described under their separate headings. See Academy; Friendly Societies; Royal Society, etc.

Society (Lat. *socius*, companion). Mankind considered collectively or as a community; more particularly, a number of persons associated for a common interest or distinguished by particular qualities, *e.g.* of social organization. Society is studied to discover (a) its origin, development, and history in different areas; (b) the effects of one society on another through migration, conquest, etc.; (c) the sources, features, growth, and effects of culture at different times and in various areas; (d) the different types of kinship, marriage, and family relationship; (e) the organization of occupational and other associations; (f) the functions of religion and magic; (g) the social controls (moral codes, administration of justice, basis of authority, etc.); (h) economic organization at different levels of culture.

Generally speaking, primitive society seems to have been characterised by a lack of differentiation of function, particularly the separation of the religious, the economic, and the legal. Emphasis has been laid latterly on group psychology, *i.e.* on the social mind as a force in

society, with the object of discovering the causes of contemporary social problems. See Anthropology; Psychology; Sociology.

Society Islands. French archipelago in the South Seas. It includes Tahiti (*q.v.*), and many

other islands and islets. The capital is Papeete. Of its area of c. 650 sq. m., Tahiti has 600 sq. m. Most of the islands are volcanic and fringed by coral reefs. Copra and phosphates are the principal products and exports. Sugar and bananas are produced for local consumption. The island group is the administrative centre for French Oceania. The Society Islands were annexed to France in 1880, and declared for Free (Fighting) France during the Second Great War. Pop. 14,000.

THE SOCIETY OF FRIENDS

* Gilbert K. Hibbert, former lecturer, Woodbrooke Coll., Birmingham, etc.

See the articles on other branches of the Christian Church, *e.g.* Church of England; Congregationalism; Methodism. See also the biographies of Fox, G.; Fry, Elizabeth; Penn, William, and other leaders; also Jordans; Mysticism; Quietism

The Society of Friends, commonly known as Quakers, is a Christian body, numbering about 22,000 members in Great Britain and Ireland, and some 120,000 in N. America.

It began its existence about the middle of the 17th century, as a revolt of mystical or "spiritual" Christianity against the ecclesiasticism and bibliolatry of the Reformed Churches, both Anglican and Nonconformist.

Groups of dissatisfied "seekers" were at that time meeting together, waiting for some authentic revelation from God; and this many of them believed that they received through the preaching of George Fox. He was at that time a young man of imperfect education, but of deep moral earnestness; and, in spite of some temporary extravagances, he showed remarkable sanity, clearness of moral vision, and organizing ability. He had passed through very deep spiritual experiences in his search for God, and believed that, when no help had come to him from men or books or churches, God at last had spoken to him directly, as to the ancient prophets.

Of those who were convinced by Fox, and who gathered as children of the light, a large number became preachers and travelled over the British Isles, parts of the Continent, and the American colonies. Some of the converts were men of learning, like Pennington, Penn, Ellwood, and Barclay. Their aim was not to form a new sect, but to bring the whole Christian Church back from "the dark night of apostasy" into the light of truth. They met with fierce persecution from the orthodox, who regarded their

views as subversive of both Church and Bible. During this period of persecution their numbers increased rapidly both in the U.K. and in America.

After the Toleration Act of 1689, persecution for the most part ceased, and a time of mystical quietism and decline set in. The evangelical revival of the 18th century hardly touched the Friends till near its close. Joseph John Gurney was the chief agent in bringing a new evangelical spirit into the society, which in the 19th century manifested itself in fresh interest in biblical study, in home and foreign missions, and in the spread of the adult school movement; but with some loss of the mystical element that was fundamental in early Quakerism. From about 1890 there was a drawing together of these elements, aided by the spread of a new desire for religious education and a widened intellectual outlook.

The Inward Light

All the distinctive views and practices of the Quakers flow from the root principle of the inward light—the belief that every man has, or may have, some direct experience of God in the soul. In public worship they discard all professional ministry and arranged services. They meet in silent fellowship and wait on God, giving freedom to any man or woman who is believed to be moved by the Spirit to preach or lead the company in vocal prayer. They do not practise the outward sacraments of Baptism and the Lord's Supper, believing that the whole emphasis of Jesus Christ and His apostles was not upon symbolic acts, but upon inward experience and rightness of life.

They have a unique form of marriage, in which human priesthood finds no place, the man and woman simply taking one another in the presence of God and the congregation. They refuse to take judicial oaths, believing that anyone who walks in the light will always and everywhere do his best to speak the truth. In church government every member, man or woman, has an equal voice. No question is decided by a vote; but after a time of silent worship matters are discussed in a reverent spirit, and the clerk or president gathers what he believes to be the sense of the meeting—his decision being very rarely challenged.

From the earliest days the conviction that the light of God is in some measure present in all men has given the Friends a special sense of human brotherhood, and has made them pioneers in philanthropy. The society was the first Christian body in the U.S.A. to forbid its members to hold slaves, and in England Friends, led by Elizabeth Fry, took the lead in prison reform, and also in the kindly treatment of the insane. The same spirit is at the root of their rejection of war, involving the double conviction, upheld by no other Christian body, (1) that war is always contrary to the spirit of Christ; and (2) that it is always unnecessary for a nation that will persistently act with justice to all. This twofold conviction was put into practice in Penn's "holy experiment"—the colony of Pennsylvania having been maintained under Quaker rule for more than 70 years without armed defence against Indian marauders, and without being attacked by them. During the First and Second Great Wars most Quakers refused military service, but did good work in organizing relief services and ambulance units for both home and overseas service. The Nobel peace prize for 1947 was awarded to the Friends Service Council (Great Britain) and the American Friends Service Council jointly.

Socinus, FAUSTUS (1539-1604). Latinised form of the name of the Italian theologian, Fausto Sozzini. Born at Siena, Dec. 5, 1539, he was poorly educated, and after some wanderings in France and Switzerland, where he associated with members of the Reformed churches, entered the service of the daughter of the grand duke of Tuscany. Having studied theology for three years at Basel, he went in 1579 to Poland, where he vigorously promulgated his rationalistic and anti-Trinitarian views, especially at the synod of Brest-Litovsk in 1588. The publication of his book, On Jesus Christ the Servant, in 1598, provoked a riot in Cracow, in which he nearly lost his life. He died, March 3, 1604.

His uncle, Laelius Socinus (1525-62), also born at Siena, travelled through many parts of Europe, associating with the reformers and scholars of France, England, Germany, and Poland, and settled in Zürich, where he died, May 14, 1562. His rationalistic teaching was developed by his nephew, the real founder of the Socinians. This sect rejects all Christian doctrines that cannot, in its view, be based on human reason, particularly those concerning the Person of Christ. It spread in Poland, where it was suppressed in 1648, and survives in Transylvania, where it numbers about 60,000 adherents.

Sociology. Scientific study of human life in organized communities. In 1839 Auguste Comte coined the word to express the idea that the phenomena of social life are included within the unity of nature and are subject to inevitable natural laws. Sociology may be compared with biology: as biology aims at gathering into a single beam the lights thrown by anatomy, physiology, embryology, and natural history upon the process of individual life, so sociology seeks to bring together the results gained by workers in the several social sciences.

Man being essentially a social animal, the social sciences cover almost all phases of human activity and interest, e.g. economics, the comparative study of property, law and justice, crimino-

logy, and penology. All may, however, be grouped under three heads: (1) anthropology; (2) social psychology; (3) the study of social institutions.

Anthropology is, so to speak, the natural history of human societies. It includes ethnology, which becomes anthropology, in the proper sense, only when men are studied in their actual social groupings. A classical instance of this "descriptive sociology" is Spencer and Gillen's account of the central Australian tribes—which has inspired many valuable studies of the primitive peoples. In such studies the "functional" method, i.e. taking a view of all the features of a particular society as fitting together to form a working whole, came to be generally accepted. A general comparison of the customs, beliefs, and cultures of primitive peoples, such as E. B. Tylor made in his pioneer works, is a natural sequel to these studies of special communities, and leads inevitably to questions about the forces which determine change and progress among mankind. Here a notable difference of opinion and method has appeared. The older anthropologists assumed that resemblances in the customs and institutions found in different parts of the world were due to the similar reactions of the human mind to the same conditions. A later school maintained, on the contrary, that they are often, if not generally, due to the spread of culture from one people to another.

Social psychology seeks to discover in the individual human mind the forces which account for the origin and cohesion of social life. The old idea of Hobbes and his successors, that social life sprang from reasoned choice, has long been abandoned, to be replaced by conceptions based upon the obvious analogy between the social behaviour of men and of certain animals. Psycho-analytic and similar systems have contributed much to social psychology.

Among the special studies of social institutions, a chief place must be given to the discoveries about religion, magic, and folklore, which have thrown a flood of light, not only upon the workings of barbarian minds, but also upon the foundations of western civilization. Sir James Frazer's monumental works contributed substantially to this conception. E. A. Westermarck's comprehensive study of marriage is, perhaps, the best instance of minute

sociological inquiry into a single institution, while the works of the same author and Prof. Leonard T. Hobhouse on the evolution of moral ideas illustrate the application of sociological methods to wider questions. Literature and art have also been treated by such methods; indeed, every aspect of culture is now thought worthy of sociological examination.

It is maintained that exact knowledge upon the matters indicated is indispensable, if the future of a complicated society is to be intelligently guided, especially in an age of flux. Sir Patrick Geddes, following the French master, P. G. F. Le Play, advocated the sociological survey of cities and the regions from which they draw their life, so that the material and spiritual needs of the inhabitants may be better supplied and organized. It has also been urged that ignorance of comparative sociology has not infrequently led govts. having colonial responsibilities and their agents into costly mistakes in their dealings with undeveloped peoples, and anthropological advisers to colonial govts. are frequently appointed.

The Institute of Sociology is a British learned society founded in 1905 as the Sociological Society, to promote investigation and education in social science. It has published *The Sociological Review* since 1908. The headquarters (1948) are at Ledbury, Herefordshire. See Anthropology; Family; Kinship; Marriage; Society.

Ginsberg, 1934; *A Study of History*, A. I. Toynbee, 1934-39; *Social Psychology*, K. Young, 1946; *A Handbook of Sociology*, W. F. Ogburn and M. F. Nimkov, 1947.

Sock (Lat. *soccus*, slipper). Originally, the light shoe worn by actors in ancient Greek comedy. It was hence sometimes used as a symbol of comedy as distinct from tragedy, in which the actors wore buskins (*q.v.*). The name is now given to a knitted or woven covering for the foot, ankle, and part of the leg, or to a detachable inner sole to a shoe.

Socman. In old English law, person holding a tenure by socage. A socman was distinguished from one holding tenure by the rendering of sporadic military service by the fact that he rendered a specific and regular service, and he stood in a class superior to the villen; thus, petty serjeantry was a form

of socage tenure. Free, simple, or common socage implied that the socman rendered some service of an honourable nature, as commonly the acknowledgement of fealty and a fixed annual payment. Villein socage left the socman with a fixed and definite, but meaner, service for his tenure. From the free socmen of early times, the descent of the medieval yeoman class has been traced, and they became gradually merged in the freeholder class of tenants. See Copyhold; Freehold; Manor.

Socorro. Town of Colombia, in the dept. of Santander. It is 145 m. N.E. of Bogotá, and has woollen and straw plait industries. Founded in 1540, it was destroyed in 1681 and rebuilt on its present site. Pop. 10,000.

Socrates, the Greek philosopher
From a statuette in the British Museum

Socrates (c. 470-399 B.C.). Greek philosopher. Son of Sophroniscus and Phaenaretē, he was born about 470 B.C. and is said to have learnt the hereditary craft of a sculptor. He married Xanthippē, by whom he had three sons; according to Xenophon she was a shrew. Our knowledge of Socrates is almost wholly derived from the dialogues of Plato.

Assuming that, as recent criticism has rendered probable, the historical background of the dialogues is in the main accurate, the following narrative may be constructed. From his childhood Socrates was visited by experiences

which he described as the warnings of a "spiritual voice"; these were always prohibitions. He was also subject to trances. He also possessed exceptional powers of physical endurance, and could hold his own in drinking bouts, although "no man ever saw Socrates drunk." He was thickset and ugly in countenance, with a snub nose and prominent, piercing eyes; his portrait is preserved in many busts.

From his youth up Socrates was keenly interested in the religious, philosophical, and scientific movements of his time. Physical science was then represented partly by the Ionic school of inquiry, which devoted itself mainly to the search for the "primary substance" underlying the diversity of phenomena, and partly by certain Western schools, especially that of the Pythagoreans. Socrates seems to have been specially interested in the theories of Diogenes of Apollonia, who held that air, in various degrees of condensation, formed the substratum of the material world, and he also shows acquaintance, in the *Phaedo*, with the doctrines of Empedocles.

The Theory of "Forms"

The result was that he framed the theory of "forms." According to this theory the world of sense is related to that of thought by the participation of things in the "forms" or patterns which alone are permanent. This theory, perhaps of Pythagorean origin, was developed by Socrates, both in its logical aspect and also as the key to morals, since, for example, just or courageous actions were viewed as becoming such by participation in the "forms" of justice and courage. But Socrates owed more to the Pythagoreans. His mystical nature was attracted by the doctrine of the soul as a divine, immortal spark, imprisoned in the body and released at death.

Socrates rapidly became a man of note in Athenian society. About 435 B.C. his friends Chaerephon asked the Delphic oracle whether any man was wiser than he, and received a negative answer. Socrates interpreted this to mean that he alone was conscious of his own ignorance, and that his mission was to convince others of the same truth about themselves; and this mission he pursued until the close of his life, seeking opportunities of discussion, especially with the young, and exposing the inner contradiction of popular ideas, particularly in morals and politics, by the method of question and answer. In 432 B.C. the war with

Sparta broke out, in which Socrates served with distinction.

In 423 B.C. Aristophanes produced his comedy of the Clouds, in which Socrates is caricatured. The "thinking-shop" (*phrontisterion*), with its "souls," who are also students of "things in the air and below the earth," suggests a Socrates who is the head of a community like those of the Pythagoreans, but the instruction given in the art of "making the worse appear the better reason" is a shaft aimed at the Sophists, amongst whom it is not fair to class Socrates. From the dialogues of Plato we are led to picture him rather as the centre of a coterie of youths belonging to the best Athenian families, notably Alcibiades and the uncles of Plato, Glaucon and Adeimantus, who are represented as regarding him with affectionate admiration. The assumed date of the Symposium of Plato, in which Alcibiades gives a vivid account of his relations with Socrates, is 416 B.C., and Aristophanes appears to be on friendly terms with him.

In 399 B.C., after the restoration of democracy, he was prosecuted for corrupting youth, and introducing new divinities in place of those recognized by the state. The real ground of the prosecution was doubtless political; Socrates was held responsible for the anti-democratic careers of such men as Alcibiades and Critias, who had been members of his circle. The death penalty was only voted by 280 to 220. A month later he drank the hemlock in prison, having refused the offers of his friends to contrive his escape. His last hours were spent in discussing the immortality of the soul with a group of disciples; their conversation is recorded by Plato, one of the younger members of the school, in the *Phaedo*.

The importance of Socrates' philosophy was capital, both in logic, through the theory of "forms" which implies that thought deals with universals, and in morals: his famous doctrine that "Virtue is knowledge and vice ignorance," rightly understood, means that true goodness can only be based on a full realization of the nature and faculties of the soul of man. From this flow all specific virtues, e.g. the brave man is he who "knows what ought and ought not to be feared." See Greece; Philosophy; Plato. *Pron.* Sockra-teez.

Soda. Popular name for sodium carbonate or washing soda, also known as soda-ash. In such expressions as baking soda, sodium bicarbonate is meant, which is more suitable for use in baking powder on account of the larger yield of carbonic acid gas which it gives on contact with acid.

Soda Lake. Name given to the natural sink in which the drainings of alkali plains have collected. They are in reality lakes with no outlet, and form the most important sources of soda. Three of the most famous of these lakes are Albert Lake, Mono Lake, and Owens Lake, all in the U.S.A.

Sodalite. In mineralogy, one of the feldspathoid group. A complex sodium aluminium silicate with sodium chloride, it occurs in blue isometric crystals or grains in soda-rich igneous rocks low in silica, e.g. nepheline-syenite.

Soda Water. Aerated water charged with carbonic acid gas. The gas is forced into the water under pressure, and the liquid mechanically bottled and stoppered. Soda water is used generally with other liquids, e.g. whisky, or milk. Soda water was first manufactured commercially in Geneva at the end of the 18th century, and introduced into England by Schweppe. In a soda fountain, soda water is contained in a marble or metal vessel supplied with valves and pipes by which the contents can be drawn off. See Aerated Waters.

Soddu, UBALDO (b. 1884). Italian soldier. This Neapolitan was commissioned in the Italian cavalry in 1904 and served in the First Great War. He commanded a motorised brigade in the Italian invasion of Abyssinia, and a military station near Addis Ababa was named after him. In 1939 he was appointed under-secretary for war and in 1940 vice-chief of staff to Gen. Graziani. Soddu was commander-in-chief of Italian forces in Albania, but after his defeat by the Greeks in Dec., 1940, he was relieved of his command and retired in disgrace.

Soddy, FREDERICK (b. 1877). British scientist and monetary theorist. Born at Eastbourne, Sept. 2, 1877, he was acting as Rutherford's chemical assistant at Montreal, 1900-02, and as co-worker with Ramsay at Uni-

versity College, London, 1902-04. He lectured on radio-activity and physical chemistry at Glasgow university, 1904-14, then became professor of chemistry at Aberdeen until 1919, when he was made Lee's professor of chemistry at Oxford, retaining that chair until his retirement in 1936. An authority on radium and radio-activity, he discovered and worked out the theory of isotopes, 1912, and, with Rutherford, originated the theory of atomic disintegration and the displacement law of radio-activity, receiving the Nobel prize for chemistry in 1921. His many publications were mostly concerned with the branch of science he had made his own, e.g. Radio-activity, 1904; Interpretation of the Atom, 1932. But in later years he became interested in the problem of money, and formulated a theory of virtual wealth, which he expounded in *Wealth, Virtual Wealth, and Debt*, 1926; *Money versus Man*, 1931; *The Role of Money*, 1934.

Frederick Soddy,
British scientist

Söderblom, LARS OLOF JONATHAN (1866-1931). Swedish theologian. Born at Trönö, Jan. 15, 1866, and educated at Hudiksvall and Uppsala university, he was pastor of the Swedish Church in Paris, 1894-1901. Professor of theology at his old university during 1901-14, he also held the chair of comparative theology at Leipzig, 1912-14. He was then appointed archbishop of Uppsala and pro-chancellor of the university, in which offices he continued till his death, July 12, 1931. The author of many books on religion, the best known being *The Nature of Revelation*, he became a member of the Swedish academy in 1921. This leader in the movement for the unification of churches helped to prepare for the universal Christian conferences on life and work, held at Stockholm in 1925 and at Lausanne in 1927. Nathan Söderblom was awarded the Nobel peace prize in 1930.

Söderhamn. Seaport of Sweden. It is 135 m. in a direct line N. by W. of Stockholm on an arm of the Gulf of Bothnia, and is connected by a branch line with the main rly. from Stockholm. Wood pulp, timber, and iron goods are exported from it and its outport, Stugsund, 3 m. S.E. Pop. 11,600.

Södermanland. Län or co. of Sweden. It lies between Lake Malar and the Baltic Sea, and has an indented coastline. Iron is mined at Kantorp, copper at Tunaberg. Nyköping is the capital. Area, 2,634 sq. m. Pop. 204,727.

Södertelje. Town of Sweden. Situated at the S. end of Lake Malar, it forms a residential suburb 15 m. S.W. of Stockholm, with which it has connexion by rly. and steamer. It is on the Södertelje Canal, which joins Lake Mälaren to the Baltic Sea. Pop. 22,080.

Sodium. One of the metallic elements. Its chemical symbol is Na, atomic number 11, atomic weight 22.99. It was first distinguished from potassium, its neighbour in the periodic table, by Duhamel in 1736, and both elements were first separated in the metallic state by Davy in 1807. Sodium metal is still manufactured by Davy's process, *i.e.* by passing electricity through fused caustic soda in an iron vessel kept hot by a suitable furnace. Sodium and hydrogen are separated at the cathode, and oxygen at the anode. The former may also be prepared by electrolysis of a salt solution, arrangements being made for the sodium deposit to be prevented from combining with the water.

In the pure state, sodium has a silver white lustre, and exhibits most of the properties characteristic of metals generally, but it differs from the better known metals in being extremely soft, lighter than water (sp. gr. .9724), in melting very easily (at 97° C.), and especially in reacting violently with water to form caustic soda, hydrogen being released and then bursting into flame from the heat of the reaction.

Sodium unites with mercury to produce sodium amalgam, and with potassium metal to form an alloy which is liquid at 0° C., and is used for filling special thermometers to measure temps. higher than the boiling point of mercury. When sodium metal is heated in dry air it produces sodium oxide, Na_2O , and sodium peroxide, Na_2O_2 , the latter a strong oxidising agent.

Most sodium compounds are colourless and readily soluble in water. They impart a yellow colour to a non-luminous air-gas flame when a trace of the substance is introduced on a wire into the flame, and this yellow light is used frequently as a monochromatic light. (*See* Sodium Lamp.) In nature, sodium is never found in the metallic state, but in the

form of various compounds, *e.g.* sodium chloride, or common salt, either as rock salt or dissolved in sea water; sodium nitrate in the form of Chile saltpetre; sodium sulphate in the mineral glauberite, etc.

The chief compound of sodium is the chloride, NaCl , or common salt. This may be produced by the direct union of its elements, sodium and chlorine, or by neutralising caustic soda, or washing soda (sodium carbonate) with hydrochloric acid. It is soluble in water, and mixed with ice or snow it forms a good freezing mixture. It is insoluble in alcohol, melts at a red heat, and is used in the manufacture of washing soda, and of hydrochloric acid. It is a necessary adjunct to the diet of man, and is obtained from deposits of rock salt, as in Cheshire, or by distillation of sea water, as at Aden. (*See* Salt.)

Sodium bromide, NaBr , and sodium iodide, NaI , are respectively more soluble and less well crystallised than potassium bromide and iodide. In medicine they have the advantage of not being so depressing as the latter.

Caustic Soda Production

Sodium hydroxide, NaOH , or caustic soda, is manufactured by two processes. One is by boiling together slaked lime and sodium carbonate, whereby a solution of caustic soda is produced and a deposit of chalk formed. The solution is poured off, and evaporated until solid caustic soda remains. It may be melted and moulded into sticks. The other is by the electrolysis of a solution of sodium chloride; solution of caustic soda is produced at the cathode, and free chlorine, which is applied chiefly to the manufacture of bleaching powder, is evolved at the anode. Caustic soda is a white opaque brittle solid, rather more than twice as heavy as water, in which it is very soluble, forming a highly caustic solution, capable of destroying most animal and vegetable materials. The solution combines with oils and fats to form soap, in the manufacture of which caustic soda is chiefly used. It is also soluble in alcohol and in glycerine.

Sodium carbonate, or washing soda, is manufactured by the Leblanc and the ammonia-soda processes, and is one of the chief products of the alkali industry.

Sodium bicarbonate, NaHCO_3 , is used in medicine, in the manufacture of baking powders, seidlitz powders, etc. When more strongly heated, it leaves anhydrous sodium carbonate. It is

made by saturating a strong solution of sodium carbonate with carbon dioxide, when it is deposited as minute crystals, which require twelve times their weight of water to dissolve them. It is also obtained directly in the ammonia-soda process.

Sodium sulphate, $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$, or Glauber's salt, is made as follows. In the Leblanc process of soda manufacture anhydrous sodium sulphate, Na_2SO_4 , in the form of salt cake, is obtained. This, on dissolving in water and crystallising, yields clear colourless crystals of Glauber's salt. A good cheap freezing mixture can be made by adding half a pound of common hydrochloric acid to one pound of the crystals. The anhydrous salt on heating with sulphuric acid produces sodium bisulphate, NaHSO_4 .

A solution of sodium carbonate on neutralisation with sulphur dioxide and concentration yields sodium sulphite in the form of clear colourless crystals. If the solution be saturated with sulphur dioxide, sodium bisulphite, NaHSO_3 , is obtained in solution. Both are used chiefly as antichlores, for staying the action of chlorine bleaching agents in the paper and textile industries. The bisulphite is also a useful preservative for certain foods. Sodium thiosulphate, $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$ is popularly known as sodium hyposulphite and as hypo. The clear colourless crystals are one of the products of the alkali industry. They dissolve in three-fifths their weight of water, and are used in bleaching as an antichlore.

Uses of Sodium Salts

Sodium salts have extensive uses in photography. the thiosulphate as a universal fixer, carbonate as the most usual accelerator, sulphite as a preservative. Broadly speaking, they have a similar effect to the corresponding salts of potassium, and in some work are interchangeable, with appropriate modifications as to quantity.

Sodium silicate is obtained in several forms of various composition. It is produced by fusing together sand with about half its weight of sodium carbonate and a little charcoal. It is known as soluble glass, and the thick syrupy concentrated solution is known as water glass. It has many applications, *e.g.* preserving eggs, fireproofing wood and fabrics, manufacturing artificial stones, making cements, etc. *See* Alkali; Saltpetre.

Sodium Lamp. Lamp which makes use of an electric discharge through sodium vapour contained within a tube made of a glass resistant to sodium vapour. The tube is in the form of a U and contains, in addition to metallic sodium, neon at a low pressure. The discharge is started up through the inert gas. This gradually heats the tube and causes the sodium to vaporise. The luminous efficiency of such lamps, which have a characteristic yellow glow, reaches as much as 70 lumens per watt.

Sodom. City of Palestine, in the neighbourhood of the Dead Sea. One of the so-called cities of the plain, it is associated with Gomorrah as a place of unusual wickedness. Near here Lot made his dwelling. After he had been warned to leave, the cities were destroyed by fire and brimstone (Gen. 19). The exact site of the cities is unknown. Their destruc-

Soest. Old town of W. Germany, in N. Rhine-Westphalia. Situated 28 m. E. of Dortmund, in the centre of a rich agricultural area, it was famous in the 15th century for its school of painting. It was an independent member of the Hanseatic league and, with its urban legal code, originator in 1120 of all German local govt. law. From 1444 allied with the Brandenburg dynasty, Soest fell to Prussia in 1815. Its cathedral of S. Patroclus (10th-13th cent.), with fine mural paintings, and its Gothic S. Mary of the Meadow (14th-15th cent.) were in the main spared from otherwise severe damage in the Second Great War. There are several other 12th to 13th cent. churches, walls, and towers, and fine medieval dwellings. Soest is an important rly. junction, educational centre, and seat of iron, electrical, and shoe industries. It was captured on April 7, 1945, by the U.S. 9th army in the operations to conquer the Ruhr basin, and after the war came within the British zone of occupation. Pop. 27,500.

Sofa (Arab. *suffah*, bench). Article of furniture. In the East, where they originated, sofas were merely mattresses or thick carpets and cushions, or low platforms provided with cushions. They were introduced into England about 1700, and Cowper wrote of them in 1784. They were then low couches with several cushions, differing from the settee, which was an upholstered settle. But later the term sofa was used with less discrimination to cover both the couch and the settee, or any similar piece.

Sofala. Name of a prov. (with Manica), town, bay, and river of

Mozambique. The prov. was acquired from the chartered Mozambique Company in July, 1942. The small and decayed port of Sofala, with the scanty remains of the great fortress of San Caetano, lies some 25 m. S.W. of Beira. Long before the Portuguese occupation in 1505, Arabs carried on a great trade at Sofala in ivory and gold; it was the chief outlet for the gold mines of Manicaland and Mashonaland.

Soffit or **INTRADOS.** In architecture, term for the under surface of a structure such as an arch, a cornice, a vault, or a stairway.

Sofia or **SOPHIA.** Capital of Bulgaria, the ancient Serdica or Sardica. Situated on a plain at the foot of the Rhodope Mts., within a basin traversed by the river Isker, it is an important station on the Orient Express route and is distant by rail 407 m. N.W. of Istanbul, 100 m. S.E. of Nish, and 284 m. S.W. of Bukarest. Although much improved and modernised, it has few striking features; the chief buildings are the former royal palace, government buildings, the old cathedral of S. Nedelia (damaged by an anarchist bomb outrage 1925), the cathedral of S. Alexander Nevski (completed 1924), and the university. Sofia exports maize, silk, linen, cloth and hides. It is

Sofa. Carved and gilt example of Louis XV period, covered with old Gobelin tapestry

tion has been explained as a volcanic eruption and as a conflagration of the local bitumen ignited by lightning. See Dead Sea.

Sodoma, IL. Sobriquet of the Italian painter Giovanni Antonio Bazzi (q.v.).

Sodor and Man. Name of a diocese of the Church of England, now confined to the Isle of Man. The diocese of Sodor (Old Norse *Sudreyjar*, Southern Islands, i.e. Hebrides) was formed in 1154, and comprised the Isle of Man and numerous islands off the W. coast of Scotland, then belonging to Norway. After Norway lost her Scottish possessions in 1266, the name Sodor was retained for the diocese, which in 1334 was limited to Man, the cathedral being on St. Patrick's Isle near Peel. In the 17th cent. the words "and Man" were erroneously added. For some purposes the diocese is in the province of York. The bishop does not sit in the house of lords.

Soekarno or **SUKARNO.** AHMED. Indonesian statesman. See Sukarno in N.V.

Sofia, Bulgaria. General view showing Parliament House Square with the statue of the Tsar liberator, Alexander II. Top, cathedral of S. Alexander

the seat of a Greek metropolitan. Taken by the Turks in 1382, it remained in their hands till 1878, when the Russians occupied it, and it became the capital of Bulgaria.

In the Second Great War Sofia was an important communication centre for Axis forces in the Balkans and was frequently bombed by Allied aircraft. The city was captured by Russian armies under Gen. Tolbukhin on Sept. 15, 1944. Pop. est. 401,300.

Softening of the Brain. Popular term applied to conditions in which degeneration of the brain tissue occurs, as in general paralysis of the insane or cerebral thrombosis or embolism. See Brain; Mental Disorder.

Soft Grass (*Holcus*). Small genus of grasses of the family Gramineae. They are natives of

Soft Grass. Flower panicles and leaves of Yorkshire Fog, a downy meadow grass

Europe, temperate Asia, and Africa. *Holcus lanatus*, known in Great Britain as Yorkshire Fog, is a tufted, downy, perennial meadowgrass, with leafy stems and flat, soft leaves. The flower panicle is somewhat open, and the spikelets two-flowered.

Holcus mollis has a creeping rootstock, and the plant is more slender. It grows in woods and waste places. The grass is of little economic value.

Softwoods. Term for the timber of various trees in which the wood is soft by comparison with that of the hardwoods. The distinction is loose, and some of the so-called hardwoods are comparatively "soft." Softwoods are used for building construction and similar work; they include timber from conifers such as pines, firs, hemlock, spruce, larch, as well as cedars. See Hardwood; Timber.

Sogdiana. Ancient division of Asia, now part of Soviet Central Asia, mostly in Uzbek S.S.R. The Jaxartes separated it from Scythia, the Oxus from Bactria. It was conquered by the Persians in the time of Cyrus, was invaded by Alexander the Great, and, later, came into the hands of the Seleucid dynasty.

Sogne Fjord. Longest of the Norwegian fjords. On the W. coast, it stretches inland 112 m., and has branch fjords such as the Lyster and Naero fjords. The walls rise sometimes to 5,000 ft.

Sogn-og-Fjordane. Fylke or co. of Norway, formerly called North Bergenhus. Bounded W. by the Atlantic and E. by Opland and Buskerud, it is penetrated by the Sogne Fjord. Area, 7,135 sq. m. Pop. 95,869.

Soham. Town of Cambridgeshire, England. It is 6 m. S.E. of Ely, with a rly. station. The chief building is S. Andrew's church, a cruciform building with several beautiful features. Dating in part from the 12th century, it has a Perpendicular tower. The grammar school was founded in 1687. In 630 a monastery was founded, but was destroyed in 890 by the Danes. Soham is the centre of a fruit-growing dist. Soham mere, now drained, was one of the large sheets of water in the fens. Pop. 5,000.

Soho. District of W. London. It lies within the area bounded by Oxford Street, Charing Cross Road, Shaftesbury Avenue, and Regent Street, and also in the S.W. corner of Tottenham Court Road. Dating from the first half of the 17th century, it was once part of the parish of St. Martin-in-the-Fields, is notable for its literary, artistic, and musical associations, foreign colony, foreign restaurants, and is the centre of the film trade in London. Soho Square, built 1681, was once a fashionable, and is now largely a commercial, centre. It contains a hospital for women, St. Patrick's R.C. church, 1893, and a French Protestant church, 1893. S. Anne's, in Wardour Street, founded 1685, with a curious tower dating from about 1802, was renovated 1896-97, and virtually destroyed in a German air raid, 1941; in the churchyard, now a recreation ground, are monuments to Hazlitt, and Theodore, king of Corsica. Consult *The Romance of Soho*, E. B. Chancellor, 1931; *Soho Square*, M. Goldsmith, 1947.

Sogne Fjord, Norway. View of this beautiful fjord near the branching Naero Fjord

Soho. Name of a ward, hill, public park, and rly. station of N.W. Birmingham. Another rly. station is Soho and Winson Green. Here was the foundry of Boulton and Watt, where gas was first used as an illuminant by Murdock in 1802-03.

Soignies. Town of Belgium. In the prov. of Hainault, it lies on the Senne, 22 m. by rly. S.W. of Brussels, and is a junction on the Brussels-Mons line. The main industry is quarrying blue limestone, and there is local agricultural commerce. The abbey church of S. Vincent, a 7th century monastic foundation, is a noteworthy example of early Romanesque work, and there is a 17th century town hall. In the woods to the S. of the town British and German cavalry first came into conflict in Aug., 1914. Pop. 11,000.

Soil. The surface layer of earth in which plants grow. It is more correctly called the soil mantle. It consists of (a) mineral matter derived from the rocks of the earth's crust (see Geology); (b) organic matter (humus) dark in colour and resulting from the decay of plant and animal material; (c) water (rainwater moving downwards and ground water often drawn upwards through the soil by evaporation from the surface in warm weather); and (d) air held in pores and crevices and passing down through cracks and other spaces between soil particles. The mineral part of the soil is derived from the materials of the crust either by direct incorporation when those materials are soft or unconsolidated (e.g. clays, sands), or after weathering when the rocks are hard (e.g. granite, limestone, sandstone), as a result of the action of natural agents such as air, seeping waters, and by plants, animals (including earthworms and insects), and by bacteria and substances produced by the life processes of living things.

The soil mantle thus contains and supplies the food (other than that derived from the air) plants need. The food is taken through roots from soil moisture, especially that clinging to the minute constituent particles of the soil and containing nutrients in solution. The soil mantle consists of a vast number of individual soils known to farmers and scientists. The differences between them are due to such factors as differences of climate, vegetation, geological nature and origin of mineral constituents, natural drainage, topography, colour, acidity or alkalin-

ity, texture, depth, and presence or absence of stones. By these factors, many of them interrelated, all soils are classified, first as they are known to the practical farmer on his own land and then by grouping according to recognizable zonal properties which may be valid over large areas on a continental scale (e.g. Tundra soils, Podzols of northern Europe, Chernozems or black soils of the European wheat-belt, Chestnut soils, Arid soils). Thus a farmer in England may distinguish individual soils of his farm by their sandy or clayey nature, their rapid or slow drying after rain, their steepness on hillsides or flatness in the plain, their dark or light colour, their acidity or alkalinity, their ease or difficulty in ploughing, their shallowness or depth, or their pebble-content, while the soil scientist may find large numbers of such individual soils with common characteristics imposed mainly by climate. Thus most of the soils of Great Britain show an upper foot or two depleted of colouring matter (mainly sesquioxide of iron) by seepage of rainwater rendered faintly acid by decaying vegetation. Much of this colouring matter is redeposited deeper down, and is frequently reddish brown. Such redistribution produces a horizonation, the appearance of which in a pit or other excavation is called the soil-profile. In addition to iron compounds, clay and humus are among other substances carried down and redeposited. When the processes are unrestrained (as in sandy materials) a horizon not far below the surface (about 8 ins. and downwards) becomes ashy-grey. Such a soil is called a podzol (Russian, ashy soil) and the process is podzolisation. The podzol zone includes the British Isles and runs east and west across Europe and Asia in a belt about 900 miles wide. Podzolisation depends upon downward displacement by water, and the presence of acid conditions (due to decaying plant debris) in the surface soil. These two conditions may be absent in the podzol zone and another (intrazonal) soil may occur, e.g. where limestone occurs in the surface soil all acids are neutralised, and podzolisation cannot take place; water-logging likewise inhibits podzol production.

The texture of a soil (upon which ease or difficulty of working depends) is determined by the proportions of sand, which is gritty, with particles visible to the naked eye; silt, smooth and not sticky with particles too small to be de-

tected by the unaided eye; and clay, which is sticky and plastic. When sand is dominant the soil is light; when clay and silt are dominant it is heavy. When sand, silt, and clay are evenly balanced so that the soil is neither gritty, entirely smooth, nor sticky it is called a loam. Frequently loams owe their composition to the mixing action of rivers which gather geological materials from the different rocks in their course. Thus soils in valleys, and especially on river terraces and hillsides where rivers formerly worked, are often loams which have been elevated by earth movement, and some of these are among the best soils, especially when well but not excessively drained. The suitability of soils for different crops is a complex matter, depending upon the natural characteristics which have been mentioned.

Well-drained soils of dark colour are warmest, especially those (in the northern hemisphere) facing south, but hollows which hold cold air at nights in spring (frost-pockets) are to be avoided for fruit crops liable to blossom damage.

Manures can be added to soils; so can lime when it is needed; but most of the natural properties of the soil cannot be changed on a farm scale. The selection of good soils is therefore important.

See Agriculture; Crops; Farm; Gardening; Manure; Rothamsted. Consult Physical Properties of Soils, R. Warrington, 1900; The Soil, A. D. Hall, 1903; Farm Soil and Its Improvement, Sir E. J. Russell, 1923; Good Soil, S. G. Brade-Birks, 1947.

S. G. Brade-Birks, D.Sc

Soil Erosion. Man-made denudation of the soil (average depth only 10 ins.) is of widespread occurrence and great antiquity. In modern times it affects particularly the continents of N. America and Africa, where excessive cultivation has removed the covering of grass and the cohesive influence of tree and bush roots and exposed the loose topsoil to wind and water; winds, rain, and streams wear this away, leaving bare rock exposed. The taking of too many crops of the same kind without proper rotation; failure to replace humus by the use of natural manures; tractor instead of horse ploughing; excessive grazing of native-owned cattle within tribal boundaries, are some of the causes of this grave problem which, in view of the increasing total population, threatens a world food shortage.

Soil Creep. Slow movements of the particles of soil down sloping surfaces. Gradual loosening of upper layers of soil is caused by weathering, and gravity aids in bringing loosened material from higher to lower levels.

Soissons. Town of France, in Aisne dept. It stands on the Aisne, 65 m. N.E. of Paris. The

Soissons arms

Romanesque-Gothic cathedral, composite in style, was founded in the 12th century. The great castellated abbey of S. Jean des Vignes is in ruins, the old abbey of Notre Dame is now a barracks, that of S. Léger an educational institution. The trade is mostly agricultural. Pop. 18,174.

Soissons is one of the oldest cities in France, and was the seat of the powerful tribe of the Suessones. Here, Clovis defeated Syagrius in 486, and ended Roman rule in France by establishing the kingdom of the Franks. The fortified key to the capital against invaders from the N., Soissons has suffered incessantly from warfare. Sacked by the Huguenots in 1567, in the war of 1814 it was twice taken and retaken by the allies; in 1870 the Germans took it.

In the First Great War it was occupied by the 1st British corps during the retreat from Mons in 1914. The Germans held it for a short time, but were driven out on Sept. 12, after which they bombarded it, ruining the cathedral and most of the buildings. On Dec. 28 a small force of French troops attacked the German front N. of Soissons with liquid air bombs, of which much was hoped; but these proved a failure. The Germans came back at the end of May, 1918, but were finally driven out by the French on Aug. 2. To rebuild the town, in 1922 a group of Canadian banks lent over £1,000,000 to the municipality. In 1928 a memorial to missing soldiers was unveiled at Soissons. The restored cathedral was reconsecrated in 1937.

In the Second Great War the town was entered by German troops June 9, 1940, and lay in the German occupied zone until liberated, Aug. 29, 1944, by units of the U.S. 1st army, who met with no opposition from the German rearguards. See Aisne Battles; Marne Battles.

Soke. Originally the right to hold a court of law. The land

subject to such jurisdiction was known as sokeland, and the men whose duty it was to attend the courts as sokemen or socmen. Later the word was used for the district under such jurisdiction, and, although its use disappeared with the end of the manorial system, it survives as a name in the soke of Peterborough (*q.v.*). See Manor; Socage.

Sokol (Czech, falcon). Czech patriotic and gymnastic organization. It was established in 1862 by Miroslav Tyrsh (1832-84) and Jiudrich Fügner (1822-65), and was democratic and fraternal. The movement spread rapidly, and Sokol unions were formed everywhere throughout Bohemia, including, after some years, special organizations for women. Though frowned on by the Austrian authorities and from time to time suppressed, the Sokols came to represent more and more the intense national spirit of the Czech people, especially of Czech youth. At the congress of 1920, held at Prague, one item was a mass drill by 12,000 men, and another a similar display by 12,000 women, participants coming from all over the world. Under the Communist regime set up in 1948 membership of the Sokol was made compulsory and attempts were made to change it into a Communist party institution. The special dress is a loose fawn jacket, often worn hussar-wise over a red shirt, and a round fawn cap bearing a Sokol feather. See Czechoslovakia illus. p. 2539.

Sokolovsky, VASILII DANLOVICH (b. 1899). Russian soldier. Son of a Georgian peasant, he joined the Red Army as a private in 1919 and saw active service in the Russo-Polish war, being commissioned in 1922. He achieved prominence in the Second Great

V. Sokolovsky,
Russian soldier

War as commander of the Soviet forces which recaptured Vyazma from the Germans on March 12, 1943. Appointed to a command in the 1st Ukrainian army under Marshal Konev (to whom he became chief of staff in Jan. 1945), he led the troops which liberated S. Poland, taking Kielce Jan. 15, Cracow Jan. 19, 1945, and advanced through German Silesia to cross the Oder in March. In 1946 Sokolovsky was promoted marshal

and made c.-in-c. of Soviet occupying forces in Germany and Soviet member of the Allied control council in Berlin. In that capacity he enforced in 1948 a blockade of the Western powers' sectors in Berlin. In 1949 he was appointed first deputy minister of the armed forces of the U.S.S.R. He was created hon. K.B.E. in 1945.

Sokoto. Prov. and city of N. Nigeria. The province has been administered as a native state of Nigeria since 1903. Its history is of considerable antiquity. Under Moorish, Berber, and Arab influences the Hausa embraced Mahomedanism, and developed large cities and a considerable trade. Prior to the establishment of the Fula power in the early part of the 19th century the country, as a whole, was subject to various rulers. Under the Fula regime the sultan of Sokoto exercised control over the Hausa states, his overlordship extending to Bornu on the E., and S. to the Benue, and even at one time to Adamawa. The states within this kingdom were known variously as the Sokoto or Fula empire, and are generally alluded to as Hausaland.

The city of Sokoto was visited by Clapperton in 1823 and 1827, and by Barth in 1851-55. From 1901 the submission and annexation by the British of Yola, Bornu, Kano, and Katsena took place, and Sokoto was occupied on March 22, 1903.

Sokoto prov. consists of the Gando, Argungu, and Ilo divisions, as well as Sokoto proper. It is bounded N. by the French Niger territories, W. by Dahomé, E. and S. by other northern provs. of Nigeria. The chief river is the Gublin Kebbi, or Sokoto, which flows into the Niger. Area, 35,400 sq. m. Pop. approx. 1,300,000. A portion of the former independent sultanate lies within French territory.

Sokotra or **SOCOTRA**. Island of the Indian Ocean. It has been a British protectorate by agreement with the sultan of Keshin since 1876, and is administered from Aden. Situated 135 m. E.N.E. of Cape Guardafui, the horn of Africa, in the Arabian Sea at the entrance to the Gulf of Aden, it measures 72 m. by 22 m., and rises in the middle to the Haghier Range, 4,600 ft., with well-watered valleys densely clothed in vegetation, which yields frankincense and myrrh. Tamarida, the capital, is on the N. coast. Butter (ghee), aloes, and incense are exported; goats and cows are

reared in large numbers. The Mahomedan population of mixed Arab and Hindu origin lives on the coasts, the Sokotri among the mountains. Area 1,382 sq. m. Pop. 12,000. See Africa, map.

Sol. Peruvian currency unit, nominally of gold, equivalent to one-tenth of the obsolete Peruvian libra, or pound. It is divided into 100 centavos, and was until 1935 coined in silver pieces, but since then has been in paper form.

Sol. Term used to indicate a colloidal solution. Where the dispersion medium is water the solution is called a hydrosol. See Colloid.

Solanaceae. Large and important family of shrubs, herbs, and a few trees. With narcotic or tonic properties, they are natives chiefly of the warmer regions. The family includes such valuable plants as the potato (*Solanum tuberosum*), the tomato (*S. lycopersicum*), chillies (*Capicum*), tobacco (*Nicotiana* species), belladonna (*Atropa belladonna*), and henbane (*Hyoscyamus niger*).

Solano (Span., from Lat. *solanus*, easterly). Cloudy, rain-bearing E. wind experienced in E. Spain. It is probably an ordinary eddy in the main air currents of the South Westerlies, not to be confused with the leveche (*q.v.*).

Solar Constant. Unit value of the sun's energy radiation. It is the theoretical amount of energy which a square centimetre of the earth's surface would receive per minute if exposed perpendicularly to the sun's rays. An assumption is made that no heat is absorbed by the atmosphere. According to observations continued over a long period and in both hemispheres by C. G. Abbot of the Smithsonian astrophysical observatory, this unit of radiation is subject to long-period and short-period variations. In the last recorded results the fluctuations ranged over about 2 p.c. between the extreme limits of 1.91 calories per square centimetre per minute to 1.95 calories. Measurements of the sun's heat are made by a bolometer (*q.v.*).

Solar Cycle. In the Julian calendar, a period for finding the particular day of the week corresponding to a given day of the year. The period is one of 28 years. It enables the dominical letter (*q.v.*) of the year to be found. See Calendar.

Solarimeter. Instrument, designed by L. Gorczynski, for determining the intensity of solar radiation. It consists of a sensitive thermopile of low thermal

capacity and resistance, connected to a millivoltmeter or milliammeter; when a continuous record is obtained, the combination is known as a solariograph. Solarimeters can determine the intensity of the radiation from the sun and/or the sky falling upon a horizontal surface. If records of the sun radiation on a surface perpendicular to the solar beam are required, the thermopile must be mounted on a suitable clockwork or electrically driven heliostat. See Bolometer.

Solario, ANDREA (c. 1460–c. 1530). Italian painter of the Lombard school. Born at Milan, he probably studied there. In 1490 he accompanied his brother Cristoforo, a sculptor, known as Gobbo, to Venice, and Venetian as well as Lombard and Flemish influence is visible in his work. About 1507 he went to France to decorate the Château Gaillon for the Cardinal d'Amboise. He died at Pavia. There are many paintings by him at Milan, and two portraits in the National Gallery, London.

Solar Myth. In mythology, the personification of the sun. Thus the twelve labours of Hercules (*q.v.*) have been explained by mythologists as an allegorical representation of the sun passing through the twelve signs of the zodiac. See Mythology.

Solar Plexus. Network of nerves situated in the abdomen behind the stomach. It surrounds the coeliac axis, the thick, short artery which is a branch of the aorta. The solar plexus contains several ganglia or collections of nerve cells, and from it nerve filaments go to all the abdominal viscera. A blow on the pit of the stomach is the so-called solar plexus blow in boxing, and temporarily paralyses the sensitive network of nerves.

Solar System. Assemblage of bodies controlled by the attraction of the sun. It includes the planets and their satellites, asteroids, comets, and meteor swarms. The planets are all separately described in this work, as are other members of the system. The span of the solar system, counting Pluto as its farthest limit, is over 7,000 million miles, though comets go out beyond Pluto. On a scale giving Pluto's orbit a radius of one mile, the nearest star would be 6,900 miles away. The distances separating the planets conform to a rough empirical law known as Bode's law (*q.v.*). All the planets move round the sun in the same direction, as do the asteroids and

the majority of the satellites. Comets move in either direction round the sun. The origin of the solar system has been accounted for by the nebular hypothesis (*q.v.*) or by various tidal theories; but no explanation yet put forward is generally accepted. See Planet; Sun.

Solar Time. Time as measured by the diurnal motion of the true sun (apparent solar time) or of a fictitious mean sun moving uniformly (mean solar time). The unit, the day, is the time taken for one complete rotation of the earth to bring the sun back to the same direction in the sky. Because the sun appears to move backwards among the stars on account of the earth's orbital motion, any given interval of solar time is longer than the corresponding interval of sidereal time (*q.v.*) in the ratio $366\frac{1}{4}:365\frac{1}{2}$. Apparent solar time kept by the sundial is not quite uniform from day to day; mean solar time kept by ordinary clocks may differ from apparent solar time by as much as 16 mins. See Equation of Time.

Soldering. The joining of metals by an adherent film of a fusible alloy melting at a lower temperature than the fusing point of the work to be soldered. It is distinguished from welding (*q.v.*) by the fact that in the latter process the work to be joined is fused, though additional metal of a similar sort may be added for strength or for filling. In soft soldering, as used for domestic tinsmith work, the solder is an alloy of lead and tin with a small proportion of antimony (tin, 40–50 p.c.). Plumber's solder, used for wiped joints to lead pipes, has about 30 p.c. tin; a solder for electrical work, having high conductivity and great strength, may contain 95 p.c. tin. Melting points range from about 200° C. upwards. Hard soldering is used for work which has to withstand higher temperatures. Here the solder may be a spelter of brass, or one containing silver and copper in varying proportions (silver-solder). The name brazing was applied to the process using spelter as the joining alloy, but is loosely given to hard soldering in general. Melting points for hard solder are from about 850° C.

Requisites for soldering are that the faces of the joint shall be rendered chemically clean, and oxidation prevented, by use of a suitable flux; that the work to be joined shall be raised to a temperature at which the solder will melt

and run; and that the parts to be joined shall be held immovably in the correct position until the solder has cooled and set.

Fluxes used for soft soldering include resin (on tinplate or tinned surfaces); killed Spirit of Salt (*q.v.*), or a solution of zinc chloride and various proprietary solutions or pastes; dilute hydrochloric acid (for soldering zinc). Various non-acid fluxes come into electrical work and other jobs where danger of later corrosion must be avoided. The heat required may be applied by a soldering bit heated over a gas flame; or by an electrically heated bit. Joints may be sweated together by first tinning them (applying a coating of solder), then exposing to heat from a blowlamp, or in a kind of oven, while they are held immovably.

Hard Soldering

Hard soldering requires the heat of a blowpipe, gas torch, or brazing lamp; the temp. varies according to the composition of the solder and that of the metal to be soldered. Borax is a common flux. In "lead-burning," lead pipes, etc., are joined by fusing the lead with an oxy-acetylene torch. A common application of hard soldering is in the capillary process for joining copper pipes and copper-alloy fittings. The parts to be joined are cleaned, and a thin liner of silver solder is placed around between them; on the application of heat by a gas torch the solder melts and flows by capillary attraction around the joint, and unites the parts. In a similar process steel parts (*e.g.* for motor vehicle accessories) are joined by a thin disk of copper or a piece of copper foil placed between them, the work being heated electrically in an oven in the presence of hydrogen, which prevents oxidation.

Soldier (Lat. *solidus*, piece of money). General term applied to one engaged on military service, the equivalent on sea being sailor. Soldiers are sometimes spoken of collectively as soldiery. Adjectives formed from the word, *e.g.* soldierly, suggest bravery and discipline. Soldiers have almost everywhere been treated as a class apart and usually live under a special code of laws and special regulations. See Army; Barracks; Martial Law; Mercenary; War.

Soldiers', Sailors' and Air-men's Families Association. British charitable organization. Founded in 1885 by Sir James Gildea, it had as its object

the relief of distress among the dependents of servicemen. Its work first became national in scope in the S. African War (1899-1902). In 1916 a statutory committee was established, since when the association has worked in cooperation with the ministry of Pensions. In the Second Great War most servicemen voluntarily contributed a regular quarterly sum from their pay to its funds. The headquarters of the association are at 23, Queen Anne's Gate, London, S.W.1.

Soldiers Three. Volume of seven short stories by Rudyard Kipling. "Setting forth certain passages in the lives and adventures of Privates Terence Mulvane, Stanley Ortheris, and John Learoyd," respectively an Irishman, a Cockney, and a Yorkshireman, it was originally published in 1888. Further stories of the same three were included in other collections of stories, e.g. *Life's Handicap*, *Many Inventions*.

Sole (Lat. *solea*, a sandal). Under part of a boot or shoe, that which comes into contact with the ground. Usually made of hard leather to withstand wear and damp, the sole is often protected by nails, tips of metal, or a layer of rubber to prolong its life. *See Boots and Shoes*.

Sole (*Solea solea*). Flat fish. One of the important food fishes, it is usually about a foot long, and

Sole. Marine flat fish, esteemed for the table

is dark brown on the right or upper side, with greyish white beneath. For firmness of flesh and delicacy of flavour it is regarded as one of the choicest of marine fish, and it always commands a high price in the markets. It is often called the Dover sole to distinguish it from the inferior Limande or lemon sole. It is taken in the trawl, and is found on sandy shores from the Mediterranean to N. Denmark.

Sole Bay, BATTLE OF. Naval encounter in the third Dutch War, May 28, 1672. The English and French fleets, numbering some 100 vessels, under the duke of York and the count d'Estrées, had proceeded from Portsmouth to the North Sea and put into Southwold or Sole Bay to water and refit.

While there the Dutch admiral, De Ruyter, with over 70 vessels, attacked from the N.E., and taking advantage of the sailing dispositions which separated the French and English fleets, concentrated on the English squadron which formed the centre of the allied line. Upon this the French bore away to the S., the brunt of the battle falling on the blue squadron under the earl of Sandwich, whose flagship was blown up. The fight lasted until the remainder of the English fleet came up, the Dutch withdrawing at nightfall. *See* Sandwich, 1st Earl of.

Solecism. Grammatical error, or other offence against the rules of language; by extension, any offence against the conventions of good breeding. It is from the Gr. *solokismos*, used in the same senses, said to be derived from Soli, a town of Cilicia, where the Attic colonists spoke a corrupt Greek.

Solemn League and Covenant. Alliance made in 1643 between the English parliamentarians and the Scots. To counteract the substantial help rendered to Charles I by the Irish, Vane, on behalf of the parliament, effected a contract with Scotland, agreeing, in return for the aid of a Scottish army of 20,000 men, that England should accept the Presbyterian form of church government. The treaty was signed Sept. 25, 1643, and the Covenant was subscribed by large numbers of the English clergy. This League and Covenant must be distinguished from the Scottish National Covenant of 1638. *See* Covenanters.

Solenhofen Stone. In geology, name given to a fine-grained, smooth-textured limestone, derived mainly from Solenhofen in Bavaria. The stone is found in beds of 50 or more ft. thick, is a deposit of the Upper Jurassic, and is particularly rich in fossils, notably those of pterodactyls and the archaeopteryx (*q.v.*). It is unequalled as a lithographic stone. *See* Fossils; Lithography; Rock.

Solenoid. In electrical engineering, a helical coil of insulated wire through which a current is passed. The magnetic field thus set up is used to attract a loose

iron core, or plunger, pulling it up inside the coil. A solenoid is not very effective over large travels, but for short distances considerable power can be developed, pulls up to several thousand lb. over strokes of a few ins. being possible. It is used for the operation of magnetic brakes and for closing large circuit breakers, and in smaller sizes used for relays and contactors.

Solent. Western end of the channel separating the Isle of Wight from Hampshire, England. Extending from Cowes to the Needles, it is 17 m. long and varies in breadth from 2 m. to 4 m. Secure anchorage is found in the Solent, which is a favourite yachting water. *See* Hurst Castle.

Solesmes. Small town of France. It stands on the Sarthe, in the dept. of Sarthe, 18 m. from La Flèche. It is famous for its abbey. The abbey buildings are modern, save only the church, which contains two famous pieces of sculpture. There was a religious house at Solesmes in the Middle Ages, but this fell into decay. A Benedictine house, founded in 1831, existed until 1901. *Pron.* Sô-laym.

Solesmes. Town of France, situated on the river Selle, 12 m. E. of Cambrai, in the dept. of Nord. Its chief industry is the manufacture of linen. Pop. 7,000.

Sole Trader. Person in business on his (or her) own account, without a partner and not as a shareholder of a company, and thus entirely responsible for running the business and for its liabilities, and entitled to receive all profits. This form of business is common among shopkeepers, agents, professional men, farmers, and among manufacturers whose product does not require extensive (and therefore expensive) machinery or premises.

Soleure. French name for a canton and town of Switzerland, also known by the German name Solothurn (*q.v.*).

Solfatara (Ital., from *solfo*, sulphur). Type of dormant volcano, which emits only gases, especially sulphuretted hydrogen, carbon dioxide, and hydrochloric acid. The French equivalent is *soufrière*. Solfataras are common in the volcanic regions of Italy, the best known being that near Pozzuoli (*q.v.*), the last eruption of which occurred in 1198. Its vapours are used for the cure of cutaneous diseases. The Soufrière in St. Vincent, W. Indies, is a volcano in the solfatara stage. *See* Volcano.

Solfeggio. Vocal exercise utilising Guido d'Arezzo's solmisation syllables Do, Re, Mi, Fa, Sol, La, Si, Do. The first syllable was originally Ut, d'Arezzo's words being the initial syllables of a hymn to S. John. This system is that of a fixed Do, not to be confounded with the Tonic Sol Fa (*q.v.*) method.

Solferino. Village of Italy in the prov. of Verona. It is 73 m. E. of Milan on the hill bordering the S. shore of Lake Garda.

The battle of Solferino, fought June 24, 1859, was a victory of the French over the Austrians. The battles of Montebello, Palestro, and Magenta had effectually weakened the Austrian hold on Lombardy, and Victor Emmanuel II and Napoleon III passed through Milan and marched towards the Mincio, which formed one side of the Quadrilateral (*q.v.*). Here they met the Austrian army of 140,000 men which had taken up its position round Solferino. The Piedmontese were engaged at San Martino when Napoleon arrived before Solferino and took command of the French. The attack on Solferino was brilliantly executed by the French, while the generalship of MacMahon and Niel gradually overcome the stubborn resistance of the Austrians, who finally retreated. The French losses were 12,000; the Austrian, 20-25,000.

Soli (Gr. *Soloi*). In ancient geography, a town of Cilicia, in Asia Minor. A flourishing colony of Rhodes, it was destroyed by Tigranes, king of Armenia, who removed the inhabitants to Tigranocerta. Restored by Pompey, who repopled it with pirates, it was afterwards called Pompeiopolis.

Solicitor (Lat. *solicitare*, to ask earnestly). Term used in England and Scotland for a member of the lower branch of the legal profession. Professionally a solicitor is an officer of the supreme court.

Solicitors have no right to appear as advocates in the high court, or the supreme court, except before a judge sitting in chambers; but they may be advocates in coroners', police, and county courts, and sometimes at quarter sessions. In England the Law Society is the registrar of solicitors, prescribes and conducts their examinations, and exercises discipline over them subject to the judges of the high court. The time of apprenticeship is from 3 to 5 years according to education. A solicitor who commits any crime, or is guilty of any misconduct, such as cheating a client, may be complained of to the Law Society (Chancery Lane,

London), which by disciplinary committee holds an inquiry into the charges. If a solicitor is found guilty the committee may suspend him for a limited period or strike him off the roll. The solicitor can appeal to the high court.

A solicitor who has once undertaken a lawsuit cannot drop it so long as the client demands that he shall go on, and supplies him with funds for the purpose. Unlike a barrister, a solicitor may sue for his fees; but before doing so must deliver to the client a signed bill, and then wait a month. This delay is to enable the client to have the bill taxed. (*See Taxation of Costs.*) But a solicitor may, before undertaking any business, stipulate for a special rate of payment, or a lump sum, and can enforce the contract, provided that the client agrees in writing under his hand. Unlike a barrister, a solicitor is liable to his client in damages for negligence. A solicitor has a lien on his client's papers in his hands for his costs. An effort to bring about fusion between barristers and solicitors was defeated by members of the Law Society in 1919. By the Sex Disqualification (Removal) Act, 1919, women became eligible as solicitors. *See Barrister; Law Society.*

Solicitor-General. In England one of the law officers of the crown. He ranks second to the attorney-general, and the duties of the two are to advise the various depts. of the govt. on legal matters. The solicitor-general is usually a member of parliament, but not of the cabinet, and must be a barrister of standing; his salary in 1946 was raised to £7,000, any fees payable being set off against it. He was first appointed in the time of Edward IV, and following the English precedent there are now solicitors-general for Scotland, Canada, Australia, S. Africa, and other parts of the Empire. In the U.K. and the self-governing dominions this official is a party politician, *i.e.* he leaves office with his party.

Solid. In mathematics, a three-dimensional figure occupying space and having length, breadth, and thickness. Physically the solid state is one of the three states of matter, which Sir Oliver Lodge defined as having form and volume in contrast to a liquid which has volume without form. An ideal solid is one which completely returns to its original shape after the removal of the stress to which it has been subjected. Some solids exhibit different properties

in different directions, *e.g.* wood has a different elastic modulus in the direction of the grain than across it. A solid may be distinguished by various physical properties, *e.g.* coefficient of expansion, hardness, ductility, etc.

The solid state is thus the state of matter in which the molecules are considered to be vibrating with a very small amplitude about an equilibrium position. As the temperature is raised, the average amplitude of the vibrations increases, so that the substance expands against the attractive forces between the molecules. At a certain temperature the vibrations become sufficiently intense for any particular molecule to break away from its neighbours and to come under the influence of another group. At this stage the melting point of the solid will have been reached.

The attractive forces between the molecules is known as the force of cohesion, and is the agency which maintains the shape of the body. A solid resists compression, indicating the presence of a repulsive force which becomes operative as the molecules get closer together.

Solidifying Point. In physics, the temperature at which a cooling liquid begins to solidify. The temperature remains unaltered until solidification is complete. Experimental observation shows that the solidifying point of a substance is identical with its melting point.

Solid Solution. A solid phase in alloy systems whose composition is variable between certain limits. Solid solution may be based on either a pure metal or an intermediate constituent, the solute atoms being incorporated into the crystal lattice of the solvent metal or constituent. *See Lattice; Super-lattice.*

Solidus. Roman gold coin. It was struck to replace the aureus, and was also known as the bezant, or Byzantine solidus. This coin was a standard in the Eastern Empire till 1453. The solidus was used in Great Britain until the 7th cent., and was adopted by the Franks until the time of Pepin. The silver solidus was valued at one-twentieth of a libra and was worth twelve denarii. The Italian *soldo* (now obsolete) and French *sou* are deviations from solidus, which has given us the s in £ s. d. (*libra, solidus, denarius*).

Solifluxion. In geology, a process of erosion encountered in sub-arctic regions. The surface

soil, permanently frozen at depth, becomes saturated with water from melting snow. The mud so formed cannot lose its water by percolation downwards, and so the whole mass flows laterally downhill, and spreads out on low level ground. Coombe Rock was probably a product of solifluxion when the ice sheets extended as far S. as the Chiltern Hills. *See* Ice Age.

Solihull. Urban district and market town of Warwickshire, England. It is 6 m. S.E. of Birmingham on the rly. At the grammar school, founded in the 14th century, the poet Shenstone was a pupil. The church is Early English and Perpendicular restored. Solihull Hall dates from the 14th century, and there is a small town hall. Solihull gives its name to a co. constituency. Market day, Thurs. Pop. of dist., 65,500.

Solingen. Town of W. Germany, in N. Rhine-Westphalia. It is situated near the Wupper, 11 m. E.S.E. of Düsseldorf. Standing on the Westphalian coalfield, it is chiefly noted for its cutlery, while steel articles of almost every other kind are also produced. Solingen was made a town in 1374, but before that time its sword-blades were noted. An important armament centre during the Second Great War, the town was heavily damaged by bombs. After the war it came within the British zone of occupation. Pop. 145,000.

Solitaire. Name of a game played by one person. In the U.S.A. it denotes a patience card game; in the U.K. a game in which marbles placed in round hollows on a board are "jumped" and removed as in draughts, in such order that the last remaining marble is left in the central hollow. This game is said to date from the 17th century. The word also denotes a precious stone when set by itself, e.g. in a ring, and a kind of loose necktie fashionable for men in the 18th century.

Solitaire (*Pezophaps solitaria*). Large flightless bird of the pigeon family. Formerly abundant in the island of Rodriguez, it is now extinct. It was about the size of a turkey, but longer in the neck and legs; and the plumage was brownish grey. The wings were too small to serve the purposes of flight.

Solitary Confinement. Imprisonment and isolation of criminal and other offenders. In England, under the Criminal Law Consolidation Acts, 1861, many offences were punishable with solitary confinement at the discretion

of the court; and the Prison Act, 1865, made the separate system the normal prison discipline. Prisoners left their cells only for chapel and exercise. The Prison Act, 1898, virtually abolished the system, but confinement to cell for 3 days survived as a punishment for breach of prison discipline until 1949, when it became permissible only for refractory or violent prisoners.

Sollas, WILLIAM JOHNSON (1849-1936). British geologist. Born at Birmingham, May 30, 1849, and educated at the City of London school, the Royal School of Mines, and St. John's College, Cambridge. He was a university extension lecturer, 1873-78. He was professor of geology and zoology at University College, Bristol, 1880-83; of geology and mineralogy at Dublin until 1897; thereafter of geology and palaeontology at Oxford. President of the Geological Society, 1908-09, he wrote books on geology, mineralogy, and zoology, including *The Age of the Earth*, 1905; *Ancient Hunters and Their Modern Representatives*, 1911. He died Oct. 20, 1936.

Sollum. Gulf and small port in the extreme W. of Egypt. The approach to Sollum by land is along the coast through Mersa Matruh, to which point a rly. has been constructed from Alexandria. The port of Sollum is of small commercial value, but significant in connexion with the control of the Senussi (*q.v.*) of the interior. During the First Great War Sollum was occupied by the Senussi, but was retaken by the British, and used as their principal base in operations against the tribesmen.

In the Second Great War the Italian army occupied Sollum, Sept. 13, 1940, the British garrison having withdrawn. They were driven out on Dec. 16, during Gen. Wavell's advance into Cyrenaica; but the port fell to Rommel's forces, April 14, 1941. During 1941-42 it changed hands no fewer than five times, the final occasion being its occupation by the British 8th army, Nov. 10, 1942, after their victory at Alamein.

Solo (It., alone). (1) In music, a part for a single voice or instrument, whether accompanied or not. The term is used rather loosely. A pianoforte piece, though consisting of many parts, is called a solo, but a string quartet, though performed by soloists, is not. (2) The solo organ is an extra manual found in large instruments, on it being placed stops suitable

for solo effects, i.e. played in single notes by one hand, while the harmonic accompaniment is supplied by the other hand and the feet. It is as a rule placed above the swell organ. *See* Singing.

Solo or **SOLO WHIST.** Popular card game. It is a development of whist (*q.v.*). The principal divergence from the parent game is that each player acts independently, except in one call. There are four players, the cards hold the same values as in whist, the players out for deal, and the dealer first gives cards to the player on his left, distributing three cards at a time to each player until the last round, when the remaining four cards are dealt singly, the last one being faced for trumps. The player on dealer's left has first call, and the calls are as follows:

(1) *Proposal and acceptance.* If a player thinks he can make four tricks, he "proposes" on the chance that another player may be able to do the same and so "accept," thus contracting to make between them eight tricks in order to win what is commonly called a "prop and cop." This is the only instance in solo where two players act as partners.

(2) *Solo.* A player undertakes to make five tricks; all the others doing their best to prevent him.

(3) *Misère.* A player backs himself to lose every trick.

(4) *Abundance.* The caller undertakes to make nine tricks, choosing his own trump suit. A player calling abundance on the trump suit originally turned up takes precedence.

(5) *Misère ouverte.* The same as misère, except that after the first trick the caller must expose his hand upon the table; but he may play any card he chooses consistent with the rules.

(6) *Abundance déclarée.* All thirteen tricks must be made, the caller naming his own trumps and having the right to lead.

The call rests with the player calling the highest; should all pass, the original caller has another opportunity to go solo, as also if his proposal was not accepted; but should he refuse there is a fresh deal. The player on dealer's left leads first. *See* Whist.

Solo, BENGAWAN, OR SAMBAYA. River of Java. It rises among the mts. near the S. coast, and flows with many meanders over the lowlands, to reach the sea by two mouths opposite the island of Madura, after a course of 310 m. The lower portion is used for shipping.

The above illustrations, which are virtually self-explanatory, show the true features of the solar system. On the left the Planets are drawn to scale in relation to a segment of the Sun, which is in white. On the right the elliptical orbits of the Comets are shown by dotted lines. Within the white rectangle (right) a section of the orbits of each of the four giant Planets is specially marked to show how far the Planets travel in one year, the section for Jupiter can be recognized readily as about one-eighth of the orbit, Jupiter taking nearly twelve years for each revolution. The orbit of Pluto has been omitted as it is not concentric, overlapping that of Neptune, and as a plan of this scale, not enough of it would appear to give any helpful indication.

THE SOLAR SYSTEM; THE SUN, THE PLANETS AND THEIR SATELLITES, AND THE COMETS

Sologne (anc. *Secalaunia*; from Lat. *secale*, rye). District of central France, sometimes called La Sologne. It lies between the Loire on the N. and the Cher on the S., and is a flat, marshy district comprising much of the three departments of Cher, Loir-et-Cher, and Loiret. About 1860 much of it was planted with pine trees, and many of its ponds were drained; this rendered it less unhealthy, while it was further improved by new roads. It is now a farming and sporting district, through which the Cosson, the Beuvron, and the Sauldre flow. It covers about 2,000 sq. m. Before 1685 it was prosperous and thickly peopled, but it suffered when the Huguenots left the district after the revocation of the edict of Nantes in 1685.

Solomon (d. c. 937 B.C.). Third king of Israel. Also named Jedidiah, he was a younger son of David, by his wife Bathsheba. A youth at his father's death, about 969 B.C., Solomon had already received assurance of the succession, on the attempt of his half-brother Adonijah to secure it, and after his accession sanctioned the execution of his rival and of Joab. Solomon waged few wars, but consolidated his power by alliances, marrying a daughter of Pharaoh, perhaps the last of the Tanite dynasty, a daughter of Hiram, king of Tyre, and other foreign princesses.

His relations with Phoenicia and Egypt enabled him to share in the traffic with Ophir and other distant countries, and he accumulated wealth which made his reign proverbial for splendour, though his vast harem and extravagant display exhausted the national resources. For his great buildings at Jerusalem, the temple, the palace, the fortress Millo, etc., Solomon employed forced labour, thus provoking the discontent which resulted on his death in the secession of the N. tribes.

He was renowned for his wisdom as a judge and an author of songs and proverbs, as well as of discourses on plants and animals; but although parts of the collection known as Proverbs may be his, the other extant works attributed to him, viz. Canticles, Ecclesiastes, Wisdom, and the Psalms of Solomon, were composed in later ages. In Jewish and Mahomedan legend Solomon is a great magician, the controller of armies of demons. The account of Solomon in 2 Chron. 1-9, representing the late priestly point of view, is more favourable than that given in 1 Kings 1-11.

See Miserere; Temple. Consult King Solomon, F. Thieburger, 1948.

Solomon. Professional name of Solomon Cutner (b. 1902), British pianist. This London boy played

Solomon,
British pianist

at a Queen's Hall concert at the age of 8; studied in Paris; and reappeared as a soloist at Wigmore Hall in 1921. He joined the ranks of leading British exponents, excelled in Brahms and Beethoven, and was associated with the concerto of Arthur Bliss. Among repeated foreign tours was his remarkable effort of giving 30 concerts to troops between Gibraltar and Cairo in one month in 1943. Solomon was made C.B.E. in 1946.

Solomon, SOLOMON JOSEPH (1860-1927). British artist. Born in London, Sept. 16, 1860, he studied at Heatherley's and the R.A. schools, and in Munich and Paris. A vigorous painter of historical subjects and portraits, he was elected A.R.A. in 1896, R.A. in 1908, and became president of the Royal Society of British Artists, 1918. During the First Great War he was the first to recognize the usefulness of camouflage as a means of defence, and introduced it to the British army, inventing in 1916 the network which formed the basis of military camouflage. He wrote *Strategic Camouflage*, 1920. He died July 27, 1927. Consult *Life*, O. S. Phillips, 1933.

Solomon Islands. Archipelago in Melanesia, South Seas. Of the seven chief islands, Bougainville is administered by Australia; Choiseul, New Georgia, Ysabel, Guadalcanal, Malaita, and San Cristoval form a British protectorate with a resident commissioner on Guadalcanal. There are also numerous smaller islands, among them Buka, the Treasury Is., Vella Lavella, Kolombangara, Shortland, Rendova, and the Russell Is. All are volcanic and mountainous; their forests produce ebony and sandalwood, other principal products being rubber, copra, gold, mother-of-pearl, and tropical fruits. Malaria is prevalent.

After the first discovery of the Solomons by the Spaniard Mendana, who named them, in 1568, later explorers sought them in vain until Carteret in 1767 and Bougainville in 1768 found them again.

Attempts in the 19th century to colonise and Christianise the group were not welcomed by the islanders, who murdered a number of white men, missionaries and others. In 1893 Ysabel, Choiseul, and Bougainville fell to Germany by treaty, and the other islands became a British protectorate. Ysabel and Choiseul were exchanged by Germany for territory in Samoa and added to the protectorate in 1900. After the First Great War Bougainville was placed under Australian mandate by the League of Nations, and became part of the territory of New Guinea. The group has an area of 16,500 sq. m. Pop. 145,000.

SECOND GREAT WAR. The Japanese landed on Bougainville at Kieta on April 6, 1942, and the whole group was soon in their possession, for the Solomon Is. were not fortified. Allied reconquest began when, on Aug. 7, U.S. Marines landed on Guadalcanal (g.v.). Japanese resistance was determined, and it took the Americans until Feb. 10, 1943, to get control of that island. On Feb. 21 U.S. Marines seized Banika and Pavuvu in the Russell Is., evacuated by the Japanese before the Allies landed. Marines landed at Segi Point, on New Georgia, on June 20, and on July 1 took Viru. A landing on Rendova on June 30 was followed by further landings of U.S. and N.Z. forces on New Georgia; it was Aug. 28 before Japanese resistance was overcome. On Aug. 15, N.Z. troops with U.S. support landed on Vella Lavella; Kolombangara was pounded from land, sea, and air; between Oct. 1 and 9 the Japanese evacuated both these islands. On Oct. 27 Allied troops seized the Treasury Is.; on the 28th U.S. Marines landed on Choiseul, evacuating it, however, on Nov. 12, when the Japanese moved their troops from there to Bougainville. U.S. Marines landed in the Empress Augusta Bay, Bougainville, on Nov. 1, and seized Cape Torokina and a small area in the vicinity. These conquests rendered the remaining Japanese in the Solomons group innocuous to the Allies; but fighting was still continuing on Bougainville when Japan surrendered, Aug., 1945. Australia had taken over responsibility for operations in the group in Nov., 1944, and it was to Lt.-Gen. Savage, commanding the Australian 2nd corps, that Lt.-Gen. Kanda, Japanese commander, surrendered at Torokina, Sept. 8, 1945, the 20,000 men still under his command.

Solomon's Seal (*Polygonatum multiflorum*). Perennial herb of the family Liliaceae. A native of Europe and N. Asia, it has a thick, branched, creeping rootstock, and leafy arching stems. The large oblong leaves form two rows, and the greenish-white, tubular, bell-

main ridge of the Jura Mts. and part of the Aar valley. Farming occupies many of the inhabitants, most of whom are German-speaking Roman Catholics. Industries include watchmaking (Grenchau) and machine making (Olten). Its area is 302 sq. m. Pop. 144,198.

Solothurn or **SOL-**

EURE. City of Switzerland, capital of the canton of the same name. It is a walled city on the Aar, 20 m. N.N.E. of Berne, and is an important rly. junction. The 18th century cathedral of S. Ours, built on the site of an earlier church dating from 1050, is the cathedral church of the bishopric of Basel. The town hall, the arsenal, and a 13th century clock-tower with a 16th century clock are notable buildings; the museum contains an interesting geological collection from the Jura Mts. Quarrying and watch-making are the chief industries. The town was a free imperial city in 1218, and had extended its authority over the land comprised in the present canton before 1481. Pop. 15,414.

Solovetsk. Group of islands in the White Sea at the entrance to the Gulf of Omega. On the largest of these, Solovetsk, there is a famous monastery, one of the wealthiest in Russia, founded in 1429. The stone buildings were erected in the reign of Ivan the Terrible by Abbot Philip, whose remains rest in the cathedral of the Transfiguration.

Solstice (Lat. *sol*, sun; *sistere*, to stop). Point in the ecliptic at which the limit of extreme N. or S. declination is reached by the sun. At such points the sun appears to stand still. The summer solstice is June 21 and the winter Dec. 21, coinciding approximately with the longest and shortest days. See Equinox. *Pron.* solstiss.

Solution (Lat. *solvere*, to dissolve). In chemistry, name given to certain types of mixtures of two or more substances. These substances may be solid, liquid, or gaseous, and the mixture so formed is homogeneous.

The commonest forms of solutions are liquid. Gases dissolve in liquids according to Henry's law, which states that the mass of any gas absorbed by a liquid is proportional to the pressure of the gas, and decreases as the temperature increases. The law only applies to gases which have a low solubility. With high solubility

the probability is that a chemical action takes place which apparently invalidates the law. The decrease of solubility with pressure is seen in the familiar example of opening a bottle of aerated waters, the dissolved gases immediately beginning to bubble out from the liquid.

Liquids mix according to no well-defined law, but the mixing is important, as upon it depend fractional distillation processes.

As a general rule, solids dissolve in liquids at a rate depending upon the temperature, but the rule has a number of notable exceptions, *e.g.* solubility actually decreases with increase of temperature. Salt dissolves very little more in hot water than cold, while saltpetre dissolves nearly twenty times more in boiling water than in water at freezing point. When a liquid has dissolved as much of the solid as possible, it is said to be saturated. A solid is precipitated from a saturated solution on cooling, as a rule, and generally in the form of crystals.

Solid solutions are of two kinds, the solution of gases in solids and the solution of solids in solids. The occlusion of hydrogen in palladium is a well-known example of the former, and some alloys and amorphous mixtures, as glass, of the latter.

Solutions were formerly not distinguished from chemical compounds, but though it is now known that chemical action does not take place, the true nature of solutions has still to be settled. From considerations of osmotic pressure, it has been shown that the solute obeys the laws for gases, *e.g.* Boyle's, Avogadro's, etc. This suggests that the molecules of the solute are in the same state as they are when the solute is a gas. The kinetic theory of gases fits in very well, in fact, with many properties of solutions, but in certain solutions, *e.g.* those of mineral salts in water, which are conductors of electricity, the osmotic pressure is higher than theory. In such solutions, *e.g.* a salt solution in water, it is supposed that there are certain free ions of sodium and chlorine, carrying positive and negative charges respectively of electricity, and differing in their properties from the actual elements. This theory fits in with many of the observed facts of electrolytic solutions. See Osmotic Pressure.

Solutrian. Middle period of the upper Palaeolithic age in Europe. The climate was cold

Solomon's Seal. Spray of leaves and flowers

shaped flowers hang from the lower side of the arch. The flowers are succeeded by small, blue-black berries.

Solon (c. 638-c. 558 B.C.). Athenian statesman and law giver. Of noble birth, he spent his youth in foreign trade, and attained such eminence as a gnomic poet that he was accounted one of the Seven Sages. Having by one of his poems incited the Athenians to expel the Megarians from Salamis, he commanded the expedition which conquered that island. As Athens was suffering great distress from an economic and political crisis, Solon was elected archon in 594, with full power to amend the laws. By his disburdening ordinance he cancelled existing debts, forbade enslavement for debt, and limited the rate of interest.

Repealing most of Draco's legislation, he gave Athens a new constitution. With a view to obliterating clan divisions and feuds, the citizens were divided into four classes, according to their wealth, and on this basis taxation and admission to office were regulated. Solon increased the powers of the *boulé* or senate, and of the *ecclesia* or assembly. Other laws encouraged industry and foreign trade, especially that establishing a new monetary standard. Having induced the people to swear that they would not change his laws for a term of years, Solon travelled in Egypt, Cyprus, and perhaps in Lydia, where he is said to have advised Croesus. Soon after the overthrow of his constitution by Peisistratus (*q.v.*), Solon died in retirement. See Greece. Consult Solon the Liberator, W. J. Woodhouse, 1938.

Solothurn or **SOLEURE** (anc. *Salodurum*). Canton of N.W. Switzerland, admitted to the confederation in 1481. It occupies the N.W. of the republic and contains the

(horse, reindeer, mammoth), and the human burials indicate an eastern race, apparently dominating for a time the Aurignacian. It was named from a rock-shelter at Solutré, Saône-et-Loire.

Solvent. Term used in chemistry to denote the bulk of a solution, e.g. water, the dissolved substance being called the solute. Water is the greatest general solvent, but alcohols and numerous other organic compounds are also used.

Solway Firth. Arm of the Irish Sea. It separates the Scottish counties of Kirkcudbright and Dumfries from the English county of Cumberland, extends inland for 38 m., and has a breadth varying from 22 m. between St. Bees Head and Balcary Point to 1½ m. where the Esk flows into it. In addition to the Esk it receives the waters of the Annan, Dee, Nith, and Urr on the Scottish side, and the Derwent, Eden, and Ellen on the English side of the border.

At low tide much of the firth is dry, but the returning tide is extremely rapid and a bore sweeps in at the rate of ten miles an hour, sometimes causing damage to shipping. The fisheries are extensive, the salmon catches being of great value. The Solway rly. viaduct, connecting Bowness with a point of the Scottish coast S. of Annan, was opened in 1869, and reopened in 1884 after destruction by floating ice three years earlier. It is 1,960 yards long.

Solway Moss. Dist. in Cumberland, England. Situated between the rivers Sark and Esk on the Scottish border, it is reclaimed bogland, having a circumference of some seven miles. A number of villages were overwhelmed and destroyed in 1771 through the overflowing of the waters of the bog caused by excessive rains.

Solway Moss was the scene of the defeat of James V of Scotland by the English on Nov. 24, 1542. He had marched with 18,000 men into Cumberland, where he was met by a much smaller force of English under Sir Thomas Wharton. The encounter was a rout, not a battle. Without striking a blow, the Scots fell back in panic haste and disorder to the Esk, then running high, and to the marshes of Solway Moss. Some were drowned, and about 1,200 were taken prisoner in the bog.

Solyman, OR SULEIMAN THE MAGNIFICENT (c. 1495-1566). Sultan of Turkey. Son of Selim I, he inherited his father's ambitions and valour, and on ascending the throne in 1520, having crushed

Solyman the Magnificent, Sultan of Turkey

rebellions in Syria and Egypt, began a series of campaigns against the Western powers. Belgrade, 1521, and Rhodes, 1522, fell to his armies, and at the battle of Mohacs (q.v.), August 29, 1526, he dealt a crushing blow to the Christian armies of Louis II. In 1532 he advanced to within a few miles of Vienna, which was only saved by the timely succour of Charles V. He still held Hungary, however, and in alliance with Francis I of France ravaged the Mediterranean coasts as far as Nice and Tripoli, 1542.

The remaining years of his life were spent in wars against Persia, the Knights of Malta, and Spain. Completely under the influence of Roxalana, the beautiful Russian slave whom he had freed and married, Solyman caused his legitimate offspring to be bow-stringed in order to give the succession to her son, who succeeded him as Selim II (q.v.). Solyman died Sept. 4, 1566.

Soma. In the ancient religion of India, name of a sacred plant, from which an intoxicating juice was extracted, and of a god identified with it. It was probably *Sarcostemma brevistigine* or some other plant of the Asclepiadaceae, several of which are still used sacrificially by Brahmans and Parsees. The 9th book of the Rig Veda consists of hymns to Soma. As the drink of Indra and other gods, it was poured in libation and drunk by the worshippers.

Somali. People of Hamitic stock, forming the main population of the E. horn of Africa. Numbering under 1,000,000—approximately one-third each in British, the former Italian, and Abyssinian Somaliland—there are outlying subtribes, mostly Isa, in French Somaliland, and scattered off-shoots, much negriified, down to the Tana river in Kenya Colony. The purest type are a stalwart, lithe, dark people, 5 ft. 7 ins. in height, long-faced, thin-lipped, and straight-nosed, with ringlety hair. Brave, excitable, pastoral nomads, with vast herds of sheep, camels, and goats, they live under patriarchal conditions of Arabian origin. The coast-dwellers practise agriculture, fishing, and handicrafts. Islam is professed, but some early Hamite animism survives. The

King's African Rifles are recruited from them.

Somaliland, BRITISH. Protectorate in N.E. Africa. It comprises the hinterland of that portion of the Somali coast on the Gulf of Aden between Loyi-Ada and Bandar Ziade (400 m. approx.). It was administered, 1929-40, by the British Colonial office through a military governor, and, after the reoccupation of 1941, by the War office. British lies between French Somaliland and the former Italian Somaliland, and adjoins Abyssinia in the W. and S. though the frontiers remain indefinite. Only the coast strip, where are Berbera, Zeila, and Bulhar, the chief towns, is effectively controlled and developed; the hinterland is a barren steppe, mountainous, with peaks attaining 6,000 ft. The climate is hot and, for Europeans, unhealthy. Rice, textiles, dates, and sugar are imported, mainly from India; skins, hides, cattle, sheep, camels, donkeys, gums, and resins are exported. The monetary unit is the Indian rupee. The country was at one time administered by the India office. Area 68,000 sq. m. Pop. (1947 est.) 700,000, only a few score of whom are Europeans.

The British first established the protectorate 1885-87, when the Egyptians withdrew in order to concentrate their forces in meeting the onslaught of the Mahdi. From 1901 to 1920 a great deal of trouble was caused by a local Mahdi, who became known as the Mad Mullah. He fought the British so persistently that in 1910 they were obliged to withdraw from the interior.

Somaliland. Map of the British, Italian, and French colonies on the east coast of Africa

For activities in British Somaliland in the Second Great War, see East Africa Campaigns.

Somaliland, FRENCH. Colony in N.E. Africa. It adjoins Eritrea near the Strait of Bab-el-Mandeb, has an inland frontier with Abyssinia, a coastline on the Gulf of Aden, and adjoins British Somaliland in the S.E. France obtained Obock in 1862, further territory in 1884, created Jibuti, the capital and seaport, in 1888, and later developed rly. communication with Addis Ababa, capital of Abyssinia, Jibuti becoming the chief port for that country. Salt mines and fisheries provide the main occupations, salt, coffee, ivory, hides, and skins being the chief exports. French Somaliland sends one deputy to the French national assembly, one to the council of the republic, and one to the assembly of the French union. Est. pop. (1946) 44,800.

Somaliland, ITALIAN. Name given to the hinterland of that portion of the Somali coast from British Somaliland to Dick's Head, Kenya Colony. An Italian colony from 1927, it was in 1936 incorporated with Eritrea and Abyssinia in the govt. of Italian East Africa. Wrested from Italy in the Second Great War, the country was administered by the British 1941-50, then restored under U.N. trusteeship to Italy for 10 years. The capital is Mogadishu, from which a rly. line runs to Afgai and Adalei. Other towns are Kismayu, Bardera, and Bullo Burti. The chief rivers are the Juba and the Webi Shebeli. Pop. (1939) 1,021,572.

For the campaign in Italian Somaliland in the Second Great War, see East African Campaigns.

Sombrero (Sp. *sombra*, shade). Broad-brimmed felt hat. It originated in Spain, but is worn largely in Central and South America.

Somers, JOHN SOMERS, 1ST BARON (1651-1716). English statesman. Born at Claines, near Worcester, March 4, 1651, and educated at Worcester cathedral school and Trinity College, Oxford, he entered the Middle Temple, 1669. An expert in civil law, he

Lord Somers, English statesman

part in framing the Declaration of Right. William III's most trusted minister, Somers was knighted, 1690, appointed lord keeper, 1693, and lord chancellor, 1697, when he was made Baron Somers of Evesham. Attacked by the Tories, he was deprived of the great seal, 1700, and impeached by the commons, 1701, but acquitted by the lords. Anne was hostile to him, but under George I he was a member of the privy council and had a seat in the cabinet without office, 1714. He died April 26, 1716. The Somers Tracts, a valuable collection of state papers, were edited by Sir Walter Scott, 1809-15.

Somers, ARTHUR HERBERT TENNYSON SOMERS COCKS, 6TH BARON (1887-1944). British boy

Lord Somers, British boy scout chief

scout chief. Born Mar. 20, 1887, he inherited the barony on the death of an uncle, 1899. He served in the First Great War, gaining the D.S.O., the M.C., and the French award of chevalier of the Légion d'Honneur, retiring from the army in 1922. In 1920 he became district commissioner of boy scouts in Herefordshire, and while governor of Victoria, 1926-31, was chief scout of that province. Acting governor-general of Australia, 1930-31, he was also chief scout of Australia. While Lord Baden-Powell, the chief scout, was in S. Africa in 1936, he acted as chief scout in Gt. Britain and continued as deputy chief scout until Baden-

Powell's death in 1941, when he became chief scout of the British Commonwealth. Lord Somers, who was made K.C.M.G. in 1926, died July 14, 1944. His wife, Daisy Finola, chief commissioner of the girl guides 1942-49, was awarded the C.B.E., 1950.

Somerset. Co. of England. In the S.W. of the country, it has a long coastline on the estuary of the

Somerset arms

Severn and the Bristol Channel. The hills include the Mendips in the N.E., and the Quantocks and the Brendons in the W. Minor ranges are the Polden Hills and the Black Down Hills. The highest point is Dunkery Beacon on Exmoor. The chief rivers are the Avon and Parret; others are the Axe, Tone, Brue, Yevo, and Cary. Somerset is on the whole a fertile area, the vale of Taunton being especially so. Wheat, barley, and oats are grown, and there are extensive orchards of cider apples. Sheep and cattle are reared, and there are many dairy farms. There is a coalfield in the north of the co., Radstock being the mining centre.

Taunton is the county town. The boroughs include Bath, Bridgwater, Wells, Yeovil, and Chard, and there are a number of smaller places, several, among them Dunster, having once been prosperous trading towns. Among urban districts are Wellington, Clevedon, Shepton Mallet, and Street. In Somerset are many places of interest: Cheddar, with its rocks and caves, the plain of Sedgemoor, and

Somerset. Map of the English county famous for its historic associations

part of Exmoor; Weston-super-Mare and Minehead are holiday resorts on the Bristol Channel; Watchet and Porlock are small seaports; Glastonbury and Athelney are associated with the early history of England. The county is almost wholly in the diocese of Bath and Wells, and elects six M.P.s. Somerset was the heart of the kingdom of Wessex, its old capital, Somerton, being herein. Area 1,613 sq. m. Pop. 475,142.

LITERARY ASSOCIATIONS. Prior Park, near Bath, was the original of the residence of Squire Allworthy in Fielding's *Tom Jones*; while Bath itself recalls Smollett's Humphrey Clinker, Sheridan's *The Rivals*, Jane Austen's *Persuasion*, Dickens's *Pickwick Papers*, and George Meredith's *The Tale of Chloe*. Clevedon Court is the Castlewood of Thackeray's *Esmond*, and Clevedon church inspired passages in Tennyson's *In Memoriam*. Exmoor may be said to have a literature of its own, including Blackmore's *Lorna Doone* and J. W. Fortescue's *Story of a Red Deer* in prose, and Newbolt's *Song of Exmoor* in poetry.

Bibliography. *Bygone Somerset*, J. C. Walters, 1897; *Victoria History of the Counties of England*, Somerset, 2 vols., ed. W. Page, 1911; *Somerset in Bygone Days*, W. J. Tate, 1912; *Highways and Byways in Somerset*, E. Hutton, 1912; *Somerset (The King's England series, ed. Arthur Mee)*, 1940; *Companion into Somerset*, J. H. Ingram, 1948.

Somerset, or North Somerset. Island in the N. American archipelago. Part of the North-West Territory of Canada, it is divided from the mainland by the Bellot Strait. It is separated on the E. from Baffin I. by the Regent Inlet, and on the W. from Prince of Wales I. by Peel Sound. To the N. are Devon I. and Cornwallis I.

Somerset, Duke of. English title held by the families of Beaufort and Seymour. In 1397 Richard II granted the earldom of Somerset to his kinsman, John Beaufort. John's son, John (d. 1444), was made duke in 1443, as was another son, Edmund, in 1448. Edmund's son Henry was deprived of his titles during the Wars of the Roses.

In 1547 Edward Seymour was made duke of Somerset, but on his attainder in 1552 the title passed into abeyance, being restored in the person of his grandson, William Seymour, husband of Lady Arabella Stuart, in 1660. He was succeeded by his grandson, William,

3rd duke, on whose death without heirs in 1671 it fell to John Seymour, the 2nd duke's youngest son. He also died without issue, and the dukedom devolved upon his cousin Francis, who became 5th duke in 1675. Charles, brother of Francis, became 6th duke in 1678. He was a man of importance at the court of Anne and George I. On the death in 1750 of his son Algernon, 7th duke, the title passed to another branch of the family, from whom subsequent holders of the title descend. *See* Beaufort; Seymour.

Somerset, Edmund Beaufort 2nd Duke of (d. 1455). English statesman and soldier. Son of John, earl of Somerset, and younger brother of John, 1st duke of Somerset, he won military successes in France, succeeded his brother as earl of Somerset, 1444, and as a Beaufort and a favourite of the king was made lieutenant of France, 1447, with the disastrous result to Henry VI that the whole of Normandy was lost by 1450. On his return to England, he was appointed high constable, 1452. Popular discontent was focused on the king's party, and when the duke of York, Somerset's principal opponent, became protector during the king's temporary incapacity, 1453, Somerset was sent to the Tower. After his release in 1455, York raised an army against him and fought the first battle of the Wars of the Roses at St. Albans, May 23, 1455, where Somerset was killed.

Somerset, Edward Seymour, Duke of (c. 1506-1552). English statesman, known as the lord protector Somerset.

Duke of Somerset, English statesman

Ason of Sir John Seymour, his early years were passed at court, and he was attendant on Henry VIII and Wolsey. In 1536 he was made a viscount and in 1537 earl of Hertford, his sister Jane having just been married to the king. In charge of the forces sent to Scotland in 1544, he took Edinburgh, and he gained further military experience on the borders and in France. In 1547, on the accession of Edward VI, Hertford was a member of the council of regency. Almost at once he was chosen protector and made duke of Somerset, and for two years he governed England. As the first Protestant ruler of England, he

subordinated the bishops to the king, issued new liturgies, insisted on the use of English in the churches, and gave parliament control over tithes. His rule saw less religious persecution than any in the past century, although he was a strong Calvinist. Moderation is to be seen also in his attitude towards the people, whom he relieved of oppressive measures by abolishing the ancient treason and heresy laws. Somerset pressed forward the projected marriage between Queen Mary of Scots and Edward VI, but, peaceful methods having failed, he led the army which won the overwhelming victory of Pinkie, Sept. 10, 1547.

But the intrigues of his brother, Sir Thomas Seymour, reflected on the protector; the Scots recovered lost territory; the French pressed on Boulogne; religious reforms offended many, and Somerset's attempts to stop the enclosure of common lands alienated the landowners. Two rebellions broke out in 1549, the second, under Kett, assuming serious proportions. Led by Warwick, the councillors and heads of the army planned the protector's fall, and in Sept., 1549, Somerset surrendered to their demands and was sent to the Tower, but was soon reinstated. Warwick (now duke of Northumberland) received news of a plot against himself to be led by Somerset, and had him again incarcerated in the Tower. Somerset was condemned on a charge of felony and executed on Tower Hill, Jan. 22, 1552. Relentless and rapacious, he had made a huge fortune out of the sale of Church lands and the dissolution of monasteries; but his kindness gave him great popularity among the masses, who protested loudly against his execution. Historically, he stands as the practical consolidator of the Reformation in England.

Somerset, William Seymour, 2nd Duke of (1588-1660). English royalist leader. Grandson of

William Seymour, Duke of Somerset

Edward Seymour, earl of Hertford, 1539-1621, he married Arabella Stuart (q.v.), 1610, and lived in exile in Paris, 1610-16. He inherited the earldom of Hertford, 1621, and was raised to a marquessate, 1640, when he became governor to the prince of Wales. A

royalist general, he captured Hertford, 1642, Cirencester and Bristol, 1643, and was in charge of Oxford during 1645-46. Although attending Charles I during his captivity and trial, he was left at liberty during the Commonwealth, and in 1660 welcomed Charles II at Dover. He received back his forfeited estates, and was created duke of Somerset just before he died, Oct. 24, 1660.

Somerset, ROBERT CARR OR KER, EARL OF (d. 1645). Scottish courtier. Belonging to the family of Ker of Ferniehurst, he came to England in the retinue of James I in 1603, and was one of the king's most favoured minions. Knighted 1607, and made Viscount Rochester 1611, he became the king's private secretary, 1612. His influence brought about the arrest of Sir Thomas Overbury (*q.v.*) in 1613, and he married the countess of Essex, having just been created earl of Somerset and lord treasurer of Scotland. Lord chamberlain, 1614, he quarrelled with James, was accused of poisoning Overbury, and was imprisoned in the Tower, 1616-22. He died in retirement in July, 1645.

Somerset House. British government building in London. The building suffered severely

births, marriages, and deaths may be obtained from Somerset House for 2s. 6d., plus 1s. for search fee, and 1d. stamp.

Somerset House was erected on the site of the palace built, 1549-52, by the lord protector Somerset, and later occupied by the wives of James I, Charles I, and Charles II. Elizabeth lived here before her accession; Inigo Jones died here, 1652; Oliver Cromwell's body lay in state here, 1658.

Somerset Light Infantry. Regiment of the British army. Raised by the earl of Huntingdon in 1685 as the 13th Foot, it first saw active service in Holland. In 1706 it was converted into dragoons, and served as such in Spain; to commemorate the regiment's temporary mounted rôle, the officer's mess jackets are still cut on cavalry pattern. Reformed as infantry in 1710, the Somersets took part in the defence of Gibraltar in 1727, and fought at Dettin-gen and Fontenoy. It was part of the British army that defeated Charles Stuart at Culloden in 1746; in that action all the officers be-

Somerset Light Infantry badge

Infantry, being affiliated to the co. of Somerset in 1881. The regt. fought in the Crimea, the Indian Mutiny, the Zulu War of 1878-79, the Burmese War of 1885-87, and throughout the S. African War.

Sixteen battalions were raised for service in the First Great War and gained the honours: Marne, 1914, '18; Aisne, 1914; Ypres, 1915, '17, '18; Somme, 1916, '18; Albert, 1916, '18; Arras, 1917, '18; Cambrai, 1917, '18; Hindenburg Line; Palestine, 1917, '18; Tigris, 1916. In the Second Great War, battalions fought in N. Africa, Italy, and N.W. Europe. The depot is at Taunton.

Somers Town. District of N.W. London. Part of the met. bor. of St. Pancras (*q.v.*), it was built in the latter part of the 18th century, named after the Somers family, who then owned the freehold, and became a resort of refugees from the French Revolution. Part of the area is covered by the marshalling yards outside the St. Pancras rly. station.

Somervell, SIR ARTHUR (1863-1937). British composer. Born at Windermere, June 5, 1863, he

Sir A. Somervell, British composer

was educated at Uppingham and King's College, Cambridge, and studied music under Stanford and Parry, and in Berlin. During 1893-1901 he taught harmony and counterpoint at the Royal College of Music, then became principal inspector of music to the board of education in London and to the Scottish education department. He was made Mus. Doc. of Cambridge, 1903, and was knighted 1929. Known chiefly for his songs and notably for his settings of lyrics from A Shropshire Lad and Maud, his works also include a Mass in C, 1891; a symphony, 1913; and children's musical playlets. He edited Songs of the Four Nations, a popular collection of folk songs of the British Isles. Somervell died May 2, 1937.

Somervell, SIR DONALD BRADLEY (b. 1889). British lawyer. Born Aug. 24, 1889, he was educated at Harrow and at Magdalen College, Oxford, and became a fellow of All Souls's College, Oxford. He was called to the bar in 1916, and took silk in 1929. In 1931 he was elected Unionist M.P. for Crewe, which he represented until 1945. Solicitor-gen. in the

Somerset House, London. The frontage of the government building on the Victoria Embankment, viewed from Waterloo Bridge

from damage by German bombs dropped in air raids, 1940-41. In quadrangular form and Palladian in style, it is between the Strand and the Victoria Embankment, and was built, 1776-86, by Sir William Chambers, the E. wing being added by Sir Robert Smirke, 1829-34, and the W. wing, 1854, by Sir James Pennethorne. Before 1864 the extensive river front was lapped by the Thames. In the court is a fountain group by John Bacon. Apart from the E. wing, occupied by King's College (*q.v.*), the structure houses the audit, registrar-general's, inland revenue, wills and probate, and other government offices. Wills may be seen on payment of 1s. Certificates of

came casualties and the company commands devolved on the sergeants, from which circumstance arose the existing practice of sergeants wearing their sashes over the left shoulder, as was then customary for officers.

Having been with Abercromby in Egypt, the Somersets proceeded to the W. Indies, and were at the capture of Martinique and Guadeloupe. They took part in the Burmese War of 1824-26; the Afghan War of 1839-42 brought five battle honours. For the heroic defence of Jalalabad, the mural crown and inscription on the regimental badge were granted, together with the secondary title of Prince Albert's. In 1843 they became the 13th Light

national government during 1933-36, then attorney-gen. until 1945, he was knighted 1933 and made a privy councillor 1938. In Churchill's "caretaker" govt. of 1945 he held the office of home secretary. From 1940 to 1946 he was recorder of Kingston-upon-Thames, and in 1946 was appointed a lord justice of appeal.

Somerville. City of Massachusetts, U.S.A., in Middlesex co. It stands on the Mystic river, 2 m. N.W. of Boston, and on the Boston and Maine Rly. Its industries include meat packing, dyeing and bleaching, and desk and picture-frame manufactures. Its large foreign-born population (28 p.c.) is mainly Irish, Italian, and Canadian. Somerville, settled in 1631, held the main powder magazine of the American forces during the Revolutionary War. Pop. (1940) 102,177.

Somerville, EDITH OENONE (1858-1949). Irish novelist and artist. Born in Corfu, she studied art in Paris and London, and became known as collaborator with her cousin "Martin Ross" (q.v.) in a succession of humorous novels of Irish country society and foxhunting, some of which she illustrated. She was master of the West Carbery foxhounds, 1903-08. In an early collaboration of the Somerville and Ross series, *An Irish Cousin*, first pub. 1889, she used the pseudonym of Geilles Herring. Their best known book was *Some Experiences of an Irish R.M.*, 1899. Others were *The Real Charlotte*, 1894; *Some Irish Yesterdays*, 1906; *Further Experiences of an Irish R.M.*, 1908; *Dan Russel, the Fox*, 1911; *In Mr. Knox's Country*, 1915. After the death of Martin Ross, 1915, the two names still appeared over many books written by the survivor. *Strayaways*, 1920, told of the collaboration. Other books by her include *The States though Irish Eyes*, 1931, illus. by herself; *Sarah's Youth*, 1938; *Notions in Garrison*, 1941. She died Oct. 8, 1949.

Somerville, MARY (1780-1872). Scottish writer on science. Born at Jedburgh, Dec. 26, 1780, she was a daughter of Admiral Sir William Fairfax. Her scientific faculties developed in the brilliant intellectual society in which she moved, first in Edinburgh, and, after her second marriage in 1812 to Dr.

Mary Somerville,
Scottish writer

the Society for the Diffusion of Useful Knowledge of Laplace's *Le Mécanique Céleste*, published in 1831 as *The Celestial Mechanism of the Heavens*. This was followed in 1834 by *The Connection of the Physical Sciences*; *Physical Geography*, 1848; and *Molecular and Microscopic Science*, 1869. She died Nov. 28, 1872. *Consult* *Personal Recollections of Mary Somerville*, ed. by her daughter, 1873.

Somerville College. Women's college at Oxford university. It was founded in 1879 as Somerville Hall, in memory of Mary Somerville (v.s.). In that year a building was opened, with residential accommodation, to the W. of Woodstock Road, adjoining the Radcliffe infirmary. The hall was enlarged several times, and in 1894, on the occasion of the opening of a new wing, its name was changed to Somerville College. A library and other buildings were opened in 1904. The Maitland buildings date from 1913, the Penrose block was built in 1927, and the E. quadrangle opened in 1934. In the First Great War the college was used as a military hospital, and in the Second it housed nurses from the Radcliffe infirmary. Dame Emily Penrose and Margery Fry were principals of Somerville, where Vera Brittain, Winifred Holtby, Dorothy L. Sayers, and Barbara Ward were students.

Somma, MONTE. The semi-circular ridge surrounding the present active cone of Vesuvius. It is probably the remains of the large volcano destroyed A.D. 91, and the new cone is accumulating on the floor of an older crater. Somma rings are circular inward-facing, cliff-like features of any volcanoes, the result of the disappearance by explosion or collapse of the upper part of the

William Somerville, in London. She was on intimate terms with the Herschels, Sir Charles Lyell, Sir George Airy, and Dr. Whewell.

Her first considerable publication was a popularisation for

the Society for the Diffusion of Useful Knowledge of Laplace's *Le Mécanique Céleste*, published in 1831 as *The Celestial Mechanism of the Heavens*. This was followed in 1834 by *The Connection of the Physical Sciences*; *Physical Geography*, 1848; and *Molecular and Microscopic Science*, 1869. She died Nov. 28, 1872.

Somme. River of France. It rises near St. Quentin, and flows to the English Channel near St. Valéry. The chief towns on its banks are Péronne, Corbie, Amiens, and Abbeville. Partly canalised, it is connected with the Oise and Schelde by the Somme Canal. Its length is 150 m.

Somme. Dept. of France. Bounded W. by the English Channel, it lies adjacent to the depts. of Pas-de-Calais, Nord, Aisne, Oise, and Seine-Inférieure, and is formed of the old prov. of Picardy and part of Artois. The greater part of the dept. consists of bare, chalky plateau land, traversed by the broad valley of the Somme river, other streams being the Avre, Noye, Selle, Nièvre, Authie, and Bresle. Agriculture is important, cereals and beet being among the crops of a generally fertile soil. In

Somerville College, Oxford. Buildings of the women's college; left, library, etc., opened in 1904; right, the original house

dustries include the manufacture of textiles, woollens, sugar, and paper, brewing, etc., and there are important chalk quarries. Crécy is the chief forest. Amiens is the capital, other towns of note including Abbeville, Doullens, Montdidier, Péronne, Albert, Gamaches, and Picquigny.

The W. half of the dept. suffered much damage during the First Great War, and the two great Somme battles are described in a separate article in pages 7652-55. In the Second Great War, during the 1940 campaign in France, the Germans reached the Somme on May 21. Next day the French destroyed all the bridges across it; but during the first week in June the Germans crossed the river in strength. In the 1944 campaign the Germans made no attempt to hold the line of the river, which was crossed Aug. 31 by the British 2nd army in its spectacular one week's advance from the Seine to Antwerp. Area, 2,443 sq. m. Pop. 467,479.

SOMME: BATTLES OF 1916 & 1918

These two great encounters of the First Great War must always rank among the most significant battles in British and world history. They are described here in the full detail they merit, as are certain other outstanding battles of 1914-18, e.g. Arras; Jutland; Marne; Verdun; Ypres. See the biographies of Foch; Gough; Haig, etc.; also First Great War, Tank

For the summer of 1916 an extensive attack upon the German front on both sides of the Somme was planned. The battle had to be opened a little earlier than had originally been intended

(in order to relieve the pressure on Verdun), before the British preparations were quite complete. The British were to assault from Gommecourt to Hardecourt, with, in the first instance, Rawlinson's 4th army, supported in the extreme N. section of front by divisions of Allenby's 3rd army. S. of Hardecourt the French with their 6th army under Fayolle (directed by Foch) took up the attack on a front extending to Soyecourt. The German staff gives the German force engaged on the first day of battle (July 1) as 12½ divisions. The total British force available at the outset was 26 divisions; the French strength 13; 15 British divisions took part in the initial attack.

Strength of German Fortifications

There was no attempt at surprise, as immense preparations had to be made behind the lines. The Allies at this date had 167 divisions on the French front (French 105, British 56, and Belgians 6) to 122 German divisions, a superiority of about 33 p.c., for the attack on the German fortifications. These were of the most formidable character with wide belts of thick wire, concrete and steel machine-gun emplacements, and deep dug-outs which could only be destroyed by the heaviest projectiles. The operations thus resembled a gigantic siege. For counter-battery work the British heavy artillery was still weak, only possessing 30 long-range 6-in. guns, in addition to heavy howitzers and a few very heavy guns. At the outset almost complete command of the air was secured by the Allied air forces.

The bombardment of the German line began on June 24 and was accompanied by heavy discharges of gas with deadly effect, and by the destruction of most of the German captive balloons, achieved by the air forces. It continued, with some interruptions due to bad weather, till July 1, when at 7.30 a.m. the British and French infantry advanced to the assault.

On the N. section of the front the British attack was repulsed with very heavy (indeed, tragic) loss, particularly from machine-gun fire.

The British right was more successful. Fricourt was enveloped, Mametz entered, and Montauban stormed. The French attack had not been expected by the Germans, and Fayolle's troops reached the outskirts of Hardecourt and Curlu with little loss.

On the following day the battle was resumed; Gough of the 5th army was placed in command of the left, from La Boisselle to Serre, while Rawlinson pressed the attack on the British right between La Boisselle and Montauban, and Fayolle continued his advance in the general direction of Combles. Fricourt fell on the 2nd, and by the 5th the British had secured La Boisselle and reached the outskirts of Contalmaison. All these villages were fortified with extraordinary strength, and held by resolute German troops supplied with abundance of machine guns.

The German first line was now in British hands between La Boisselle and Hardecourt, while the French rapidly advanced and on July 7 took Biaches. Preparations were made for the assault on the second German line, and, as the preliminary, Contalmaison was stormed, after a desperate struggle lasting three days; Mametz wood was cleared; and most of Trônes wood was captured. The British loss in the first fortnight of the battle had been 90,000 men, against a German loss which was probably about the same.

Struggle at Delville Wood

On July 14 at 3.25 a.m. the assault was delivered on the second German line. The two Bazentins with the last part of Trônes wood were carried; and in the next two days Ovillers was seized, Pozières approached, a footing gained in the S. end of Longueval, and in High wood and Delville wood, where the British troops were exposed to gas shelling. A deep salient had been driven into the German front, but for a further successful advance it was necessary to clear the flanks. Unfortunately the weather became rainy and misty, impeding artillery work, which depended entirely on air observation.

On July 18 the Germans violently counter-attacked at Del-

ville wood, where a fearful struggle opened; and they also recovered the N. part of Longueval, which they had momentarily lost. On July 23 Rawlinson attacked from Guillemont to Pozières, while Gough attacked on his left, and after hard fighting Gough carried Pozières on July 26. Delville wood was completely cleared, with the whole of Longueval, by the end of July, after violent fighting, but an attack on Guillemont failed. The British casualties had now risen to 180,000.

Few armies have ever faced such an ordeal; all eye-witnesses are agreed that even at Ypres the misery in the mud was not so great nor the difficulty of maintaining communications so extreme. A serious fact was the heavy consumption of ammunition; though the British ministry of munitions was turning out shells in large numbers, Haig found that in the first 17 days of the battle a supply had been exhausted which he calculated would have lasted a month. On the German side the 1st army had been drawn into the battle and a very large number of divisions had been employed; the losses were heavy, and the exhaustion of the German units extreme.

Guillemont and Thiéval

Bad weather, the need of constructing roads, and shortage of ammunition, to which the explosion of a large dump contributed, prevented large-scale operations being renewed till mid-August, when both British and French carried out a combined attack on Guillemont. As the result, after some days of severe fighting, the station and outskirts of that village were secured, while continuous local attacks were made on the German positions at Thiéval in which important ground was gained. By the end of August the French were in the outskirts of Cléry and were close to Péronne.

At noon on Sept. 3 the British assaulted from Beaumont-Hamel to Guillemont, and the French S.E. of Guillemont, which village was stormed by the British, who also penetrated into Ginchy, whence they were subsequently driven by counter-attacks. The French captured Cléry and extended the attack to the S. by employing the 10th army (Micheler, 13 divisions strong), which took Vermandovillers with little difficulty or loss on Sept. 8. The previous day Ludendorff and Hindenburg, now in complete control of the German army, held a conference at Cambrai at which the Somme position was discussed. Ludendorff states that this was one of the most

critical moments of the war and that the German troops were near the limit of their resistance. Orders were issued for the preparation of the vast fortified zone known to the Allies as the Hindenburg Line, in the event of a German retreat.

On Sept. 15, at 6.20 a.m., another great Allied attack opened, the 4th army attacking between Le Sars and Morval, and the French in the direction of Comblès and S. of that place. For the first time in the war tanks were employed by the British, the effective total of machines at that date being 47. The ground was so shell-torn and unfavourable that these new engines of war had everything against them, and their success was small. But at Flers and Gueudecourt 2 tanks did excellent work, while 7 others gave valuable support elsewhere. No fewer than 9 broke down and 5 were ditched. The general result of the experiment, made prematurely with half-trained crews, was disillusionment.

Results of the Battle

Another general attack was delivered by the Allies on Sept. 25, on a front from Martinpuich to the Somme, with the aid of 13 tanks, and on the following day the front was widened to include Thiépval. After three days of severe fighting, Thiépval, the ridge behind it, Gueudecourt, and Morval were carried, and the British and French secured Comblès, the British alone accounting for 6,000 prisoners with 27 guns, and taking two of the strongest German works, Stuff and Zollern redoubts. In the capture of Gueudecourt remarkable work was done by a tank which, with infantry cooperating, secured a German strong point, and forced the surrender of 370 Germans with a British loss of only 5. Once more the Germans seemed to be on the run, and there were distinct signs of weakness on their front. But again the weather intervened to save them, after Eaucourt had been taken on Oct. 3, in three days of severe fighting.

Le Sars was stormed on Oct. 7, but repeated attempts to carry the Butte de Warlencourt failed with heavy loss, mainly owing to the state of the ground. Men sank up to the knee, and had to shelter in water-logged craters, the construction of trenches being almost impracticable. The French, however, were able to make better progress and, on Oct. 18, carried all the fortified village of Saily-Sailhsel. Down to Oct. 12 they had captured 40,125 prisoners in the battle. In the closing days of Oct., and in early Nov., the British gained ground towards Le Trans-

loy and Grandcourt. German counter-attacks were numerous in these operations, but except on Oct. 23, when the Germans recovered a point of some importance near Le Sars, they were beaten off with heavy loss. During Nov. 11-20 the Allies undertook the operations for the capture of the German positions on the Ancre.

The total British loss in the whole series of battles on the Somme (including the Ancre) was 22,923 officers and 476,553 men, the heaviest incurred in any series of battles on the Western front by any Allied army. The Germans suffered in a lesser degree, losing 444,933 men. The British captured 38,000 prisoners with 125 guns. The Germans engaged in all, on the British front, 95 divisions, or more than half their whole army in the West.

The net results were important. Verdun was relieved, and the Germans were worn down; they did not, for many months, make good their losses in material and their expenditure of ammunition, and they were forced, early in 1917, to fall back from their positions to the Hindenburg Line. The "creeping barrage" was one of the artillery innovations employed by the British in this battle; it had been used by the French, in June, at Verdun. The total territory gained in the actual fighting and the subsequent German retirement, which the Allied advance on the Somme necessitated, was about 1,000 sq. miles, but it had been reduced to the condition of a desert.

A Comparison of Forces

The second battle of the Somme was the first act of Ludendorff's gigantic offensive of the spring of

1918. It was fought with the object of reaching

Amiens and forcing the British and French armies apart. It falls into two sections: the N. attack by the Germans on the British 3rd army (Byng, for which see Arras), and the main attack on the British 5th army (Gough) on the S. section of the front from Gouzeaucourt to Baxis, S. of La Fère. The total front held by the British 5th army was 42 m.; the force for its defence was 11 divisions in line (averaging some 14,000 men), 1 in reserve, 2 under orders of headquarters, not instantly available, and 3 cavalry divisions (which equalled in rifle strength 1 infantry division). Against Gough there stood, ready to advance, 43 German divisions (averaging about 15,000 men, a total of 650,000 men) in front line or immediate reserve with 6,800 guns,

of the 2nd (Marwitz), 18th (Hutier), and 7th (Boehn) German armies, specially trained for attack, reinforced by the pick of the German troops withdrawn from Russia, and assisted by lethal gas-shells of blue and green cross patterns, with which it was hoped to paralyse the British artillery. Byng's army of 17 divisions was stationed N. of Gough, holding a front of 27 m., and against it, on the sector attacked, 25 divisions of the 17th (Below) and 2nd German armies were deployed.

Opening of German Attack

A great offensive was anticipated by the British command, but owing to the absence of a supreme Allied command the arrangements for rapid reinforcement of Gough were defective. No powerful British reserves were near enough. Haig and Pétain, the British and French commanders-in-chief, had agreed that in the event of a German offensive on this portion of the front reinforcements should be provided by the French. Such reinforcements were not immediately available. Violent German demonstrations in the direction of Reims had drawn Pétain's attention to that quarter, and he also feared an offensive at the extreme E. of his front, near the Swiss frontier.

The defences on Gough's front were comparatively weak, as the most dangerous part of that front had been recently taken over from the French, nor had there been the labour available to complete its wiring and entrenchment. The area in the front was organized in three zones; the first or forward zone was to be held by machine-gun posts and redoubts, the garrisons of which were to face annihilation, inflicting first the maximum of loss; in the second, or battle zone, the main force was to engage; the third, or rear zone, had been hastily prepared for a further stand.

The attack was expected in the 5th army on March 14 or 16, from information given by prisoners and deserters. About this date there was heavy gas-shelling by the Germans, and on March 19 the British replied by pouring gas drums into St. Quentin. On the night of March 20 a British trench raid secured definite information that the attack was coming in a few hours, and Haig was warned. Ludendorff that day had been uncertain whether the wind would permit his offensive to open, but before noon it was reported to be not unfavourable, and the order was issued to proceed. Gough's general plan was to fall slowly back, fighting, if he were not quickly reinforced, in order to avoid envelopment and complete destruction.

The night of March 20-21 was unusually quiet, till at 4.40 a.m. of the 21st the Germans opened a terrific bombardment, shelling not only the British front line, but also to a depth of 20 m. behind the front, and in particular concentrating long-range fire on all the roads by which reinforcements could arrive. Unfortunately, none had yet been moved up. Telephonic communication broke down. A dense mist hung over the field, and little or nothing could be seen.

This may have hampered the German attack, though at the time it was thought to have aided Ludendorff. At various points of the line the German infantry storm began at different times—between 7 and 9.30 a.m.—and at one or two points German tanks were used with success. The British infantry, artillery, and machine-guns, though they included many young troops, put up a most gallant and determined resistance, typical of which was the stubborn defence of the 9th division and the stand of the men in the Manchester redoubt.

The Germans advanced, in spite of losses, as far as the Crozat canal, S.W. of St. Quentin; but at most points they were temporarily held, and had British reinforcements been available promptly their attack might have been brought to a standstill. At no point had a break-through occurred. Gough had not received any help from the French or the main British reserves, though he had been permitted to bring up the two divisions (20th and 50th) held back by Haig, one of which reached the field in the evening.

German Advance to St. Quentin

On March 22 mist again hung over the field, and the Germans renewed the attack with masses of men, "leap-frogging" fresh troops through their tired divisions and pushing the British slowly back. Epéhy and Roisel were lost; the Germans, after a furious struggle, crossed the Crozat canal and forced the weak British divisions back before St. Quentin, reaching Vaux. No strong reserves were available on the British side at this point, though the second of Gough's reserve divisions, which had been held back by the British command, had entered the battle in the morning. No French troops had reached the field, but one cavalry division and portions of three infantry divisions were moving towards it. Either destruction or retreat was inevitable, and Gough decided to fall back on positions E. of the Somme.

In view of information as to the

immense German reinforcements moving to support the attack, and in view of the loss of the Crozat canal, early on March 23 Gough decided to continue his retreat to the W. bank of the Somme, a decision which has been criticised.

During the day the Germans fought their way into Ham and Péronne, and followed the British back to the Somme. As the British retreated bridges were as far as possible destroyed, but in a good many cases the German bombardment cut the wires or blew up the charges held ready, and thus the destruction was incomplete. During this day detachments of French troops began to arrive on the battle-front; the French infantry, however, had only 200 rounds of ammunition per man and no artillery. Haig arranged with Pétain that the French should take over the front S. of Péronne. Their intervention only just balanced the fresh reserves which Ludendorff threw in, and could not stabilise the line. Gough's choice was still between annihilation or retirement, and his losses had already been extremely heavy. The situation at the junction of his army with the 3rd (Byng) caused grave anxiety.

German Thrust for Amiens

On March 24 the Germans forced the passage of the Somme between Péronne and Ham. Owing to the dry weather, which had singularly assisted them throughout, the river was no serious obstacle; and farther to the S. they forced back the French and British troops towards Chauny and seized that rly. junction. On this day Pétain issued as a directive order to his forces above all to maintain "the solid connexion of the French armies, and then, if possible, to preserve contact with the British forces," which pointed to an intention to retreat towards Paris and Reims, diverging from the British line of retreat.

On March 25 Haig, fearing that the separation of the British and French armies was only a question of time, asked for 20 French divisions to take up the battle on both sides of the Somme and cover Amiens, on which great rly. junction the Germans were violently thrusting, bombing it constantly and shelling it with their extreme-range naval guns. Gen. Fayolle now assumed charge of the battle S. of the Somme; the French reserves which entered the battle by the close of the 25th were one cavalry and seven infantry divisions, but against these about 10 more German divisions had been thrown in, so that the

numerical balance was still disastrously against the Allies. Over the whole front allied dumps were exploding and allied camps were in flames; on every road multitudes of peasants were in flight, and behind them moved thin, worn screens of British skirmishers and occasional artillery, desperately resisting the furious thrust of the gigantic German force.

On March 25 the Germans entered Bapaume, wresting it from the 3rd army, and that same night, at the S. end of their attack, they carried Noyon, despite a brilliant counter-attack by the 18th division. They already claimed the capture of 45,000 prisoners (many of them, however, wounded) and 750 guns. A gap was opening wide between the main British and French armies, and another gap was opening in the centre of the battle, between the 19th corps (Watts) and the 18th corps (Maxse), both worn and weakened by days of terrific fighting against overwhelming odds. The crisis had come. Gough summoned his chief engineer, Major-Gen. P. G. Grant, and directed him to take every man he could scrape together and hold the ground E. of Amiens. This force, wrongly known as Carey's, from the general who took command of it later, by its bold front deterred the Germans from advancing direct on Amiens.

Loss of Albert

On March 26 the Germans continued their thrusts both to the N. and S. of the Somme. N. of the Somme they captured Albert from the 3rd army and Bray from the 5th army; S. of that river they neared Proyart and captured Lihons, Chaules, and Roye. That day at Doullens a momentous conference took place between M. Clemenceau, Lord Milner, Haig, Pétain, and Foch, as the result of which, at Haig's proposal, Foch was appointed to coordinate the allied movements, though he was not yet given complete control. He immediately directed Débeney to take the 1st French army out of the line and to move with it towards Amiens, and asked both Haig and Pétain to concentrate all efforts on maintaining the united front of their armies.

On March 27 the battle still raged. On the S. front the Germans that day reached Montdidier (*q.v.*), but were checked by the French in an effort to advance between Lassigny and Noyon. In the Allied centre after very fierce fighting they took Proyart, Morcourt, and Framerville. Débeney reported that there was still a gap of ten miles between the British and French. There was

grave risk of an irruption of German cavalry, but, fortunately the German command did not realize its advantage or instantly use it.

British and French reserves were now at last moving swiftly to close the opening, and the Germans had failed to gain the success they desired. Foch issued the order, "Lose not another yard of ground" and Monash, with his Australians, began his deployment, 11 m. E. of Amiens, and with these troops stopped the German advance. By noon he reported that he had the situation well in hand; and Amiens was saved. On March 28 Ludendorff strove to clear the N. flank of his attack by a determined thrust against the 3rd British army and Arras, but this completely failed; and the German offensive towards Amiens gradually died down, though local attacks continued in which some further ground was lost by the British, and Hamel, Mézières, and Dëmuin fell into German hands. By March 29 the Germans had thrown in 100 divisions against 35 British and 15 French divisions. On March 30 Australian, Canadian and British troops counter-attacked, and Dëmuin was recovered. The last German onslaught of importance in this quarter came on April 4-5, when the Germans were repulsed between Hamel and Hangard. The front was stabilised on April 6.

In this battle and the battle of Arras to the end of March, the British loss was estimated at 200,000; the German loss was probably as great in everything but prisoners. Ludendorff states that the desired result was not obtained and that the casualties were severe. In fact, the battle, though a brilliant tactical success for the Germans, was a strategical failure.

A striking memorial to the 73,367 British soldiers who fell in the Somme battles and whose graves are unknown was built at Thiepval (*g.v.*) and unveiled in 1932 by the then prince of Wales.

Sommen. Lake of Sweden. It is 28 m. in length, and stands at an elevation of 480 ft., 15 m. to the E. of Lake Wetter; it has a steamer service from Sommen at the head of the lake.

Somnambulism (Lat. *somnus*, sleep; *ambulare*, to walk). Walking during sleep. This act, very rare in normal individuals, is most often associated with some form of neurotic disturbance. It implies that the muscular apparatus and the part of the brain which controls it are awake while the intellect is deep in unconsciousness.

The sleepwalker avoids pitfalls and collisions, and on waking is unaware of his prowlings. The condition may persist, but a raising of the tone of health, and psychological treatment, should usually result in its disappearance.

Somnath. Ruined town of Junagadh state, Saurashtra, India. On the W. the plain is covered with Mahomedan graves, and on the E. are many Hindu shrines and tombs. It was captured by Mahmud of Ghazni, the Idol-Breaker in 1024. The modern town of Veraval lies to the W., and between the two is a temple of Siva.

Somnus. In Roman mythology, the god of sleep, son of night, and brother of death. In art, sleep and death are represented as two youths holding inverted torches.

Son. River of N.E. India. It rises in the Amarkantak range at the E. end of the Shahpur Hills, Madhya union, and flows N.W. and then N.E. along the S. face of the Kaimur range into the Uttar union, and across Bihar to its junction with the Ganges near Patna. At Dehri it is spanned by one of the longest rly. bridges in the world, 10,044 ft. in length. A dam, 12,500 ft. long, here holds back the water to supply the Son canals which irrigate W. Bihar. The length is 487 m. Drainage area 21,000 sq. m.

Sonant (Lat. *sonans*, sounding). Term used in modern philology to denote the sound which carries the syllabic accent, as *a* in apt. A sonant, therefore, is regarded as the opposite of a consonant, and sonants are vowels, liquids, and nasals. There can only be one sonant in a syllable. See Consonant; Phonetics.

Sonata (Ital. *sonare*, to sound). A composition of importance in music. Originally applied to an instrumental piece only, the term eventually designated a composition comprising several related movements, played by one (or two) performers. The first sonata composer was Andrea Gabrieli, who published his Sonate à 5 instrumenti in 1568. For some time the composers of the 17th and 18th centuries seem to have felt their way towards the evolution of some definite form from the madrigalian type which was their model. These efforts diverged into the Sonata da Camera, or chamber music, and the Sonata da Chiesa, or church music, the former employing, and the latter eschewing, dance forms.

In both the vocal style was gradually superseded by greater free-

dom of melody and rhythm, which became possible through better instrumental technique. Contrast was secured by grouping together different pieces, thus resulting in the suite (*g.v.*). The sonata was the result of a desire to break away from the dance forms of the suite, and the two continued on separate lines, the sonata developing its possibilities and so affecting the course of instrumental music.

Domenico Scarlatti was more homophonic, and in his sonatas he attained a basic design, the principles of which can be traced in later developments. They are constructed on a two-part plan. Their importance lies in their definite rhythm, which thus led up to distinct subjects, evolved by Paradies, C. P. E. Bach, and others, who used subjects contrasted in character and in key. With Haydn sonata form became fixed. Movements, three or four in number, are usually, though not invariably, as follows: (1) A quick movement (sometimes preceded by an introduction); (2) a slow movement; (3) a minuet, scherzo, or something similar; (4) a lively movement. The first and last are in the same key; the others are in related keys.

The plan on which the first movement is written, and sometimes the last also, though this is frequently a rondo (*g.v.*), is in three parts: (1) the enunciation of two subjects, the second being in a related key; (2) the development of this material; and (3) the recapitulation of part one, except that the second subject is now in the primary key. A coda concludes the movement. This is called sonata form, and is the plan of the symphony and most chamber music. With modern composers the tendency is to increase the emotional significance.

A sonatina (Ital., little sonata) is a piece of simpler texture and smaller dimensions than a sonata. See Harmony; Music.

Bibliography. The Art of Music, C. H. H. Parry, 1893; Sonata Form, W. H. Hadow, 1896; Dictionary of Music and Musicians, Sir G. Grove, new ed. 1940.

Sonderbund. German word meaning separate league, applied especially to one formed in 1843 by seven Swiss cantons. Feeling between Roman Catholics and Protestants was very bitter, and the matter came to a head when, in 1841, the great council unconstitutionally voted in favour of suppressing the monasteries in Aargau. This was passed in a

modified form by the diet in 1843. The Roman Catholics protested, and on Sept. 13 seven cantons in which they were dominant formed a Sonderbund; these were Zug, Lucerne, Unterwalden, Fribourg, Uri, Schwyz, and Valais. Disorder broke out in Lucerne, the Sonderbund armed, and in 1847 the diet of the Swiss confederation declared the separate league illegal, and took steps to enforce its authority. The seven cantons were defeated. See Switzerland.

Sondrio. Prov. of Italy, in Lombardy. It is adjacent on the N. to Switzerland, and contains spurs of the Rhaetian and Bergamesque Alps. Its area of 1,233 sq. m. mainly comprises the valley of the Adda. Wine, silk, and chestnuts are the principal products. The town of Sondrio stands on the Mallerio, 25 m. E.N.E. of Colico. Pop. of town, 11,672.

Sonepat. Town of Punjab state, India, in Rohtak dist. Situated on the rly. N. from Delhi, 10 m. W. of the Jumna, it is a local market town and contains two Jain temples. Pop. 15,000.

Sonepur. Town and former state of India. The state, drained by the Mahanadi, was merged in 1948 in the administration of Orissa. Rice, sugar-cane, and cotton are grown. Area 948 sq. m. The town, also called Nijgarh, is at the confluence of the Tel with the Mahanadi. Pop. of former state, 248,873; town, 10,200.

Song. Simultaneous production by the voice of words and musical sounds. Considered as a form, a song consists of words set to music which recurs as many times as there are stanzas, an elementary example being the folk song. From this came the ballad with its simple accompaniment. In the art song the aim is to emphasise the meaning of words by suitable melody, supported by a more elaborate accompaniment, the purpose being to suggest an "atmosphere." Other forms of song are known as scena, aria, etc.

In a literary sense, song often designates verses of a lyrical nature, and in a restricted sense is also applied to the notes of the more vocal birds, such as the nightingale, the thrush, the black-bird, the canary, etc. See Bird Song; Lyric; Minstrel; Music; Singing.

Song Ca, SONG KA, OR SONG KOR. Alternative names for the Hong-Kiang (q.v.) or Red river of Indo-China.

Songhai OR SONRHAI. Negroid people in the middle Niger basin,

S. Sahara. Tall, slender, deep-brown, thin-lipped, straight-nosed, with black, ringlety hair, they present varying intermixtures with Libyan and Arab strains. They now congregate round Gobo and Timbuktu.

Song of Songs (Lat. *Canticum Canticorum*). Hebrew title for the O.T. book, otherwise known as Canticles and The Song of Solomon. See Canticles.

Song of the Shirt, THE. Poem by Thomas Hood, first published in Punch, Christmas, 1843. Suggested by the sight of a widowed needlewoman struggling to keep herself and two children on seven shillings a week, the poem remains unexcelled as a lyric inspired with humanitarian purpose.

Song Thrush OR MAVIS (*Turdus ericetorum*). British song-bird. It is common in most districts, except

Song Thrush or Mavis. Song-bird common throughout most of Britain

the N. of Scotland, and is to be found all the year round, though the majority of the birds migrate in autumn. It builds its nest of grass and twigs, lined with mud and rotten wood, and feeds mainly upon worms, snails, and insects. See Eggs, colour plate; Thrush.

Sonnblick. Meteorological station and observatory in Salzburg, Austria. Established on Mt. Sonnblick in 1886, it stands at an elevation of 10,180 ft., in the Hohe Tauern, N.E. of Lienz in the Puster Thal, and is one of the highest stations in the world.

Sonneberg. Town of Germany, in Thuringia, 9 m. N.E. of Coburg, at the S. of the Thuringian Forest, some 1,300 ft. above sea level. It was long the centre of the German toy industry, with a training school for toymaking and ceramics. Owing to its beautiful surroundings, it had some repute as a holiday resort. Pop. 19,157.

Sonnet (Ital. *sonetto*, a little sound). Form of verse. Invented in Italy in the 13th century, and perfected by Dante and Petrarch, the regular or Petrarchan sonnet consists of 14 iambic lines of 10 or 11 syllables, the first eight lines,

or octave, generally devoted to the exposition of the theme, having the rhyme-scheme *abbaabba*; and the last six, or sestet, containing the application of the idea, with two or three rhymes variously arranged, a closing couplet being avoided. In England, from Surrey to Milton, many irregular forms were used, the chief being the Shakespearian sonnet, rhyming *ababcdcdefeggg*. Milton used the Petrarchan form, but ignored the break after the eighth line. Most of the great poets of the 19th century were attracted to the sonnet, especially Wordsworth who wrote some hundreds. E. B. Browning and D. G. Rossetti produced their best work in this form, and a later specialist was Lord Alfred Douglas. Longfellow was an early exponent of the form in America.

Sonora. Maritime state of N.W. Mexico. Bounded to the N. by the U.S.A. and W. by the Gulf of California, it is mountainous in the E. and has an area of 70,477 sq. m. It is rich in minerals, silver, gold, copper, coal, and iron being worked, and cereals, cotton, sugar, and tobacco are cultivated. Hermosillo is the capital of the state. Pop. 364,176.

Sonoran. Family of American Indian languages, spoken mostly in Chihuahua and Sonora, but also in Arizona.

Sonsonate. Dept. and town of Salvador. The dept. is low-lying near the Pacific Ocean and elevated inland. Sugar, coffee, tobacco, fruit, and cabinet woods are the chief products. Area, 540 sq. m. Pop. est. 100,000.

The town, capital of the dept., is 32 m. W. of San Salvador, and is connected by rly. with Acajutla. It was founded in 1524 by Spaniards under Pedro de Alvarado. Pop. 23,559.

Soo Canals. Popular variant of the Sault Sainte-Marie (q.v.) ship canals of N. America.

Sonnblick, Austria. Meteorological station on the top of the mountain

Soong. Name of an influential Chinese family. Soong Yao-ju (1863-1918), who sailed to America as a boy, was converted to Christianity by a sea captain, Charles Jones, and at baptism took the names of his benefactor. Returning to China in 1886 he was first a preacher and teacher, marrying a co-worker, then an agent for foreign machinery, and finally, from 1895, a follower and helper of Sun Yat-sen (*q.v.*). He set up a printing press at Shanghai which became one of the world's largest. It printed Bibles openly and revolutionary literature in secret.

Of his six children, the four eldest were educated in America. The eldest daughter Eling (b. 1890) returned to Shanghai in 1909, and married in 1913 Kung Hsiang-hi, a 75th descendant of Confucius. Kung founded the Oberlin Shansi memorial college at Shansi and was its first principal. Between 1926 and 1938 he held several important govt. offices, including those of minister of industry and minister of finance. C. J. Soong's eldest son Tse-ven (b. 1891) returned to China in 1917 and became president of the central bank, then minister of finance, 1925-27; vice-pres. of the executive yuan, 1930-44; foreign minister, 1941-44 (attending the first Quebec conference, 1943); and president of the executive yuan (prime minister), 1944-47, representing China at the San Francisco conference, 1945. In 1947 he became governor of Kwantung. Chingling, the second daughter, who returned to China in 1913, became secretary to Sun Yat-sen, whom she married in 1914, against the wishes of her family; she was vice-president of the Communist govt. set up in Peking, 1949. The third daughter, returning in 1917, married Chiang Kai-shek in 1927; see Chiang Kai-shek, Mme.

Soot. Black carbonaceous deposit due to imperfect combustion of many substances, *e.g.* coal. Soot consists mainly of carbon, tar, and ash or mineral matter, together with small quantities of sulphur and nitrogen compounds, and is frequently acidic. Analyses show great variations in composition. Soot is employed as a manure on account of the nitrogen it contains. Various estimates have been made of the quantity of atmospheric soot. The soot-fall in the built-up area of London (425 sq. m.) was estimated in 1947 to be 92,400 tons annually. See Pollution.

Soothsayer (A.S. *sóth*, truth). One who professes, by supernatural

means, to reveal the future or any unknown fact. The word is virtually synonymous with diviner, though applied more especially to those who utter predictions in a state of trance or ecstasy, or by interpreting dreams or subjective impressions, without the aid of physical objects. See Divination; Magic; Oracle; Prophecy; Sibyl.

Sophia (Gr. *sophos*). Word meaning wisdom. The term Hagia Sophia, or the Holy Wisdom, is used for the supreme wisdom. Many churches are dedicated to it, the most notable being that at Istanbul. The word is also a feminine Christian name. See Istanbul; Saint Sophia.

Sophia (1630-1714). Electress of Hanover. The twelfth child of the Elector Palatine and his wife

Sophia,
Electress of Hanover

Elizabeth, daughter of James I, she was born at The Hague, when her parents were in exile, Oct. 14, 1630. She married in 1658 Ernest Augustus, a duke of Brunswick, who, in 1692, became elector of Hanover. Neither William III nor Anne, who would succeed him, had children living, and in its anxiety to exclude the R.C. descendants of Charles I, parliament settled the crown on Sophia and her heirs, being Protestant. She did not live to become queen, as she died, June 8, 1714, only a few weeks before Anne. George I was the eldest son of her large family. An unusually intelligent woman, she took a keen interest in the last in the affairs of England. See Settlement, Act of; consult S. of Hanover and Her Times, F. E. Bailey, 1936.

Sophia Dorothea (1666-1726). German princess. Born Sept. 15, 1666, daughter of George William of Brunswick-Lüneburg, she was compelled for family reasons to marry, Nov. 21, 1682, her cousin George, the future elector of Hanover and king of England. She bore her husband two children, George, afterwards George II of England, and Sophia Dorothea, who married Frederick William I of Prussia. The re-

Sophia Dorothea,
German princess

lations between Sophia Dorothea and her husband became worse as time went on. She was accused by her enemies of criminal intrigue with Philipp von Königsmark, who vanished mysteriously and was probably murdered in the palace at Hanover on July 1, 1694. Divorced and imprisoned that year at Ahlden, near Celle, she lived there until her death on Nov. 3, 1726.

Sophister or **SOPHOMORE** (Gr. *sophos*, wise). In various universities, term commonly applied to undergraduates of more than one year's standing.

Sophists (Gr. *sophistēs*, wise man). Class of teachers in Greece, first prominent in the 5th century B.C. The general progress of culture, mistrust of the traditional beliefs, democracy's newly found consciousness of its power, the growing importance of oratory as an aid to personal ambition, had created a demand for competent teachers. This demand was met by the sophists, professors of wisdom, who declared themselves ready to give instruction in all possible branches of knowledge, and especially to fit their pupils for practical life. These sophists are the representatives of the Greek illumination, an intellectual movement reflecting the altered social, political, and religious conditions of Greek life. They are the apostles of subjectivity, of the doctrine that objective truth does not exist.

The earliest sophists were Protagoras of Abdera (*q.v.*), the first to ask a fee for teaching, and Gorgias of Leontini (*q.v.*). Later sophists, *e.g.* Critias the tyrant, who described religion as the invention of politicians, were advanced free-thinkers. Hippias of Elis and Prodicus of Ceos have a better reputation. Later generations of sophists, by their greed of money and their attacks on family life and all social, religious, and political institutions, drew upon themselves the odium of the public. In spite of these defects, the sophists brought a mass of general knowledge within reach of the people, and in particular rendered great services in the formation of Attic prose. They were the first to pay attention to style, rhythm, and rhetoric as an art. Attic oratory begins with them; Antiphon and Isocrates are their literary descendants. See Greek Literature; Hippias; Prodicus.

Sophocles (495-405 B.C.). Athenian tragic dramatist. Born at Colonus, near Athens, the son of a well-to-do worker in metals,

Sophocles received the usual education of an Athenian gentleman. At the age of 15 he was chosen for his grace and beauty to lead the chorus which sang the song of triumph in celebration of the victory over the Persians off Salamis in 480 B.C. He won his first prize for tragedy in 468, Aeschylus being placed second. For the rest of his long life he was chief favourite on the Athenian stage, winning the first prize 20 times. In 440 B.C. he was appointed one of the ten generals in the campaign against Samos, but Pericles, the Athenian leader, employed the poet chiefly in connexion with the work of supply. There is a story that towards the end of his life one of Sophocles' sons, Iophon, brought an action against his father alleging that he was of unsound mind, but that the case was brought to an abrupt conclusion by the aged poet's reciting a magnificent choral ode from his latest tragedy.

Sophocles wrote about 130 plays, but only seven are extant. These were probably produced in the following order: Antigone, Electra, Trachiniae, Oedipus Tyrannus, Ajax, Philoctetes, Oedipus Coloneus, the best known being the first, fourth, and seventh, which deal with the hereditary curse on the house of Oedipus (*q.v.*). Sophocles, however, intensifies and humanises tragedy by insisting on the elements in it which are due to man's arrogance and self-will, and to the moral conflict between human wills. He teaches the wisdom of self-restraint, and acceptance of divine and eternal law. He rises above the traditional religion of Aeschylus, but avoids what was considered the irreverent realism and scepticism of Euripides.

The plays of Sophocles, typical of the Greek spirit in the age of Pericles, are marvels of harmony, proportion, and restraint, above all the Oedipus Tyrannus, which in plot and construction is the masterpiece of Greek tragedy. By introducing a third actor, and diminishing the rôle of the chorus, Sophocles was a great reformer of dramatic technique. *See* Antigone; Drama; Electra; Greek Literature; Oedipus; Tragedy; *consult also* Works, ed. L. Campbell, 1871-81; Works, by R. C. Jebb, 1883-96; trans. F. Storr in the Loeb Classical Library, 1912; History of Ancient Greek Literature, G. Murray, 1897; Religious Teachers of Greece, J. Adams, 1909.

Sophonisba (d. c. 203 B.C.). Daughter of the Carthaginian general Hasdrubal, son of Gisco.

Sophocles, the Athenian dramatist
